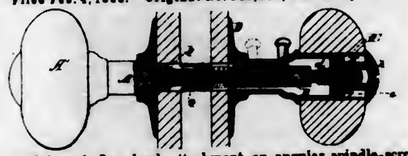
Claim.—1. A foot-board, F, hung at one end by a universal or double-acting joint, as at H, and suspended at its other end by a swinging rod, I, and also connected to a pitman, E, provided with a bar, G, which swings and rocks it over the dead-center, substantially as and for the purpose set forth.

2. An adjustable bar, G, provided with a stop-notch, *s*, in combination with a fixed supporting-pin, *g*, of the frame, and with an oscillating foot-board, F, which has a hinge at one end and a suspending swinging rod at the other, substantially as described.

3. The socket-bearing H for the ball, made with a slot, *j*, and provided with an adjusting clamp-bolt, *l*, and nut *m*, in combination with the foot-board, pitman E, and pitman-bar G, provided with adjusting-holes *r*, substantially as and for the purpose described.



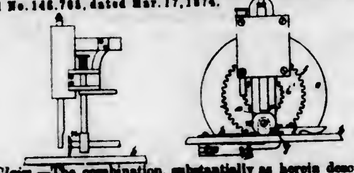
4. The foot-board comprising metal end pieces, *b b'*, which are grooved and perforated or slotted, as at *d*, wooden pieces *c c*, and a rocking rod, J, which is provided with a shoulder, *e*, screw-thread *f'*, and clamping-nut, substantially as and for the purpose described.

5. The grooved end pieces of the foot-board proper, provided with adjusting-slots *d*, substantially as and for the purpose described.

6. The bar G, having one of its ends hinged on a fixed pin of the frame and its other end hinged upon a pin of the pitman at a point between the ends of the pitman, in combination with an oscillating foot-board, substantially as and for the purpose described.

REISSUES.

10,066. KNOB ATTACHMENT. HOWARD L. PHIPPS, Milford, Mich., assignor to the Milford Door Knob Company, same place. Filed Feb. 4, 1882. Original No. 241,659, dated May 3, 1881.



Claim.—1. In a knob attachment, an angular spindle-screw cut upon its corners, an angular sleeve-screw tapped to engage said spindle, a locking-washer adapted to slip longitudinally over the spindle and simultaneously engage the angular part of the sleeve and the angular part of the spindle, and thereby lock them together, and means for holding said washer in place upon the spindle, substantially as described.

2. In combination with a knob interiorly threaded, and with an interiorly-threaded spindle which is squared at the engaging end, as described, a rectangular recess in the outer face of said knob and a similarly-shaped washer, substantially as set forth.

3. In combination with the knob C, provided with a rectangular recess, *c*, and with a spindle and rectangular washer, as described, the flanged nut E', substantially as and for the purposes specified.

4. In combination with the spindle A, constructed so that it will freely turn within the hub of the lock through which it passes, and made partly round and partly square, as shown, a slide, B, upon said spindle, which engages with the hub of the lock, substantially as and for the purposes described.

10,067. CUTTING AND TRIMMING ATTACHMENT FOR SEWING-MACHINES. SAMUEL W. SHEARY, Boston, Mass., assignor, by mesne assignments, to Willcox & Gibbs Sewing Machine Company, New York, N. Y., and National Sewing Machine Company, (Limited,) Philadelphia, Pa. Filed Feb. 3, 1882. Original No. 146,705, dated Mar. 17, 1874.

Claim.—The combination, substantially as herein described, with stitch-forming mechanism, of a rotary cutter having its cutting edge or edges eccentric.

DECISIONS OF THE U. S. COURTS.

U. S. Circuit Court—Southern District of New York.

CRANDAL *v.* WALTERS *et al.*

Decided December 13, 1881.

1. REISSUE—NEW MATTER—CLAIM—ADJUNCT.

When the real invention was a box-loop for carriage-tops of a particular construction and the claim of the original patent was limited to the use of the box-loop in connection with an adjunct—a new strengthening or stiffening plate—*Held* that the patent might be reissued for the purpose of inserting a claim for the loop itself, without reference to the strengthening-plate.

2. SAME—EXPANSION OF CLAIM.

The patentee having described and claimed a box-loop with an open frame or bottom, from the edges of which lugs project through the material to be clinched on the other side, it is an immaterial variation to employ a closed bottom and make the lugs project from it, and it is not a departure from the original patent to claim upon reissue a box-loop with lugs projecting from it.

3. REISSUE NO. 6,974 SUSTAINED IN VIEW OF PRIOR PATENTS—VARIOUS ANTICIPATIONS—PATENTS EXAMINED.

It appearing that it required ingenuity and invention to pass from the prior devices to the box-loop of the patentee, the validity of the patent is sustained.

Mr. Neri Pine and *Mr. Charles M. Stone* for the plaintiff.

Mr. A. v. Briesen for the defendants.

BLATCHFORD, *J.*:

This suit is brought on Reissue Letters Patent No. 6,974, granted to Charles H. Davis, March 7, 1876, for an improvement in box-loops for carriage-tops, the Original Patent No. 95,004 having been granted to him September 21, 1869.

The specification of the reissue is as follows, reading what is outside of brackets and what is inside of brackets, and omitting what is in italics:

Figure 1 is a perspective view of the loop with straps and buckles complete attached to a piece of leather or section of a carriage-top, B. Fig. 2 is a perspective view of the loop ready for use. Fig. 3 is a plate or cap used on the back or inside of the top B, for securing the loop A. Fig. 4 is a cross-sectional view of the whole complete.

Similar letters of reference indicate corresponding parts.

My invention has for its object [an improvement in] *to improve* the construction of box-loops for carriage [tops,] trimmings, [&c.] *and it* [it] consists in forming the loops [in] *from one piece of* metal, either cast or struck up [into form from one single piece of plate or sheet metal] with a series of [spurs or] lugs [projecting from the] *upon its lower* edges *or corners next the surface to which they are to be affixed*, which [spurs or lugs] *lugs or spurs* [pass] *are passed* through *openings formed in* the carriage top [or curtain] and [are clinched down tight upon it; and I introduce] *through openings in* a metal *stiffening*-plate [on the opposite side] *placed upon the under surface* of the *leather*, [leather, as a stiffening-plate, through which the spurs pass before they are clinched, as a further security in the fastening, by which form and construction I securely affix the box-loop to the curtain, &c.,] *The lugs are then bent down or clinched upon the metal plate, thereby securely fastening the box-loop in place* without the employment of rivets or screws.

Box-loops, as usually constructed, are made of leather, and either sewed or riveted in [place] place, *and* [They] are liable to be bent out of shape and torn from [their fastenings;] *the rivets.* [and this] *This method* [mode of construction and application] is [slow and] expensive, requiring the labor of skilled workmen; while by my improvement the box [loop can be] *is* easily applied [by anyone,] and [is] not liable to get out of order.

In the accompanying drawings, [which form a part of this description, Fig. 1 is a perspective view of the loop, either cast or struck up from thin metal, affixed in place with buckles complete. Fig. 2 is a perspective view of the loop detached. Fig. 3 is the stiffening-plate C.]

A is a metal loop, either cast or struck up from [thin] *sheet* metal, preferably the latter, [latter, which] *When formed of sheet metal the blanks* are cut out by suitable dies [with] *having spurs or lugs* [lugs or spurs formed at] H H upon [the] two [sides] *opposite edges*. [The loop is then] *They are* bent into *the* form [and stamped or embossed, as in Figs. 1, 2, or otherwise, which completes the manufacture of the loop, which is then ready to be affixed in its place B, Fig. 1. To apply this loop to a carriage-top or elsewhere the spurs or lugs H H H are thrust through holes or slits made therefor in the leather, and the ends are bent and clinched down upon the other side. Buckles may be affixed to their place on B, as in Fig. 1, in any convenient way, and the loop put over them and affixed to B. As an additional security, plates C (see Fig. 3) are employed on the opposite side of the curtain to stiffen and support the fastenings or supports H, which are clinched down on them after passing through openings therein for the purpose.] *shown in Fig. 2 to produce the loop.*

D is a strap or straps, each end passing around and through the buckle E, and secured in any proper manner to the piece B of the carriage-top. The piece B is provided with a series of holes upon each side of the strap D corresponding in number and position to the spurs H upon the loop. The loop is applied to the piece B by passing the spurs through these holes, as shown in the drawing, and through holes X X, formed in the metal plate C, laid against the inner surface of the piece B. The lugs are then bent down or clinched upon the surface of this plate, thereby firmly securing the loop in place without the aid of rivets.

Reading in the foregoing what is outside of brackets, including what is in italics, and omitting what is inside of brackets, we have the specification of the original patent.

The claim of the reissue is as follows:

The box-loop A, formed out of thin plate metal, as described, with the lugs or spurs H projecting therefrom to affix it to a carriage-top, either with or without the plate C, substantially as and for the purposes specified.

The claim of the original patent was this:

The box-loop A, when formed as described, with the lugs or spurs H upon its edges, and applied to a carriage-top by passing said lugs through the same and through the metal plate C, and then bending them down upon the surface of said plate, substantially as described, for the purpose specified.

It is apparent that the article specified in the claim of the reissue is to be (1) a box-loop (2) made of metal, (3) the metal so thin that the article can, if desired, be struck-up from it; (4) the metal of the loop to be a single piece bent into shape; (5) the lugs to project from the loop toward the surface of the material to which the loop is to be affixed; (6) the loop to be capable of being affixed by passing the lugs through the material and clinching them down tight upon the other side, the clinching being done by bending them at right angles, and no rivets or screws being employed. These characteristics are all found in the specification of the reissue in connection with its claim. They are all found in the specification of the original patent. The drawings of the two patents are the same. The model filed with the application for the original patent shows all the foregoing characteristics. The claim of the original patent was so framed as to seem to require that the loop should be actually applied to a carriage-top in order to infringe. It also required that the metal plate C should be used in such application. Makers of loops were not makers of carriages, and it was obvious that

the invention was really of the loop ready to be affixed, and that the inventor was entitled to have a claim which would reach the maker of the loop. Besides, even if the claim of the original would have extended to the maker of the loop, it might have been questioned whether it would reach him when he made a loop without the plate C. And it was plain that that was only a stiffening or strengthening plate—an adjunct—making the article better, perhaps, but yet not of the essence of the invention. The case was therefore one for a reissue.

It is objected that the specification of the original patent says that the series of lugs is on the lower edges of the loop—that is, projecting from the lower edges of the long parallel sides of the loop and in the same plane with such sides. The drawings and model show such a construction. The reissue says that the lugs project from the edges or corners next the surface to which they are to be affixed. The plaintiff's loop has an open bottom, the metal being only on the top and the sides. The defendants make one form of loop with a closed bottom, and with lugs punched out of the bottom at three sides of the lug and bent down at the fourth side, ready for use, and standing at right angles to the sides of the loop and in the same plane with each other.

To maintain non-infringement, and yet enable themselves to appropriate the real invention, they contend that the claim of the reissue is a departure from the invention shown in the original (1) in making it necessary only that the lugs should project from the loop, without limiting them to being arranged, as in the drawings, on the lower edges of the sides; (2) in making it necessary only that the lugs should be used to affix the loop, without it being necessary to use them by putting them through the carriage-top; (3) in making it optional to use the plate C.

It is clearly a mere formal alteration, and within the invention, to put on the closed bottom and make the lugs project from it, instead of making them project from the edges of the sides. The closed bottom or fourth side is a useless expenditure of labor and material so far as the real invention and the employment of it are concerned. The defendants' lugs project in a manner entirely equivalent, and if the claim of the reissue had said, as did the claim of the original, that the loop had lugs on its edges, it would have been proper to say that for all practical purposes the defendants' lugs were upon the edges, the variation being immaterial.

The claim of the reissue is not capable of the construction, that the lugs are to be used without putting them through the carriage-top. It was no departure and no new matter to make the use of the plate C optional. To say that the lugs of the patent project from the edges or corners next the surface to which they are to be affixed is just as accurate a description of them as to say that they are upon the lower edges of the loop. It is from the edges next the surface to which the lugs are to be affixed that the lugs project. There is no statement in the reissue that the lugs are not to project from the edges, and calling the edges corners does not alter their location. It is plain that the forms of loop shown in Complainant's Exhibit 2 and in Complainant's Exhibit 3 infringe the claim of the reissue, and that the reissue is not open to the objection that it is not warranted by the original patent.

The remaining question is that of novelty. Various old devices are introduced, wherein sheet-metal prongs or lugs projecting through a material, such as leather or paper, and clinched by bending them, hold and secured the metal or other article to which they were attached on the other side of the material. This idea was old, and was embodied and used by Davis; but, no article like the plaintiff's, capable of being taken and used for the purposes for which the plaintiff's can be used, without alteration and adaptation requiring invention, existed before. Almost all inventions at this day that become the subjects of patents are the embodiment and adaptation of mechanical appliances that are old. In that consists the invention. When the thing appears it is new and useful. No one saw it before, no one produced it before, it supplies a need, it is at once adopted, all in the trade desire to make and use it, yet it is said to have been perfectly obvious and not to have been patentable. Where an article exists in a given form and applied to a given use, and is taken in substantially the same form and applied to an analogous use, so as to make a case of merely double use, there is no invention. But it is very rarely that a thing of that kind secures a patent.

A patent to Joseph E. Ball, No. 20,246, granted May 18, 1858, for a mode of attaching the traces of harness for horses to the draft plates or straps, is adduced. Ball's apparatus could never be used as a loop for a carriage-top. The metal was not so thin that it could be practically struck up from a single piece and be bent into shape. The lugs could not be practically clinched by bending them, but were secured as rivets by a process entirely inapplicable to the use of a loop on a carriage-top.

A patent granted to Robert Meyer, No. 61,628, January 29, 1867, for a buckle-fastening, is relied on. That does not show lugs clinched by bending, but shows only pins secured by riveting. For some purposes, in considering questions arising on letters patent, bent lugs and riveted pins may be the equivalents of each other; but in considering the question of the novelty of the plaintiff's loop, riveted pins are not the equivalents of the bent lugs. The Meyer device could not be used in place of the Davis device without adaptation requiring invention.

The defendants also introduce a patent granted to Charles H. Littlefield, No. 67,322, July 30, 1867, for an improvement in breast-plates for harnesses. It is a piece of metal bent into a loop at one end to hold a buckle, and to allow the tongue of the buckle to pass through a slot made in such bent end, and having wings or projecting pieces turned over so as to overlap a harness-strap. This could not be used as a substitute for the plaintiff's loop without invention. It is easy after the desired thing is obtained to see how an old thing could have been adapted or altered.

The Ball, the Meyer, and the Littlefield patents were all of them considered by the Patent Office in granting the original Davis patent, and the Ball patent was again considered by it in granting the reissue, as appears by the record.

The defendants also adduce English Patent No. 1,204, dated May 13, 1859, to William S. Thomson for improvements in the manufacture of hooped skirts. Their expert, with the Davis device and the Thomson device before him, has cut away parts of the former and claims to have converted it into the latter. It may not be difficult for ingenuity, with both articles in view and with the problem given to convert the later one into the earlier one, to do so; but the inventor of the earlier one had only that one and did not produce the later one. There is nothing in the Thomson device to suggest the Davis box-loop. It required adaptation and invention to convert it into the box-loop. An exact reproduction in a model of figure 8 of the drawings of the Thomson patent shows that there is no identity between it and the Davis structure.

The French patent to Franeson, No. 25,417, granted November 15, 1855, for a clinched fastening for gloves, may also be dismissed. It contains several features which are availed of in the Davis loop, yet, to pass from it to that required adaptation beyond that existing in a mere double use.

It is not necessary to allude to the numerous other old patents introduced by the defendants. The foregoing remarks apply to all of them, and also to the alleged prior structures respecting which oral testimony is given.

Attention is directed by the defendants to an exhibit of theirs, marked "Bolt guide and catch," alleged to represent a prior structure. The exhibit is not claimed to be a structure which was actually made before Davis's invention, but only to represent one. It is a bolt-guide consisting of a metal plate, with two three-sided metal loops on it, each loop open at its two ends, which open ends are lengthwise of the plate, this plate being intended to be placed on one article, and of another metal plate, with one three-sided metal loop on it, open at its two ends, which open ends are lengthwise of the plate, this plate being intended to be placed on an adjoining article. Each loop has on it, projecting downward from the lower edge of each vertical side of it, a spur or lug integral with it, and passing through a slot in the metal plate and bent over and clinched down on the opposite side of the plate. The exhibit in question is introduced by a witness, who states that it is "a guide for a sliding bolt and a catch, into which the bolt would slide when the article is put in use," and that he has known articles similar to it to have been in public use and on sale in the United States for nine and a half years before January 15, 1881. This would carry it back to July 15, 1871. The application for the original Davis patent was filed April 22, 1868. Moreover, the attention of the witness was not directed to the feature of the bending over of the lugs to clinch them as distinct from riveting them. It does not appear that the metal used prior to Davis's invention in making any such bolt guide and catch was so thin that the article could be or was struck up from a single piece of metal.

Another witness states that to his knowledge bolt-guides were made on the plan of said exhibit, but larger, nearly twenty years before January, 1881, the loops being fastened to the bottom plate twenty years ago the same as in the exhibit, "clinched to the back of the plate." On cross-examination he says that they were made of heavier metal, some of them. He then testifies:

Cross-Q. 10. Were not the ends of the hasp or staple headed down on the plate by a blow of the hammer, as in riveting, instead of being bent over or clinched, as in defendants' exhibit, "Bolt guide and catch"? A. As a general thing they were made in that way, riveted with a hammer to form a clinch. They were not riveted to form a head like a boiler-rivet, but were bent over like the exhibit.

Again, he says that they were mostly made for heavier purposes than the exhibit.

The defendants' expert says that the exhibit could be attached to a carriage-curtain.

The plaintiff in his testimony as a witness gives evidence throwing doubt on the view that the lugs in any bolt-guide were not headed down by riveting.

On the whole evidence it must be held that the prior existence of the bolt-guide made of metal so thin that the article could be struck up from a single piece of it, and with lugs clinched by bending and not riveting is not satisfactorily shown. Besides all this it is plain that the bolt-guide never did and never would suggest Davis's box-loop.

There must be a decree for the plaintiff for an account of profits and damages, and a perpetual injunction, with costs.

U. S. Circuit Court—District of Kentucky.

MILLER *et al. v.* FOREE *et al.*

Decided January 2, 1882.

1. REISSUE NO. 8,060—MARKING PLUG-TOBACCO—ANTICIPATION.
Reissue Letters Patent No. 8,060, for a process of marking plug-tobacco with an ineffaceable identifying-impression by one and the same pressure by means of compress-plates with draws in relief, *Held* to be anticipated by the invention of Ed. F. Smith.

2. IMPEACHING WITNESSES—GENERAL CHARACTER—ADMISSIBILITY.
A successful assault upon the general character of a witness does not necessarily exclude his testimony from consideration. The law recognizes the possibility of a witness of general bad character telling the truth, and thereupon permits such witnesses to testify, their evidence to be received for whatever, under the circumstances of the particular case, the tribunal charged with the duty of passing on and deciding the facts may deem it worth.

Messrs. Sterm & Peck, Messrs. Beattie & Winchester, and *Mr. Geo. Harding* for the complainants.

Mr. S. S. Boyd for the defendants.

BAXTER, *J.:*

Complainants sue for an alleged infringement of Reissue Letters Patent No. 8,060, issued to them on the 29th of January, 1878. The invention claimed consists of a process for finishing and marking tobacco plugs with an ineffaceable identifying-impression by one and the same pressure, by means of compress-plates with draws in relief, whereby the tobacco takes a permanent set with the impression in it and in a finished state, the tobacco having been previously prepared by a forming pressure in the molds.

The patent contains two claims.

1. The described process of marking plug-tobacco, which consists in impressing letters or other marks directly into the side of the plug during the process of manufacture, and by the pressure employed in making the plug, substantially as described.
2. A tobacco plug marked with an impression, substantially as described.

The defendants, among other defenses, allege that Miller and Worley, the parties named in the original patent as the first and original discoverers of the patented process, are not the original discoverers thereof, and aver that said process was understood and applied by the several parties named in the answer before its discovery and use by Miller and Worley.

The case, as it was then presented, was heard by me more than a year ago, when a decree was entered sustaining the first claim of the patent, adjudging defendants guilty of infringement, granting an injunction, and ordering an account of profits, &c. But before the account was taken I granted a rehearing to enable defendants to put in additional and newly-discovered evidence to sustain this defense of prior discovery and use of the process secured by complainants' patent. Further evidence was accordingly adduced by both

parties bearing on this issue, the most important of which is found in the depositions of Ed. F. Smith and Robert E. Lee.

The object of these depositions is to show that the patented process had been discovered, matured, and successfully used by Smith before it was discovered by the patentees. If the depositions of Smith and Lee, his foreman, are true, the defense of prior discovery and use is well sustained. But are these depositions reliable? The witnesses have been severely attacked and successfully impeached in so far as evidence assailing the general character of a witness can discredit their testimony; but this successful assault upon the general character of these two witnesses does not necessarily exclude their testimony from consideration. The law recognizes the possibility of a witness of general bad character telling the truth, and therefore permits such witnesses to testify, their evidence to be received for whatever, under the circumstances of the particular case, the tribunal charged with the duty of passing on and deciding the facts may deem it worth. It therefore becomes our duty to consider and decide how much weight ought to be given to the testimony of these witnesses as against the *prima facie* case made by the patent itself. The patent is evidence of its own validity, and hence the burden of proof to invalidate it rests upon the defendants. Every reasonable doubt ought to be resolved against them, and if, proceeding on this hypothesis, it shall be found that Smith's alleged discovery, &c., was incomplete and resting on speculation and experiment only, or that the evidence on this point is evenly balanced, it cannot avail to defeat complainants' patent. Let us now examine the testimony and see how the fact in this regard is.

As preliminary to the main question it is perhaps proper to remark that the defendants on the former hearing contended that complainants' patent had been anticipated by English and American patents issued to other parties; but this defense was rejected as untenable. I still adhere to the opinion then expressed. Although said several anticipating inventions had been successfully used in marking soap, tobacco, and other substances with the names of the manufacturers or with such other trade-mark or identifying-mark as the manufacturers chose to impress on the product of their labors, neither of such inventors had conceived or clearly developed the precise process which constitutes complainants' discovery; but these prior discoveries reflected more or less light upon this general subject, if they did not distinctly suggest the identical idea which constitutes complainants' invention. The surprise is therefore not that Smith should have blundered upon the same thought, but that the thing patented had not occurred to some one at an earlier date.

Smith says that he did conceive the idea, and proceeds to detail the different steps taken to develop it. He was a manufacturer, in a small way, at a remote place in Arkansas, of plug-tobacco. Both his means and facilities for carrying on his business were exceedingly limited. He used wooden molds, and finding that the faces of his molds were such as to leave the tobacco with a rough finish, he made an effort to remedy the matter by plating the molds with metal plates fastened on by screws, and, discovering that when the molds thus plated were used the screw-heads made an impression upon the finished tobacco, he conceived the idea of marking the tobacco with his name, and began at once a course of experiments to mature and develop the thought and apply it to practical use. But he found difficulty in giving a satisfactory finish to the tobacco and making the impression permanent. At this point Lee, his foreman, came to his assistance and advised him to buy a finisher. Thereupon Smith ordered a finisher from a firm in Louisville, whose name is given, and after further consultation with Lee and one G. W. Davidson, a jeweler, he employed the latter to make him two zinc plates with the letters of his name raised thereon, which he occasionally used in marking two tobacco plugs out of the one hundred and eighty plugs in each finishing process, at intervals, from August, 1875, to April, 1876, at which last-named period his factory was seized by the Government and his business suspended. Now if, as has been stated, Smith's evidence is true, the process so discovered and applied by him is a clear anticipation of complainants' discovery. The explanation and the manner in which it has been told is well calculated to impress one with confidence in its truth. Besides, he is confirmed in every material particular by Lee.

But complainants have examined quite a number of witnesses, who, in addition to testimony impeaching the general character of both Smith and Lee, testify that they bought and sold tobacco manufactured by Smith during the period mentioned, and that they had no recollection of having seen any plug of tobacco marked with Smith's name. This evidence is, notwithstanding its negative character, entitled to a good deal of weight.

But defendants rejoin, first by argument and then by evidence. Their argument is, that Smith being a manufacturer in but a very small way, using his plates for marking only at intervals, and then only marking, say, one or two plugs out of one hundred and eighty in each finishing process, it is not unreasonable to suppose that Smith may have marked tobacco in the manner and by the process described by him and that none of the witnesses examined by complainants should have noticed any of the marked plugs. And, by way of further rejoinder, the defendants have adduced other and corroborating evidence that has not been questioned. Davidson, who made the marking-plates for Smith, and who is shown to be a reputable man, has been examined by defendants, and on his examination testified that he had, at or about the time alleged, at Smith's instance and request, made such plates for Smith as herein previously described; and his testimony is confirmed by the production of one of said plates, which bears every indication of genuineness, and is identified by Smith, Lee, and Davidson as one of the plates made by the latter and used by Smith in his business. There is, in fact, no ground on which to doubt the truth of this part of the evidence. If, then, said plate was made at the time and for the purpose mentioned, it follows, as the night follows the day, beyond all reasonable doubt, that it was so used.

But this is not all. The conclusions reached and authorized in the preceding paragraph are confirmed by the positive testimony of other witnesses. Thomas Y. Huddleston, who was at the time of his examination and for nearly eight years prior thereto sheriff of his county, and who, so far as this record discloses, notwithstanding the attempt to impeach his credibility, is a reputable citizen, testifies that he had purchased plug-tobacco from Smith about that time with Smith's name impressed upon it; and he is confirmed by M. W. Wright, one of complainants' witnesses, who, on cross-examination, says that Smith showed him two plugs of tobacco so marked, which Smith at the time represented to be his work. This evidence, supplementing, as it does, the testimony of Smith, Lee, and Davidson, makes a clear case of anticipation. Yet complainants contend that Smith never perfected and reduced his alleged discovery to any practical use, that it was merely experimental and incomplete, and in support of this theory they further insist that Smith could not, and did not, impart as fine a finish to his tobacco as was given to the tobacco finished under complainants' process, and that for this and other insuperable difficulties in his way he abandoned the invention in an uncompleted condition.

I cannot, however, concur in this view of the facts. Smith discovered the "process." This he seemed thoroughly to understand, and having applied it successfully to one or two plugs, it required no inventive genius to apply it to others. It is not important that he did not do this. He did not have the necessary facilities nor the means with which to obtain them. Besides, the seizure of his factory by the Government some eight months after his first experiment was made constrained him to abandon the prosecution of the idea. But he did not so abandon it until he had fully developed the process and until it was understood by himself, Lee, and Davidson, and this, we think, is enough, under the authority of *Coffin* v. *Ogden*, (18 Wallace, 120,) to supersede and overthrow complainant's patent.

A decree will be entered, dismissing complainant's bill, with costs.

Erratum.

OFFICIAL GAZETTE, April 4, 1882, Volume 21, page 924, Patent No. 255,917, in title, second line, for "filed July 19, 1882," read *filed July 19, 1881.*

DEPARTMENT OF THE INTERIOR,
OFFICE OF THE SECRETARY,
Washington, D. C., February 25, 1882.

SIR: I am directed by the Secretary to inform you that he has ordered that William U. Saunders, of New Orleans, Louisiana, be not recognized from and after this date as an attorney in the prosecution of any claim or other matter before the Department of the Interior or any bureau thereof.

I am, sir, very respectfully, your obedient servant,

GEO. M. LOCKWOOD,
Chief Clerk.

The Commissioner of Patents.

Issue of April 4, 1882.

Patents	356	No. 255,752 to No. 256,109,	inclusive.

DESIGNS.

12,842.—WALL-PAPER.—*Caroline Townsend*, Albany, assignor to *Warren, Fuller & Co.*, New York, N. Y. Application filed February 3, 1882. Term of patent 3½ years.

12,843.—CARPET.—*Edwin Fisher*, Boston, assignor to *Lowell Manufacturing Company*, Lowell, Mass. Application filed February 20, 1882. Term of patent 3½ years.

12,844.—PICKLE-BOTTLE.—*Henry J. Heinz*, Pittsburg, Pa. Application filed January 27, 1882. Term of patent 14 years.

12,845.—FRINGE.—*George S. Hensel*, Philadelphia, Pa. Application filed February 21, 1882. Term of patent 3½ years.

12,846.—CARPET.—*Arthur L. Halliday*, New York, N. Y., assignor to *The Bigelow Carpet Company*, Clinton, Mass. Application filed January 26, 1882. Term of patent 3½ years.

12,847.—FRINGE.—*Henry A. Kehrenberg*, Philadelphia, Pa., assignor to *The Fair Hill Manufacturing Company*, same place. Application filed February 21, 1882. Term of patent 3½ years.

12,848.—TOY MONEY-BOX.—*Louis Kyser* and *Alfred C. Rex*, Philadelphia, Pa. Application filed February 13, 1882. Term of patent 3½ years.

12,849.—STOVE.—*Isaac T. Montross*, Peekskill, N. Y. Application filed February 13, 1882. Term of patent 7 years.

12,850.—TOILET-CASE.—*Henry Pattberg*, Jersey City, N. J. Application filed December 1, 1881. Term of patent 3½ years.

12,851 to 12,853, inclusive.—CARPET.—*Edward Perrin*, Kidderminster, county of Worcester, England, assignor to *Horner Brothers*, Philadelphia, Pa. Applications filed March 2, 1882. Term of patents 3½ years.

12,854.—CARPET.—*Edward Perrin*, Kidderminster, county of Worcester, England, assignor to *Horner Brothers*, Philadelphia, Pa. Application filed March 2, 1882. Term of patent 3½ years. Registered in England October 26, 1881.

TRADE-MARKS.

[Certificates of registration of Trade-Marks numbered 8,191 and upward are registered under the act of March 3, 1881.]

9,253.—MEDICAL COMPOUND.—*Charles O. Brooks*, Waverly, N. Y. Application filed February 10, 1882.
"The pictorial representation of the Good Samaritan."

9,254.—THRASHING-MACHINES.—*Gaar, Scott & Company*, Richmond, Ind. Application filed March 8, 1882.
"The word-symbol 'FEARLESS.'"

9,255.—PLUG AND TWIST TOBACCO.—*Inge & Mahone*, Petersburg, Va. Application filed March 8, 1882.
"The words 'SOUTHERN CHOICE.'"

9,256.—PLUG AND TWIST TOBACCO.—*Inge & Mahone*, Petersburg, Va. Application filed March 8, 1882.
"The words 'NAVY KING.'"

9,257.—AXLE-GREASE.—*A. Judson Wise*, Chicago, Ill. Application filed August 4, 1881.
"The arbitrary letters 'C. & W.'"

9,258.—RAZORS.—*William H. De Pew*, New York, N. Y. Application filed February 14, 1882.
"The triangles △ and the letter 🅿, in combination with the word 'PERFECT.'"

9,259.—CIGARETTES.—*Teuscher & Gernsheimer*, New York, N. Y. Application filed March 7, 1882.
"The arbitrary word 'HORATIO.'"

9,260.—SEWING-NEEDLES.—*John Thornton, Jr.*, Brooklyn, N. Y. Application filed March 11, 1882.
"The arbitrarily-selected word 'CLEOPATRA.'"

9,261.—SEWING-NEEDLES.—*John Thornton, Jr.*, Brooklyn, N. Y. Applications filed March 11, 1882.
"The representation of an obelisk."

9,262.—PLUG AND TWIST CHEWING-TOBACCO.—*Brown & Brother*, Winston, N. C. Application filed March 10, 1882.
"The compound word 'HAZEL-KIRKE.'"

9,263.—PERFUMERY.—*Young, Ladd & Coffin*, New York, N. Y. Application filed March 11, 1882.
"The words 'CALIFORNIA WATER.'"

9,264.—ESSENTIAL OILS FOR TOILET ARTICLES.—*Young, Ladd & Coffin*, New York, N. Y. Application filed March 11, 1882.
"The arbitrarily-selected words 'OIL OF COLOGNE.'"

9,265.—PERFUMERY.—*Young, Ladd & Coffin*, New York, N. Y. Application filed March 11, 1882.
"The word 'FASCINATION.'"

9,266.—ATOMIZERS.—*Young, Ladd & Coffin*, New York, N. Y. Application filed March 11, 1882.
"The arbitrarily-selected word 'CENTENNIAL.'"

9,267.—PERFUMERY.—*Young, Ladd & Coffin*, New York, N. Y. Application filed March 11, 1882.
"The monogram of the letters and figure 'Y L & C.'"

9,268.—PERFUMERY.—*Young, Ladd & Coffin*, New York, N. Y. Application filed March 11, 1882.
"The arbitrarily-selected word 'CRITERION.'"

9,269.—PERFUMERY.—*Young, Ladd & Coffin*, New York, N. Y. Application filed March 11, 1882.
"The arbitrarily-selected words 'TALLY HO.'"

9,270.—PERFUMERY.—*Young, Ladd & Coffin*, New York, N. Y. Application filed March 11, 1882.
"The fancifully-selected word-symbol 'EDENIA.'"

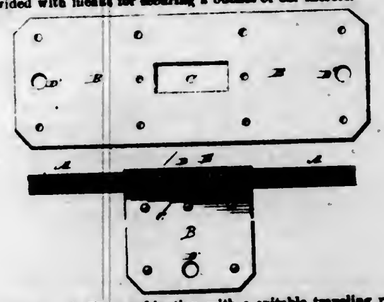
9,271.—PERFUMERY.—*Young, Ladd & Coffin*, New York, N. Y. Applications filed March 11, 1882.
"The representation of a three-leaved clover."

LABELS.

2,657.—Title: "GERMAN-AMERICAN COLOGNE."—*Adrian M. Kloczewski*, Washington, D. C. Application filed March 8, 1882.

2,658.—Title: "RYE BALSAM."—*Earle & Pedley*, Canon, Colo. Application filed March 14, 1882.

2,659.—Title: "IMPROVED DETERGENT."—*C. Tiers Myers & Co.*, Philadelphia, Pa. Application filed February 18, 1882.



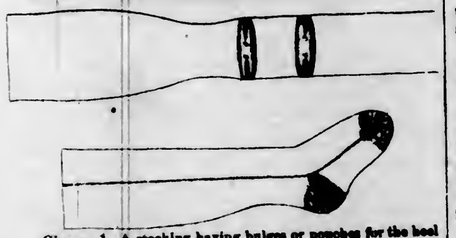
2,660.—Title: "BURDOCK LIVER ELIXIR."—*Perry Van Kleeck*, Seneca Falls, N. Y. Application filed March 8, 1882.

PATENTS

GRANTED APRIL 4, 1882.

255,752. CLIP FOR ROPE TRAMWAYS. CHARLES H. ABBOTT and ALBERT W. HARRINGTON, Chaffee, Colo. Filed Dec. 24, 1881. (No model.)

Brief.—On a traveling rope is loosely secured a clip by means of one or more collars firmly secured to said rope. Said clip is provided with means for securing a bucket or car thereto.

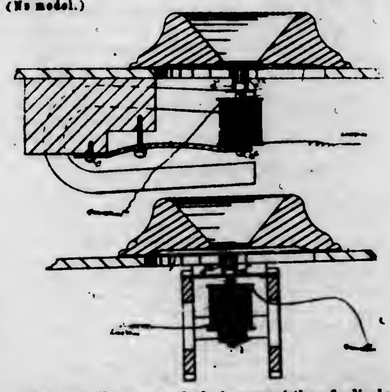


Claim.—1. The combination, with a suitable traveling rope, of a metallic clip bent in the form shown and adapted to be loosely secured to the said traveling rope by one or more collars, substantially as shown.

2. The combination, with a suitable traveling rope, of a metallic clip provided with a rectangular opening and bent in the form shown and a collar firmly secured to the said rope and adapted to occupy the said rectangular opening in the clip and hold it against displacement, substantially as set forth.

3. The combination, with the rope A, of the clip B, bent in the form shown, and having the opening C formed therein, and provided with means for securing a bucket or car thereto, and the collar D, rigidly secured to the said rope and adapted to occupy the opening C of the clip B, substantially as set forth.

255,753. STOCKING AND METHOD OF MANUFACTURING THE SAME. WALTER AIKEN, Franklin, N. H. Filed Jan. 14, 1882. (No model.)



Claim.—1. A stocking having bulges or pouches for the heel and toe and having seams from the toe bulge along each side of the foot and leg to the top of the leg, substantially as described.

2. The herein-described method of making stockings, which consists in knitting a long narrow web containing pouches or bulges suitable for the toe and heel and of sufficient length for the foot and front and back of the leg, then turning the said web back on itself at the toe-pouch and uniting the same together at its edges from the toe-pouch along each side of the foot and heel to the top of the stocking, as shown and described.

3. A stocking having bulges or pouches to form a heel and toe and fashioned in the leg as described, and having seams from the toe bulge along each side the foot and leg to the top of the leg, substantially as described.

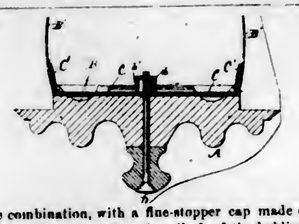
255,754. TELEPHONE. EDWARD H. AMET, La Grange, and WILLIAM S. D. HUNT, Irving Park, Ill. Filed July 19, 1881. (No model.)

Claim.—1. The improved telephone consisting of a diaphragm and a thin strip made of some magnetic substance connected with one or more magnets and vibrating in unison with the diaphragm in front of a helix the core of which has no magnetic connection or magnetism of its own, substantially as specified.

2. The combination, with two magnets having their like poles connected together by a thin strip of magnetic metal, of a connecting medium by which said strip is made to vibrate in unison with the diaphragm, and a helix the core of which has no magnetic connection or magnetism of its own, substantially as specified.

3. In a telephone, the combination of a helix the core of which has no magnetic connection or magnetism of its own with a vibratory magnetic strip connected to the pole of a magnet, substantially as specified.

4. The combination, with a helix having a soft-iron core, of a vibratory magnetic bar or strip connecting the like poles of two magnets, substantially as specified.



5. The combination, with the diaphragm of a telephone, of a vibratory soft-iron strip connected with like poles of two magnets, and a cushion made of felt, rubber, or other like material, placed between said diaphragm and strip, whereby said strip and diaphragm are made to vibrate in unison with each other, substantially as specified.

255,755. FLUE-STOPPER. FRANCIS G. ARTHS, Lima, Ohio, assignor of one-half to George Hall, same place. Filed Nov. 28, 1881. (No model.)

Claim.—1. The combination, with a flue-stopper cap made of porcelain, having a transverse groove across its inner face, of a holding-spring consisting of two parallel metallic pieces, B C, the arms B' C' of said pieces being of unequal lengths, substantially as shown and described, and for the purpose set forth.

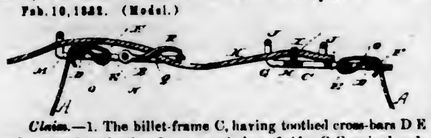
2. A holding-spring for flue-stoppers, consisting of two parallel metallic pieces adapted to fit a transverse groove in the inside face of the stopper-cap, and having arms B' C' of unequal lengths, substantially as described, and for the purpose set forth.

255,755.

3. The combination, with a fine-stopper cap made of porcelain, grooved and perforated as described, of the holding spring-pieces B C and thimble *b'*, substantially as described, and for the purpose set forth.

255,756. SPECULUM. WILLIAM AUTENRIETH, Cincinnati, Ohio, and JOSEPH M. THORNTON, Hagerstown, Ind. Filed Dec. 12, 1881. (Model.)

Brief.—A slide working in a longitudinal opening can be adjusted sidewise or partially withdrawn to uncover parts of said opening.

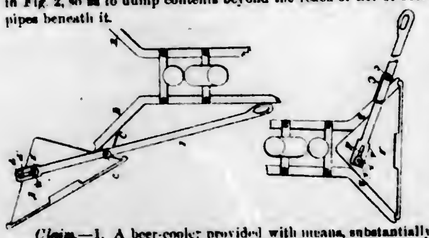


Claim.—1. A rectum-speculum having its inserting end closed and rounded and having its outer end flaring, and provided with longitudinal openings or fenestræ, combined with interior slides capable of both lateral and longitudinal adjustment to cover and uncover said openings, substantially as described.

2. In a rectum-speculum consisting of a tapering or straight tube with a smooth, rounded, inserting end, and with longitudinal fenestræ or openings, the plug C, constructed as described and arranged within the tube at the upper end, whereby a guide for laterally-adjustable slides is obtained, and also a means for the painless extraction of the speculum secured, substantially as described.

3. The slides D, having their rear portion turned so as to conform with the flare of the tube, and having guide-pins *p*, working in slots, together with the lips that embrace the end of the tube, and set-screws *t*, as and for the purpose set forth.

255,757. SURCINGLE. EDWARD BARNARD, Rome, N. Y. Filed Feb. 10, 1882. (Model.)



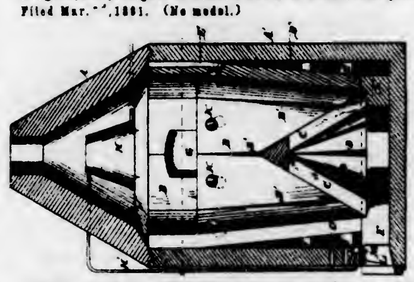
Claim.—1. The billet-frame C, having toothed cross-bars D E and outward projecting frame consisting of sides G G, raised ends or loops J J, and cross-bar H, having stud I, as set forth.

2. The buckle-frame B, having toothed cross-bars D E, outward-projecting loop or bail Q, and tongue R, hinged centrally upon the outer frame-bar, as set forth.

3. As an improvement in surcingles, the girth or band A, in combination with the buckle-frame B, billet-frame C, and billet K, constructed, arranged, and operating substantially as set forth.

255,758. BEER-COOLER. LEMEN J. BINGLER, Cincinnati, Ohio, assignor to the firm of F. C. Dechebach, same place. Filed Dec. 6 1881. (No model.)

Brief.—One side of trough A is pivoted at *c*, on which it turns, by lever D, from horizontal position shown in Fig. 1 to that shown in Fig. 2, so as to dump contents beyond the reach of tier of beer-pipes beneath it.

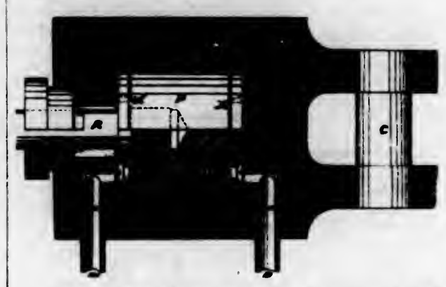


Claim.—1. A beer-cooler provided with means, substantially as described, for lifting and tilting the beer-trough in such a manner that the washings from the trough will not fall on the pipes below it, substantially as described.

2. A beer-cooler provided with apparatus for lifting the beer-trough to one side of the pipes and tilting and allowing it to fall back in position over the pipes, substantially as and for the purposes specified.

3. The combination of arms B, lever D, provided with slot *d*, and trough A, provided with pin *a*, substantially as and for the purposes specified.

4. The combination of connecting fulcrum-rod *c* and the apparatus at each end of the beer-trough, consisting of the arms B and lever D, provided with slot *d* and pin *a*, substantially as and for the purposes specified.



255,759. SMELTING-FURNACE. CHARLES W. BLISS, Wilmington, Del., assignor to himself and E. A. Blake, same place. Filed Mar. [illegible], 1881. (No model.)

Claim.—1. In combination with the exterior walls of the furnace, an interior brick lining, B, set away from the outer wall, whereby an annular chamber, B'', is left between the lining B and said exterior wall, and openings B', extending from the bottom to near the top of the lining B, substantially as described.

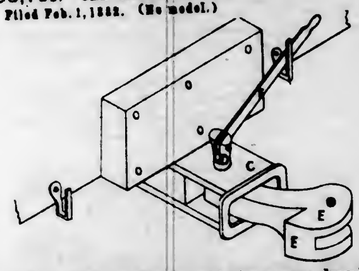
2. In combination with the exterior walls of the furnace, an interior brick lining provided with gradually-decreasing openings extending from the bottom to near the top, substantially as specified.

255,760. ENGINE-GOVERNOR. REGINALD P. BOLTON, Cambridgeport, Mass. Filed Sept. 3, 1881. (No model.)

Claim.—1. The interposition between the piston and crank of any steam, air, gas, or water engine of a hydraulic cushion in which the pressures set up by variations in the load are used to actuate the motive supply, substantially in the manner as shown and described.

2. A cross-head or sliding block bored out as a cylinder and used for a governor, substantially in the manner as shown and described.

3. In an engine-governor, the combination of the piston-rod and the plunger P with the cylinder cross-head A B and hydraulic cushion, substantially as shown and described.



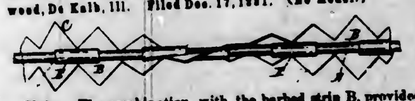
4. In an engine-governor, the combination of the rams E and E', the links S, and the cranks T and T', said cranks being free of each other's motion by a slotted keyway, substantially as shown and described.

5. In an engine-governor, the combination of a dash-pot, G, with the rams E and E', substantially as shown and described.

6. In an engine-governor, the combinations of the rams E and E', and the springs M and M', and the roller Q with the cross Y and wheel Z, for the purpose of proportionately increasing the load on the lever L, substantially as shown and described.

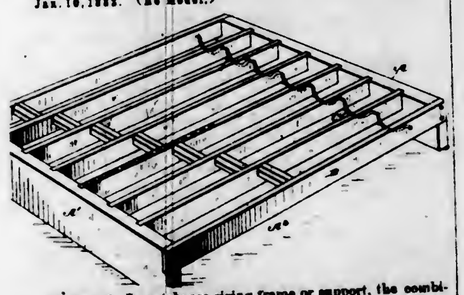
7. In an engine-governor, the combination of the rams E and E' and the cross-head A B with the parallel bar H and the wheel and bell-crank lever W O, whereby the throttle-valve or cut-off gear may be actuated, substantially as shown and described.

255,761. CAR-COUPLING. SANFORD BRAY, Boston, Mass. Filed Feb. 1, 1882. (No model.)



Claim.—The combination, with the common draw-bar, C, of the short coupling-hook E, rigidly secured to the pivot D, which extends upward through said draw-bar, and having pivoted to the upper end thereof the operating spring-bar F, by which the said hook may be turned to either side of the draw-bar mouth and be held in position to couple or not, as desired, substantially as shown and described.

255,762. BARBED METAL FENCING-STRIP. WILLIAM E. BROCK, New York, N. Y., assignor to the Washburn & Moen Manufacturing Company, Worcester, Mass., and ISAAC L. ELLWOOD, De Kalb, Ill. Filed Dec. 17, 1881. (No model.)



Claim.—A metal-strip fencing with barbs formed out of one of the edges of said strip, the strip being folded together so that the edges E and D lap each other, substantially as shown and described, and for the purpose set forth.

255,763. BARBED METAL FENCING-STRIP. WILLIAM E. BROCK, New York, N. Y., assignor to the Washburn & Moen Manufacturing Company, Worcester, Mass., and ISAAC L. ELLWOOD, De Kalb, Ill. Filed Dec. 17, 1881. (No model.)

Claim.—The combination, with the barbed strip B, provided with loops E and F, of the central supporting fence-wire, A, substantially as described, and for the purpose set forth.

255,764. DEVICE FOR SIZING TOBACCO-LEAVES. JOHN D. BRUBAKER, Manor Township, Lancaster County, Pa. Filed Jan. 10, 1882. (No model.)

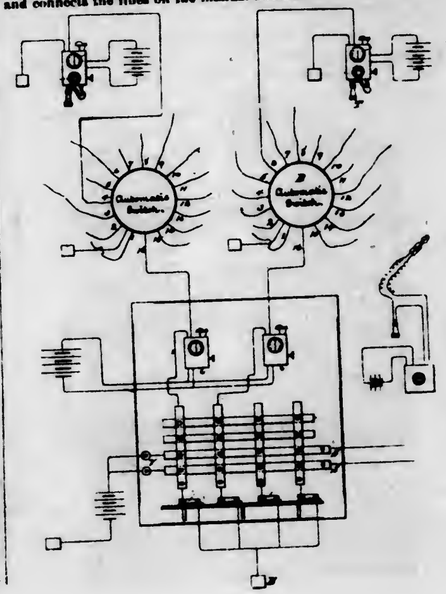
Claim.—1. In a tobacco-sizing frame or support, the combination of end bars, longitudinal slats, a stalk-support, and movable stops or head-blocks.

2. In a tobacco-sizing frame or support, the combination of stops or head-blocks having pins in their ends with elastic slats which close on the same, end bars, and a stalk-support.

3. In a tobacco-sizing frame, a rod or wire forming a series of undulations for the reception of the stalks or butt-ends of the leaves, in combination with slats through which it passes, end bars, and stops or head-blocks, substantially as described.

4. In a frame for sizing tobacco-leaves, the end pieces, in combination with the longitudinal slats, cross-supports for the butts of the leaves, and cross-supports for the tips of the leaves arranged at different distances from the end pieces, A', and at such heights as to allow sagging, substantially as set forth.

255,765. DEVICE FOR FASTENING HORSESHOES. GIDEON BRYDEN, Hartford, Conn. Filed July 23, 1881. (No model.)



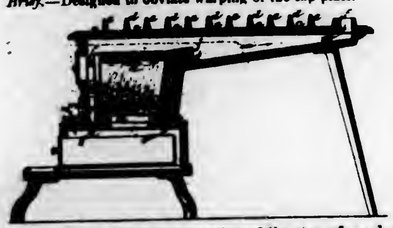
Claim.—1. The within-described horseshoe-fastening A, constructed with a long flat body substantially rectangular in cross-section, and with a cylindrical head projecting at an angle at its upper end, substantially as shown, as a new article of manufacture.

2. The combination, substantially as herein described, of a primary fastening, A, having a head at its upper end to fit a hole in the skoll of the heel, and a body or tang to occupy a nail-hole in a horseshoe, and a secondary fastening, B, having a clip-head at its upper end, and a pointed body or tang, adapted to be driven tightly into said nail-hole outside of said primary fastening, the bodies or tangs of both fastenings being roughened to adapt them to interlock with each other and with the shoe, as set forth.

3. The within-described method of fastening shoes to the hoofs of horses and mules, consisting in providing the shoes with a sufficient number of nail-holes and cutting nicks in the edges of the heels to receive the fastenings, inserting primary fastenings loosely into said nicks and nail-holes, and driving their heads into said holes in the hoofs, then drawing said primary fastenings tight and driving secondary fastenings into said nail-holes outside of said primary fastenings and cutting off the extremities which protrude through the shoes, the lower end of each fastening being secured within or beneath the shoe, substantially as herein specified, for the purposes set forth.

255,766. TELEPHONE-EXCHANGE APPARATUS. CHARLES E. BUELL, New Haven, Conn., assignor of two-thirds to James S. Smith, Hackensack, N. J., and George W. Coy, Milford, Conn. Filed Dec. 12, 1881. (No model.)

Brief.—A number of automatic switches from which subscribers' lines radiate are connected with a manual switch by one or more lines from each automatic switch, whereby a subscriber desiring communication with another subscriber at another automatic switch may put himself in communication with the operator at the manual switch who effects the required connection by operating the automatic switch with which the called subscriber is connected and connects the lines on the manual switch.

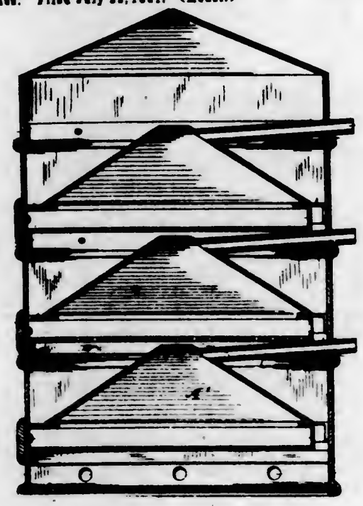


Claim.—1. The combination of two or more automatic switches substantially such as described, located at a central office, circuit-connections from each automatic switch to a manual switch, and apparatus in such circuit-connections for operating the automatic switches, substantially as and for the purposes set forth.

2. The combination of two or more automatic switches, each constructed to allow any subscriber connected thereto to automatically connect his line with any other line upon the same automatic switch and a line or lines from each automatic switch to a common manual switch, and apparatus at the manual switch for operating the automatic switches, as set forth, whereby any subscriber may connect his line either to any other subscriber's line of his automatic section or to a line leading to the manual switch for connecting the subscriber's line with any other line-connection upon the manual switch.

255,767. TAILOR'S STOVE. JAMES R. BURCHFIELD, Sharon, Pa. Filed Sept. 27, 1881. (No model.)

Brief.—Designed to obviate warping of the top plate.

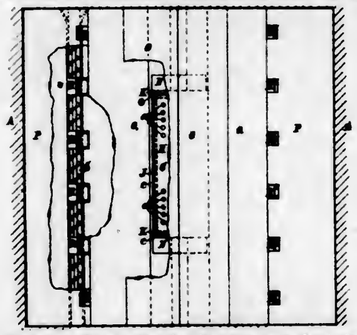


Claim.—1. The top heating-surface of the stove, formed of thin plates or holders for the irons, lap-joined and provided with top bridge-ribs, one of which extends vertically along the lapped edge of said plate, substantially as described, for the purpose specified.

2. In a stove for heating tailors' irons, the top heating-surface formed of thin lap-joined plates or holders, the lap of one edge of each plate being under and the lap of the other edge being over correspondingly-formed edges of the contiguous plates, each plate having a bridge-rib extending vertically along the top surface of that edge which underlaps, and a similar middle top longitudinal rib, substantially as described, for the purpose specified.

3. The fire-box formed with the vertical ribs *g* and the fire-bridge *j*, in combination with the ash-chamber box *b* and the combustion-chamber, the said fire-box being supported upon the ash-chamber box, and forming a surrounding air-space, *h*, opening into the latter and into the combustion-chamber around the top and beneath the bridge of said fire-box, substantially as described, for the purpose specified.

255,768. FRUIT-DRIER. JOHN H. BURKHARDT, Stockbridge, Mass. Filed July 28, 1881. (Model.)



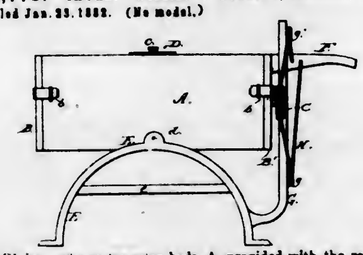
Claim.—1. The combination, with the trays arranged one above the other, of a hood supported above each tray by flanges or projections within the casing, as described, and provided with an exit-pipe extending through the casing, substantially as set forth.

2. The combination, with a fruit-drier formed of sections fitted one upon another and each provided with a tray, of a hood having inclined sides and an exit-pipe, and supported within the sections above the trays upon corner projections or flanges, substantially as set forth.

3. The combination, with the sections, each provided with a shoulder and flange for the attachment of the section next above it, of the trays and the hoods, having inclined sides, and exit-pipes extending through the sides of the sections, substantially as set forth.

4. The combination, with the sections and trays, of hoods supported above the trays, and exit-pipes passing through cut-away portions of the section-joints, substantially as set forth.

255,769. APPARATUS FOR DRYING MALT. GOTTLIEB F. BURKHARDT, Boston, Mass. Filed Dec. 13, 1881. (No model.)

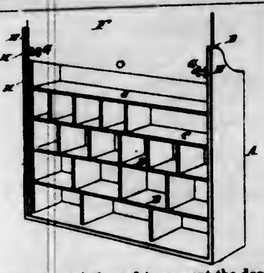


Claim.—1. The combination, in an apparatus for drying malt, of the deflectors O, inclined plates P and Q, and troughs S, having the screw-conveyers, substantially as specified.

2. The combination of the perforated drying-floor D, having pivoted or hinged sections, deflectors O, inclined plates P and Q, and troughs S, substantially as described.

3. In an apparatus for drying malt, and in combination with the deflectors O and inclined plates P and Q, a furnace embodying a combination of these elements, namely: a combustion-chamber, F, one or more flues, I, having vertical tubes *e*, top plate, H, one or more plates, L, openings M, and the double walls G, J, and K, having the air-spaces *c*, substantially as and for the purposes set forth.

255,770. CHURN. WILLIAM O. BURROWS, Stockton, N. Y. Filed Jan. 23, 1882. (No model.)



Claim.—The rectangular body A, provided with the removable heads B B', cover D, handle or lever F, and wheel C, carrying the dash, in combination with the frame E, upright G, pulleys *g g'*, and belt H, substantially as and for the purpose specified.

255,771. SEED-CASE. ROBERT P. CARPENTER, Philadelphia, Pa. Filed Sept. 19, 1881. (No model.)

Brief.—A vertical shallow seed-case provided with shelves has a vertically-sliding door with catches to support it above any shelf desired. The grooved guides for the door are extended above the top of the case.

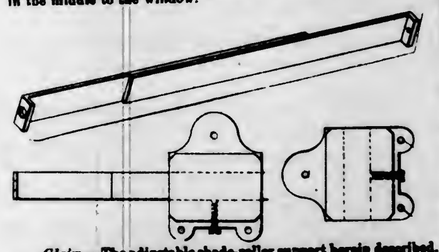
Claim.—1. A shallow seed-case adapted to stand vertically and provided with a series of shelves, in combination with a vertically-sliding door, a guide extending above the sides of the case

255,771.

and arranged on each side thereof to prevent the door tumbling over when raised above the case, and bolts or their equivalent secured to and moving with the sliding door to support the same in position above any shelf desired, substantially as and for the purpose specified.

2. In a seed-case, a shallow box, A, provided with compartments B C, in combination with a sliding door, F, arranged to slide vertically, guides E, arranged above the box and adapted to prevent the door tumbling over when raised to its highest limit, and means, substantially as described, to support the door at any desired height to expose the required compartment, substantially as shown and specified.

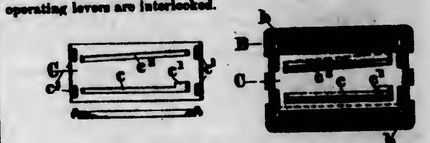
3. In a seed-case, a shallow box of wood provided with shelves, in combination with a vertically-sliding door, means extending above the box or case to guide said door and prevent it tumbling over, and means to support said door entirely above the upper shelf or compartment to expose the entire contents of said case, substantially as and for the purpose specified.



255,772. GRINDING-MILL. JOHN J. CLARK and BYRON CLARK, Elgin, Ill. Filed July 27, 1881. (No model.)

Claim.—The combination, with the stones A A', of the hub-shaped castings B, fitted within the stones, and having the annular grooves *b*, the castings C, carrying the metal grinding-rings and working within the grooves in the castings B, and the adjusting-screws E, substantially as described.

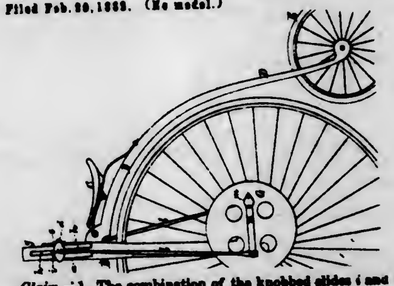
255,773. CURTAIN-BRACKET. HORATIO C. CLEMENT, Albany, Oreg. Filed Aug. 8, 1881. (No model.)



Brief.—The cornice for holding the curtain-roller is secured in the middle to the window.

Claim.—The adjustable shade-roller support herein described, consisting of the single supporting-block adapted to be secured to the casing, and the lapping arms adjustably supported and held in or upon said block and having at their outwardly-turned ends means for supporting the roller, substantially as described.

255,774. INTERLOCKING LEVER. HENRY F. COX, Altoona, Pa. Filed July 8, 1881. (No model.)

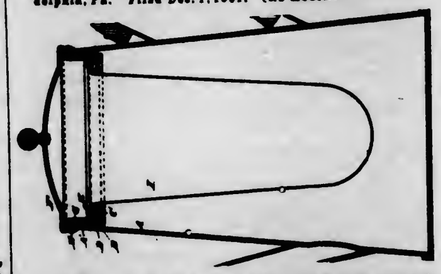


Brief.—Upon transverse ribs on a fixed plate having parallel lever-slots is supported a sliding plate having a diagonal lever-slot and a straight notched lever-slot, whereby the switch and signal operating levers are interlocked.

Claim.—1. In combination with the body A, the cap-plate B, having the transverse ribs *b b* and the straight slots *b' b''*, the locking-plate C, having the straight-sided slot *c*, with recess *c'* and slot *c''*, with inclined sides and the elongated openings *c' c''*, and the levers D and E, as described.

2. In combination with the cap-plate B, the locking-plate C, with slots *c*, *c'*, and *c''*, and the levers D E, the lines of connection *a' a''* actuating the switch, the line *a''* actuating the signal *s''*, and the line of connection *y* actuating the signal *y'*, as described.

255,775. BICYCLE. ANDREW F. CURTIS, Medford, Mass. Filed Feb. 20, 1882. (No model.)



Claim.—1. The combination of the knobbed slides *i* and the connection-rods *l* with the front fork, B, the driving-wheel A, and its foot-cranks *n*, all being substantially as set forth.

2. The combination of the auxiliary cranks *a* with the driving-wheel A and its foot-cranks *n*, the front fork, B, the connection-rods *l*, and knobbed slides *i*, all being arranged and to operate substantially as set forth.

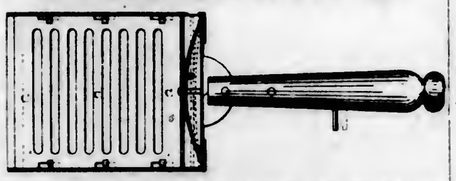
3. The combination of the handles F, provided with the tubular heads *g*, and adapted to the front fork, B, so as to be adjustable therein, as explained, with the knobbed slides *i* and connecting-rods *l*, and with the foot-crank sustaining internal gears, G, adapted to the front fork, so as to be adjustable therewith, as specified, all being substantially and to operate as explained.

4. The combination of the internal gears, G, and the lantern-pinion I, provided with friction-wheels, as described, with the front fork, B, the driving-wheel A, the knobbed slides *i*, and their connecting-rods *l*, adapted to the handles and the foot-cranks, as explained, the said foot-cranks being projected from the internal gears, as shown and described.

255,776. TEA AND COFFEE POT. JOHNSON B. DANIEL, Philadelphia, Pa. Filed Dec. 1, 1881. (No model.)

Claim.—1. A tea or coffee pot provided with an annular ledge to support the ring of a strainer-bag, located a short distance from the top, said ledge being inclined upward, having a smaller diame-

ter at the top than at the bottom, in combination with a strainer-bag and its ring, said ledge tending to expand said ring and prevent all possibility of its falling into the pot, substantially as and for the purpose specified.

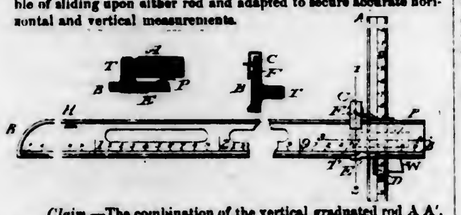


2. A conical tea or coffee pot having the body A, provided at the top with a ring-piece, A', having its bottom bent inward to form an annular groove opening upward, in combination with a cover, F, whose rim, G, fits down into said groove, substantially as and for the purpose specified.

3. A conical tea or coffee pot having the body A, provided at the top with a ring-piece, A', having its bottom bent inward to form an annular groove opening upward, in combination with a cover, F, whose rim G fits down into said groove, ring H, and bag I, substantially as and for the purpose specified.

4. A tea or coffee pot having its body creased near its upper edge to form a bead or flange on the inside, said bead forming an annular groove upon its upper side, in combination with a lid or cover provided with a rim which extends down into said groove to form a liquid seal, a straining-bag and its ring, said ring being supported in said annular groove, substantially as and for the purpose specified.

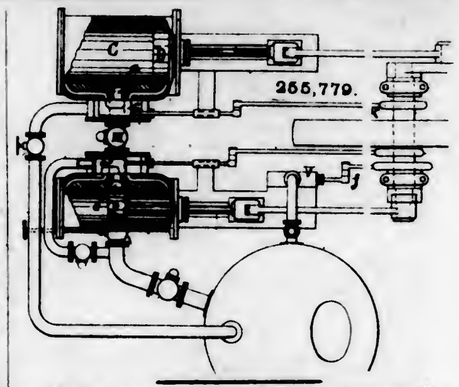
5. A vessel in which to make coffee or tea, provided with a covered inlet at the top and an open-spout outlet from or near the bottom, both of said openings being water-sealed against the escape of the aroma when making coffee or tea, substantially as and for the purpose specified.



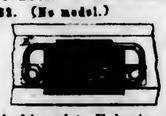
255,777. SHOVEL FOR LIFTING AND SIFTING ASHES. WM. ENTICOTT, Allegheny, Pa. Filed Sept. 10, 1881. (Model.)

Claim.—A shovel for lifting and sifting ashes, provided with a fixed and a movable bottom, the latter sliding on top of the former and acted upon by a spring at its rear end, substantially as described.

255,778. CROSS-SECTION ROD. S. BROWNLEE FISHER, Pittsburg, Pa. Filed June 20, 1881. (Model.)



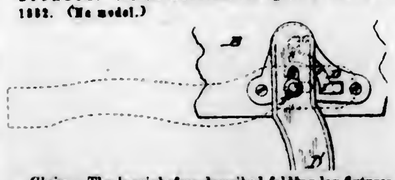
Brief.—Two graduated rods connected by a spindle-joint arranged to revolve about each other and to be set at right angles when in use and folded when out of use. The clamp-joint capable of sliding upon either rod and adapted to secure accurate horizontal and vertical measurements.



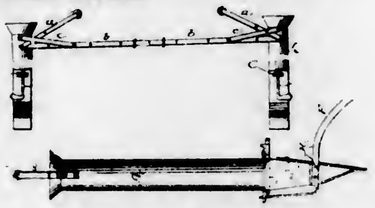
Claim.—The combination of the vertical graduated rod A A', provided with a level-bulb, L, with the horizontal graduated or measuring rod B B', provided with a level-bulb, H, by means of the stirrup P, provided with a graduated limb, D, the stirrup P, sliding along and capable of being clamped to the rod A A', and the stirrup F, provided with a graduated limb, E, sliding along and capable of being clamped to the rod B B', the two stirrups P and E being connected together by the spindle-joint T, so as to form a single instrument for the purpose of taking cross-sections on rough, rocky, steep, and bushy ground, as herein set forth.

255,779. STEAM AND HOT-AIR ENGINE. ERIK G. PAYERSEN, Newark, N. J. Filed July 1, 1881. (No model.)

Claim.—The combination, with the hot-air motor operating expansively and forcing the contents of the motor-cylinder back into the generator either by means of a separate compressing-pump or by the back-stroke of the motor-cylinder piston, of a suitable generator for heating the hot air or a mixture of hot air and gas or vapor, and a pump for providing the generator with compressed air or gases before starting the engine and for restoring such amount of air or gases as may be lost by leakage or otherwise, substantially as and for the purposes set forth.



255,780. NUT-LOCK. SAMUEL GISSINGER, Pittsburg, Pa. Filed Feb. 7, 1882. (No model.)

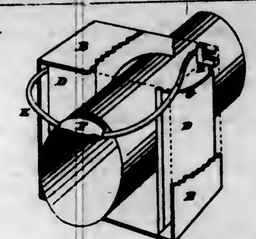


Claim.—The locking-plate F, having spring G, and hinged on the rod or pintle E, in combination with the fish-bar B, bolt or bolts C, and nut or nuts D, substantially as herein described, and for the purpose set forth.

255,781. FOLDING LEG-FIXTURE FOR EXTENSION-LOUNGES. JOSEPH GRAZER, Chicago, Ill. Filed Feb. 11, 1882. (No model.)

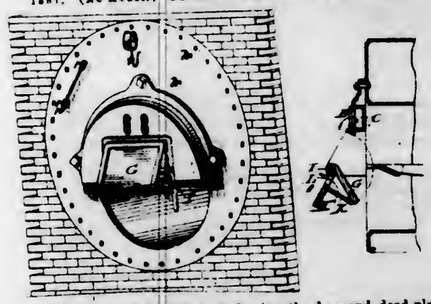
Claim.—The hereinbefore-described folding leg-fixtures, consisting of the plate D, having therein the slots H and I, arranged rectangularly therein and connected by the slot or opening J, in combination with the leg D', containing the slot E, and having thereon the pin or stud G, and with the connecting-pin F, substantially as specified.

255,782. CORN-PLANTER. MILO HARRIS, Jamestown, N. Y., assignor of one-half to Wm. H. Truesdale, same place. Filed Nov. 25, 1881. (No model.)



Claim.—1. In combination with seed-planters that are constructed with spring steel jaws rigidly attached at their top to the main tube or body of the planter, a projecting step hinged near the lower end of the planter, having an arm extending upward to operate the seed-slide, and an arm or plates extending downward between the jaws to open them, substantially as shown and described, and for the purpose set forth.

2. In combination with hand seed-planters, the rods *b b*, braces *c c*, and folding handles *a a*, all arranged to operate in the manner shown and described, and for the purpose set forth.



255,783. FLUE-CAP FOR STOVE-PIPES. FREDERICK E. HUDDE, Louisville, Ky. Filed Mar. 31, 1881. Renewed Jan 13, 1882. (No model.)

255,783.

Claim.—The combination of the doors D D, ball E, with its weight F, and cap-frame B, as above described, when arranged, constructed, and operated substantially as herein described, and for the purpose set forth.

255,784. FURNACE FRONT AND DOOR. THOMAS HENDERSON, Birkenhead, County of Chester, England. Filed Dec. 20, 1881. (No model.) Patented in England Feb. 24, 1880.

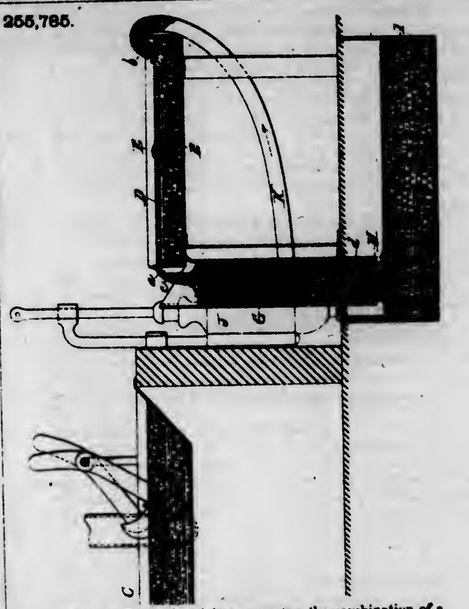
Claim.—1. A furnace-front having the door and dead-plate or a continuation of the dead-plate constructed in one piece and arranged substantially as described, whereby said parts are adapted to be rotated upon an axis, substantially as and for the purposes described.

2. In a furnace-front, the combination of a door and a dead-plate or continuation thereof, the top of the door and the end of the dead-plate or continuation being equidistant from a common axis about which they rotate when required, substantially as shown and described.

3. In a furnace-front, a counterbalanced door, G, mounted upon a shaft, I, on a level with the furnace-bottom, whereby said door may be brought to a level with the bars and caused to open the entire door-space.

4. In a furnace-front, the combination of a fire-door, G, supporting-shaft F at the lower edge of said door, and cheek-pieces E, carrying said shaft, the parts being arranged substantially as shown and described, whereby the door is adapted to hang down and act as a shield against the heat of clinker, &c., in the ash-pit and to leave an unobstructed charge-opening, as explained.

5. In a furnace-front, a door mounted and adapted to swing upon a horizontal axis, substantially as explained, and thereby to open a passage for the discharge of clinker to the ash-pit, and another for the return of the gases, &c., into the furnace.

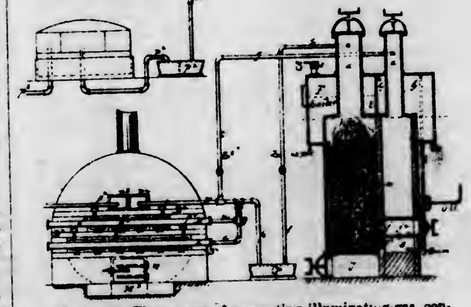


6. In combination with the door G, the supporting shaft or axis F at the lower edge or side of the door, whereby the latter is supported and adapted to fall below the charge-opening, as explained, and the counterbalanced spring J, applied as shown and described, to hold the door as adjusted.

7. The combination of the plain unperforated door G, dead-plate or continuation of the dead-plate, having orifices L, and vertical perforated plate K, inclosing an air-space from which the air is brought from the ash-pit over heated surfaces into the furnace, substantially as described.

8. The dead-plate formed in two parts, one stationary and like an ordinary dead-plate and the other, H, projecting beyond the internal face of the furnace and fixed to the door, so that as the door opens the portion of the dead-plate H nearest to it moves with it, and thus leaves a vacant space for clinkers to be thrown down.

255,785. APPARATUS FOR GALVANIZING WIRE. EDWIN H. HILL, Worcester, Mass., assignor to the Washburn & Moen Manufacturing Company, same place. Filed Apr. 1, 1881. (No model.)



255,785.

Claim.—1. In a galvanizing apparatus, the combination of a zinc bath, F, an acid bath, D, having an opening, *a*, at one end thereof, and the cooling-reservoir I, with the filtering-chamber G, containing filtering material, substantially as described, pump J, and pipe K, to return the acid in the opposite end of the acid-tank from which it escapes, substantially as and for the purpose described.

2. The combination of the acid bath D, having an overflow-opening, *a*, at one end and a return-pipe, K, with its opening at the opposite end, with filtering-chamber G, cooling-reservoir I, and the pump J, connected with the reservoir I and pipe K, substantially as and for the purposes described.

255,786. PROCESS OF AND APPARATUS FOR MANUFACTURING GAS. JAMES W. HOUGHS, New York, N. Y., assignor to the International Gas Company, same place. Filed Mar. 15, 1881. (No model.)

Claim.—1. The process of generating illuminating-gas, consisting in decomposing water or steam in contact with fuel in a state of ignition in one furnace and decomposing in a similar manner, though at a different temperature, a hydrocarbon oil in contact with ignited fuel in another and separate furnace, as described, then mixing the gases so produced before washing or purifying the gas derived from the oil, and then subjecting said mixture, previous to storage for consumption, to such purifying, superheating, and cooling as may be required, as described, all substantially as set forth.

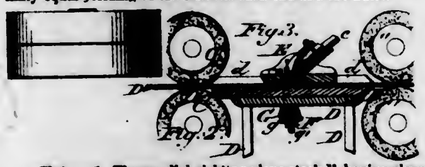
2. A cupola or generator, preferably of cylindrical form, for the production of gas by the decomposition of oil and water, divided into two decomposing-furnaces provided each with separate

fuel-grates, charging-doors, and ash-pits, and one of said furnaces with a pipe for conducting oil alone into contact with ignited fuel therein, and the other with a pipe for conducting water or steam alone into contact with ignited fuel therein, and each of said furnaces with a pipe for discharging therefrom its respective gaseous products of the decomposed steam and oil, as described, whereby the relative temperatures of the furnaces in which the respective gases are generated and the respective quantities of said gases therein generated are regulated and controlled previous to admixture for use, and the quality of their mixture likewise regulated, substantially as set forth.

3. In combination with and secured to the top of a cupola or generator, an annular water-jacket or evaporator connected with a furnace within said cupola through an intermediate superheating-chamber situated below said furnace, whereby the vapor of water is first superheated and then decomposed, substantially as and for the purposes set forth.

4. In a cupola or generator provided with separate decomposing-furnaces for steam and hydrocarbons, a steam-superheating chamber heated by the walls of the steam-decomposing furnace and open to the fuel therein, below the bed of fuel, in the hydrocarbon-decomposing furnace, substantially as and, for the purposes set forth.

5. In a cupola or generator provided with separate decomposing-furnaces for steam and hydrocarbons, a steam-superheating chamber heated by the walls of the steam-decomposing furnace and open to the bed of fuel therein, below the bed of fuel in the hydrocarbon-decomposing furnace, and provided with means for uniting said furnaces through said chamber when desired, substantially as and for the purposes set forth.



6. In combination with a cupola or generator provided with separate furnaces for decomposing steam and hydrocarbons at high temperatures, a superheating retort or retorts and an interposed purifying box or chamber, all suitably connected by pipes, as described, whereby the hydrogen of decomposed steam is first purified and then brought in contact in said retorts with the nascent or unwashed gases of a hydrocarbon previously decomposed at a high temperature, said gases being therein permanently fixed, substantially as set forth.

7. In combination with a cupola or generator provided with separate furnaces for decomposing steam and hydrocarbons at high temperatures, a series of superheating-retorts for generating carbureted-hydrogen gas, arranged with furnace for heating the same in bench, and connected by suitable pipes to said cupola, whereby the respective temperatures necessary for decomposing the steam and hydrocarbon employed can be accurately regulated at will, and the relative proportions of their resultant gases, as desired for mixture, also varied at will, substantially as set forth.

8. In a bench of retorts for the generation of illuminating or heating gas, a series of retorts having square ends and a circular mid-section, as described, set in brick-work, with flat horizontal bars of iron or other suitable refractory material interposed at each end, between the top and bottom of each retort, and between the retorts and the courses of brick, whereby the retorts may be removed and reset or renewed with but little or no disturbance of the brick-work, substantially as set forth.

255,787. PLANING-MACHINE FOR PLANING THIN PIECES OF WOOD. WALLACE S. HOLLAND, Burlington, Vt. Filed Aug. 31, 1881. (No model.)

Brief.—The plane-stock is pivoted to a yoke which is borne against by a spring underneath the table, thus causing a substantially equal yielding of the stock at each end and the knife.

Claim.—1. The parallel yielding plane-stock E, having plane-bit *e*, the yoke F, pivoted to the plane-stock having temper-screw *f'*, and spring G, in combination with the bed-plate or platen D' of a planing-machine constructed to operate in the manner substantially as described.

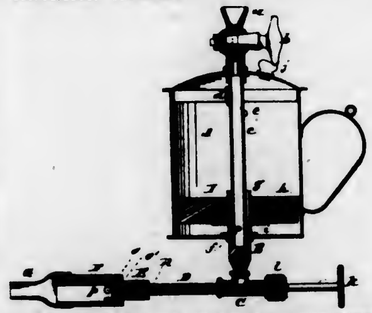
2. In a planing-machine such as above described, the combination of a parallel yielding plane-stock, E, having a plane-bit, *e*, and a parallel yielding edge-plane stock, H, having the edge-rounding bit *h* constructed and operating in the manner substantially as described.

3. In a planing-machine such as above described, the parallel yielding plane-stock E, as a plane-bit holder, and a presser-bar to hold the stuff being planed firmly upon the bed-plate, when combined in a single part and operated by mechanism substantially as described.

255,788. DOOR. GEORGE W. HOWELL, Covington, Ky. Filed Oct. 1, 1881. (No model.)

Brief.—The doors, counterweighted, are pivoted at the angle of depending portions, so as to form a rear extension to the hinges. A weighted latch on each door provided with an external handle engages a projection on the side of the door-opening and is locked by a bolt from the adjacent building.

Claim.—1. In a sidewalk-doorway, the combination of frame A, skeleton L, plates C, pivot F, located as set forth, stud D, latchment H, and handle G, substantially as and for the purpose set forth.



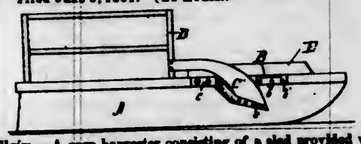
2. In a sidewalk-door latchment, the combination of weighted lever I, having hook H, stud D, and handle G, substantially as and for the purpose set forth.

3. In a sidewalk-door latchment, the combination of stud D, pivoted latch H I J, and sliding bolt E, substantially as and for the purpose set forth.

4. In a sidewalk-door, the combination of door-sheet C, skeleton L, attached to the door-sheet, as shown, and the pivot-receiving bend M, formed by an angular departure of a portion of the skeleton from the door-sheet, substantially as and for the purpose set forth.

5. In a sidewalk-door contiguous to a building, the combination of doors B C, wall N, and bolt passing through said wall, and having end O projecting from the side of said wall opposite the side from which projects the bolt end E proper, substantially as and for the purpose set forth.

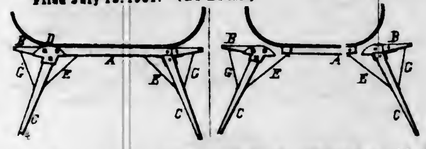
255,789. PAINT-BURNER. JOS. IRVING, Chicago, Ill. Filed Oct. 14, 1880. (No model.)



Claim.—1. An apparatus for burning paint, combining in its structure the can A, provided at its bottom with the projecting tube B, the tube *c*, extending through said can and connecting with the tube at the bottom of the can, and the mouth or extension *a* at the top of the can, connecting with the upper end of the tube *c*, and provided with a stop-cock, *b*, all substantially as and for the purpose described.

2. The combination of the can A and float I, having the tube *g*, with the tube *c*, having the stop *c*, substantially as described.

3. The combination, with the can A, of the tube *c*, having the holes *f*, the valve *d*, mouth-extension *a*, and stop-cock *b*, substantially as and for the purpose set forth.

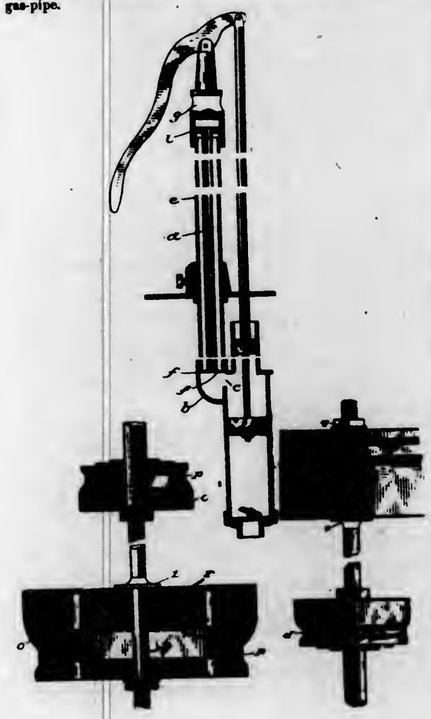


4. The combination of the can A, having the vent *j*, with the tube *a c* B and float I, all constructed and operating substantially as specified.

255,790. CORN-HARVESTER. GEORGE W. IRWIN, Ottawa, Kans., assignor to himself and EDWARD H. Crandal, Chicago, Ill. Filed June 2, 1881. (No model.)

Claim.—A corn-harvester consisting of a sled provided with cutting-blades B and C, risers E, and shocking-frame D, the whole combined, arranged, and adapted to operate substantially as set forth.

255,791. SLEIGH. JESSE JACKSON, Fort Atkinson, Wis. Filed July 15, 1881. (No model.)



Claim.—1. In a sleigh or cutter, the combination, with the beam A, knee-post C, and fender-stud B, of the angle-plate D, having flanges or sockets for said parts A C B, and bolts for separately securing the parts in said angle-plate, as and for the purpose herein shown and described.

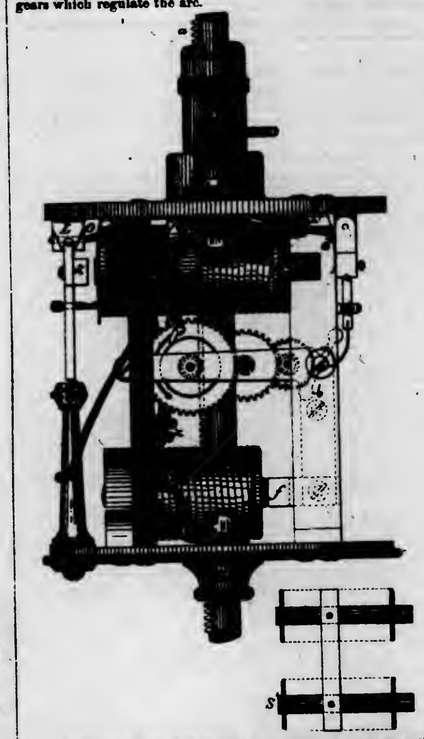
2. In a sleigh or cutter, the combination, with the beam A, knee-post C, and fender-stud B, of the angle-plate D, having flanges or sockets for said parts A C B, bolts for separately securing said parts in said angle-plate, and the braces E G, the several parts constructed and arranged relatively to each other, substantially as and for the purpose herein shown and described.

255,792. PUMP. DANIEL JOHNSON, JASON P. GOWAN, and FRANK GOWAN, Ashland, Ohio. Filed Feb. 17, 1882. (No model.)

Brief.—The discharge and air tubes may be made of ordinary gas-pipe.

Claim.—1. A forcing-pump consisting of the cylindrical compression-chamber provided with an offset, *b*, the pipe *c*, connected to said offset, the pipe *d*, arranged within the pipe *c*, opening into said offset and connected at its upper end with the spout *h*, the casting *g*, connected to the pipe *c*, and the piston-rod outside of said pipes provided with pistons, the parts being combined and adapted to operate as shown and described.

2. A pump-piston consisting of the two tapering-blocks, the packing, the ring, and the spindle, with means, substantially as described, for pressing the blocks together, as set forth.



255,793. LABEL FOR ANIMALS. PHILIP PRESTON JOHNSTON, Lexington, Ky. Filed Dec. 29, 1881. (No model.)

Claim.—In metallic ear-labels for live stock, the combination of the U-shaped strip A, with holes *a* and *a'*, and the bolt B, with solid head *b* and split point *b'*, all substantially as and for the purpose described.

255,794. ELECTRIC LAMP. NATHANIEL S. KEITH, New York N. Y. Filed Mar. 3, 1881. (No model.)

Brief.—In circuit with the carbons is a main magnet, which tilts a lever carrying a train of gears, and thereby establishes the arc. A second magnet in the same circuit holds the train normally locked. A shunt around the second magnet is automatically closed and opened by a magnet in a high-resistance branch around the arc, whereby said second magnet releases and locks the train of gears which regulate the arc.

Claim.—1. In an electric-light regulator, the combination of a feeding-train, detent mechanism therefor, an electro-magnet controlling the detent mechanism, a shunt-circuit to the electro-magnet, and devices to automatically open and close said circuit to regulate the feed.

2. In an electric-light regulator, a main-circuit electro-magnet acting upon mechanism to separate the carbons for the purpose of forming the arc, in combination with a second electro-magnet provided with an automatically-controlled shunt or derived

circuit, and acting upon the detent mechanism of the feeding-train in the main or light circuit with the carbons, in combination with

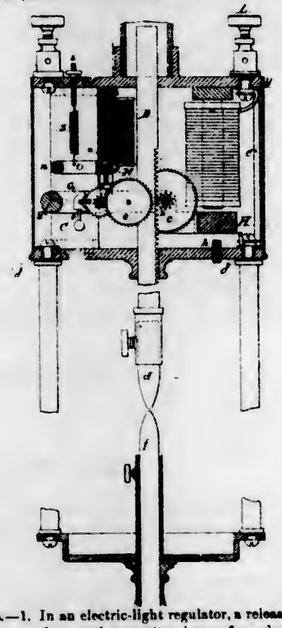
255,797. *Claim.*—1. The combination, in a mutilating canceling-stamp,

circuit, and acting upon the detent mechanism of the feeding-train, substantially as described.

3. The combination, in an electric-light regulator, of an electro-magnet in circuit with the carbons and acting upon mechanism to separate the carbons and form the arc, an electro-magnet controlling the detent mechanism of the feeding-train, a shunt-circuit around the detent electro-magnet, and a third electro-magnet in a derived circuit controlling the shunt, substantially as described.

4. In an electric-light regulator, the combination of a feeding-train, detent mechanism therefor controlled by an electro-magnet in the main circuit, and a shunt-circuit around said electro-magnet, which is opened and closed by a second electro-magnet, whose magnetic strength is varied by fluctuations in the length of arc.

5. In an electric-light regulator, the combination of a releasing or feed mechanism, detent devices for said mechanism, an electro-magnet in the main circuit controlling said detent devices and provided with a shunt-circuit, and an electro-magnet in a derived circuit of comparatively high resistance around the arc, serving to open and close said shunt-circuit, substantially as described.



6. In an electric-light regulator, the combination of an electro-magnet in the main or light circuit, acting upon mechanism to separate the carbons and form the arc, a second electro-magnet in the same circuit, controlling the detent mechanism of the feeding-train, a shunt-circuit to said second electro-magnet in a derived circuit around the two first-named electro-magnets and the arc, and acting through suitable switch devices to make and break the shunt-circuit around the second electro-magnet, substantially as described.

7. In an electric-light regulator, the combination of a detent electro-magnet, a derived-circuit electro-magnet, and intermediate switch devices serving to control the flow of current through said detent electro-magnets.

8. In an electric-light regulator, the combination of a releasing-train carried by the armature-lever of an electro-magnet in the main or light circuit, and a detent device operated by a second electro-magnet, which is provided with a shunt-circuit automatically opened and closed to regulate the feed.

9. The combination of electro-magnet H K, constructed in H form, as described, and provided at each end with two free polar extensions, armatures acted upon by said extensions, and regulating devices of an electric lamp.

255,795. ELECTRIC-LIGHT REGULATOR. NATHANIEL S. KEITH, New York, N. Y., assignor to the Fuller Electrical Company, same place. Filed Feb. 28, 1880.

Claim.—1. In an electric-light regulator, a releasing or feeding train mounted upon the armature-lever of an electro-magnet in the main or light circuit with the carbons, in combination with a detent controlled by an electro-magnet in a derived circuit to the carbons, substantially as described.

2. In an electric lamp or light regulator, the combination of an electro-magnet in the main circuit, having an armature, H, attached to a swinging frame, G, carrying a train of gears, c, and a carbon-carrier, D, with its attachments, for the purpose of making the arc and holding it while the lamp is in operation, and an electro-magnet in a derived circuit, having an armature, N, attached to a swinging frame, and carrying a yielding or spring detent, P, and the screws e and s, and spring S, so arranged that it can be adjusted to the desired current of electricity and limited in its movements by the slotted bar p, all so arranged as to automatically regulate the feeding of the carbons to supply the demand caused by the combustion of the carbon at the light-arc, substantially as herein described and shown.

3. The combination, with a vertically-moving gear-train and escapement-wheel carried by the armature-lever of an electro-magnet in the main or light circuit, of a vertically-moving detent controlled by an electro-magnet in a derived circuit, substantially as described.

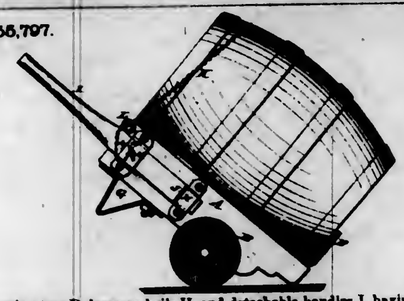
255,796. ARTIFICIAL ARM. HEDWIG M. KOLBE, Philadelphia, Pa., Executrix of Dietrich W. Kolbe, deceased. Filed Jan. 14, 1882. (No model.)

Claim.—1. Hand mechanism provided with a bar, J, in combination with the socket, the jointed bar D, and the swivel-eye C, substantially as and for the purpose set forth.

2. The perforated wrist-plate L and the wrist-plate L′, with the pin M, having neck *g*, in combination with the perforated pivoted spring-catch N, substantially as and for the purpose set forth.

3. The sliding bar of the socket and the sliding bar of the hand mechanism, in combination with the sliding tubular piece F, having a spring-nose, *e*, and operating-button, substantially as and for the purpose set forth.

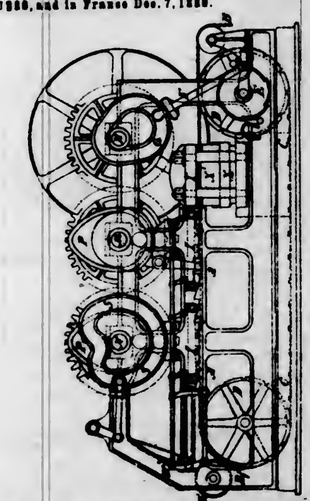
4. The thumb and finger levers V V′, in combination with the hinged plate T, the elbow-lever S, the arm R, the link S′, the arm J′, the sliding bar J, and the springs T′, substantially as and for the purpose set forth.



5. The palm and the third joints, with the pivoted levers V, in combination with the second joints, the pivoted levers X, and the crank-pieces Y Z, substantially as and for the purpose set forth.

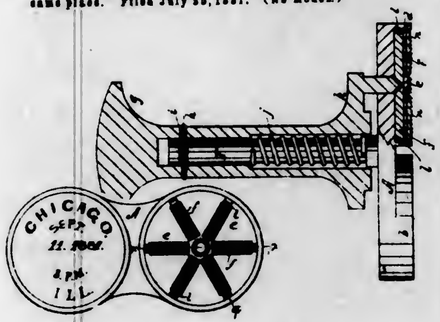
255,797. BARREL-TRUCK. JENS KNUDSEN, Dwight, Ill. Filed Jan. 23, 1882. (Model.)

Claim.—1. The combination, with a suitably-constructed truck-frame having loops or bails H and perforations N, of the detachable handles I, having chains K, the short ends of which carry keys or pins M, while their long ends are adapted to be hooked together or otherwise connected, substantially as set forth.



2. The herein-described improved barrel truck and platform, consisting of a frame, A, supported upon wheels or casters, and

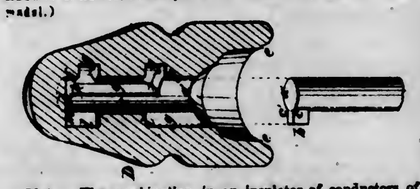
255,797.



having toes D, loops or bails H, and detachable handles I, having chains K and keys or pins M for securing said handles to the frame, substantially as and for the purpose set forth.

255,798. MANUFACTURE OF FLOOR-CLOTH. CHARLES F. LEAKE, Hale Street, Staines, County of Middlesex, England. Filed Jan. 18, 1881. (No model.) Patented in England June 4, 1880, and in France Dec. 7, 1880.

Claim.—The manufacture of floor-cloth with colored patterns produced from compounds composed of oxidized oil with other materials and colored to varied colors in the manner hereinbefore described—that is to say, by the colored compounds being first reduced to a granulated form, then built up separate the one from the other into colored patterns or devices by the means substantially as hereinbefore described, and afterward consolidated together and to a base-cloth by the application of heat and pressure.



255,799. CANCELING AND DATING STAMP. GEORGE W. LEVIN, Chicago, Ill., assignor of one-third to W. H. A. Brown, same place. Filed July 25, 1881. (No model.)

Claim.—1. The combination, in a mutilating canceling-stamp, of the head C, provided with radial slots *a*, plate *e*, provided with slots *g*, ring *d*, feet *f*, provided with teeth *n*, spring *l*, and plunger *k*, substantially as described.

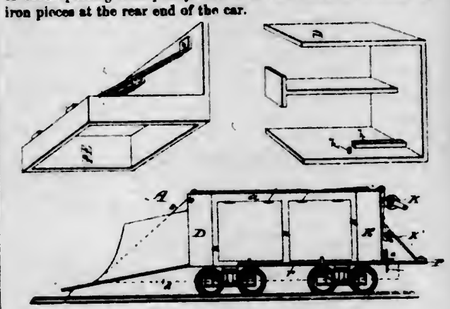
2. The combination, in a mutilating canceling and dating stamp, of the canceler-head C, mutilating-feet *f*, provided with teeth *n*, and moving reciprocally in suitable radial bearings, ring *d*, plate *e*, plunger *k*, handle *g*, standard T, spring *j*, and spring *l*, in conjunction with the dater *b*, substantially as described.

255,800. INSULATOR FOR ELECTRICAL CONDUCTORS. ALBERT C. LEWIS, Brooklyn, N. Y. Filed July 2, 1881. (No model.)

Claim.—The combination, in an insulator of conductors of electricity, of a metal support capable of being forced into stone or brick work or wood, having that part of the shank next to the head, as from *a* to *a′*, cylindrical in form, the head being formed by the end of the cylinder *a′*, and an arm, *b*, projecting outward therefrom, with a movable or independent insulating-cap, D D, having internally an open dome-like base, *e e′*, and a cylindrical opening, *f*, and slot *g*, extending from *e′* to *h* and *m*, to receive the shank and arm of the support, all substantially as set forth.

255,801. NUT-LOCK. ALBERT L. LINCOLN, Bethel, Vt. Filed July 2, 1881. (Model.)

Claim.—For the purpose hereinbefore set forth, the locking-plate D, having slight protuberances on one of its surfaces, formed by indenting the plate upon the opposite surface, substantially as herein specified.

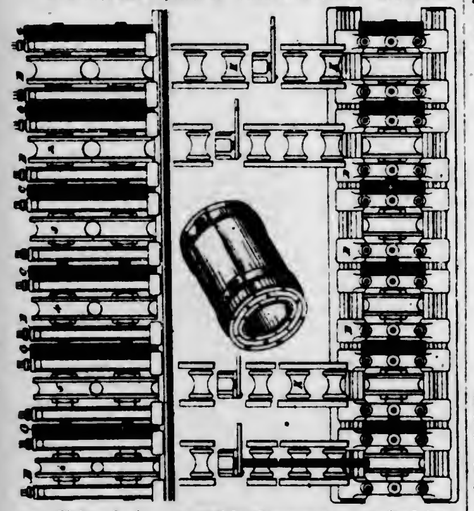


255,802. NUT AND BOLT LOCK. BERNHARD MARKS, Fresno, Cal., assignor, by direct and mesne assignments, to Alphonso B. Smith, New York, N. Y. Filed July 28, 1881. (No model.)

Claim.—The combination, with a double screw-threaded bolt, of a pair of double screw-threaded nuts capable of being placed either way upon the bolt, substantially as set forth.

255,803. SNOW-PLOW. RICHARD H. MITCHELL, Chicago, Ill. Filed Dec. 13, 1881. (No model.)

Brief.—Attached to iron pieces at the forward end of a car is a plow, which may be raised up from or swung down upon an immovable tongue or plate, and is adapted to be adjusted by means of cords passing over pulleys attached to a windlass secured to iron pieces at the rear end of the car.

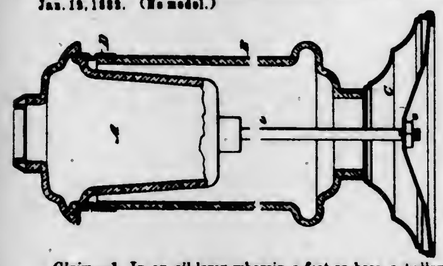


Claim.—1. A snow-plow adapted to be adjusted upon the forward end of a car or truck, as shown.

2. The adjustable plow, in combination with the immovable tongue.

3. The iron piece D, formed substantially as shown, and for the purpose described.

4. The iron piece P E, formed substantially as shown, and for the purpose described.



255,804. MANUFACTURE OF METAL TUBING. ALBERT L. MURPHY, Philadelphia, Pa. Filed Oct. 13, 1880. (No model.)

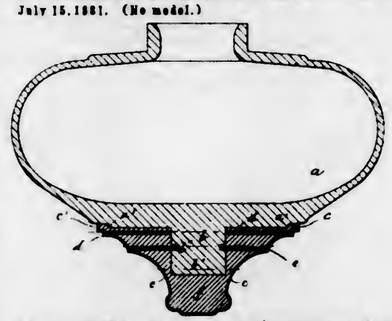
Claim.—1. As a new article of manufacture, a refined-iron tube the outer substance or portion of which consists of refined iron and the inner portion or bore of which consists of re-refined iron, or iron of a degree of refinement superior to that of the iron constituting the outer substance of the tube.

2. As a new article of manufacture, a pile for the manufacture of tubing, consisting of pieces of unrefined puddled or muck iron arranged and secured upon or about a hollow core of refined iron, substantially as and for the purposes set forth.

255,805. LAMP. WILLIAM T. MURPHY, New York, N. Y. Filed Jan. 13, 1882. (No model.)

Claim.—1. In an oil-lamp wherein a foot or base, a hollow cylinder, and an oil-receiver of glass suspended in the said cylinder are employed and all secured firmly together, the combination, with the said base, cylinder, and receiver, of a metal ring or band, D, arranged exteriorly around parts of the said receiver and cylinder and clamped between projecting parts of the same, substantially as set forth.

2. In an oil-lamp, the combination of the glass receiver A, the hollow cylinder B, the band or ring D, provided with an internal bead, *e*, arranged between the receiver and cylinder, the lamp-base, and means for securing the parts firmly together, as set forth.



255,806. LACING FOR WEARING-APPAREL, BAGS, AND OTHER ARTICLES. JOSEPH NATHAN, New York, N. Y., assignor of one-third to Adolph Cohen, same place. Filed Dec. 24, 1881. (Model.)

255,806.

Claim.—A lace, string, or cord for corsets, jackets, shirts, gloves, shoes, bags, and other articles consisting of a suitable cord provided with stiffening-pieces attached to its ends, and having fringes or tassels surrounding such stiffening-pieces and dependent from or near the upper ends thereof, concealing them from sight, all substantially as set forth.

255,807. MEANS FOR CENTERING AND ATTACHING SOCKETS TO LAMP-BOWLS. ANDREW G. PAUL, Boston, Mass. Filed July 15, 1881. (No model.)

Claim.—1. The combination, with the socket *c* and the bowl, having a peg, *b*, of the centering disk or washer *d*, centrally perforated and engaging the peg of the bowl and resting at its outer edge against the socket, substantially as described.

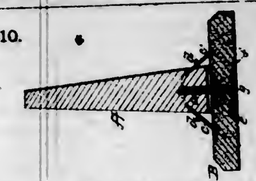
2. In combination with the peg or projection *b b' b''* on a lamp-bowl, the socket *c*, centering-washer *d d'*, and fastening-washer *e e'*, as and for the purpose set forth.

255,808. MANUFACTURE OF KNITTING-MACHINE NEEDLES. SAML. PEBBLY, Philadelphia, Pa., assignor, by direct and mesne assignments, to the Pebbly Latch Needle Company, of New Jersey. Filed May 24, 1881. (No model.)

Claim.—1. The needle A, having integral therewith the pin or pivot C, and the beat-up jaws B B', jointly with the latch D, substantially as set forth.

2. The process of forming a knitting-machine needle by striking up the pivot C upon the inner face of the flap or jaw B', inserting the pivot through the eye or hole in the heel of the latch, and bending up the flaps or jaws B B' to hold the latch in place between them, whereby the end of the latch-pivot is protected from outside friction, substantially as described.

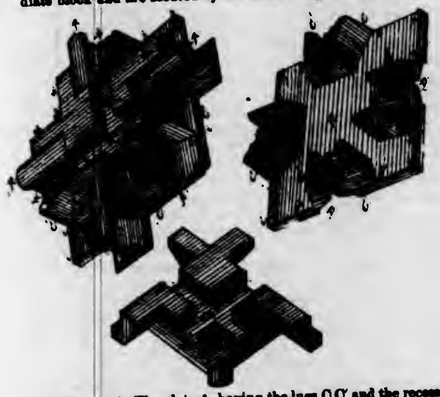
255,809. HINGE. CHARLES PFAUNTZ and HENRY FRANCK, St. Louis, Mo. Filed Dec. 10, 1881. (No model.)



Claim.—The combination, in a non-projecting hinge, of the attaching-leaves A A', having pivot-eyes *a a'* and projecting lugs a^2 a^3, with the connecting-link B, having pivot-eyes *b b'* and square corners or shoulders b^2 b^3, all arranged substantially as herein described, and for the purpose set forth.

255,810. FENCE-POST. E. P. PHILLIPS, Findlay, Ohio. Filed Jan. 23, 1882. (No model.)

Claim.—1. A fence-post formed with a bolt-hole in the center of the base, provided with base studs or rests and slanting side braces, with staples driven in the post over the side braces, in combination with a foundation or base stone formed with central top countersunk and bolt-hole and a connecting-bolt.



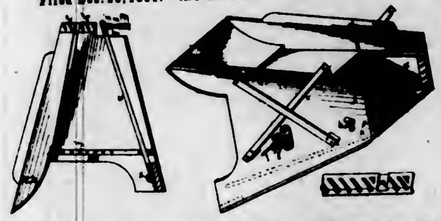
255,810.

2. The fence-post herein described, consisting essentially of the post A, base-studs *b*, braces *c*, staples *d*, foundation or base block B, and connecting-bolt *g*, substantially as and for the purposes set forth.

255,811. RAILWAY-CROSSING. DENISÉ C. PIRACH, Chicago, Ill. Filed Aug. 2, 1881. (No model.)

Brief.—A crossing-plate has lugs and recesses for the reception and attachment of the rails, which abut against an intermediate block and are secured by ratcheted wedges and pins.

Claim.—1. The plate A, having the lugs C C' and the recesses D for the reception and attachment of the rails, as set forth.



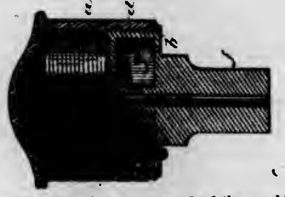
2. The combination, with the plate A, of the block B, constructed as described, and operating in the manner and for the purpose stated.

3. The combination of the plate A, block B, wedges W, and rails R, in the manner and for the purpose specified.

4. The combination, with the lugs C, provided with the ratchet-notches *r*, of the wedges W and pins P, all as and for the purpose described.

5. A corner-plate for a railway-crossing in which the rails abut against a central block and are supported and held between lugs by ratcheted wedges, substantially in the manner set forth and shown.

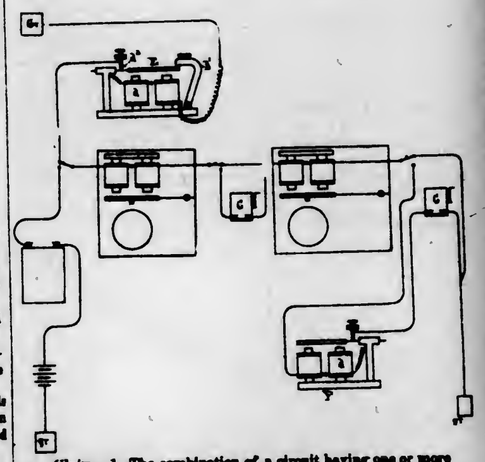
255,812. FANNING-MILL. PERRY POTTER, Kalamazoo, Mich. Filed Dec. 23, 1881. (No model.)



Claim.—1. In a fanning-mill, a laterally-shaking shoe provided with a screen loosely located therein, said screen provided with the semicircular projections, in combination with an adjustable bar provided with a similar projection and supporting the rear end of said screen, all substantially as described.

2. A fanning-mill shoe, the adjustable joint having pin-holes, and a pin for locking it in different positions, said joint and shoe being pivotally connected, all in combination with the bell-crank and connecting-link, substantially as described and shown.

3. The mill-frame, bell-crank, shoe, elastic metal bars, the adjustable joint pivoted to the shoe, means for connecting said joint with the bell-crank, and means for locking said parts in different positions, all constructed and combined substantially as described, for the object set forth.



4. The combination of a shoe the top of which forms a hopper, provided with the grooves in the sides beneath the hopper-spout, with a screen provided with studs for detachably securing it on the shoe-hopper, substantially as described.

255,813. LUBRICATOR. WILLIAM K. RHODES, Portland, Me. Filed Dec. 7, 1881. (No model.)

Claim.—A lubricating-cup composed of the combination of the cup *a*, bage *b*, having chamber *g* and duct *e*, and the stock or shank *f*, as herein set forth.

255,814. SIGNALING ON ELECTRIC CIRCUITS. DAVID HALL RICE and LUPINE C. RICE, Lowell, Mass., assignors to the Carrier Telephone Bell Company, of Massachusetts. Filed Nov. 14, 1881. (No model.)

Claim.—1. The combination of a circuit having one or more call-bells provided with vibrating strikers having different periods of vibration with a vibrating circuit-breaker which automatically makes and breaks the electric current passing over the circuit in an interval of time substantially different from that of any vibrating striker upon the line.

2. The combination of an electric or magnetic circuit having a magnetic generator placed at one station thereon and a magnet and vibrating striker placed at another station thereon with an automatic vibrator which makes and breaks the current with each vibration and vibrates in a period of time different from that of the striker, substantially as described.

255,815. COFFIN. WILLIAM A. RICHEY, Indianola, Iowa. Filed Feb. 28, 1882. (Model.)

Claim.—1. The herein-described improved corner-clamp for coffins, consisting of the flanged bar E, having cap-plate H, provided with downward-projecting studs J J, and bracket L, having downward-projecting bolt N, substantially as set forth.

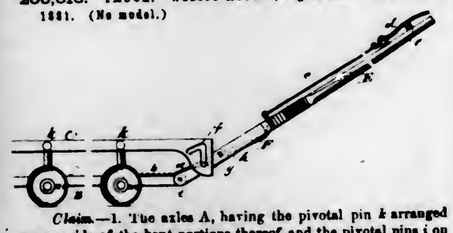
2. The combination of the side A and end B, having beveled edges G and recesses I K, and the bottom C, having recess M, with

the corner-clamp consisting of the flanged bar E, having cap-plate H, provided with studs J, and bracket L, having bolt or screw N, substantially as set forth.

255,816. SCREW. CHARLES D. ROGERS, Providence, R. I., assignor to the American Screw Company, same place. Filed Dec. 28, 1881. (No model.)

Claim.—As an improved article of manufacture, a screw having a steel core and a surrounding iron shell welded to the core, substantially as set forth.

255,817. THREADING-DIE. CHARLES D. ROGERS, Providence, R. I., assignor to the American Screw Company, same place. Filed Oct. 12, 1881. (No model.)



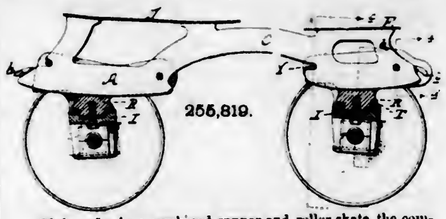
Claim.—1. A threading-die composed of a threaded hub having radial grooves, constructed as described, on its face or extreme end, cutters mounted in said grooves and retained therein against movement lengthwise of the hub, and a single screw-sleeve which engages the threaded portion of the hub and has a beveled mouth which engages the beveled rear ends of the cutters, substantially as set forth.

2. As an improved article of manufacture, a threading-die having an interior chamber and ducts leading outward therefrom, whereby the chips, &c., which would tend to clog the die may be discharged, substantially as set forth.

3. As an improved article of manufacture, a threading-die composed of a chambered hub having dovetail grooves in its face for the reception of cutters, cutters mounted in said grooves, a sleeve mounted on said hub and adapted to adjust and hold the cutters to gage, means for securing said sleeve in position, and ducts leading outward from the chamber in the hub, substantially as and for the purposes specified.

255,818. TRUCK. NELSON ROGERS, Elgin, Ill. Filed July 2, 1881. (No model.)

Claim.—1. The axles A, having the pivotal pin *k* arranged on one side of the bent portions thereof and the pivotal pins *i* on the opposite side, substantially as described.



2. The combination, in a cranked truck, of the slots or cams *f* and pins *g* with a hinged tongue or handle, substantially as set forth.

3. The combination of the tongue or handle E, having the pins *g*, with the bars C, having slots or cams *f*, bars D, and crank-axles A, substantially as specified.

4. In a cranked truck, the combination, with the lower rails or frame, D, and the upper rising and falling platform supported by the axles of the truck, of the ratchet-teeth *b* on the lower rails or frame, the tongue or handle E, hinged to the latter and connected with the rising and falling platform, and the ratchet-bar F on the tongue or handle, said members being arranged to raise, lower, and hold the platform in its adjusted position, whereby it may be pushed or pulled at any partial or complete elevation, substantially as described.

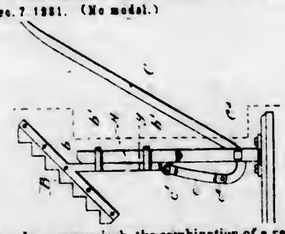
5. In a cranked truck, the combination, with the lower rails or frame, D, the rising and falling rails or platform C, and the tongue or handle E, hinged to the lower rails or frame, of a connection between the tongue or handle and the rising and falling rails or platform, which connection is caused to descend toward the lower rails or frame as the platform is elevated by the movement of the tongue or handle, substantially as described.

255,819. COMBINED ROLLER AND RUNNER SKATE. WILLIAM H. ROSEWORTH, Camden, N. J. Filed Feb. 26, 1881. Renewed Oct. 18, 1881. (No model.)

255,819.

Claim.—1. As a combined runner and roller skate, the combination of a double ice-runner, A B, united by a bridge-piece, C, which establishes a fixed relation between its respective runners, with two separate roller-trucks removably applied to the runners, substantially as set forth.

2. In combination with a runner-skate, two separate roller-trucks removably applied thereto, and each having an independent vibratory and rotary motion with respect to the plane of the foot-pieces of the runner-skate, substantially as set forth.



3. As a means of attaching the foot-plates and the runner of a skate to two separate roller-trucks, the clamp-plates S, being a part of the trucks, and being adapted to embrace the runner by means of cross-studs connected with the clamp-plates and engaging with notches in the runners, and by means of thumb-screws adapted to unite both clamp-plates and runners, substantially in the manner set forth.

4. In combination with a runner-skate, two separate roller-trucks removably applied thereto by means of clamp-plates in the manner described, and each connected with the runners in such manner as to each be capable of independent vibratory and oscillatory motion with respect thereto, substantially as set forth.

5. The oil-chamber V, formed in the bed-plate I at the base of the trunnion R and about the connecting-screw U, as and for the purpose specified.

6. As a device for securing the axles of roller-trucks, the combination of the journal-box casings A, upper and lower packings, L, packing-pin O, and sliding lock-piece P, substantially as set forth.

255,820. CARRIAGE-JACK. WILLIAM J. SCOTT, Boston, Mass. Filed Dec. 7 1881. (No model.)

Claim.—In a wagon-jack, the combination of a vertical metal support, A, the notched rest B, its vertical arm *b*, the straps *b'*, holding the arm to one side or surface of the support and fastened permanently to either the arm or support, the lever C, shaped as described, pivoted at the base of the standard, and the link *c*, all substantially as and for the purposes set forth.

255,821. BOTTLE-STOPPER. CHARLES SEDGWICK, New York, N. Y., assignor to Henry W. Putnam, Bennington, Vt. Filed Feb. 3, 1881. (No model.)

Claim.—1. A bottle-stopper provided with rigidly-projecting arms B, which unite it to the operating-lever fulcrumed at one side of the neck of the bottle at a point midway between the connection of the lever with the neckband and the handle of the lever, substantially as and for the purpose described.

2. The neckband F, provided with eyes or fulcrum-pieces E E, which are both arranged on one side of the bottle and combined with a lever, C, that is hung in said fulcrum-pieces, and with the arms B of the stopper A, that straddle the bottle diametrically and connect directly with said lever C, substantially as described.

3. The neckband F, provided with the downwardly-extending stop-catch G, and combined with the actuating-lever C, that is pivoted to the same neckband F, and with the arms B and stopper A, substantially as specified.

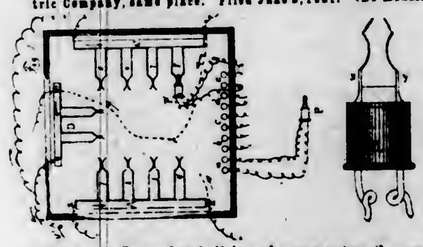
4. The combination of the neckband F, having the fulcrum-pieces E E on one side of the bottle and the stop-catch G on the other side, with the lever C, arms B, and stopper A, substantially as specified.

255,822. PRIMER FOR CARTRIDGES. WILLIAM S. SHOUP, Ilion, N. Y., assignor of one-half to E. Remington & Sons, same place. Filed Feb. 11, 1882. (Model.)

Claim.—1. An anvil constructed of thin sheet metal, and having a continuous outer flange and an inwardly struck-up cone-shaped bottom with an aperture at the apex.

2. As a new article of manufacture, a primer for cartridges composed of an anvil constructed of thin sheet metal and having a continuous outer flange and an inwardly struck-up cone-shaped bottom with an aperture at the apex, an outer cap, and interposed fulminate.

255,823. CARPET-SWEEPER. ROBT. BOYDE, Detroit, Mich., assignor to the Automatic Carpet Sweeper Company, same place. Filed May 17, 1881. (Model.)



Claim.—1. In a carpet-sweeper, the combination, with the pivoted dust-pans having the slots formed in their end walls, of the dumping-bar E, having the downwardly-bent ends provided with pins projecting into said slots, and said bar being also provided with an arm projecting upward through a slot in the top of the case, the pans being relatively so connected with the bar that as said bar is moved vertically the pans are both dumped outward simultaneously.

2. The combination, with the vertically-moving dumping-bar, of a spiral spring housed within its stem and acting to draw it back and lock the pans shut when in use, substantially as described.

3. In a carpet-sweeper, friction mechanism consisting of frames for supporting the friction-wheels, said frames pivoted above the wheel-axles, and each frame provided with a projection at the side of its pivotal point, and in connection therewith a spring secured at its middle point, extending across the case, with its ends bearing downward against the said projections, whereby the wheels are forced together against the brush-roller, substantially as described.

4. The handle connecting and supporting mechanism consisting of the two perforated prongs at the end of the handle, one of said prongs being provided with a detent, and the ear-pieces or standards *g*, provided with pins to enter the perforations of the prongs, one of said pins being provided with an encircling-spring, *g'*, and the opposite standard having in its upper end a slot, *g''*, to engage the detent, substantially as described.

255,824. SYSTEM OF ELECTRICAL DISTRIBUTION. ELIHU THOMSON, New Britain, Conn., assignor to the American Electric Company, same place. Filed June 8, 1881. (No model.)

Claim.—1. In an electric light and power system, the combination, with [illegible] electric generators, local circuit, and two or more pairs of circuit-closing springs, such as described, arranged in series in said circuit, of a number of working light or power circuits, the two terminals of each of which are kept insulated from one another and formed into a plug for insertion between any pair of springs, whereby the working circuits may be included in series and in any desired combination in the same generator-circuit.

2. In an electric light and power system, the combination, with an electric generator, of two or more switch-points or circuit-closers arranged in series, a number of light or power circuits, the two terminals of each of which are brought into suitable proximity with the generator-circuit, and means, as described, whereby the light or power circuit may be interposed in series and in any desired combination or relation in the same generator-circuit.

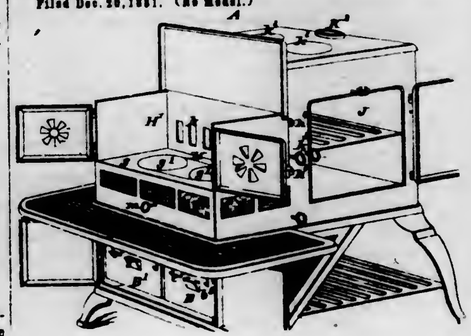
3. In an electric lighting and distributing system, the combination of two or more electric generators, two or more pairs of springs for each generator, through the opposed surfaces of which the circuit of a generator is closed in series, a series of lighting or distributing circuits, and a set of plugs forming the terminals of said circuits, whereby said circuits may be inserted as a part of or removed from the circuits of said generators in any desired combination or may be changed from one generator to another.

4. A switch plug or plugs, P, provided with a symbol for indicating the direction of the current when inserted between the switching-surfaces, in combination with the switch-board or spring having corresponding symbol.

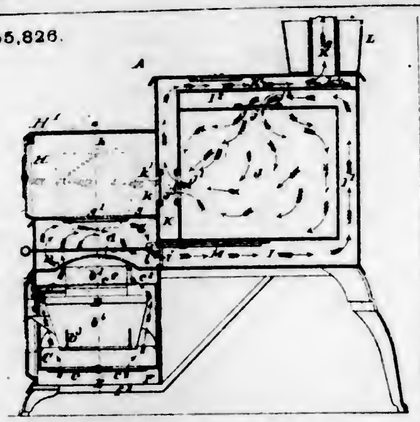
5. The combination, substantially as described, of two or more generators, a pair of circuit-closing springs in each generator-circuit, and two switch-plugs, constructed as described, and joined by two insulated conductors.

6. In an electric lighting and distributing system, the combination of two or more electric generators, each provided with a circuit containing a lamp or lamps operated by said generators independently, with a partial circuit common to the generators, and containing lamps or equivalent resistances in which the energy given out as useful work is due to the combined current strengths of the said generators or the differences thereof according to the respective directions of their individual currents.

7. The combination of two or more electric circuits, each containing one or more electric lamps, with a partial single circuit common to both, and in which partial-circuit lamps of greater or less lighting power than those used upon the other parts of the circuits are placed and operated, substantially as described.



255,825. CENTER FOR COOKING-STOVES. ALBERT TROLLOPE, Detroit, Mich. Filed Jan. 9, 1882. (No model.)



Claim.—1. In a stove-center, the part A, provided with shoulders 1 and 2, in combination with the parts B, provided with engaging-lips 4, substantially as and for the purposes described.

2. In a stove-center, the part A, provided with shoulders 1 and 2 and ridges or lugs *r*, in combination with the parts B, provided with the engaging-lips having concavities to embrace said ridges or lugs, substantially as described.

255,826. COOK-STOVE. WILLIAM H. VIRINS, Southwick, Mass., and EDWARD A. QUESNEL, St. Louis, Mo., assignors to the American Stove Manufacturing Company, Belleville, Ill. Filed Dec. 28, 1881. (No model.)

255,826.

Claim.—1. The combination of the burner B, the casing C, and the chamber F, substantially as described.

2. The combination of the chamber F, the ledges $f' f'$, the casing C, the projections $c' c'$, the hook c^3, and eye f^3, substantially as described.

3. In the stove A, the combination of the chamber F, the burners or burner B, the chamber G, the oven J, and the chamber H, substantially as described.

4. The combination of the chamber F, the casing or casings C C', and the register or registers E E, substantially as described.

5. The combination of the chamber G, the flue I I' I'', and the oven J, substantially as described.

6. The combination of the oven J, having the openings $j j'$, the flue I', and the flue K, substantially as described.

7. The combination, in an oil or gas stove, of the chamber G, the oven J, and the chamber H, the heated currents passing from the chamber G to without the stove via either or both of the apartments J H, as desired.

8. The stove A, having the detachable casing H', and the chamber G and oven J, substantially as and for the purpose described.

9. In the stove A, the movable rest M, substantially as and for the purpose specified.

255,827. GRIPPING-PULLEY. DANIEL W. WARREN, New York, N. Y., assignor to himself and John H. Blaisdell, same place. Filed Aug. 29, 1881. (No model.)

Claim.—1. A pulley constructed substantially as herein shown and described, consisting of flanged annular sections or rings A A', compression-levers B, and central disks, C, provided with inclined planes, as set forth.

2. In a pulley, as a means for supporting the rope in position, the flanged annular sections A A', substantially as herein shown and described.

3. In a pulley, as a means for compressing and holding the pulley-rope, the compression-levers B, substantially as herein shown and described.

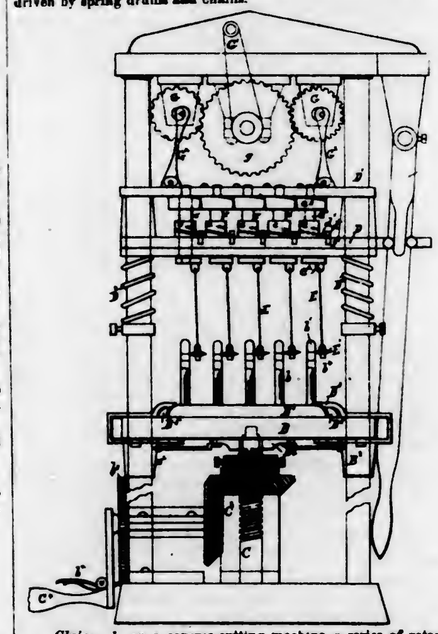
4. In a pulley provided with compression-levers B, the supporting-disks C, having inclined faces, substantially as herein shown and described, whereby said levers are operated, as set forth.

5. The combination, with the flanged annular pulley-sections A A', provided with sockets *f*, of the pivoted compression-levers B and disks and arbor C E, the said disks forming an annular groove, substantially as herein shown and described.

6. In a pulley, as a means for compressing and holding the rope, the combination of compressing-levers and inclined planes moving relatively to each other as set forth.

255,828. COOLER FOR BONE-BLACK-REVIVIFYING KILNS. FRANCIS WARTON, Philadelphia, Pa. Filed Feb. 23, 1882. (No model.)

Claim.—The combination, with the socket or box into which a retort of a bone-black-revivifying kiln delivers, of a series of



255,828.

tubes communicating with the said socket or box and adapted to receive the hot black from the same and to conduct it away, the said tubes being each, or all of them but one, provided with a suitable opening and closing device, by which one or more of the tubes may be closed to the passage of the black and the cooling effects of the system be varied as desired, substantially as specified.

255,829. MACHINE FOR CUTTING OFF CAPSULES. LOUIS J. WOEHLICH and RICHARD J. SCHOLES, Detroit, Mich., assignors to said Scholes, William McFarland, and Andrew McFarland, all of same place. Filed Jan. 22, 1882. (No model.)

Brief.—The rotary cutter-arms are suspended from wrist-pins driven by spring drums and chains.

Claim.—1. In a capsule-cutting machine, a series of rotary cutters mounted on spring-arms depending from vertical rotary shafts provided with drums driven in one direction by the uncoiling of chains or bands and retracted by springs, substantially as described.

2. The combination, with a series of drums fixed upon the cutter-shafts, of the bands, each having one end attached to the outside of one of the drums, one or more slides connected with the opposite ends of said bands, and means for operating said slides, the whole being arranged to operate essentially as set forth.

3. The combination, with the rotary shaft and drum to which any cutter is attached, of a spring, one end of which engages the shaft and the other end is attached to an adjustable drum-case, and pins or screws by which said drum-case may be given any desired rotary adjustment for varying the tension of the spring, substantially as described.

4. The combination, with a platform supporting the rotary cutters, of one or more supporting-arms, connected at their upper ends eccentrically with corresponding pinions, and a crank and pinion for rotating the same and imparting a jigging motion to the cutters, substantially as described.

5. In a capsule-machine, the combination, with the mold-plate-supporting platform, of the two clamps B^3 B^3, the lever B', and connecting-links, whereby said clamps are operated simultaneously, substantially as described.

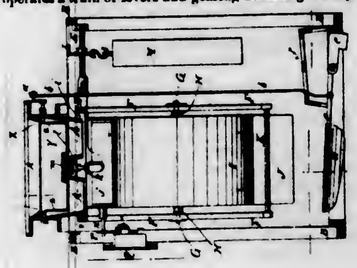
6. In a capsule-cutting machine, the combination, with the rotary cutter supporting-platform and jigging mechanism, of springs located beneath the platform, serving as cushions, substantially as and for the purposes described.

255,830. TREATMENT OF SACCHARINE JUICES. CHARLES U. YATES, Barton, near Manchester, County of Lancaster, England, and PAUL DEGENER, Brunswick, Germany; said Yates assignor to said Degener. Filed Dec. 30, 1881. (No specimens.)

Claim.—For the purpose of preventing the formation of an excessive quantity of molasses by the concentration of saccharine juice and the boiling of the syrup, the execution of these operations in a vacuum corresponding to a boiling-temperature of the liquor which does not exceed 57.5° centigrade, and, in case the evacuating apparatus should not be powerful enough to create the degree of rarefaction of air, the use of hygroscopic substances for the absorption of the vapors generated in the concentrating or boiling pans, and which are not condensed by the ordinary means, substantially as and for the purpose described.

255,831. DRAW-BRIDGE. MAX A. SCHENER, Chicago, Ill. Filed Jan. 14, 1882. (No model.)

Brief.—Each truss spanning an opening is hinged at its inner end to the turn-table. Flexible connections of the inner ends of the upper chords are deflected at their middle part from a right line, thereby causing said upper chords to approach each other, as lifting the outer ends of the bridge. Such deflection is effected by a right-and-left-hand screw.

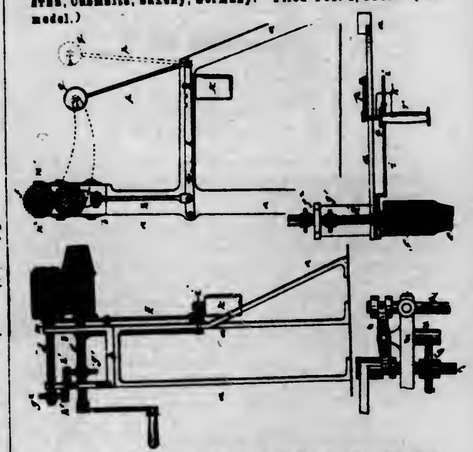


Claim.—1. In a draw-bridge, the combination, with the center pier, swinging mechanism, and abutments, of two spans, one crossing each opening and hinged or pivoted in place at its inner end, and mechanism at the center of the bridge for raising the outer end of each span from its abutment and lowering it thereon, substantially as described.

2. In combination with the center pier, abutments, and turn-table of a draw-bridge, the two spans D, each pivoted at its inner end, as described, pivoted rods or members *r* and *r'*, connecting the inner ends of the upper chords of the spans and forming a double knuckle-joint, as shown, and mechanism for removing the linked inner ends of the rods or members to or from each other at will to raise or lower the outer ends of the spans, as set forth.

3. In combination with the center pier, abutments, and turn-table of a draw-bridge, the two spans D, pivoted at their inner ends, as described, pivoted rods or members *r* and *r'*, connecting the upper chords of the span, nuts *s* and *s'*, right-and-left-hand screw E, passing through the nuts and braced in a suitable standard, and mechanism for turning the screw either way, substantially as described.

255,832. GRAIN WEIGHING AND REGISTERING MACHINE. WILLIAM H. ALLEN, New York, N. Y. Filed July 30, 1881. (No model.)

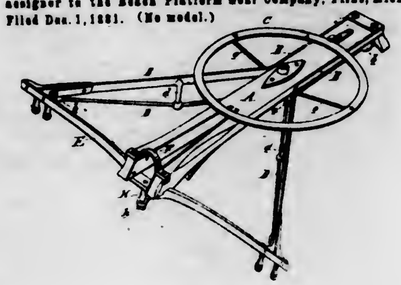


Brief.—The cut-off valve of the hopper carries a crank connected to a weighted and balanced plate, upon which the discharge of grain falls from one compartment of the weighing-box and closes the valve and the flow of grain from the hopper until the weighed grain has been fed to the stone or receptacle and the plate again rises, opening the inflow-valve. The oscillation of the weighing-box operates a train of levers and gearing actuating the register.

Claim.—1. In an automatic grain weighing and registering machine, the combination, with the spout A, having shoulder X, and the weighing-box I, of the cut-off valve Y, having flange Z, the crank *a*, the connecting-rod *b*, and the weighted lever *c e*, having plate *d* upon its forward end, substantially as herein shown and described, whereby the admission of grain to the weighing-box is regulated automatically, as set forth.

2. In an automatic grain weighing and registering machine, the combination, with the vibrating weighing-box I, having pin N, and the register Q, having saw-toothed ratchet-wheel W, of the lever P, having straight slot O and double-inclined slot R, and the bent lever T U V, substantially as herein shown and described, whereby each vibration of the said weighing-box will vibrate the said bent lever twice and move the said saw-toothed ratchet-wheel through the space of one tooth, as set forth.

255,833. SOFTENING YARNS AFTER DYEING. JOSEPH HALSTEN, Chemnitz, Saxony, Germany. Filed Feb. 4, 1882. (No model.)



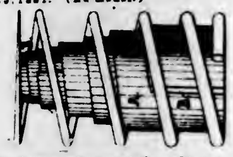
Claim.—1. The process herein described for softening hard yarn, which process consists in passing the yarn between rubbing-surfaces to which simultaneously longitudinally-reciprocating and rotating motion is imparted and removing the dust from the yarn by quickly stretching the hanks while they are operated upon by the rubbing-surfaces, substantially as set forth.

2. The combination of the revolving rollers *e f*, supporting-standards *b b*, carrying the shafts *c d*, the bearing of the upper shaft, *d*, being pivoted to the outer standard, means for longitudinally reciprocating the rollers, and a weighted lever connected to the bearing of the upper shaft on the standard adjoining the rollers, whereby the upper roller is pressed down upon the lower roller, substantially as specified.

3. The combination of the revolving and longitudinally-reciprocating rollers *e f* with a pivoted stretching-lever, *p*, carrying the spool *r* for the hanks, substantially as set forth.

4. The combination of the revolving and longitudinally-reciprocating rollers *e f*, the lower of which has a conical extension, *e*, while the upper one is weighted, with a pivoted stretching-lever *p*, carrying the guide-spool *r* for the hanks, substantially as specified.

255,834. PLATFORM-GEAR. ALEXANDER H. BEACH, Linden, assignor to the Beach Platform Gear Company, Flint, Mich. Filed Dec. 1, 1881. (No model.)

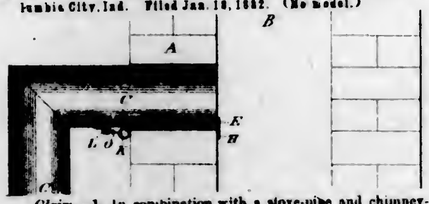


Claim.—1. A fifth-wheel platform consisting of a central bar, A, cross-bar E, and futchells B B, secured at their ends to said central bar and cross-bar, in combination with the tie truss-rods D, the brackets *b*, and the struts *d*, substantially as and for the purpose specified.

2. In a fifth-wheel platform, the combination, with the central bar, A, the cross-bar E, the futchells B, and the tie truss-rods D, of the strut *d'*, secured to the central bar, A, and provided with hooks *c*, the struts *d*, and the brackets *b*, substantially as and for the purpose specified.

3. In a fifth-wheel platform, the combination, with the central bar, A, cross-bar E, futchells B, brace-rods D, struts *d d'*, and the brackets *b*, of the circle C and the brace-rods *e*, secured to said circle and to the strut *d'*, substantially as and for the purpose specified.

255,835. CAR-SPRING. JOHN E. M. BERRY, Baltimore, Md. Filed Dec. 15, 1881. (No model.)



Claim.—1. A car-spring consisting of two or more volute spiral members, each of uniform thickness throughout its length and having an edgewise taper, the said members being of different lengths, as and for the purpose set forth.

2. A car-spring consisting of two or more volute spiral members, each of uniform thickness throughout its length and having an edgewise taper and an inclosing cylindro-spiral adapted to sustain a covering, as and for the purpose set forth.

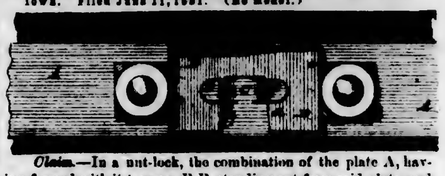
3. A car-spring consisting of two or more volute spiral members, each of uniform thickness and having an edge taper, the said members being concentrically coiled and unconnected with each other, as set forth.

255,836. STOVE-PIPE RETAINER. ALFRED O. RIGGS, Columbia City, Ind. Filed Jan. 18, 1882. (No model.)

Claim.—1. In combination with a stove-pipe and chimney-flue, the retainer, as described, having upper flange, E, lower flange, H, and loop K, substantially as set forth.

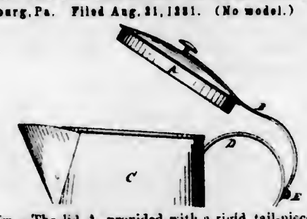
2. The combination of pipe C and loop L, wire O, loop K, flange E, and flange H with flue-wall A, all substantially as described, and for the purposes specified.

255,837. SPRING BED-BOTTOM. THEODORE BURDICK, Grand Haven, Mich. Filed Dec. 5, 1881. (No model.)



Claim.—The combination, in woven-wire spring bed-bottoms, of two fabrics of woven wire, A A, attached to cross-cleats D D, supported by longitudinal slats C C, with two sets of spiral springs, B B, one spring B being placed upon the upper sheet of woven-wire fabric A, and one spring B being placed upon the under side of each slat C and extending to and supporting the lower fabric, A, as represented in Figs. 1 and 3 by letters A A, B B, and C C.

255,838. BUCKLE. ALEXANDER CARWELL, Petaluma, Cal. Filed Nov. 30, 1881. (No model.)



Claim.—A buckle, A, having a frame, *a*, with a hole, *c*, in its end, and a tongue, *b*, with an inwardly curved or turned point, *b'*, adapted to fit within the hole *c* when said tongue is closed, substantially as and for the purpose herein described.

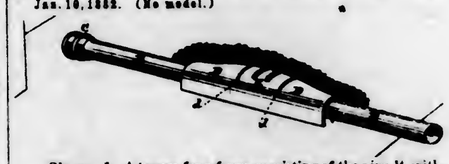
255,839. NUT-LOCK. SAMUEL H. CHURCHILL, State Centre, Iowa. Filed June 11, 1881. (No model.)

Claim.—In a nut-lock, the combination of the plate A, having formed with it tongues B B, standing out from said plate, and providing spaces between them and the plate A, and the angular plate D, having an open slot, as at *d*, to permit its legs to fit or be inserted between the tongues B and the plate A, substantially as and for the purpose set forth.

255,840. LID FOR TEA OR COFFEE POTS. JOHN B. CLARKE, Pittsburg, Pa. Filed Aug. 31, 1881. (No model.)

Claim.—The lid A, provided with a rigid tail-piece, B, constructed, as described, so as to curve around upon and extend down the back of the handle D to a point most remote from its connection with the body of the pot C, and hinged or pivoted to the handle in the manner shown, for the purposes set forth.

255,841. COMBINED LABEL-HOLDER AND HANDLE FOR BOXES. JAMES CROAK and EDWARD J. MORAN, Davenport, Iowa. Filed Jan. 11, 1882. (No model.)



Claim.—1. The metallic handle B for boxes, having the under-folded sides *d*, terminating in fastening-prongs *e*, adapted to pass through the wall and be turned down on the inside of the box, and the bearing *l* to fit against the outside of the box, substantially as specified and shown.

2. In combination with a box, the metallic handle B, having the under-folded sides *d*, end bearings, *l*, offsets *k*, forming recesses with the box at the ends of the handle-loops *h*, and terminal fastening-prongs *e*, substantially as specified.

3. In combination with a box, the metallic box-handle B, having the shallow offsets *k*, forming recesses with the box at the ends of the handle-loop *h*, the said recesses being adapted to receive and hold a trapezoidal label or card, L, the handle having the end bearings, *l*, and the terminal prong-fastenings *e*, substantially as shown and described.

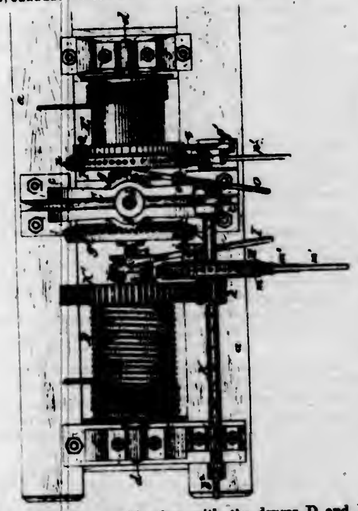
255,842. TUYERE. JEREMIAH E. DAY, San Francisco, Cal., assignor of one-half to James C. Aitken, same place. Filed Jan. 10, 1882. (No model.)

Claim.—1. A tuyere for a forge, consisting of the pipe B, with its closed end and aperture *b*, and the removable casting D, fitting over said pipe and having a convex upper surface and a grate-opening, *d*, and the removable grate E, fitting the opening *d*, substantially as herein described.

2. A tuyere for a forge, consisting of the pipe B, having an opening, *b*, and extending beyond the fire and closed by a screw-cap, C, for the purpose specified, the removable casting D, with its convex surface and grate-opening *d*, and the removable grate E, substantially as herein described.

255,843. KEY FOR BOLTS, &c. BOLTON W. DU COURCY, Winchester, assignor of one-half to James C. Brant, Covington, Ky. Filed Dec. 27, 1881. (No model.)

Claim.—1. A bolt-key which performs the functions of a nut and nut-lock.



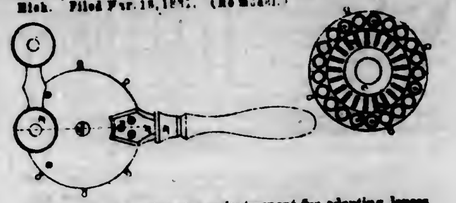
2. A key consisting of body C and legs A and B, constructed substantially as described.

3. A key whose faces *a a'* are beveled toward the point, and whose edges are beveled toward the head and provided with spring-legs A B, substantially as and for the purposes specified.

4. A key consisting of a head or solid end and spring-legs A B, and whose faces *a a'* are beveled toward the points of the legs, and whose edges are beveled toward the head, excepting the edge of leg A, from the line *a* to the point of said leg, which latter edge is beveled toward the said point, substantially as and for the purposes specified.

5. In combination with a key having beveled faces, as *a a'*, and beveled edges, substantially as described, and spring-legs A B, the bolt having a slot of such a size and having sides so beveled as to receive the key and allow the faces *a a'* of the latter to snugly fit against said sides after the widest portion of the key has passed through said slot, substantially as and for the purposes set forth.

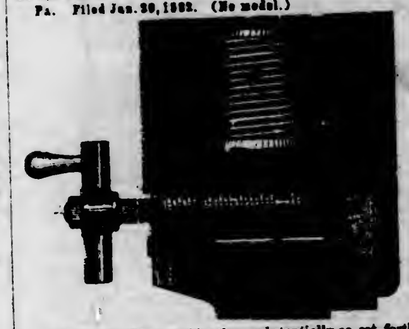
255,844. HOISTING-MACHINE. ARCHIBALD DOBBIN, Thorold, Ontario, Canada. Filed Dec. 29, 1881. (No model.)



Claim.—1. The combination, with the drums D and E, mounted loosely upon a shaft, *d*, of the driving-shaft *h*, gear-wheels *g g'*, clutch-couplings H M, counter-shaft K, pinion *k*, and brakes M *m* and P *p*, substantially as set forth.

2. The combination, with the drum D, mounted loosely on the shaft *d* and provided with gear-wheel K', clutch H, driving-shaft *h*, and gear-wheels *g g'*, of the counter-shaft K, provided with pinions *k* and hand-crank *P*, substantially as set forth.

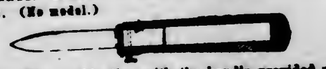
3. The combination, with the drums D E and shafts *b d*, of the arched standard C, provided with bearings *b' f' f''*, arranged between the drums and end bearings, *f*, substantially as set forth.



255,845. OPTOMETER. GEORGE D. ROBINSON, Detroit, Mich. Filed Nov. 18, 1881. (No model.)

Claim.—1. An optometer or instrument for adapting lenses to the sight, consisting of a series of rotary frames pivoted face to face and carrying at intervals lenses of different powers, an eye-piece or rest, and a stationary lens-support, substantially as described, whereby any lens or combination of lenses may be brought in line with the eye or another lens, substantially as described.

2. In an optometer, the outside shell consisting of two plates, between which the series of frames are pivoted face to face, said plates being provided with orifices for the reception of an eye-piece or rest through which any lens or combination of lenses may be brought into juxtaposition with the eye or another lens, substantially as and for the purpose set forth.

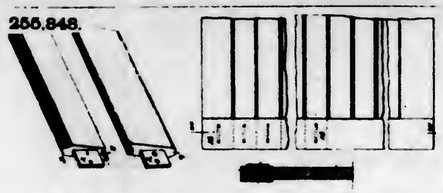


255,846. BORING-BAR. LUTHER B. FAUGHT, Philadelphia, Pa. Filed Jan. 30, 1882. (No model.)

Claim.—1. The combination, substantially as set forth, of a boring-bar having a transversely-slotted head or enlargement and a segmental female screw-thread formed on one side of its slot or opening, a block or tool-holder adapted to receive a shouldering or facing tool and fitting in a recess in the head of the bar, a feed-screw fitting in a recess in the tool-holder and engaging the female thread of the boring-bar, and a stem or stock fitting a socket in the feed-screw and serving to impart rotation thereto.

2. A tool-holder for boring-bars having a tool-slot adjacent to one of its ends, a semi-cylindrical recess at right angles to said slot for the reception of a feed-screw, and a collar projecting into said recess to retain the feed-screw in position longitudinally, substantially as set forth.

255,847. HANDLE FOR POCKET-KNIVES AND OTHER IMPLEMENTS. BRADLEY A. FISKE, New York, N. Y. Filed July 8, 1881. (No model.)

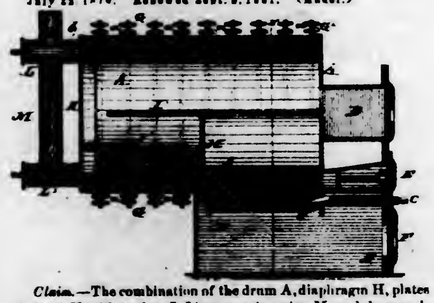


Claim.—The combination, with the handle provided with a plate-spring having a detent and a yoke or staple, constructed and arranged as shown and described, of the notched longitudinally sliding or moving tool, substantially as and for the purpose set forth.

255,848. WINDOW-SHUTTER. CALEB E. GARRY, New York, N. Y. Filed Sept. 7, 1881. (No model.)

Brief.—The flexible shutter consists of top and bottom rails and intervening slats, the meeting edges thereof formed with knuckle-joints and the rails and slats being secured to side rails divided transversely and connected together by means of flexible metallic strips. The shutter moves in curved guideways.

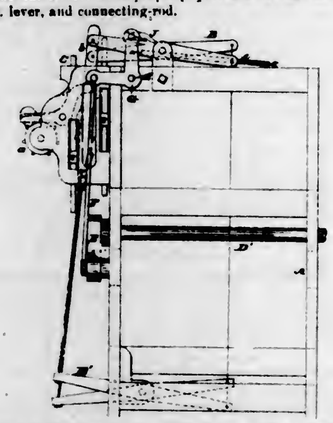
Claim.—1. A flexible window-shutter consisting of top and bottom rails and intervening slats united together by stiles that are divided so as to render the whole or a portion of the slats capable of an oscillating movement, said divided portions being connected by flexible metallic strips, substantially as described.



255,848.

2. The combination of a window-shutter having divided stiles connected by flexible strips with a frame-work provided with curved guideways, substantially as described.

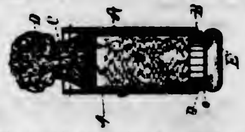
3. A flexible window-shutter consisting of top and bottom rails and intervening slats, the meeting edges whereof are provided with knuckle-joints, which rails and slats are secured to stiles that are divided transversely and connected together by means of flexible metallic strips, substantially as described.



255,849. HEATER. EDWARD E. GOLD, New York, N. Y. Filed July 23, 1870. Renewed Sept. 5, 1881. (Model.)

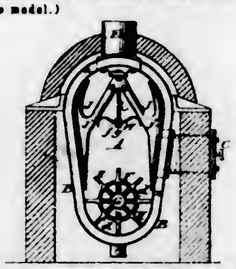
Claim.—The combination of the drum A, diaphragm H, plates I J, head K with outlets L L', connecting-pipe M, and damper *b*, substantially as and for the purposes herein set forth.

255,850. SHEDDING MECHANISM FOR LOOMS. ROBERT S. GOODYEAR, Philadelphia, assignor of one-half to Wolfenden, Shore & Co., Cardington, Pa. Filed July 26, 1880. (No model.)



Brief—The upper harness-levers are formed with projections or noses on their upper sides, and after having been moved to open the shed are held from changing their positions by means of the locking-bar. The latter is drawn forward by a spring, which may yield if the bar strikes an improperly-placed nose and retracted by a cam, lever, and connecting-rod.

Claim.—1. The combination, with the levers B, having noses J and mechanism for operating them, a locking-bar transversely arranged to said lever, and mechanism for positively returning said bar from the noses, of a spring for advancing said bar, substantially as and for the purpose set forth.



2. The combination of harness-levers B, having noses J, with locking-bar H, bell-crank lever G, shaft *d*, arm G', spring *e*, driving-shaft D', cam D, bell-crank lever E, and connecting-rod F, substantially as set forth.

255,851. SLATH-WASHER. WALTER R. GROSS and JOHN B. GROSS, Bridgeport, Conn. Filed Aug. 26, 1881. (No model.)

Claim.—The combination, with the shell B, having tapering end C, sponge D, disk *c*, reservoir *g*, stopper E, and pin *d*, of the sliding shell A, having slots *a* and *b*, substantially as described, and for the purpose set forth.

255,852. APPARATUS FOR DRYING AND PULVERIZING OFFAL, &c. JOHN F. GROSING, Chicago, Ill. Filed Jan. 30, 1882. (No model.)

Claim.—1. An apparatus for drying and pulverizing refuse matter, consisting of a steam-jacketed cylinder and a rotary shaft composed of concentric pipes and intermediate trussing, provided with broad teeth or fingers located in the lower part of the chamber, and adapted to be rotated at a high speed, whereby it is caused to throw or project the material in a separated condition through the open interior of the chamber, as explained.

2. The herein-described drying apparatus, consisting of the steam-jacketed cylinder A, shaft F, located in the lower part thereof and armed with teeth or blades, scrapers J, and mechanism, substantially such as shown and described, for imparting a traveling motion to the scrapers, as set forth.

3. In a drying apparatus, a beater or agitator shaft composed of two concentric pipes, F G, and intermediate braces or trussing, substantially as shown and described.

4. The agitator-shaft consisting of concentric pipes F G, braces or trussing *d*, and end pieces, *e*, substantially as shown and set forth.

5. In a drier, a yielding or elastic reciprocating scraper, substantially such as described, provided with a rack, in combination with a pinion, and means for rotating the pinion alternately in reverse directions.

6. In combination with the rack-bar K and the scraper connected therewith, the pinion L, pulleys O, O', and P, belts Q R, and fingers S S' S'', arranged substantially as described and shown, whereby the belts are alternately passed upon pulley P, as and for the purpose specified.

7. The scraper J, consisting of arms pivoted to an intermediate support and separated and pressed outward by a spring, W, substantially as shown.

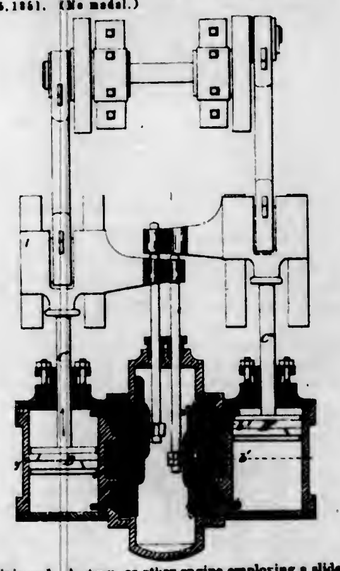
8. In combination with the pivoted scraper-arms J, the intermediate threaded stem, *h*, and nuts *f g*, as and for the purpose described.

9. In a drier substantially such as described, a shaft composed of concentric pipes and intermediate trusses, as shown, and armed with broad teeth or arms, whereby the shaft is adapted to be rotated at high speed, and thereby to cause the material to be projected from the shaft into the open space of the containing-chamber, as explained.

10. The scraper J, provided with adjustable steel plates J.

11. The herein-described drier, consisting of steam-jacketed chamber A, provided with feed and discharge openings, shaft B, having teeth H spirally arranged thereon, scrapers J, and means, substantially such as shown and described, for imparting a traveling motion to the scrapers, as set forth.

255,853. WRENCH. JOHN C. GUNN, Knoxville, Tenn. Filed Feb. 23, 1882. (Model.)

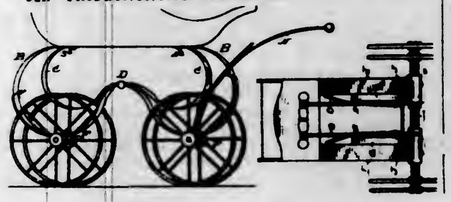


Claim.—1. The combination of the handle A, having grooved hook B, the adjustable slide C, having grooved recess D, and spring-pawl S, and the die E, having opening O and ratchet-flange P, as set forth.

255,853.

2. The combination, with the stock or handle A, having hook or jaw B, and slot G, of the slide C, having lugs H and screw F, the block *d*, having opening K, and the lugs L and the nut N, substantially as set forth.

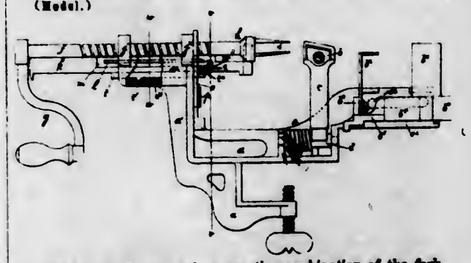
255,854. STEAM-ENGINE. MILAS W. HALL, Plainfield, N. J., assignor of one-half to Albert E. Hall, same place. Filed Feb. 5, 1881. (No model.)



Claim.—1. A steam or other engine employing a slide-valve and the usual inlet and exhaust ports, in which the valve has a stroke equal in length to the piston, and the longest axis of the port-opening under the valve is in the plane of travel of the valve, substantially as set forth.

2. The combination, with the two cylinders and their pistons, rods, cranks, common shaft, and valves, actuated as shown, of the two port-plates L L', yoked together and arranged to be shifted simultaneously, said port-plates being provided with one set of plain and one set of crossed ports, arranged inversely in the two plates, whereby when the plates are shifted the crossed ports of one plate will be brought into play and those of the other plate thrown out, substantially as and for the purposes set forth.

3. In a duplex engine, the combination of two steam-cylinders, one provided with direct steam-ports and the other with crossed steam-ports, two slide-valves controlling said ports, two piston-rods, and mechanism connecting the piston-rod of each engine with the valve of the opposite engine, for moving said valves in the same direction as said piston-rods, substantially as specified.



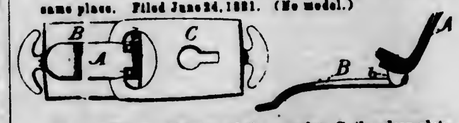
255,855. CHILD'S CARRIAGE. ADAM HEIM, San Francisco, Cal. Filed Nov. 25, 1881. (No model.)

Claim.—1. The springs B and C, connected by the clamps D, attached to the spring C, and the spring-supports G, attached to the axles and supporting the springs B, as set forth, the whole being combined and operated substantially as and for the purposes set forth.

2. The handles or shafts N, having the spring T attached, and the spring catch or stops R, and the rest-hooks P, to form the bearing of the spring-supports G, in combination with the spring-supports G, the whole being constructed and operated as and for the purposes set forth.

255,856. APPLE PARER, CORER, SLICER, AND QUARTERER. C. RAYMOND HEISMANN, Reading, Pa., assignor to the Penn Hardware Company, same place. Filed Dec. 23, 1881. (Model.)

Claim.—1. In an apple-parer, the combination of the fork-shaft *f*, the crank *g*, the track-bar *k*, having a track, *l*, the supporting-bar *t*, and the engaging-bolt *o*, for the purpose of effecting engagement between the said bolt *o* and the said shaft *f*, substantially as set forth.



2. The combination of the fork-shaft *f*, crank *g*, the track-bar *k*, having a track, *l*, and the engaging-bolt *o*, for the purpose of effecting disengagement between said bolt *o* and said shaft *f*, substantially as set forth.

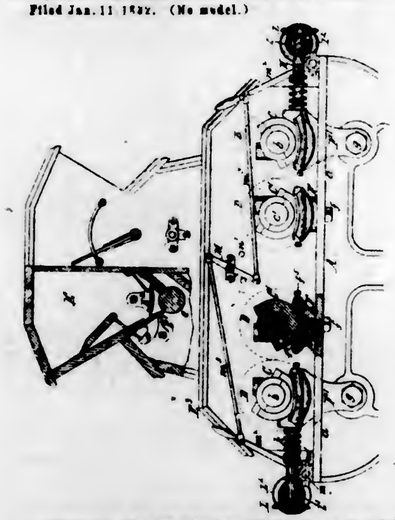
3. The combination of the corer and slicer b^2 with the corer and dividers b^2 b', forming one reversible piece adjustably attached to the frame, whereby the machine is adapted at will for slicing apples crosswise or dividing them lengthwise while coring them, all substantially as set forth.

4. In an apple-parer, the apple-bearing shaft, its crank and fork-head, and a track-bar located as above described, in combination with a rack, nut, trigger, or equivalent device, carrying a screw-thread or segment for the purpose of throwing such screw-thread or segment into or out of engagement with the screw-thread of said apple-bearing shaft, substantially as set forth.

5. In an apple-parer, the combination of the shaft *f*, its fork, the crank *g*, track-bar *k*, base *q*, and supplementary paring-knife *q'* for paring the rear portion of an apple, substantially as set forth.

255,857. CLASP FOR GLOVES OR SHOES. FRANK J. HENRICK, New Britain, Conn., assignor of one-half to H. C. Noble, same place. Filed June 24, 1881. (No model.)

Claim.—The combination of the eye-plate C, the clasp-plate B, and the peculiar lever A, pivoted by a pin which passes through the short arm near the middle of its length, and having the straight inner face, which extends beyond two opposite sides of said pivot-pin, and which face slants backward with reference to the plane of the clasp-plate when the lever is closed, substantially as described, and for the purpose specified.



255,858. KNOB ATTACHMENT. OLIVER M. KIDDER, Detroit, Mich., assignor to himself, George Watkins, and Frank M. Blackman, same place. Filed Feb. 4, 1882. (No model.)

Claim.—1. In a door-knob, the serrated spindle A, in combination with the serrated yoke B and the shank E, having a socket adapted to receive the yoke and close the same upon the spindle, substantially as described.

2. The combination, with the serrated spindle A, serrated yoke B, and the shank E, constructed substantially as described, of the screw F, adapted to draw the yoke within the shank, as and for the purpose specified.

255,859. ROLLER-MILL. NOAH W. HOLT, Buffalo, N. Y. Filed Jan. 11, 1882. (No model.)

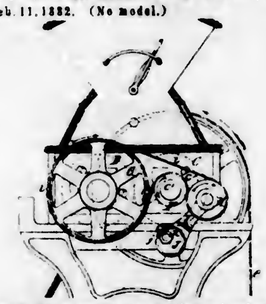
Claim.—1. The combination, with the frame A and journal-boxes C, having each a projection, f^3, and socket f', of base-pieces F, supporting said boxes, and provided with a socket, f^3, and horizontal bolt f^4, and a vertical pivot-bolt, f, whereby each base-piece F is attached to the frame A, substantially as set forth.

2. The combination, with the frame A and journal-boxes C, each provided on its under side with a transverse rib, of base-pieces F, each provided with a transverse recess, f', in which the rib of the journal-box plays, and whereby the play of the journal-box is limited, and a projection, f^3, and bolt f^4, constituting horizontal pivots on which the journal-box can rock, substantially as set forth.

3. The combination, with the rollers B D and journal-boxes C C, provided each with a projection, f^3, and a recess, f', of supporting base-pieces provided each with a recess, f^3, and screw-bolt f^4, substantially as set forth.

4. The combination, with the movable roller B and its journal-boxes, of the pivoted supporting-arms F, adjusting-bolts h, sleeves H, in which the bolts h are supported, and mechanism whereby the sleeves H are simultaneously moved toward or from the stationary roller, substantially as set forth.

5. The combination, with the movable roller B and its journal-boxes, of the pivoted supporting-arms F, adjusting-bolts h, and mechanism whereby the same are simultaneously adjusted, sleeves H, in which the bolts h are supported, and mechanism whereby the sleeves H are simultaneously moved toward or from the stationary roller, substantially as set forth.

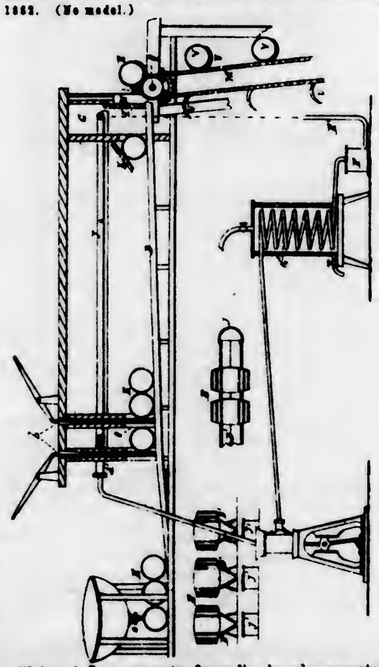


6. The combination, with the movable roller B and its journal-boxes, of the pivoted supporting-arms F, adjusting-bolts h, sleeves H, in which the bolts h are supported, eccentrics i, and shaft m, and mechanism whereby the movement of the eccentrics is limited, substantially as set forth.

7. The combination, with the movable roller B and its journal-boxes, of the pivoted supporting-arms F, adjusting-bolts h, sleeves H, in which the bolts h are supported, mechanism whereby the sleeves H are moved simultaneously, gear-wheels L, secured to the bolts h, shaft l, supported on the sleeve H, and gear-wheels L', substantially as set forth.

8. The combination, with the movable rollers B B and their journal-boxes, of the pivoted supporting-arms F, adjusting-bolts h, sleeves H, in which the bolts h are supported, eccentrics i, shafts m, arms m^2, rods m^3, lever M, and stops n n', substantially as set forth.

9. The combination, with the stationary roller-bearings C C' and movable roller-bearings C C, of the springs k and adjusting-screws k, whereby the movable roller-bearings are adjusted, sleeves H, eccentrics i, whereby the sleeves H are moved toward and from the stationary roller-bearings, and mechanism whereby both eccentrics are connected and turned simultaneously, substantially as set forth.



255,860. ROLLER-MILL. NOAH W. HOLT, Buffalo, N. Y. Filed Feb. 11, 1882. (No model.)

Claim.—1. The combination, with a pair of rollers, C D, of the pulleys F and G, mounted on the shafts of said rollers, a friction-pulley, H, and an endless driving-belt, i, which passes around the pulleys F G H, and which is clamped between the friction-pulley and the adjacent roller-pulley.

2. The combination, with an endless driving-belt, i, of a pulley, G, arranged within the driving-belt, a pulley, F, arranged outside of the driving-belt, a friction-pulley, H, arranged within the driving-belt, and means whereby the driving-belt is clamped between the pulleys F and H, substantially as set forth.

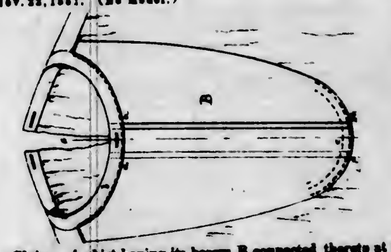
255,861. METHOD OF AND APPARATUS FOR GLUING BARRELS. GEORGE H. HOPPER, Unionville, Ohio. Filed Feb. 10, 1882. (No model.)

Claim.—1. In an apparatus for cooling barrels preparatory to their being glued, the arrangement and combination of the frigid chamber A and sub-chambers F and G, with their respective downs and cooling-pipes Y, in combination with an ammoniacal-gas pump, condenser, and receiver, with their several connecting-pipes, substantially as described, and for the purpose set forth.

2. Arranged in relation to and in combination with the frigid chamber A, an inclined trunk, glue-tub, and elevator, operating conjointly in the manner set forth, and for the purpose specified.

3. As a preparatory step in the process of gluing barrels, the cooling of said barrels to a low degree of temperature by passing them through a refrigerating apparatus that the glue, when applied to the interior of the barrel, may chill and set quickly, for the purpose specified.

255,862. MACHINERY FOR CRUSHING ORES, &c. FREDERICK J. HOYT, New York, N. Y., and WILLIAM H. HOYT, Jersey City, N. J. Filed May 14, 1881. (No model.)



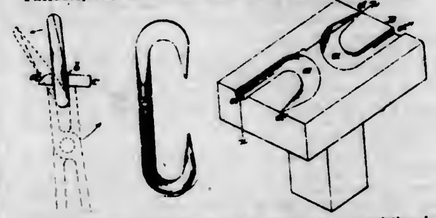
Claim.—The combination, with the vertical rotary shaft, of the disk C, secured thereon, and provided with hammers D, the cylinder B, and the lugs or anvils secured in the cylinder, the said disks successively increasing in diameter from the top to the bottom of the series, and the lugs being graded so as to successively extend farther toward the cylinder from the bottom to the top of the series, substantially as described.

255,863. EXTRACTION OF ANIMAL FAT FROM SLAUGHTER-HOUSE SCRAPS, &c. ALFRED J. HUNT, Paris, France. Filed Feb. 28, 1882. (No specimens.)

Claim.—The method herein described of extracting animal fats, comprising essentially, first, the treatment with aluminium chloride prepared by acting upon natural rocks or in other suitable way; and, second, the expression of the fat and gelatine at an elevated temperature by means of hot plates, centrifugal machines, or other suitable apparatus.

255,864. SHIRT. GEORGE D. HULL, Poughkeepsie, N. Y. Filed Nov. 22, 1881. (No model.)

Claim.—A shirt having its bosom B connected thereto at its upper end to the collar-band and yoke and at its lower end to the body of the shirt, and unattached elsewhere throughout its entire area, substantially as shown and described.



255,865. OVEN. MARTIN L. HULL, Cleveland, Ohio. Filed Nov. 14, 1881. (No model.)

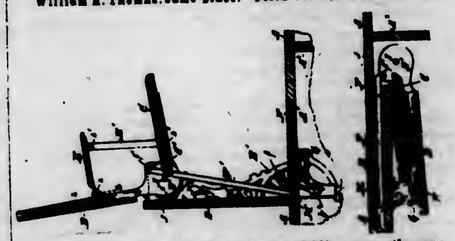
Claim.—1. In an oven having two walls with an air-space between them, the combination, with the outer wall provided with openings to the outer air which are located near the base of the oven, of the inner wall provided with openings to the air-space between the two walls, said openings being located at the top of the inner wall, and tubular openings connecting the inner and outer walls and located near the base of the oven, substantially as set forth.

2. In an oven having an inner and an outer wall connected by inlets F, and having exits G and H, the combination, with a burner or other source of heat, A, of a dispersing-plate, E, and foraminating plate or floor E', substantially as set forth.

255,866. MANUFACTURE OF OPEN LINKS. DAVID HULTS, Philadelphia, Pa. Filed Sept. 6, 1881. (No model.)

Claim.—1. The method of making open links, consisting in pointing the ends of a piece of metal, bending the pointed ends into hook shape, placing the hooked portions in a die and flattening one face of each of said portions, then bending the double-hooked piece into link form, and finally spreading apart the link at the flattened ends, substantially as and for the purpose set forth.

2. The flat-faced die B', in combination with the die B, having a depression, a, which is shallow and elliptical and of the form of a pointed hook, whereby one face of the hook or head of the link is shaped, smoothed, and finished, and the other face flattened, substantially as and for the purpose set forth.



3. The shank provided with a notch, b, and cut away, as at d, substantially as and for the purpose set forth.

255,867. ADJUSTABLE DANDY-ROLL STAND. ROBERT HUTTON, Holyoke, Mass. Filed Feb. 20, 1882. (No model.)

Claim.—The combination of the coarse and fine cut screw by which the perfect adjustable movement of the support E is effected, and thereby the absolutely required position of the dandy-roll is secured.

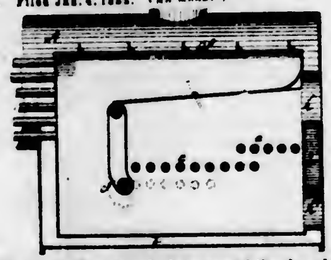
255,868. OPERA-CHAIR. SIDNEY M. JOHNSON and AUGUSTUS M. DE SOUSSURE, Indianapolis, Ind., assignors of one-third to William H. Thomas, same place. Filed Oct. 6, 1880. (Model.)

Claim.—1. In an opera-chair having folding arms, the combination with the said arms and the back of the chair, of joints or hinges c, the contact portions of which are constructed at an angle, as shown, whereby said arms are caused to spread apart from each other when in position for use, but by which they are brought into substantially parallel relation when folded up, substantially as set forth.

2. The combination of the seat C, back D, arms E, hinges c, and rods or strips E', all constructed, arranged, and operating substantially as and for the purposes set forth.

3. The combination of the part B, having part B', provided with the projecting stud b', the seat C, having part C', having groove c^2 on its inner face and groove c' on its outer face, and the back D, having part D', provided with the stud d', said several parts B' C' D' being connected by a common pivot or rod, substantially as set forth.

4. The combination, substantially as described, of a folding



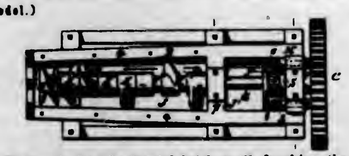
chair, the floor having an opening into which the chair is adapted to fold, and on the edges of which the chair-standard is pivoted, an independent floor-section, and the rods F F', connecting said floor-section with the folding chair, whereby said section, which fills the opening when the chair is in use, is folded up by the folding of the chair to permit the chair to drop into the opening, substantially as set forth.

5. The combination of the temporary floor-section F, the rods F F', the folding back D, and the standard B, all substantially as and for the purposes set forth.

6. The combination, with the main portion B of a folding opera-chair which moves on pivots H, of locks G, which are operated by means, substantially as described, to move sidewise at the proper point and engage with the adjacent floor or frame-work, thereby securing said portion of the chair in upright position, substantially as set forth.

7. The combination, with a folding opera-chair adapted to be folded into an opening in the floor, of locks G, attached to the sustaining portion of said chair, as shown, and provided with projections with which the folding back shall come in contact as it is folded or unfolded, and thereby force said lock out of or into engagement with the notch in the side of the floor-opening provided to receive it, substantially as and for the purposes set forth.

255,869. FIRE-BOX FOR LOCOMOTIVES. MICHAEL KNARR, North Springfield, and MELVILLE C. HAWLEY, St. Louis, Mo. Filed Jan. 6, 1882. (No model.)



Claim.—1. In a downdraft-furnace of the class shown, the combination, with a tubular water-grate composed of two or more lines of transverse tubular bars and a water-space which forms the bottom of the ash-pit, said water-space communicating with the boiler, of a pendent partition, which forms the front wall of the fuel-chamber, projects below the grate, and causes the flame and products of combustion to impinge on the water-space, substantially as and for the purpose specified.

2. The combination, with a grate, of a pendent partition, which projects below the grate and is inclined or bent at a point below the grate to increase the deflection of the flame and products of combustion, substantially as and for the purpose specified.

3. The combination of a grate composed of two or more broken lines of transverse bars, with a vertical partition, which projects below the bars and is inclined or bent to increase the deflection of the flame and products of combustion, substantially as and for the purpose specified.

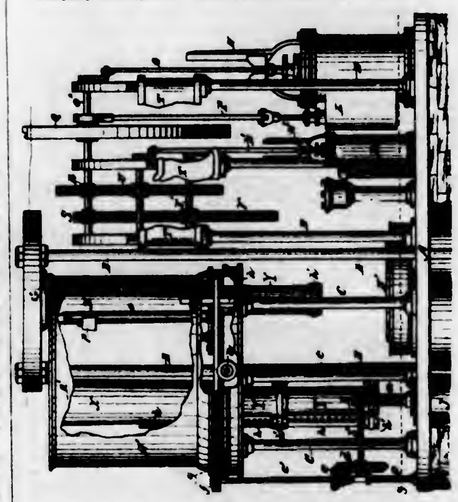
4. The combination of the grate composed of two or more broken lines of transverse tubular bars with the pendent water-partition, which projects below the bars, the water-partition and the bars communicating with the water-legs of the boiler, substantially as and for the purpose specified.

255,870. BRICK-MACHINE. PHILIP H. KELLS, ABRAM KELLS, and JACOB H. KELLS, Adrain, Mich. Filed Jan. 4, 1882. (No model.)

Claim.—1. In a horizontal brick or tile machine, the grinding-shaft provided with a flanged collar, in combination with the friction-wheels and their bearings, substantially as and for the purposes specified.

2. The shaft G, having spiral leaves N and annular flange, the tab B, master-wheel C, and washer S, combined with the bearings R and friction-wheels *e*, as set forth.

3. In a brick-machine, the lower semi-cylindrical casting having end bearings for the operating-shaft, a diaphragm for dividing the mud-box and to form a recess for receiving mechanism for modifying friction, and bearings for the attachment of a die-plate, as set forth.



4. In a brick-machine, the lower semi-cylindrical casting, B, having bearings for the shaft G and die-plate E, and the diaphragm I, cast in one piece and adapted to serve with operating mechanism, a die-plate, and semi-cylindrical cap K, as and for the purposes set forth.

255,871. SPRING-HEEL FOR BOOTS AND SHOES. MICHAEL B. KERR, New York, N. Y. Filed Mar. 24, 1880. (No model.)

Claim.—The combination, with the heel A, provided with the tapering bore or passage B, of the tapering chambered block E, loosely arranged in the lower end of the said bore or passage and adapted to freely move vertically therein, a coiled spring, C, bearing at its lower end upon the block, and the screw D, secured in the said block and having its head confining the lower end of the spring in position, substantially as described.

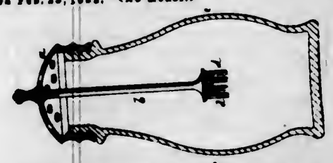
255,872. HYDRAULIC PRESS. CORNELIUS KIMPLER, Chicago, Ill., assignor to himself and the Northwestern Fertilizing Company, same place. Filed July 27, 1881. (No model.)

Claim.—1. In a hydraulic press, the combination of two or more bark-receiving cylinders with a cap carrying two or more pistons or plungers operating within the cylinders, and a pressure cap or plate located at the discharge end of the cylinders and coacting with each of the latter, substantially as and for the purpose described.

2. The hydraulic cylinder I, having a rack, *a*, on the piston-stem, in combination with the pinion *b*, and gears *d*, *e*, and *f*, for operating the turn-table, substantially as specified.

3. The pinion *l*, in combination with the rack *m*, pinion *i*, and racks *h*, for lowering the plungers Y, substantially as set forth.

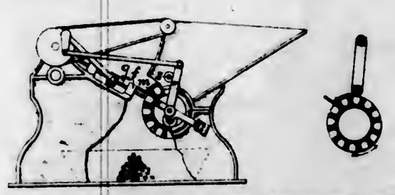
4. The combination of the turn-table carrying the fixed cylinders X with the pressure-plate G and cap E', said turn-table being arranged to rotate the cylinders alternately between the plate and cap and out, substantially as set forth.



5. The combination of the turn-table with the fixed cylinders X and the plungers Y, supported and carried by the turn-table, substantially as specified.

6. The combination of the turn-table, the cylinders X, supported thereon, and the plungers Y with the hydraulic press E E' and hydraulic cylinders I and J, said members being arranged for operation substantially as and for the purpose described.

7. The combination of the pumps K, press E E', and hydraulic cylinders I J with the cylinders X and plungers Y, constructed and operating substantially as specified.

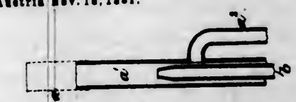


8. The discharging-piston J' and cylinder J, in combination with a cylinder, X, having a piston or plunger, Y, substantially as and for the purpose specified.

255,873. SALT-CASTER. JOSEPH J. KITTEL, Brooklyn, N. Y. Filed Feb. 23, 1882. (No model.)

Claim.—The combination of the bottle A, having bulged portion *c*, with the perforated cap *a*, to which is attached stem *b*, having downwardly-extending prongs *d d*, all being so arranged that said prongs are opposite the bulge *c*, substantially as and for the purpose specified.

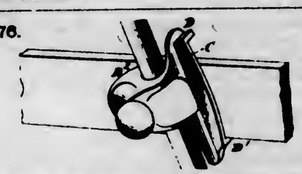
255,874. CHERRY-SEEDING MACHINE. GEORGE W. KNAPP, Baltimore, Md. Filed Nov 3 1881. (Model.)



Claim.—1. In a cherry-seeder, the combination of a cylinder adapted to revolve and having sockets, each of which are to receive a cherry, a hopper from which the cherries are fed to the cylinder, and an endless belt or apron mounted in the hopper in proximity to the cylinder and constituting one of the walls of the hopper, as and for the purpose set forth.

2. In a cherry-seeder, the combination of a hollow cylinder adapted to revolve and provided with sockets to receive cherries, punches to reciprocate and arranged for the end of each punch to enter a socket, and two wires stretched through the cylinder and arranged to permit the ends of the punches to enter between the wires, as set forth.

3. In a machine for seeding cherries, the construction herein set forth, consisting of a hollow cylinder provided with holes leading into the cylinder for the passage thereinto of the seeds, and a shaft extending through the cylinder, having a spiral flange arranged to revolve in contact with the interior surface of the cylinder at its bottom, whereby the spiral flange serves both as a scraper and a seed-remover, as set forth.

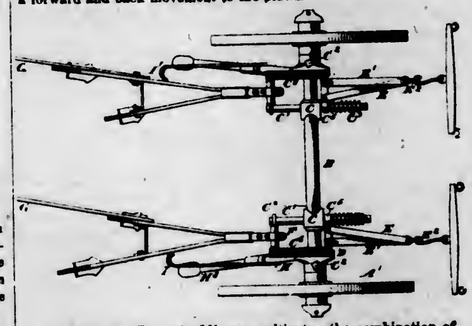


255,875. COMBINED AIR AND GAS BURNER. JAMES LEWIS, Safe Harbour, Arbor Square, County of Middlesex, England. Filed Dec. 28, 1881. (No model.) Patented in England Apr. 14, 1881, in France Oct. 14, 1881, in Germany Oct. 14, 1881, and in Austria Nov. 16, 1881.

Claim.—The improved burner described, consisting of tube *a'*, surmounted by the described cap *a*, and arranged and adapted for having a current forced into it under pressure, the tube *b* within the same, also adapted for a forced current under pressure, and the lateral tube or pipe a^2, entering tube *a'* at a point below the tip or exit end of tube *b*, and adapted for an induced current, these parts being combined and arranged for operation as shown, and described.

255,876. HARROW. LUPPS LUPPEN, Pekin, Ill. Filed Nov. 21, 1881. (No model.)

Claim.—1. The clip C, constructed substantially as shown and described, it having its pivotal point in a lug projecting from

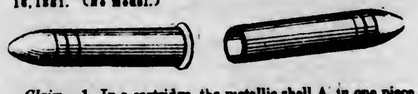


one side thereof, and being provided with a groove for the reception of the harrow-teeth, and with projections D and D' for determining the positions of the teeth, as set forth.

2. The combination of the clips C, having in it a groove for the reception of the tooth of a harrow, a pivotal point in a projection formed on one of its sides, and projecting lugs for determining the positions of the teeth, and a clamping-bolt for securing the clip to the beam of a harrow, the parts being constructed and arranged substantially as shown and described.

255,877. CULTIVATOR. LUPPS LUPPEN, Pekin, Ill. Filed Oct. 18, 1881. (No model.)

Brief.—A tongueless cultivator with jointed runners or foot, which carry the beam-supporting hooks. The draft-bars have lateral vibration at the front, and their rear ends are attached to frames arranged to slide back and forth on the axle, and thus give a forward and back movement to the plows.



Claim.—1. In a straddle-row cultivator, the combination of an arched axle, a sliding frame, to which the forward ends of the beams are connected, and a draw-bar connected to the forward end of said frame, which is capable of lateral play at the draft end, substantially as and for the purpose set forth.

2. The sliding frame composed of rod or bar C', one end of which is provided with a spring, substantially as shown, the cross-bars C^1 and C^2, and flat grooved guide-bar C^3, the parts being constructed and arranged to operate substantially as and for the purpose set forth.

3. The combination, with the axle B, of the sliding frame, the draw-bars E E', the forward ends of which vibrate laterally, and the pivoted clevis E^2, substantially as and for the purpose set forth.

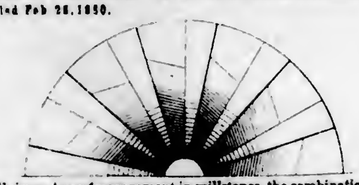
255,878. CARTRIDGE. HENRY MCGEE, Norwich, Conn., assignor of one-half to Thomas E. Ryan, same place. Filed Sept. 16, 1881. (No model.)

Claim.—1. In a cartridge, the metallic shell A, in one piece, having the weakened portion *a'* immediately joining its head and being firmly secured to the ball at its other end, substantially as and for the purpose set forth.

2. The metallic shell in one piece, having the weakened portion *a*, formed by cutting or molding a circular incision or groove around it, in combination with the ball, having a portion of itself turned upon the inbent edge of the shell, substantially as and for the purpose set forth.

255,879. SPUR. ALONZO MCMAHUS, New Britain, Conn. Filed July 18, 1881. (No model.)

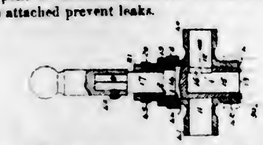
Claim.—1. In a spur, the rim or heel-band clasp consisting of a single piece of metal, having the lugs which form the rowel-arms turned up therefrom and formed integral therewith, substantially as described, and for the purpose specified.



2. In a spur, the rim or heel-band clasp A, having the lugs

255,879.

which form the rowel-arms *a a* cut out and turned back from the body of the rim at the perforations and formed integral with said rim, substantially as described, and for the purpose specified.

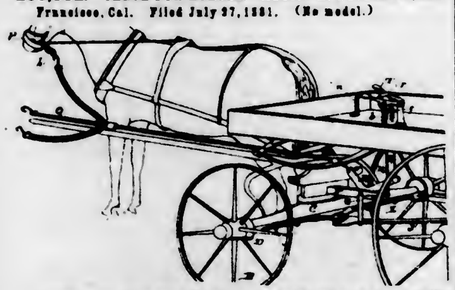


255,880. MILLSTONE. RUFUS MOODY, North Monmouth, Me. Filed Feb 28, 1880.

Claim.—As an improvement in millstones, the combination of the plane or level bed-stone with the runner, having slanting radial furrows, and intermediate ridges, having level or plane skirts and slanting tangentially-furrowed facets, as herein shown and specified.

255,881 FAUCET DAVID MORRISON, New York, N. Y. Filed Jan. 12, 1882. (No model.)

Brief.—The packing around the stem of the plug and the packing at the point of connection between the faucet and the pipe to which it is attached prevent leaks.



Claim.—1. The combination of the shell, the plug, the packing 4, covering the joint between the lower end of the plug and the shell, means for holding said packing in place, and the packing 45, surrounding the stem of the plug and held in place by a screw-cap, substantially as described.

2. The combination of the shell, the plug, the spring 3, held in place by a screw-cap, and the packing 45, surrounding the stem of the plug, and also secured in place by a screw-cap, substantially as described.

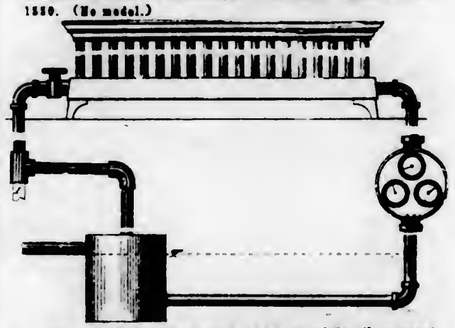
3. The combination of the shell, the plug having the shoulders 1 and 2, the spring seated on shoulder 1, the cap 19, holding the spring in place, the packing 45, surrounding the spindle 17, and the cap 21, holding the packing in place, all substantially as described.

255,882. CHECK FOR HORSES. MARTIN M. NATHANSON, San Francisco, Cal. Filed July 27, 1881. (No model.)

Claim.—1. The strap P, adapted to be placed over the nostrils of a horse, with means, substantially as described, for operating the same, as set forth.

2. The strap P, adapted to be placed over the nostrils of a horse, having pads *m* for the purposes described, with means, substantially as described, for operating the same, in the manner set forth.

3. The combination of strap P, adapted to be placed over the nostrils of a horse, strap Q, lever R, rod S, and lever T, for the purposes set forth.



4. The means for checking horses, consisting of the strap P, with its pads *m* and springs *o*, or equivalent device, fitting over the nostrils of the horse and adapted to be tightened or drawn by the strap Q, bell-crank lever R, rod S, spring *f*, and foot-lever T, substantially as herein described.

255,883. INSECTICIDE COMPOUND. WILLIAM B. NEVILL, Steward's Mills, Tex. Filed Jan. 30, 1882. (No specimens.)

Brief.—Water is poured into the holes where the ants or other insects are, followed by one-half to one pint of the fluid, and a lighted match is then applied.

Claim.—The herein-described insecticide compound for the extermination of insects, consisting of bisulphide of carbon, sulphur, and sulphydric acid, in about the proportions specified.

255,884. METHOD OF MEASURING HEAT SUPPLIED FROM STEAM. EUGENE F. OSBORNE, St. Paul, Minn. Filed Oct. 20, 1880. (No model.)

Claim.—1. The method described of determining the amount of heat imparted by steam in a steam-heating apparatus, which consists in measuring or weighing the water condensed in said apparatus, and therefrom estimating the correlative amount of heat due to the condensation, reference being had to the pressure or temperature at which the steam is supplied to the apparatus, as set forth.

2. The method described of determining the amount of heat imparted by steam in a steam-heating apparatus, which consists in first supplying the steam at a known pressure or temperature to said heating apparatus; second, condensing the steam within said apparatus; and, third, measuring or weighing the water so condensed as a basis of estimate in calculating the quantity of heat supplied, as set forth.

3. In combination with steam-heating apparatus, means whereby the water condensed in such apparatus may be automatically weighed or measured and the quantity of such water registered, as and for the purpose stated.

255,885. THERMO-ELECTRIC BATTERY. ANDREW PATTERSON, Idlewood, Pa. Filed Jan. 9, 1882. (No model.)

Claim.—1. The combination of the members of a thermo-electric couple with a mass of refractory insulating materials in which they are embedded, whereby fusible or oxidable materials may be used for the couple without injury from fusion or oxidation, substantially as described and set forth.

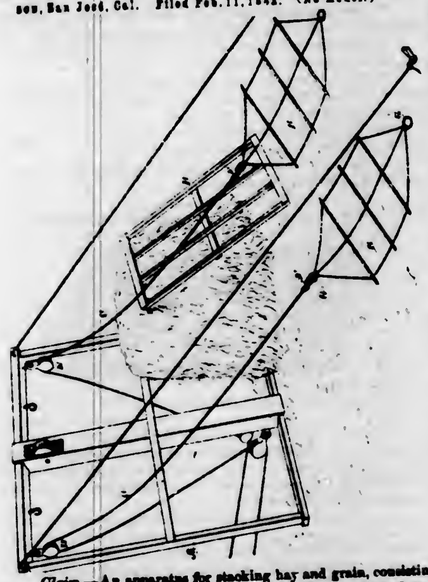
2. A mass of refractory insulating material having embedded therein one or more thermo-electric couples, consisting of fusible and infusible elements, the fusible element of each pair being placed below the infusible one, as and for the purpose specified.

3. A mass of refractory insulating material having embedded therein one or more thermo-electric couples, consisting of two fusible elements, the member or element of greater specific gravity being placed below the one of less specific gravity, as and for the purpose specified.

4. As a new article of manufacture, a thermo-electric brick consisting of a mass of refractory insulating material enveloping one or more thermo-electric couples, substantially as described and shown.

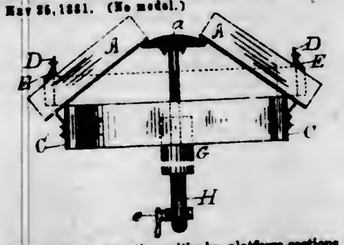
255,886. MECHANICAL TOY. JOEL W. PERKINS, East Hampton, Conn. Filed Feb. 16, 1882. (No model.)

Claim.—1. In a mechanical toy, a screw bearing a ball and



255,886.

pivoted to a wheeled frame and attached to the axle by intermediate mechanism, whereby the revolutions of the wheel and axle operate the device, all substantially as described.



2. In a mechanical toy, in combination, a frame, *a*, wheels *b* and *c*, axle *d*, crank *e*, pitman *f*, sceesw *g*, and bell *h*, all substantially as described.

255,887. HAY-STACKING APPARATUS. GAMOR RICHARDSON, San José, Cal. Filed Feb. 11, 1882. (No model.)

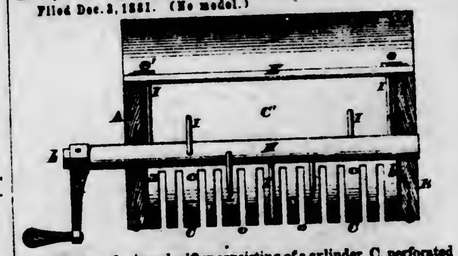
Claim.—An apparatus for stacking hay and grain, consisting of the frame A, with its direction-pulleys D E, rope C, and nets B, in combination with the inclines H, substantially as and for the purpose herein described.

255,888. DUMPING-CAR. ISAIAH B. ROBBINS, Stockton, Cal., assignor of one-half to Joseph B. Morgan, Brooklyn, N. Y. Filed May 26, 1881. (No model.)

Claim.—1. In combination with the platform-sections A A, hinged to the frame sides C C, the cylinders G G, the piston-rods of which are provided with oval heads *a*, attached beneath and at the circular openings of the transverse timbers F F of the car-frame and connected together by an air-pipe, H, having a stop-cock, *c*, in each end, the said air-pipe H being connected to that of the other cars, and the entire series being connected with and supplied with compressed air from any style of air-compressing apparatus, all substantially as herein described and set forth.

2. In a dumping-car, the platform constructed in two longitudinal sections, each section hinged to its respective frame side, in combination with air-cylinders attached beneath the said platform-sections to transverse timbers of the car-frame, the pistons of said cylinders having oval heads and moving upward to tilt the platform-sections in response to pressure of compressed air forced through pipe connecting the cylinders, said pipe having stop-cocks in each end adapted to shut off or admit the supply of air so as to unload one car only or several simultaneously, as herein shown and described.

3. In a dumping-car, the combination of a platform made in two center-opening longitudinal sections and tilting right and left, the air-cylinders, and devices tilting the platform-sections by pressure of compressed atmospheric air, substantially as described.



4. In a dumping-car, a platform composed of longitudinal sections A, hinged to the frame sides C, said frame sides C having bolted thereto standards D, provided with slots carrying side boards, E, which latter are loosely bolted in the slots of standards D, so as to permit of the free escape of the load when the platform-sections A are tilted for that purpose, all as herein shown and described.

5. In a dumping-car, as a means of unloading the same, the combination of a platform made in two longitudinal sections which are hinged each to its respective side of the car-frame, air-cylinders attached beneath transverse timbers of car-frame, provided with pistons having oval heads working upward through openings in said transverse timbers, and an air-pipe connecting the air-cylinders together and having a stop-cock in each end, which air-pipe, being connected to any suitable compressed-air apparatus, permits by a proper adjustment of the stop-cocks a flow of compressed air into the cylinders, the pistons of which, responding to the pressure, permit the oval heads to raise the platform-sections and discharge their loads to right and left, substantially as herein described.

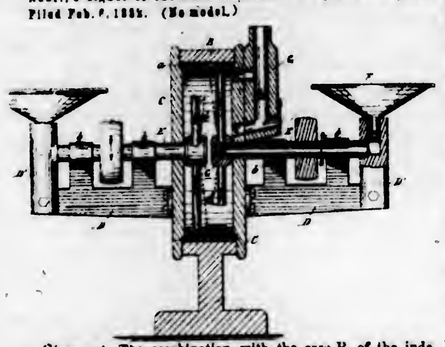
6. In combination with a railroad or similar car, a platform made in two longitudinal sections, A, hinged each to its respective sides C of the car-frame, and having applied thereto power by means of compressed atmospheric air supplied from any air-compressing apparatus through air-pipe H to air-cylinders G, attached to and beneath transverse timbers F of car-frame, as and for the purposes specified.

7. The air-cylinders G G, attached beneath the transverse timbers F F, arranged in relation to platform-sections A A and air-pipe H, the latter being provided with stop-cocks *c c* and connected with any air-compressing apparatus, so that air may be forced through said pipe H and air-cylinders C C to raise platform-sections A A by its pressure, all substantially as and for the purposes herein set forth.

255,889. ASH-SIFTER. ANDREW SCHISLER, Newport, Ky. Filed Dec. 3, 1881. (No model.)

Claim.—1. An ash-sifter consisting of a cylinder, C, perforated at the bottom *c*, and terminating at the rear with an inclined chute, D, said cylinder being traversed with a revolving shaft, H, armed with projections I, for the purpose specified.

2. An ash-sifter provided with loops G G′, that perform the twofold purpose of handles and bearings for the implement, as herein described.



3. The ash-sifter C D H I, supported in front by the loops G G′, or their equivalents, and at rear by the lower edge of the inclined chute D, as herein described.

4. The combination, in an ash-sifter, of a slotted or perforated cylinder and a revolving shaft armed with pins, which latter are in the same plane with the spaces between said slots, for the purpose specified.

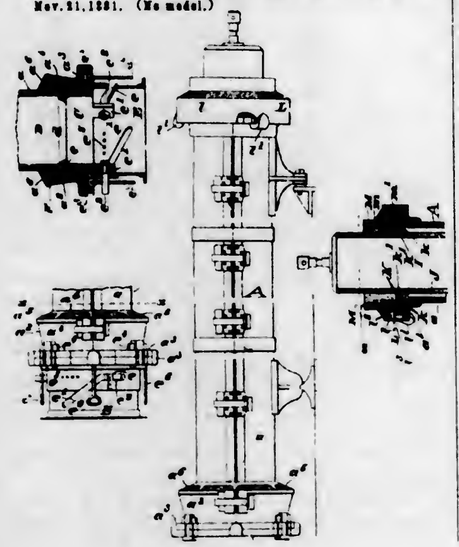
5. The sheet-metal linings *a b*, applied respectively to the inner surfaces of the wooden heads A B of an ash-sifter, for the purpose specified.

6. An improved ash-sifter, consisting of the heads A B, perforated cylinder C *c*, inclined chute D, rail E, hinged flap *e f* F, bearings G G′, and agitator H I, as and for the purpose specified.

255,890. PULVERIZER. WILLIAM S. SCARFFNECK, Blair, Nebr., assignor of one-half to Alexander Majors, same place. Filed Feb. 6, 1882. (No model.)

Claim.—1. The combination, with the case B, of the independent sets of hollow arms revolving therein in opposite directions, and means, substantially as described, for supplying the material to said arms, as and for the purpose specified.

2. The combination, with the case B and the hollow arms revolving therein, of the hollow shafts communicating with and carrying said arms, and suitable feeding devices, substantially as and for the purpose specified.



3. The combination, with the case B, of hollow arms secured at an angle to their operating shafts and revolving within the case in opposite directions, and suitable feeding devices, substantially as and for the purpose specified.

4. The combination, in a pulverizer, of an outer case, suitable feeding devices, and a hollow revolving shaft with a revolving instrument mounted upon said shaft and provided with passages running from the passage through the hollow shaft toward the periphery of the case, substantially as described, and for the purpose specified.

5. The combination, with the case B, the hollow arms revolving therein, and the shafts E, of the brackets D, provided with the boxes *b b*, and hollow castings D', substantially as and for the purpose specified.

6. The combination, with the case B, of the hollow arms *d*, the shafts E, the outlet G, and suitable means for feeding material and for regulating the amount of air admitted to the case, as and for the purpose specified.

255,891. PIPE MOLDING AND CASTING APPARATUS. FREDERICK SHICKLE, St. Louis, Mo., assignor of two-thirds to John W. Harrison and Thomas Howard, both of same place. Filed Nov. 21, 1881. (No model.)

Claim.—1. In a pipe-molding apparatus, the bottom C, said bottom being rotatable horizontally and movable vertically in its support, for the purposes described.

2. In a pipe-molding apparatus, the bottom C, said bottom being rotatable horizontally in its support, for the purpose described.

3. In a pipe-molding apparatus, the bottom C, said bottom being movable vertically in its support, for the purpose described.

4. The combination of the bottom C, having the lugs *c'* and studs *c²*, and the stand E, having the slots *e e'*, substantially as described.

5. The flask A, having the part *a²*, having openings *a³*, for the purpose described.

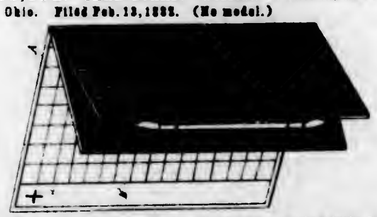
6. The flask A, having the openings *a⁴*, and the bottom C, for the purpose described.

7. A pipe-molding flask for molding pipes the bell end downward, having openings, such as *a³*, for the purpose described.

8. The combination of the flask A, having the openings *a⁴*, the bottom C, and the stand E, substantially as described.

9. The combination of the bottom C, lugs *c'*, studs *c²*, and the slotted stand E, having the perforations *e²*, substantially as described.

10. The combination of the flask A, pattern D, and ring G, having the wings *g*, and bead *g'*, substantially as described.



11. The combination of the flask A, having the flange *a'*, the ring K, and the clamp L, substantially as described.

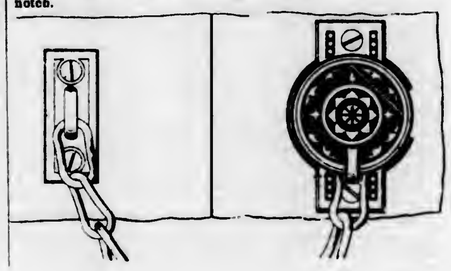
12. The combination of the flask A, flange *a'*, having the openings *a⁵*, the clamp L, having the band *l*, hooks *l'*, and projections *l²*, and the ring K, substantially as described.

13. The combination of the flask A, the ring K, the clamp L and the ring M, substantially as described.

14. The combination of the flask A, the ring M, the band *l* and the sand *m'*, substantially as described.

255,892. GAME-BOARD. WILLIAM B. SILVIS, Cleveland Ohio. Filed Feb. 13, 1882. (No model.)

Claim.—1. A diagram for playing a game indelibly formed on a slate, said diagram having spaces which are adapted to be marked on by a slate or lead pencil, substantially as and for the purpose shown and described.

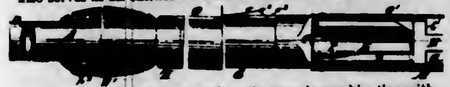


2. A diagram for playing a game indelibly formed on a slate, said diagram consisting of lines crossing each other at right angles, substantially as and for the purpose shown and described.

3. The combination, with the slate A, having an indelible diagram formed thereon, of the characters *a b*, substantially as and for the purpose shown and described.

4. The combination, with the slate A, having an indelible diagram formed thereon, of the pencil-holder adapted to hold two pencils, substantially as and for the purpose shown and described.

255,893. DOOR-CHECK. WILLIAM E. SPARKS, New Britain, Conn., assignor to P. & F. Corbin, same place. Filed Feb. 16, 1882. (No model.)



Brief.—A rotating button provided with a rib formed by two recesses, into which the link is inserted, is pivoted upon a base having a notch in its side, whereby the link can be disengaged from the rib only when the recesses of the button are brought opposite the notch.

Claim.—In a chain-fastener, the combination of the base having the notch *a* at one edge and the rotating button pivoted thereto having the link-receiving recesses and holding-rib, substantially as described, and for the purpose specified.

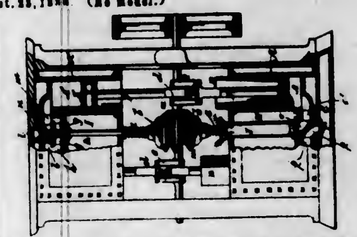
255,894. MAGAZINE FIRE-ARM. CHRISTOPHER H. SPENCER, Hartford, Conn., and SYLVESTER H. ROPER, Boston, Mass. Filed Jan. 9, 1882. (No model.)

Brief.—A breech-block and carrier, formed in a single piece, is pivoted in the frame, and is moved to receive a cartridge from the magazine and to carry it to the barrel by a sliding rod, a stud on which engages with a cam and pivoted switch-plate on the side of the block. Another arm on the opposite side carries a pivoted catch, which engages the flange of the feeding-cartridge, forces it into the carrier, afterward from the carrier into the barrel, and also serves as an extractor to remove the shell from the barrel.

Claim.—1. In a breech-loading shotgun, in combination with a movable breech-block, substantially such as described, a forked slide provided with a handle adapted to be reciprocated in a path parallel with the axial line of the barrel, the two arms or branches of such slide being provided the one with a cam-pin and the other with an extractor and inserter.

2. The cam-pin *g* and means for reciprocating the same across the wall of the receiver in a path substantially parallel to the axis of the barrel of the gun, in combination with the switch-cam *e*, pivoted to the recessed side wall of the oscillating breech-block C, and the mainspring F of the lock, substantially as set forth.

3. In combination with a movable breech-block, substantially such as described, the reciprocating yoke H, carrying the arms for operating the breech-block and the extractor and inserter, and provided with the hollow handle H', and means for guiding the same in a path parallel with and beneath the barrel of the gun, as set forth.



4. The hollow handle H' of the reciprocating yoke H, carrying the arms for operating the breech-block and the extractor and inserter, supported upon and guided by the magazine D, substantially as set forth.

5. The reciprocating yoke H, carrying the arms for operating the breech-block and the extractor and inserter, in combination with the spring-latch *h'* and a slot or shoulder, *d'*, for engaging the nose of the latch and stopping the backward movement of the yoke when fully extended forward.

6. The movable breech-block containing the carrier-coil I, and the reciprocating arm O, carrying the extractor and inserter, or catch *o*, provided with the notch *o²*, in combination with means, substantially such as described, for moving the breech-block and for reciprocating the arm O and catch *o*, substantially in the manner set forth, whereby one side of the notch *o'* catches upon and extracts the shell from the chamber of the gun during the backward excursion of the arm O, and the opposite side of the notch *o²* engages the base of the cartridge in the carrier-coil, when, by the movement of the breech-block, the carrier-coil is brought into alignment with the chamber, and during the forward excursion of the arm O inserts the cartridge into the chamber, substantially as described.

7. The top of the breech-block, provided upon one side with the upwardly and inwardly curved side wall, *p*, for the purpose of giving a sidewise direction to the shell when being thrown out of the cavity P by the upward movement of the breech-block, substantially as described.

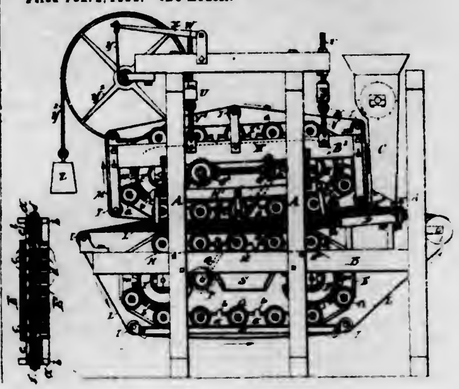
255,895. COLD-AIR MACHINE. HENRY F. STARBUCK, Chicago, Ill., assignor to William A. Reynolds, same place. Filed Oct. 28, 1880. (No model.)

Claim.—1. A main receiving-chamber or reservoir for compressed air, in combination with compressing-cylinders A and rotary valve B, having its body provided with ports *o p*, and located in a casing or chamber provided with ports *o' p'*, leading to the cylinders for alternately charging and discharging the cylinders, substantially as specified.

2. A main receiving-chamber or reservoir for compressed air, in combination with expanding-cylinders A' and a rotary valve having its body provided with chambers *g n*, and located in a casing or chamber provided with passages *h*, ports *m*, inlet-port *f*, and exhaust-port *o*, for supplying air to the cylinders and withdrawing it therefrom, substantially as and for the purposes specified.

3. A main receiving-chamber or reservoir for compressed air, in combination with compressing-cylinders A, rotary valve B, having ports or openings *o p*, and located in a casing or chamber having ports *o' p'* leading to the compressing-cylinders, and discharge-port *r*, expanding-cylinders A', and rotary valve B', having chambers *g n*, and located in a casing or chamber provided with inlet-port *f* and outlet-port *o*, and with openings or passages *h* and ports *m*, leading to the expanding-cylinders, for forcing air into the receiving-chamber or reservoir and withdrawing it therefrom, substantially as specified.

4. The air-supply pipe J, and rotary valve B, having openings or ports *o p* through its body, and located in a casing or chamber having ports *o' p'*, in combination with the compressing-cylinders A and a main receiving-chamber or reservoir for supplying air under pressure to the chamber or reservoir, substantially as specified.



5. A rotary valve for supplying air, having its body provided with openings or ports *o* and *p*, leading respectively from the top of the valve to the side thereof and from the bottom of the valve to the side thereof, in combination with a casing or chamber adapted to receive the valve, and having ports *o' p'*, in communication with which the ports *o p* are alternately brought by the rotation of the valve, and receiving and discharging cylinders communicating with the chamber or casing through the ports *o' p'* for supplying air to one cylinder while the other is being discharged, substantially as specified.

6. A rotary valve, B', having on opposite sides of its exterior chambers, *g n*, located one above the other, in combination with a casing or chamber adapted to receive the valve, and having inlet-port *f*, which communicates with the chambers *g*, air passages or openings *h*, receiving and discharging ports *m*, and exhaust-port *o*, communicating with the chambers *n*, and expanding-cylinders communicating with the chamber or casing through the ports *m*, for supplying air to the cylinders and discharging it therefrom, substantially as specified.

7. In a refrigerating-machine, the combination of two compression-cylinders, A, rotary valve B, having ports *o p*, and located in a chamber or casing having ports *o' p'*, leading to the cylinders, with a compressed-air reservoir or chamber, C, connecting-pipes C', and cooling-tanks H, for supplying air to the cylinders and educting it therefrom, and keeping the cylinders and valve cool and at the proper temperature for use, substantially as specified.

8. In a refrigerating-machine, the combination of two expanding-cylinders, A', and a valve, B', constructed as described, and located in a chamber or casing formed as described, with a cooling-chamber in which the cylinders are located, and a main receiving chamber or reservoir for compressed air for keeping the cylinders and valve cool and forming a cooling-chamber and ice-box, substantially as and for the purposes specified.

255,896. CIDER-PRESS. JOHN STEVENS, Saranac, N. Y. Filed Feb. 2, 1882. (No model.)

Claim.—1. The within-described movable endless press-bed, consisting of a series of wooden blocks flexibly connected to each other, and having a vertically-perforated center portion, and recesses *c c* at the sides of their upper face, with channels *l* divergent from the edges of the block, substantially as shown.

2. The press-bed section composed of the block E', provided with perforations *d*, made flaring at the upper end, and the plate E, removably secured to the top of the block E', and having the perforations *c c* over the flared perforations of the said block, substantially as described and shown.

3. The combination of the block E, having the flared perforations *d d* and recesses *c c*, with channels *l*, convergent toward the center, and the plate E, having perforations *c c*, over the flared ends of the perforations of the block E', substantially as described and shown.

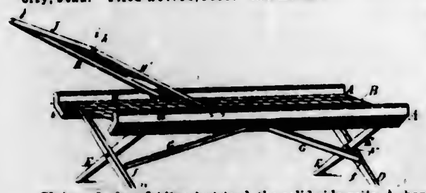
4. The within-described press-bed section, formed of the wooden block E', made convex and concave, respectively, at opposite ends, and having flared perforations *d d* and recesses *c c*, with convergent channels *l*, the plate E, secured to the top of the block E' and provided with the perforations *c c*, the clamps *a*, provided with ears *g*, and the rod *f*, passing horizontally through the solid portion of the block E', between two rows of the perforations thereof, substantially as and for the purpose specified.

5. In combination with the clamps *a*, the wooden block E', having the side rabbets, *n*, and its central portion projecting below the base of the clamps, substantially as and for the purpose set forth.

6. In combination with the perforated block E' and its clamps *a*, the perforated plate E, provided with concavo-convex projections *h h* at the sides of its edge adjacent to the companion press-bed section, substantially as described and shown, for the purpose set forth.

7. The perforated block E', the clamps *a*, provided with ears *g g* and with cog *b*, the shafts *g' g'*, and rollers G G, in combination with the carrying-wheels F, provided with interstices *m*, substantially as shown and set forth.

8. In combination with the movable endless pressing-surfaces and upper endless apron, M, the lower apron, L, having doubled side portions, *p*, and the rollers K, pivoted in a vertical position at opposite edges of the apron L, substantially in the manner described and shown, for the purpose set forth.



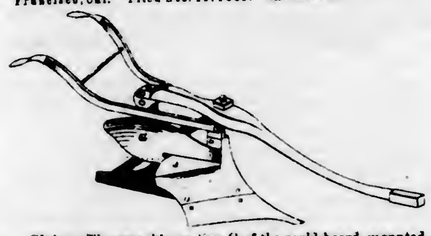
9. In combination with the movable endless pressing-surfaces and upper endless apron, M, the lower apron, L, having doubled side portions, *p*, the rollers K, pivoted in a vertical position at opposite sides of the apron L, and the trough D and spout T, all combined and operating substantially in the manner shown and set forth.

10. The apron L, provided with the projection *i*, in combination with the trough-lining provided with the guide *k*, as and for the purpose set forth.

11. In combination with the movable endless pressing-surfaces and the chute C, the endless apron L, having the doubled side portions, *p*, and projections *i*, the vertical rollers K, trough E, its lining J, provided with guide *k*, the spout T, and endless apron M, all as shown and set forth.

12. In combination with the upper endless pressing-surface, composed of a series of blocks hinged together and carried by wheels F, as described, the frame B', having journaled thereon the wheels F F, the suspension-rod V, connected to one end of said frame and supported adjustably by the screw-rod *r*, the rods V', connected to the opposite end of the frame B', and to a cross-bar, U, the post W, lever X, windlass Y, ropes *y y'*, and weight Z, all combined and arranged to operate substantially in the manner described and shown.

255,897. FOLDING COT-BED. CARL J. SUNDBECK, Salt Lake City, Utah. Filed Nov. 11, 1881. (No model.)

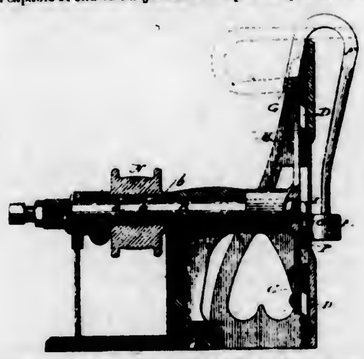


Claim.—1. In a folding bedstead, the solid side rails, A, having concave inner sides, as described, in combination with a flexible bed-bottom, B, and folding legs D E, pivoted to the said solid rails, substantially as and for the purpose specified.

2. In combination with the solid angular side rails, A, as described, and the flexible bed-bottom B, secured thereto, the legs D E differing from each other in length above and below their pivoted connection F, and pivoted to the inside of the said rails at different elevations and at lateral distance apart, substantially as and for the purpose described.

3. The combination of the solid angular side rails, A, having hook-braces G pivoted to the outside of the lower portion, *b*, of one or both of them, with the flexible bed-bottom B and the folding legs D E, pivoted to the said side rails and provided with staples *f* or their equivalents, substantially as specified.

4. In combination with the side rails, A, of a folding bedstead, the adjustable head-rest pivoted to the inside of the upper rail portions, *a*, and consisting of the side bars, H H', connected by the flexible sheet I, and the brace J, hinged with one end to one of the said bars, H, and interlocking at its other end with the other bar, H', substantially as specified.



255,898. VINEYARD-PLOW. AUGUSTUS C. TAYLOR, San Francisco, Cal. Filed Dec. 19, 1881. (No model.)

Claim.—The movable portion G of the mold-board, mounted on a vertical pivot and moving in a horizontal arc, in combination with the lower fixed portion, F, and brace I, all constructed, arranged, and operated as set forth.

255,899. MACHINE FOR TRIMMING HEMS AND SEAMS OF SEWED FABRICS, &c. JOHN F. THOMAS, Ilion, N. Y. Filed Jan. 18, 1882. (No model.)

Brief.—The movable reversible cutters are provided with separate cutting-edges; the reversible stationary cutter with two. The shaft is capable of endwise adjustment independently of the pulley

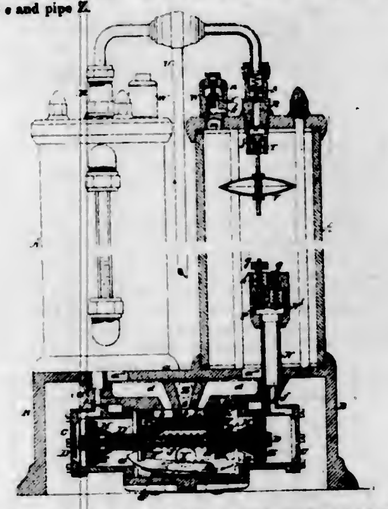
Claim.—1. The cutter D, provided with the four separate edges and so made that it can be reversed end for end and face for face, substantially as described.

2. The stationary holding and cutter plates R, provided with the right-angled edges and with the holes or means of securing them in place, arranged substantially as shown, whereby they can be reversed, and thus bring their different edges into operation successively at will, as set forth.

3. The adjustable shaft B, having the pulley N secured thereon, so as to turn with the shaft, but allow the latter to move endwise independently of the pulley, in combination with the frame A, constructed to form end bearings for the pulley, the adjusting-screw K, and bearing-stud I, all arranged to operate substantially as and for the purpose set forth.

4. In combination with the adjustable shaft B, having the cutters D attached at right angles thereto, as shown, the spring arm or plate O, provided with the stud I, arranged to bear against the end of the shaft B, substantially as shown and described.

5. The combination, in a seam or cloth trimming machine, of the reversible moving cutters and the stationary reversible cutter or holding plates, substantially as shown and described.



255,900. CUSHION-PROTECTOR FOR BOTTLES. JAMES H. THORPE, San José, Cal., assignor of one-half to Joseph A. Bolleli, same place. Filed Dec. 8, 1881. (No model.)

Claim.—A friable vessel provided with two sets or series of grooves, *a a'*, in combination with adjustable elastic rings *b b'*, fitting in said grooves, as and for the purpose set forth.

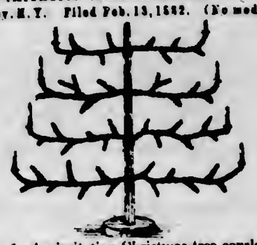
255,901. AIR-COMPRESSOR. WILLIAM WADE, Philadelphia, Pa. Filed Dec. 7, 1881. (No model.)

Brief.—Water is admitted into cylinder C through pipe Y and enters cylinder A through ports *e b d a''*. When the air is forced from A into the storage-tank the pressure of the water opens valve P, which admits it to the rear of piston E. As the piston moves the collar D' compresses spring J and the conical head H strikes and presses down the dog G, thereby relieving the saddle F, which is forced either to the right or the left by the spring J, carrying with it the plate L and valve K, which govern the ports *e b d*. In the head N' is a valve, Q, through which any water that may have remained between the head of cylinder C and piston E may be forced into cylinder A. The exhaust takes place through ports *a'' d b e* and pipe Z.

Claim.—1. The water-supplying cylinder C and its piston-rod and pistons reciprocating longitudinally therein, in combination with chest M, which is formed with ports *d d* and exhaust-port *e*, and the air-compressing cylinders A A, each of which has communication with one of said cylinders A A, said cylinders being provided with suitable valves to allow the air to be compressed within them by the influx of the water and afterward expelled thereby, substantially as set forth.

2. The water-supply cylinder C and water and air receiving cylinders A A, in combination with the pipes N, having valves substantially as described, the plate *a*, with openings *a''*, and the chest M, whereby said cylinders A communicate both with said chest M and the ends of said supply-cylinder C, for the purpose set forth.

3. The valve K, seat-plate L, and chest M, in combination with the piston-rod with heads H, the saddle F, and dogs G, substantially as and for the purpose set forth.



4. The piston-rod having at each end a piston and an encircling sleeve, in combination with the sliding saddle and valve, the loose collars, and the spring between them, the chest and the water and air receiving cylinders A A, and the water-supply cylinder C, substantially as and for the purpose set forth.

5. The water-supply cylinder C and water and air receiving cylinders A A, in combination with the pipes N, each having an adjustable valve, P, substantially as and for the purpose set forth.

6. The cylinder C and a cylinder, A, in combination with the pipe N, having an upwardly-opening valve, Q, and downwardly-opening valve, P, and the chest M, having a port, *f*, through which water passes from said pipe to cylinder C, a port, *d*, through which water passes to cylinder A, and a discharge-port Z, all substantially as set forth.

7. In combination with the air-compressing cylinders A A and the water-supplying cylinder, pistons, and piston-rod, the pipes N, provided with downwardly-opening valves P and upwardly-opening valves Q, substantially as set forth.

255,902. IMITATION CHRISTMAS-TREE. AUGUST WENGERNOTH, Troy, N. Y. Filed Feb. 13, 1882. (No model.)

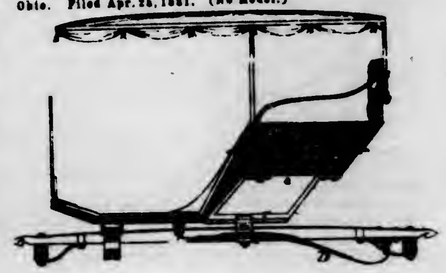
Claim.—1. An imitation Christmas-tree consisting of an upright trunk, detachable covered wire branches, and means whereby the branches are attached to the trunk, substantially as set forth.

2. An imitation Christmas-tree consisting of a trunk, detachable branches, a detachable top section, and means for attaching the branches and top section to the trunk, substantially as set forth.

3. In an imitation Christmas-tree, the combination of a trunk having longitudinal grooves, and eyes secured into the grooves, with covered wire branches having bent inner ends, which are inserted into the eyes of the trunk, substantially as set forth.

4. In an imitation Christmas-tree, a branch made of wire covered with chenille, as set forth.

5. In an imitation Christmas-tree, the combination of a covered wire branch or twig with a spirally-bent terminal and a drip-cup below the same for the candle, as specified.

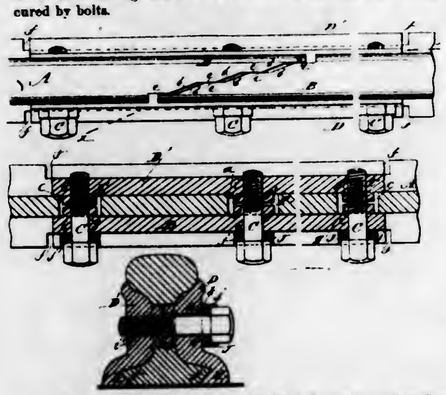


6. In an imitation Christmas-tree, the combination of a trunk, a detachable top section, detachable branches, means for attaching the top section and branches to the trunk, and means arranged at the ends of the top section and the branches for holding the candles, substantially as specified.

255,903. SPRING FOR VEHICLES. WILLIAM WOICHESKI, Atlanta, Ill. Filed Jan. 3, 1882. (No model.)

Claim.—A half-spring for vehicles, consisting of a series of lapped leaves, the under one of which is bent outwardly at one end and adapted to be secured to a side bar of a vehicle, while its inner end is bent upwardly, covering the ends of the upper leaves, and then bent inwardly to adapt it to be secured to the gear of a vehicle, substantially as set forth.

255,904. VEHICLE-SPRING. HORRIS WOODHULL, Dayton, Ohio. Filed Apr. 25, 1881. (No model.)

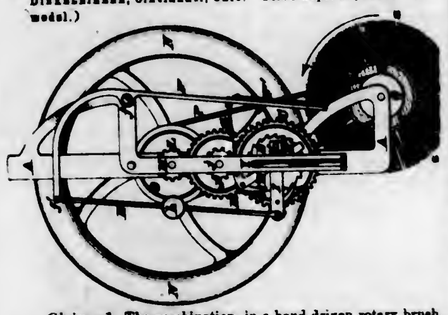


Claim.—1. The combination, with the springs of a vehicle, of a fulcrum adjustably bolted to said springs and provided with engaging-ribs adapted to slip over and be connected with a rigid support attached to the carriage-body, substantially as described, and for the purpose specified.

2. In a phaeton-buggy, the combination of half side springs running lengthwise of the rear half of the phaeton-body, the forward ends of which are bolted or hinged to the body and the rear ends of which are suitably connected to the rear axle or other support contiguous to said axle, in combination with a supporting or bridging iron connected to the body, and an adjustable or stationary connecting device for uniting said springs and supports, whereby a strong, elastic, and leveling support is obtained for the rear part of the vehicle, substantially as set forth.

255,905. JOINT FOR RAILROAD-RAILS. JAMES MORRON ADAMS, Stanberry, Mo. Filed Dec. 26, 1881. (No model.)

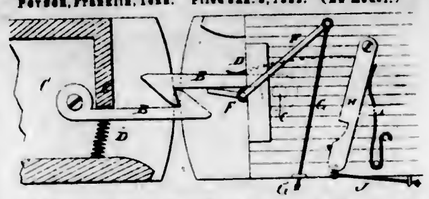
Brief.—The rail ends are scalloped to form straight and diagonal portions, and have their lower flanges cut to form lips. Fish-plates having claws adapted to fit in said lips are provided with tenons fitting into mortises formed in the rails, and are secured by bolts.



Claim.—1. The laps or splices B B of the rails, scalloped so as to form the straight portions *a e* and the diagonal portions *b b*, substantially as and for the purposes set forth.

2. The fish-plates D D', formed with the claws *d*, in combination with the rails formed with the lips *f f*, substantially as described.

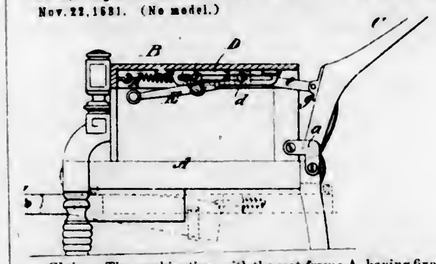
3. The rails formed with the laps B B, the mortises *c*, and slots or cut-away places *e*, and the lips *f*, in combination with the fish-plates formed with claws *d* and the tenons *g* and *g'*, substantially as and for the purposes described.



255,906. ROTARY BRUSH. CHARLES ALBERT and JOHN G. DIENELBIELER, Cincinnati, Ohio. Filed Sept. 27, 1881. (No model.)

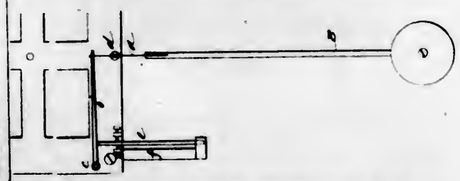
Claim.—1. The combination, in a hand-driven rotary brush, of frame A, fixed handle X, and loops Y F', said loop F' being attached to the lever F, that actuates the gearing journaled in said frame, substantially as herein described.

2. The combination, in a hand-driven rotary brush, of ratchet-wheel D, levers E E' I, pawls *e i*, actuating-rods G H, and pin *i'*, which pin projects from the heel of lever I and serves as a stop for the heel E' of the other lever, E, as herein described.



255,907. CAR-COUPLING. JOHN W. ALLEN and ASHLEY B PEYSON, Franklin, Texas. Filed Jan. 3, 1882. (No model.)

Claim.—1. In a car-coupling, the combination, with the spring-pressed coupling-hooks B, of the lever F, pivoted to the end of the car and having its upper end extending over the top of the car, and the rope G, secured to the said lever and passing down to the sides of the car, substantially as and for the purpose set forth.



2. In a car-coupling, the combination, with the spring-pressed coupling-hook B and the crank-lever F, having its upper end extending over the top of the car, of the notched catch-bar H, pivoted to the top of the car, the spring I, and the rope J, substantially as and for the purpose set forth.

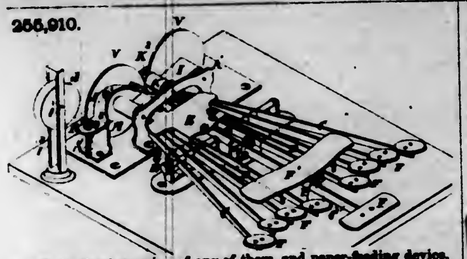
255,908. RECLINING-CHAIR. MORRIS S. ALLEN, Brooklyn, N. Y., assignor to himself and John S. Sisey, same place. Filed Nov. 22, 1881. (No model.)

Claim.—The combination, with the seat-frame A, having fixed side arms, B, grooved on the under side, and the back C, hinged to said frame at *a*, of the plates D, having longitudinal slot *b*, the rack-bar *c*, passing through slot *b*, the rod *e*, pivoted at one end to said rack and knuckle-jointed to a plate, *g*, on back C, the spring *h*, attached to arm B and connected with rack-bar *c* at the end opposite the connection of bar *c*, and the end-bent pawl-lever E, pivoted on plate D, for the purpose specified.

255,909. COMPENSATING PENDULUM. JAMES ASHER, Fort Erie, Ontario, Canada. Filed Jan. 13, 1882. (No model.)

Claim.—1. A clock-pendulum suspended from a lever above the center on which it swings, the lever being sustained on a compensation-rod, substantially as shown and described.

2. The combination of rod *c*, lever *b*, split stud *d*, and pendulum B, substantially as shown and described, for the purposes specified.



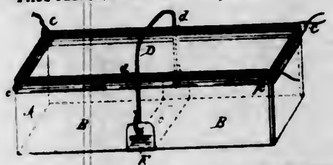
3. The combination, with a pendulum, of a compensating-rod and a multiplying-lever connected for supporting the pendulum at a point above its center of oscillation, substantially as shown and described.

255,910. STENOGRAPHIC MACHINE. MILES M. BARTHOLOMEW, Belleville, Ill. Filed Mar. 8, 1881. (Model.)

Claim.—1. The combination, with a plurality of keys pivoted on a fixed fulcrum, and a feed-plate so arranged as to be actuated by the depression of any key, of spacing-key D D F and pad P, vertically adjustable to govern the amplitude of play of the spacing-key, for the purpose set forth.

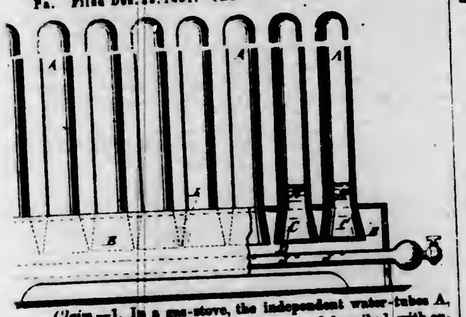
2. In combination with keys C, pivoted on a fixed fulcrum, feed-plate E, in proximity to said keys, adapted to be actuated di-

255,910.



rectly by the depression of any of them, and paper-feeding device, substantially as described, the feed-key D D F, so arranged as to move the feed-plate E further, and so give a greater feed movement to the paper at each motion than the marking-keys, substantially as and for the purpose set forth.

3. The keys C, composed of a bent bar with a finger-piece, F, for each hand, at each extremity of same, substantially as and for the purpose set forth.

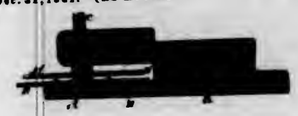


4. The ink-ribbon-feeding mechanism consisting of the reels T T, turning on adjustable arbors *u* on sliding plate U, and wheels V V and arbor K', substantially as set forth.

255,911. FRUIT-BASKET. CHARLES E. BARTRAM, Fredonia, N. Y. Filed Jan. 16, 1882. (No model.)

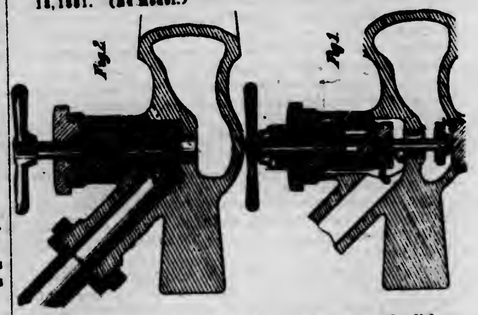
Claim.—In a knockdown fruit-basket, the combination of the veneers A B, crossed and fastened together at the bottom, the upper edges bound with tin strips *b b*, and with holes *b'* in each corner, with wire or string *a* twisted therein to hold said corners together, and the bottom piece, E, and attached or connecting wire handle D, all arranged substantially as and for the purpose specified.

255,912. GAS-STOVE. JOHN H. BAUMGARDNER, Lancaster, Pa. Filed Dec. 29, 1881. (No model.)



Claim.—1. In a gas-stove, the independent water-tubes A, constructed, substantially as herein shown and described, with enlargements C at the lower end, as set forth.

2. The combination, with the casing or base B, of the independent water-tubes A, provided with enlargements C at the lower ends, and of the burner D, substantially as herein shown and described, and for the purpose set forth.

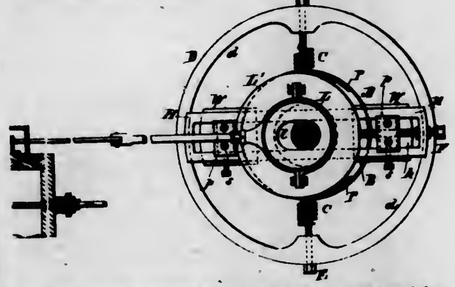


3. The combination, with the casing or base B, of the independent vacuum and water tubes A and the burner D, substantially as herein shown and described.

255,913. GRASS-MOWER. EDWIN BECKWITH, Butler, Pa. Filed Dec. 31, 1881. (No model.)

Claim.—In a grass-mower, the carrier A, composed of the two pieces *a b*, the part *a* having its front end formed into a circular disk, *d*, which forms a support for the non-rotating blade B, and the part *b*, having the quadrant *e* formed upon it, substantially as shown.

255,914. FAUCET. LOUIS BERGER, New York, N. Y. Filed May 18, 1881. (No model.)



Claim.—1. The combination, in a faucet or cock, of a disk, a valve carried by said disk and so connected therewith that the passage of liquid from the under to the upper side of said disk is effectually precluded, a screw for adjusting said disk to shift the valve into or out of contact with its seat, and having a swiveling connection with said disk, a removable cap or plug in which said screw works, and an elastic or flexible sleeve of packing material loosely surrounding said screw and fitting outside the adjacent edges of said disk and said cap or plug, whereby leakage through said cap or plug is effectually prevented, substantially as specified.

2. The combination, in a faucet or cock, of a disk carrying a valve, a screw for shifting the disk to move the valve to and from its seat and receiving the stem of the disk within it, a removable cap or plug in which said screw works, and an elastic or flexible sleeve of packing material fitting outside the adjacent edges of said cap or plug and of said disk, substantially as specified.

3. The combination, in a faucet or cock, of a valve, and a screw for operating the valve, the said valve having a stem extended up into the said screw and swiveled therein, substantially as specified.

255,915. VALVE-GEAR. HENRY L. BERGER, St. James, La., assignor of one-half to Arthur J. Dillon, same place. Filed Dec. 16, 1881. (No model.)

Claim.—1. The combination, with the driving-shaft S and the eccentric L, that operates the valve-rod, said eccentric being provided with an elongated slot, through which the shaft passes, of two weights arranged upon opposite sides of the driving-shaft and appliances to connect either one of said weights to the eccentric, whereby the varying centrifugal force of the shaft through the medium of the connected weight is made to move the eccentric into position to lengthen or shorten the travel of the valve whatever may be the direction of rotation of the driving-shaft, substantially as and for the purpose specified.

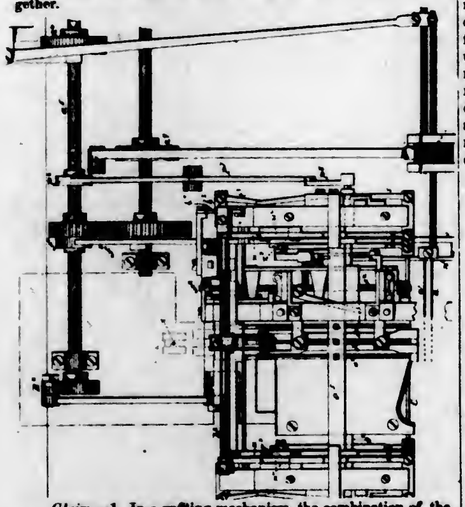
2. The combination, with the driving-shaft S, the slotted eccentric L, and the two weights W, arranged on opposite sides of said shaft, of a spring-support, to which said weights are directly attached, suitable bearings for said spring-support rigidly connected with the driving-shaft, and means to connect one or the other weight with the eccentric, substantially as and for the purpose specified.

3. The combination, with the driving-shaft S, the slotted eccentric L, and the two weights arranged on opposite sides of said shaft, of a spring-support the tension of which is made adjustable, and to which said weights are directly attached, suitable bearings for said spring-support rigidly connected with the driving-shaft, and means whereby one or the other weight may be connected with the eccentric, substantially as and for the purpose specified.

4. The combination, with the driving-shaft S and the eccentric L, that operates the valve-rod, said eccentric being provided with an elongated slot, *l*, through which the shaft passes, of means for setting the eccentric to the travel of the valve, which consist of a slide, H, rigidly attached to the shaft, and an adjusting screw or screws, F, adapted to move the eccentric on said slide and secure it in position when adjusted, substantially as and for the purpose specified.

5. The combination of the driving-shaft S, the slotted eccentric L, the slide H, set screw or screws F, and the disk D, all arranged and constructed for operation substantially as and for the purpose specified.

6. The comonation of the driving-shaft S, the slotted eccentric L, the disk D, the slide H, the weights W W, and the set-screws *s*, all arranged and constructed for operation substantially as and for the purpose specified.



7. The combination of the disk D, the bearing-blocks B B, and the weights W W, of the annular spring-band A and appliances to regulate the tension of said band, all arranged for operation substantially as and for the purpose specified.

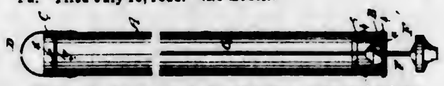
8. The combination of the disk D, having flange *d* and bearing-blocks B B, the spring-band A, the adjusting-screws E E, and the coiled springs C C, all arranged for operation substantially as and for the purpose specified.

9. The combination of the disk D, having flange *d* and bearing-blocks B B, the adjusting-screws E E, the coiled springs C C, the supporting-plates P P, and the spring-band A, all constructed and arranged for operation substantially as and for the purpose specified.

255,916. RUFFLING-MACHINE. WILLIAM BRUCKER, New Haven, Conn. Filed Oct. 10, 1881. (Model.)

Brief.—The invention relates to mechanism by means of which several strips of fabric may be simultaneously ruffled or plaited and then delivered one upon the other to the stitch-forming mechanism of a sewing-machine, so that the same stitches which secure the ruffles or plaits also secure the several strips together.

Claim.—1. In a ruffling mechanism, the combination of the following elements: first, two or more mechanisms, substantially such as described, to ruffle the strips respectively given to the said mechanism; second, two or more feeds arranged each to receive one of the ruffled strips from the said ruffling mechanisms, and together deliver the several ruffled strips through one common delivery, laid one upon the other, to, third, a stitch-making mechanism, substantially such as described, arranged relatively to the said place of delivery to run a line or lines of stitches through the said several strips as delivered to the said stitch-making mechanism, substantially as described.



2. In ruffling mechanism, the combination of the following elements: first, two or more mechanisms, substantially such as described, to ruffle the strips respectively given to the said mechanisms; second, two or more principal feeds to receive the strips, respectively, from the said ruffling mechanisms; third, auxiliary feeds acting in conjunction with the said principal feeds to bring the several strips passing through said principal feed to one common delivery, one upon the other, to, fourth, a stitch-making mechanism, substantially such as described, to run a line or lines of stitches through the said several strips as delivered to the said stitch-making mechanism, substantially as described.

3. In a ruffling mechanism, the combination of the following elements: first, two or more mechanisms, substantially such as described, to ruffle the strips respectively given to the said mechanisms; second, two or more principal feeds to receive the strips, respectively, from the said ruffling mechanisms; third, auxiliary feeds acting in conjunction with the said principal feeds to bring the several strips passing through said principal feeds to one common delivery, one upon the other, to, fourth, a stitch-making mechanism, substantially such as described, to run a line or lines of stitches through the said several strips as delivered to the said stitch-making mechanism; and, fifth, a feed in connection with said stitch-making mechanism independent of the principal and auxiliary feeds which deliver the strips, substantially as described.

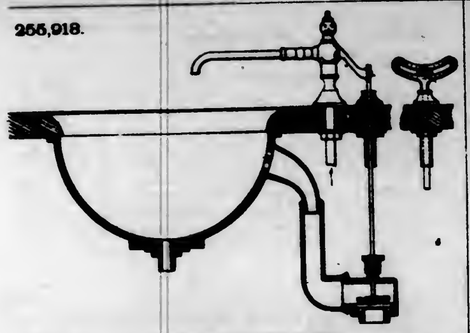
4. In a ruffling mechanism, the combination of the following elements: first, two or more mechanisms, substantially such as described, to ruffle the strips respectively delivered to the said mechanisms; second, two or more feeds arranged to respectively take the ruffled strip from said ruffling mechanisms arranged upon a carriage common to all, to which an intermittently-reciprocating movement is imparted; third, mechanism, substantially such as described, to simultaneously open and close said feeds, the said feeds being arranged to deliver their respective strips together, one upon the other, through one common delivery, to, fourth, a stitch-making mechanism, substantially such as described, arranged to run a line of stitches through the said several strips as they are delivered one upon the other to the stitch-making mechanism, substantially as described.

5. In a ruffling mechanism, the combination of the following elements: first, two or more mechanisms, substantially such as described, to ruffle the strips respectively delivered to the said mechanisms; second, two or more feeds arranged to respectively take the ruffled strip from said ruffling mechanisms arranged upon a carriage common to all, to which an intermittently-reciprocating movement is imparted; third, mechanism, substantially such as described, to simultaneously open and close said feeds, the said feeds being arranged to deliver their respective strips together, one upon the other, through one common delivery, to, fourth, a stitch-making mechanism, substantially such as described, arranged to run a line of stitches through the said several strips as they are delivered one upon the other to the said stitch-making mechanism; and, fifth, a presser-foot for said feeds, arranged to be simultaneously raised from and lowered upon the work, substantially as described.

255,917. OIL-WELL BAILER. WILLIAM H. BIRCH, Franklin, Pa. Filed July 19, 1882. (No model.)

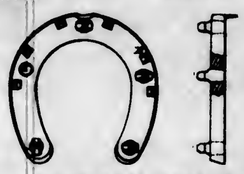
Claim.—1. An improved oil-well bailer constructed substantially as herein shown and described, consisting of tubular body A, provided with re-enforced valve-seat B, perforated valved diaphragm C, and weighted valve E, arranged as set forth.

2. In an oil-well bailer, the combination, with the body A, provided with re-enforced valve-seat B and the apertured valved diaphragm C, of the valve E, provided with the head F and the bar G, substantially as and for the purpose set forth.



3. In an oil-well bailer, the combination, with the body A, of the apertured diaphragm C, provided with the rigid inclined plate *h*, substantially as and for the purpose set forth.

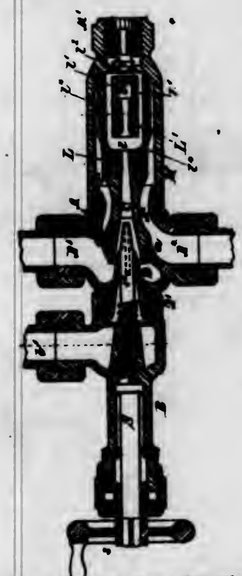
255,918. FAUCET FOR REGULATING THE OVERFLOW FROM BASINS. FRANCIS A. BISHOP, San Francisco, Cal. Filed May 4, 1881. (No model.)



Claim.—1. The bifurcated lever P, combined with the supply cocks or faucets, and with a vertically-movable valve arranged in the overflow-pipe of the basin or bowl, substantially as described.

2. In combination with the horizontally-vibrating supply-cock and its rear extension, the loop, the valve-rod, the vertically-movable valve, valve-chest, and the overflow-pipe, substantially as described.

255,918.



255,919. HORSESHOE. HENRY BLAND, Luton, County of Bedford, assignor to William Brown Lacesell, London, England. Filed Nov. 26, 1881. (No model.) Patented in England Jan. 18, 1881.

Claim.—1. A horseshoe having a number of smooth round tapering cogs set therein, said cogs having their sides flattened toward their lower or projecting ends, so as to admit of removal by a suitable key or wrench, substantially as described.

2. The combination, with a horseshoe, of round tapering cogs or roughs, flattened at their lower ends, and set vertically in holes of corresponding shape made directly in the shoe-plate itself, so that when said roughs or cogs are removed the shoe is left plain and flat, as set forth.

255,920. INJECTOR FOR STEAM-ENGINES. SAVARIN BERLAND, Manchester, County of Lancaster, England. Filed Aug. 30, 1881. (Model.) Patented in England June 21, 1880, in France Nov. 16, 1880, in Belgium Nov. 16, 1880, and in Germany Nov. 16, 1880.

Claim.—1. In an injector for steam-engines, a junction-branch for the steam-supply pipe capable of being rotated around the injector, as described, for the purpose specified.

2. In an injector for steam-engines, a casting or junction piece having a feed-water branch, A', and a delivery-branch, A^4, at the opposite extremities of its transverse axis, and an interior partition arranged to form a tubular bearing on a line with its longitudinal axis, in which bearing is seated the combining-cone, said partition serving also to cut off direct communication between the feed-water branch and the delivery-branch, as specified.

3. In an injector for steam-engines, the casting A, having the branches A' A^1 A^2 A^4, arranged at right angles to each other, and an interior tubular partition, *a*, in combination with the steam and combining cones, arranged as set forth, whereby direct communication between the branches A' A^2 A^4 is intercepted, substantially as and for the purpose specified.

4. In an injector for steam-engines, a junction or union piece or casting, A, having the branch A' screw-threaded exteriorly, in combination with the steam-cone D, seated upon said branch A', the spindle S, and its casing B, carrying the steam-branch, and arranged to hold the steam-cone to its seat when said casing is connected with the said branch A', substantially as set forth.

5. The combination of the junction or union piece A, its branch A', the spindle-casing B, and its coupling F with the sleeve E, substantially as and for the purpose specified.

6. The combination of the junction or union piece A, its branch A', the steam-cone D, and the coupling-sleeve E with the spindle-casing B, its coupling F, and the steam-branch *b*, all arranged, constructed, and operating substantially as and for the purpose specified.

7. The receiving, discharging, and overflow cone consisting of the casing L, within which is formed the receiving and discharging cone, so as to leave an overflow-passage, *l l'*, between said cone and casing, all constructed of one piece, substantially as and for the purpose specified.

8. The receiving, discharging, and overflow cone consisting of an outer casing, L, arranged to receive the discharge end of the combining-cone and having lateral passages P, the interior cone, L', arranged to form the overflow-passages *l l'* between it and said casing L, and which cone is in direct communication with said lateral passages, substantially as and for the purpose specified.

9. In an injector for steam-engines, the combination, with the steam and combining cones, of a receiving, discharging, and overflow cone, L L', arranged relatively to said steam and combining cone in such manner that both the combined steam and water and the overflow will be discharged at the same end of said cone L L', substantially as described.

10. The combination, with the union or junction piece A and its branches A' A^2, of the steam-cone D, combining-cone C, and the receiving, discharging, and overflow cone L L', of the cap M, removably connected with the branch A', all arranged and operating substantially as and for the purpose specified.

11. The combination of the cap M and the check-valve V with the receiving, discharging, and overflow cone L L', constructed, arranged, and operating substantially as and for the purpose specified.

12. The junction or union piece A, having branches A^2 A^4, the cap M, the steam and combining cones, in combination with the receiving and discharging cone having passages P, and arranged within the cap M to form the annular passage P', that communicates with the delivery-branch A^4, all constructed, arranged, and operating substantially as and for the purpose specified.

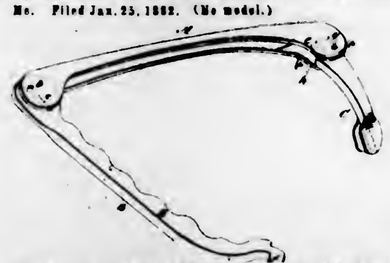
13. The junction or union piece A, having branch A', screw-threaded exteriorly, and an interior tubular bearing, *a*, the combining-cone C, seated within said bearing, and the steam-cone D, seated upon the branch A' and having the valve-seat *d'*, in combination with the casing B, carrying the steam-branch and connected with branch A' to hold the steam-cone to its seat, and the screw-spindle S, provided with the valve-face *s'*, all arranged, constructed, and operating substantially as and for the purposes specified.

255,921. MACHINE FOR COLORING AND FLAVORING CIGARS. CHARLES BOWMAN and FRANKLIN W. TREGO, Hanover, Pa. Filed Feb. 10, 1882. (No model.)

Claim.—1. In a machine for coloring and flavoring cigars, a rotary drum adapted to receive and discharge the cigars, and ar-

ranged to rotate about a stationary cylinder having its surface adapted to be saturated with the liquid, substantially as described.

2. In a machine for coloring and flavoring cigars, the combination, with the inner stationary sponge-cylinder, of the rotary drum having its inner face lined with a soft padding, H, substantially as and for the purpose described.



3. The combination, with the stationary sponge-cylinder, of the rotary drum provided with an opening for receiving and discharging the cigars, and adapted to leave a space for the cigars between its inner face and the sponge-cylinder, substantially as described.

4. The combination, in a machine for coloring and flavoring cigars, of the stationary sponge-cylinder, the rotary drum, the grooved feed-roll adapted to receive the cigars to be fed forward in its grooves, and mechanism timed for turning the feed roll intermittently, so as to feed one cigar into the drum at each revolution of the latter, substantially as described.

5. The combination, with the stationary sponge-cylinder, of the rotary drum provided with hollow journals, the shaft passing through the core of the sponge-cylinder, and devices for rigidly connecting said shaft with one of the standards of the machine, substantially as described.

6. The combination, with the stationary sponge-cylinder and the rotary drum, of the grooved feed-roller, the ratchet upon said roller, the pawl, the swinging and reciprocating bars, and the stud upon one end of the rotary drum, as specified.

255,922. BAG-FASTENER. CHARLES W. BRADFORD, Belfast, Me. Filed Jan. 25, 1882. (No model.)

Claim.—1. An improved bag-fastener, consisting of two jaws having a longitudinal sliding and pivoted attachment at one end and provided at their free ends with a locking-catch, substantially as and for the purpose set forth.

2. The arms or jaws A B, having a longitudinally-sliding and pivoted attachment with each other at their one end and fitted to enter one within the other at their free ends when closed, in combination with a locking catch or lever for holding said jaws closed, essentially as herein set forth.

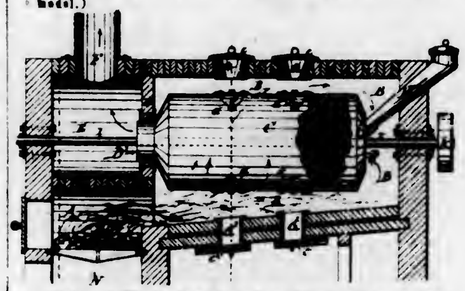
3. The arms or jaws A B, having a longitudinally-sliding and pivoted attachment with each other at their one end, in combination with the locking-lever C, pivoted to the jaw A, and constructed with a locking-tooth, *h*, for engagement with the jaw B in rear of a projection, *f*, at the free end of said jaw, whereby on closing said lever the fastening is drawn up and secured, substantially as specified.

4. The combination, with the jaw A, provided at its free end with the jaws *e*, and the pivoted locking-lever C, provided with the tooth *h*, of the jaw B, connected to the jaw A by a longitudinally-sliding and pivoted attachment, and provided with the projection *f* at its free end, substantially as and for the purpose set forth.

255,923. GROCER'S SCOOP. JOHN J. BRADBURN, Findlay, Ohio. Filed Feb. 28, 1882. (No model.)

Claim.—In a wooden scoop, the blade A, provided with the tenon *a* and rear edge, *c*, in combination with the head B, provided with the recess *b*, constructed and arranged substantially as and for the purpose set forth.

255,924. CORSET. MORRIS P. BRAY, New Haven, assignor to Isaac W. Birdseye, Bridgeport, Conn. Filed Apr. 23, 1881. (Model.)

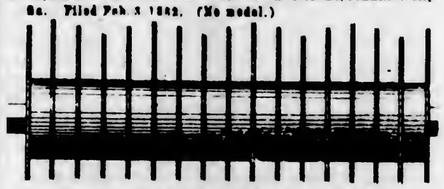


Brief.—The springs composing the stay may have both a paper and a fabric covering.

255,924. [illegible]

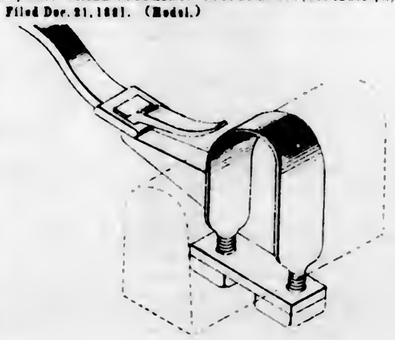
Claim.—The herein-described improvement in corsets, consisting of the stay composed of the two springs *a a*, inclosed by a covering having a space between the two springs of the stay, which is arranged in a pocket at the rear edge of the corset, and combined with eyelets introduced through the fabric of the pocket and the covering of the stay in the space between the two springs, substantially as described.

255,925. APPARATUS FOR DESICCATING ANIMAL MATTER FOR FERTILIZERS. HENRY BREER, De Witt Centre, assignor to Caroline H. Breer, Syracuse, N. Y. Filed Feb. 4, 1882. (No model.)



Claim.—1. The horizontal revolving cylinder C, having end openings, D D', and provided with the ports *a* and covers *b* over said ports, in combination with the furnace A, combustion-chamber B, smoke box and stack E F, and openings G, provided with covers *c*, substantially as described and shown.

2. In combination with the furnace A, combustion-chamber B, and smoke-box E, the longitudinal revolving cylinder C, provided with ports *a* and covers *b*, the spout H, discharge-openings G', and covers *c'*, as described and shown.



3. In combination with the furnace A, combustion-chamber, B, and smoke-box E, arranged as shown, the horizontal shaft I, provided with pulley or gear K, the spiders L, fixed to said shaft, the cylinder C, secured to the spiders and having end openings, D D', and ports *a*, with covers *b*, the rods *r*, radial wire-netting *s*, secured to said rods, and openings G G', with covers *c c'* in the combustion-chamber, all arranged as described and shown.

255,926. COTTON-GIN. RUDOLPH H. BROOKS, Jenkinsville, Ga. Filed Feb. 3, 1882. (No model.)

Claim.—The combination, with the grid-bars, of the gin saws, arranged eccentrically on their mandrel, substantially in the manner and for the purposes specified.

255,927. THILL-COUPLING. ALBERT BROWN, Schenectady, N. Y. Filed Dec. 21, 1881. (Model.)

Claim.—In combination with the clip having a hook on the forward side thereof, a thill-iron formed with a rectangular eye, provided with a projecting leg and an interposed rubber cushion, the said leg serving to retain the cushion in place within the eye, substantially as shown and described.

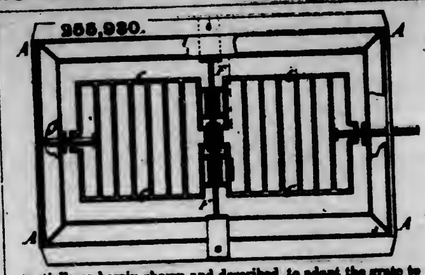
255,928. MINING-PUMP. DAVID W. BUSSTON, Leadville, Colo. Filed Oct. 31, 1881. (No model.)

Brief.—The telescopic section *a* carries the valve *l* and the strainer *m*, so that whether the pump is elevated or lowered the distance between the valve and strainer is uniform. The strainer *m* is so constructed as to obtain a large straining area with perforations at an angle to allow of the escape of débris. A compensating-tube, *f*, receives the water displaced by valve-stem S.

Claim.—1. In a mining-pump, the telescopic extensible section *a*, in combination with and carrying at its lower end a conical strainer, *m*, of greater diameter than said pipe *a*, and provided with perforations opening downwardly, substantially as set forth.

2. In a mining-pump, the working-barrel S, provided with the reciprocating rod and bucket-valve J, in combination with the exterior telescopic slide, *a*, carrying valve *l* and strainer *m*, substantially as specified.

3. In a mining-pump mechanism, the force-pump *b c* and a lift-pump below said force-pump, in combination with the connecting-pipe O and compensating-pipe *f*, all constructed, arranged, and operated as set forth.

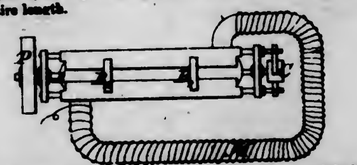


255,929. LAMP-BURNER. ROSES L. BUTLER, Ansonia, Conn., assignor to Wallace & Sons, same place. Filed June 29, 1881. (No model.)

Claim.—In a lamp-burner substantially such as described, the combination of the base A, provided with arms C, extending radially outward therefrom, said arms constructed with an opening, *h*, near their outer end, a chimney-rest, B, bearing on said arms outside the opening *h*, and springs D, extending up to support the chimney, their lower end turned inward beneath the end of the arms, thence upward through the opening *h* in the arms to a position between the chimney-rest and arms, and there secured by rivets through the said springs and arms in rear of the opening *h*, substantially as described.

255,930. STOVE. GIDEON H. BULL, New Baltimore, N. Y. Filed Feb. 9, 1882. (Model.)

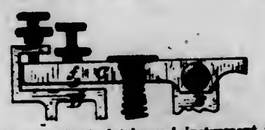
Claim.—1. A stove-grate made in two parts provided with offsets at their middle parts, and connected only by a pivot, substantially as herein shown and described, to adapt the grate to receive a division-plate for confining the fire to one part of the fire-box, as set forth.



2. In a stove, the combination, with the fire-box A and the grate C, made in two parts connected by a pivot, of a division-plate, F, having a slot, G, in its lower part, substantially as herein shown and described, whereby the fire can be confined to one part of the fire-box, as set forth.

3. In a stove, the combination, with the fire-box A, the grate C, made in two parts connected by a pivot, and the division-plate F, having slots in its lower and upper parts, of a second grate, C', made in two parts connected by a pivot, substantially as herein shown and described, whereby a small fire can be made close to the top of the stove, as set forth.

255,931. ELECTRIC GENERATOR AND MOTOR. JESSE H. BURNELL, Brooklyn, N. Y. Filed Aug. 3, 1881. (No model.)



Brief.—The elongated polar extensions are connected with the core of the field-magnet at opposite ends, as clearly illustrated in Figure 1, thereby forming a field of equal intensity throughout its entire length.

Claim.—1. The combination, substantially as hereinbefore set forth, of a rotating armature, pole-pieces of magnetic metal lying parallel with the axis of said armature in the direction of its length, and facing each other upon opposite sides thereof, and a field-magnet having each of its magnetic poles in contact with one of said pole-pieces at points adjacent to opposite ends of said armature respectively.

2. The combination, substantially as hereinbefore set forth, of a field-magnet constituting a closed magnetic circuit, pole-pieces extending parallel to each other in opposite directions from the respective magnetic poles of said field-magnet, and a cylindrical armature mounted between said polar extensions and parallel thereto.

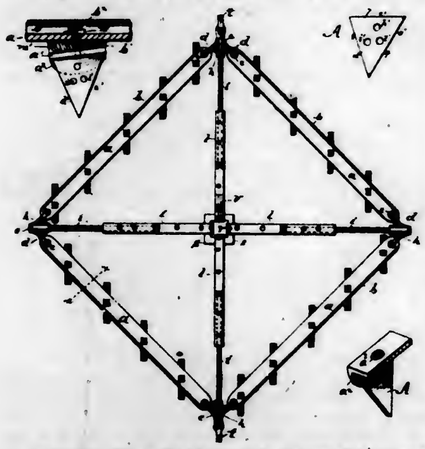
255,932. MECHANICAL TELEGRAPH-SOUNDER. JESSE H. RUSSELL, New York, N. Y. Filed Jan. 4, 1882. (No model.)

Claim.—1. In a mechanical telegraph-instrument, the combination, substantially as hereinbefore set forth, of a lever pivoted at one extremity and vibrating between fixed stops at the other, a spring holding said lever normally against its upper fixed stop, and a finger-knob for depressing said lever permanently secured thereto at a point between the axis and the free end.

2. In a mechanical telegraph-instrument, the combination, substantially as hereinbefore set forth, of a resonant base, a metallic bridge mounted upon said base, a lever pivoted at one extremity and free to vibrate at the other, a projection from said lever at its center of percussion, which is adapted to impinge upon said bridge, and a finger-knob for actuating said lever affixed thereto at a point between its center of motion and center of percussion.

3. In a mechanical telegraph-instrument, the combination, substantially as hereinbefore set forth, of a lever pivoted at one extremity and vibrating between fixed stops at the other, a heri-

zontal projection from said lever at a point between its center of motion and its free end, and a finger-knob mounted upon said horizontal projection.



255,933. WATER-CLOSET. William Bunting, Jr., Boston, Mass., assignor to Henry C. Meyer & Co., New York, N. Y. Filed Dec. 17, 1881. (No model.)

Brief.—The seat bears on two points, e, and their motion is conveyed to the valve-operating parts *f g* through the equalizing-lever m.

Claim.—The combination, with the seat C, the supporting-fingers *e e*, and suitable mechanism for imparting their descending movement to the valve of the closet, of means for rendering said fingers *e e* self-adjusting to any inequality in or changes of the plane of the said seat, substantially as set forth.

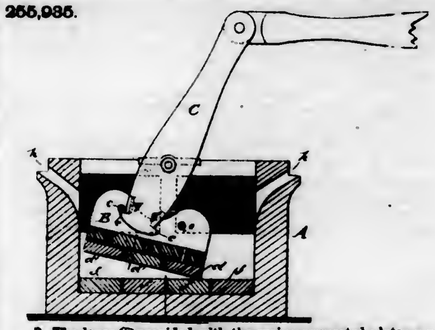
255,934. HARROW. Henry R. Burden and Joseph B. Simpson, Pinesville, Va. Filed Jan. 31, 1882. (No model.)

Claim.—1. The combination, with the harrow-beams *a*, provided with triangular teeth A, and blocks A, provided with hooks *d* and sockets *e*, of the metallic plates *l*, having perforated flanges *o*, adjusting-holes *m*, and hooked inner end, *q*, block *s*, having a central orifice, *r*, and adjustable rods *i*, substantially as described, and for the purpose set forth.

2. As an improved article of manufacture, the scalene triangular harrow-tooth A, having its sides *c' c'' c'''* of different lengths and its angles different, and provided with the holes *h' i' l'* above the middle of each side of the teeth, as set forth.

3. The combination, with the triangular harrow-tooth A, constructed as set forth, of the tooth-holder *a'*, with hole a^2, and downwardly-projecting flange a^3, with hole a^4, to which the tooth is secured, and bolt *b'*, by which the holder is secured to the harrow-beam, substantially as described, and for the purpose set forth.

4. The combination, with the triangular harrow-tooth A, tooth-holder *a'*, both constructed as set forth, and beam *a*, of the wedge *n'*, wedge-shaped washer *n'*, bolt *b'*, and nut b^2, substantially as described, and for the purpose set forth.



5. The combination of the harrow-beam *a*, triangular harrow-tooth A, having its sides of unequal length and provided with holes *i' h' l'*, tooth-holder *a'*, having flange a^3 and holes a^3 a^4, bolt *b'*, and nut b^2, substantially as described, and for the purpose set forth.

255,935. Ore-Crusher. Angus M. Cameron, Greenville Cal. Filed Jan. 23, 1882. (No model.)

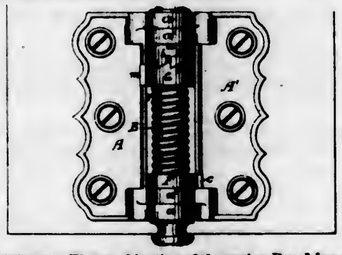
Claim.—1. The combination, with the ore-box A and rocking lever C, of the stamp-head B, adapted to be moved from end to end of the ore-box and to have its ends alternately raised and dropped by the rocking motion of the said lever, as and for the purpose set forth.

2. The stamp head or block B, provided with the cross-pieces or rods *c c*, in combination with the box A and the lever C, provided with the projections *e e*, substantially as and for the purposes set forth.

255,936.

3. The lever C, provided with the spring-supported plates *g g* and the projections *e e*, in combination with the box A and the stamp head or block B, provided with the cross pieces or rods *c c*, substantially as and for the purposes set forth.

4. The ore-box A, formed with the openings *h h* and provided with the plates *f f*, and the stamp head or block B, formed with the cross-pieces *c c* and provided with the plates *d d*, in combination with the lever C, formed with the projections *e e* and provided with the spring-supported plates *g g*, substantially as and for the purposes set forth.



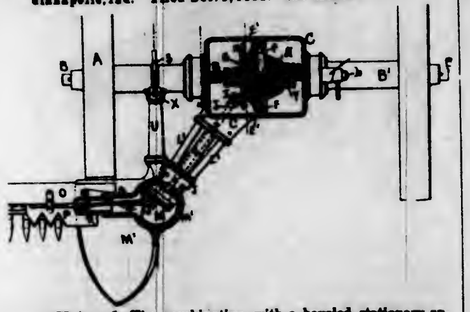
255,936. Artificial Stone. George W. Chamberlin and Andrew S. Comrade, Sterling, Ill. Filed Feb. 17, 1882. (No specimens.)

Claim.—A compound for artificial stone, consisting of three and one-half parts of clean sand to one part of Portland cement, mixed thoroughly, and combined, in a working consistency, with a composition consisting on the one part of five gallons of water and on the other part of one gallon of the mixture made of the following ingredients and in the following proportions, to wit: one gallon of silicate of soda, one pound of carbonate of iron, one and one-half pound of graphite, two pounds of raw umber, and two gallons of rain-water at the boiling temperature, all thoroughly mixed, substantially as described, and for the purpose specified.

255,937. Plastic Material. Melvin B. Chunes, Grand Rapids, Mich. Filed Feb. 7, 1882. (No specimens.)

Claim.—The described compound, consisting of pulverized calcined gypsum, glue, and sulphate of zinc or its equivalent, in substantially the proportions specified.

255,938. Spring-Hinge. Charles B. Clark, Philadelphia, Pa. Filed Dec. 22, 1881. (No model.)



Claim.—1. The combination of the spring B and leaves A A' of the hinge with a cap, E, carried by the spring, and a retaining-ring, G, fitting around the coils of the spring and adapted to engage with and to be disengaged from the cap E and prevented from turning under the action of the spring B, as set forth.

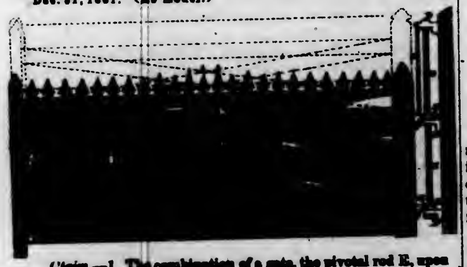
2. The combination of the spring and leaves of the hinge with the cap E, carried by the spring and adapted to engage with a retaining-ring, G, the latter embracing the coils of the spring and being capable of a limited turning and vertical movement, and having a lug, *m*, adapted to a shoulder, *n*, on one of the leaves of the hinge, as set forth.

3. The combination of the spring and leaves of the hinge, the cap E, the retaining-ring G, and a projection, *p*, on the leaf A of the hinge, to limit the vertical movement of the ring, as set forth.

4. The combination of the spring of the hinge, the cap E, the retaining-ring G, having lugs *m* and *s*, and the leaf A, having a shoulder, *n*, and a reduced portion, *t*, as set forth.

255,939. Mowing-Machine. William F. Cochrane, Indianapolis, Ind. Filed Dec. 8, 1881. (No model.)

Claim.—1. The combination, with a beveled stationary annular gear, F, fixed to encircle the main driving shaft or axle B, of a conical bifurcated sleeve or spider, E, placed upon said shaft to rotate therewith, and carrying upon its diverging arms beveled pinions or planet-wheels E' E', adapted to engage said annular gear and to mesh centrally into a pinion upon the hub of a gear-wheel H, rotating upon the main shaft B, substantially in the manner and for the purpose herein set forth.



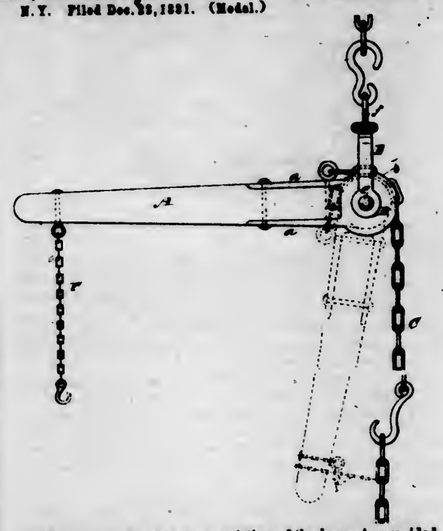
2. The combination of the inverted bevel-wheel H, turning loosely upon the main shaft B, with the beveled pinion I upon the crank-shaft J on one side and with planet-wheels E' E' engaging a pinion upon its hub on the other, substantially in the manner and for the purpose herein set forth.

3. The combination, with the shoe M' and its spherical joint M N, of an arm, U, extending radially from said joint, a slotted guide, X, upon the casing C, and a lever, S, pivoted to said casing for the purpose of elevating or depressing the shoe and its cutter-bar, substantially as herein set forth.

4. The combination, with the spherically-jointed shoe and the finger-bar carried thereby, of a pivoted arm, S, upon the main frame, actuated by an independent lever, 6, and dog 10, engaging a notched disk upon the axis of said arm S, and controlled by a spring-actuated catch-lever 12, substantially as and for the purpose herein set forth.

5. In combination with the finger-bar O, the cutter-bar P, adapted to be withdrawn endwise from the same, and provided with lugs on its inner end, the pitman-head R, having recesses adapted to receive said lugs, and means for securing the cutter-bar and pitman-head together, whereby an interlocking-joint is formed which will admit of a ready release and withdrawal of the cutter-bar, substantially as and for the purpose set forth.

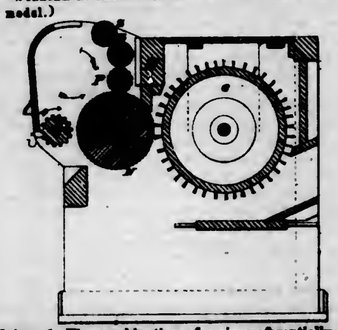
255,940. Gate. Robert J. Colvin, Lancaster, Pa. Filed Dec. 31, 1881. (No model.)



Claim.—1. The combination of a gate, the pivotal rod E, upon which the gate swings and is raised and lowered, the chain I, wheel J, braces P, and clamping-bolt H, substantially as shown.

2. The combination of a gate which can be adjusted diagonally from its corners with a series of uprights having rabbeted edges, whereby the uprights are made to form a closed gate, substantially as described.

3. The combination of the gate, the two braces which are applied to opposite sides of the gate and extend in diagonal opposite directions, a clamping-bolt and shift-wheel, the chain, and a vertical rod, upon which the gate moves, substantially as specified.



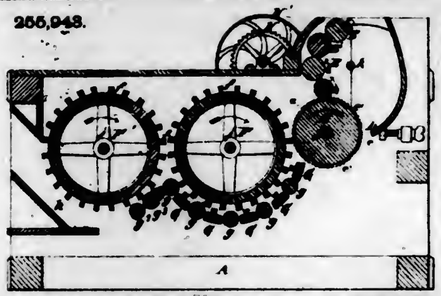
4. The combination of the gate, the upper hinge having a vertical opening for the passage of the chain and provided with a friction-roller, with the shift-wheel, the clamp, the diagonal braces, and the chain, substantially as described.

255,941. Load-Binder. Stephen S. Conkling, Middletown, N. Y. Filed Dec. 23, 1881. (Model.)

Claim.—In a load-binder consisting of the lever A, provided with the chain F at its outer end, and the head B, having cheeks *b* and arms *a*, the yoke D, pivoted to the said head and provided with the swiveled eye or link *f*, and the chain C, secured to the head and passing through the links over the head, the said swiveled eye or link and chain being adapted to be connected to the ends of a binding-chain, substantially as herein shown and described.

255,942. Machine for Hulling and Sinning Cotton, &c. William L. Crowson, St. Louis, Mo. Filed May 7, 1881. (No model.)

Claim.—1. The combination of a circumferentially-grooved roller, P, mounted in adjustable bearings, and a saw-cylinder having claw-teeth, the said roller being adapted to receive the teeth of the saw within its grooves and to be adjusted with reference to the saws to adapt the device for ginning, linting, or hulling, as set forth.



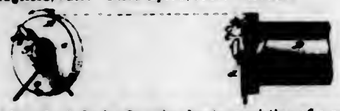
2. The combination, with a saw-cylinder, of the rollers P and Z, made adjustable in distance from the saw-cylinder, for the purpose set forth.

3. The adjustable rotating fluted roller Q, in combination with a saw-cylinder, M, and cotton-box of a cotton-gin, substantially as and for the purpose set forth.

255,943. Cotton-Gin. William L. Crowson, St. Louis, Mo. Filed June 23, 1880. (No model.)

Claim.—1. The combination of the saw-cylinder C, having saws *c c'*, and the retarding-cylinder D, having circumferential grooves d^3, forming ribs *d*, the retarding-cylinder being mounted to receive only the teeth *c'* in its grooves, leaving spaces d^3 on each side of the teeth *c'*, and the bodies *c* of the saws, and the periphery of the saw-cylinder forming ⊔-shaped channels in connection with the ribs through which the cotton is drawn while the seeds are kept from passing, as set forth.

255,943.



2. The saw-cylinder C, having saws *c c'*, and retarding-cylinder D, having circumferential grooves d^3, forming ribs *d*, provided with small recesses d', the said cylinders being so arranged that the teeth only of the saws can work within the grooves, and thus provide U-formed channels for the cotton removed from the seeds to pass through, as set forth.

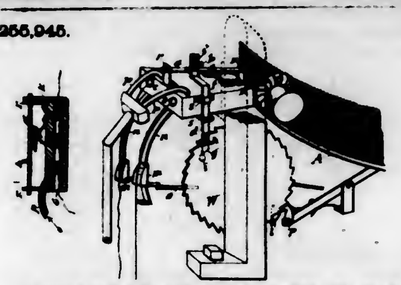
3. The combination of the saw-cylinder C, brush-cylinder F, fixed brush-strips G, and rollers *g*, substantially as set forth.

4. The combination, with the brush-cylinder F, fixed brush-strips G, and rollers *g*, of the additional cylinder, F', and moving rollers g^3 g^3, the said additional cylinder being provided with means for giving it faster rotation than the first brush-cylinder, as set forth.

255,944. CORD-TYER FOR GRAIN-BINDERS. J. HENRY DEAN, Kalamazoo, Mich., assignor to Whiteley, Fassler & Kelly, Springfield, Ohio. Filed Apr. 6, 1880. (Model.)

Claim.—1. A device for tying knots, consisting of a rotating holder to seize and hold the ends of the band when the same has been severed from the band material and carry the same around a central neck having a lip or flange on one side, mechanism which causes said neck to retreat within a coil so as to confine the cord on one side, a central holding-hook, and mechanism by which said hook is caused to seize and hold the ends while the loop which forms the knot is cast off over said held portion, whereby the cord which forms the knot is held and controlled positively during each step of the process of tying the knot.

2. The looper D, provided with a neck to receive the turns of the cord, and a laterally-projecting lip or flange, *c*, on one side, forming a detent to hold the cord on the neck, combined with an axially-reciprocating hook, whereby the outer part is held in position and carried across the end of said neck into the looping hook or jaw, whereby the ends are then seized and held while the loops are being cast off to form the knot.



255,945. KNITTING-MACHINE. JAMES DEUTOS, Amsterdam, N. Y., assignor of one-fourth to John K. Warnick, same place. Filed Jan. 14, 1882. (No model.)

Brief.—The invention is adapted to the knitting of single-threaded figured fabrics. Blow-pipes are connected with the tubular thread-guides, and when it is desired to feed a particular kind or color of yarn to the knitting-burr the end of said yarn is propelled forward through the tubular guide by pressure of air, aided by the thread-lifting devices in the rear of the guides. Simultaneous with the feeding of one thread to the needles the one being knitted in is severed by a double-bladed knife, adapted to oscillate across the ends of the tubular guides, and serving at the same time as a valve to open and close the ends of said tubular guides. Novel devices are provided for operating the combined knife and valve and thread-lifters.

Claim.—1. In combination with the needle-cylinder and burr or loop-wheel of a knitting-machine, a tubular thread-guide arranged to deliver the thread to the burr, and a blow-pipe communicating with the interior of said thread-guide and arranged to propel, by pressure of air or other analogous fluid or gas, the thread introduced in said thread-guide, substantially as set forth.

2. In combination with the needle-cylinder and burr or loop-wheel of a knitting-machine, two tubular thread-guides, two blow-pipes arranged to force currents of air through said thread-guides, and a combined knife and valve for severing the thread and controlling said air-currents, as set forth

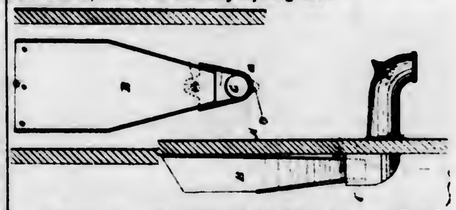
255,945.

3. The combination, with the needle-cylinder and needles, of two tubular thread-guides arranged to feed separate threads to said needles, blow-pipes for forcing currents of air through said thread-guides, a knife arranged to oscillate across the paths of the two threads, and mechanism for transmitting motion from the cylinder to the oscillating knife, all as specified.

4. The combination, with the needle-cylinder and the thread-guides *c c*, of the blow-pipes *p p* and the combined knife and valve K, arranged to alternately open and close the thread-guides, and mechanism for transmitting motion from the cylinder to said combined knife and valve, substantially as described and shown.

5. The combination, with the thread-guides *c c*, of the rock-shaft *a*, provided with the knife K and with the arm *b*, the pitman *d*, engaging the arm *b*, and suitable mechanism for imparting an intermittent reciprocating motion to the pitman, as and for the purpose set forth.

6. In combination with the thread-guides *c c*, the rock-shaft *a*, provided with the knife K and with the arm *b* and cam *e*, the pitman *d*, having the slot *e*, engaged with arm *b*, the spring *f*, engaging with cam *e*, and mechanism for operating said pitman, as described.



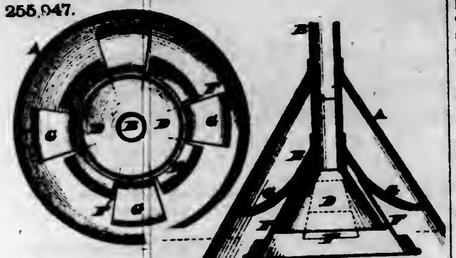
7. In combination with the thread-guides *c c*, the rock-shaft *a*, provided with the knife K, arm *b*, and cam *e*, the spring *f*, engaging said cam, the pitman *d*, engaging the arm *b*, and provided with the beveled foot-piece *g* and with the lug *h*, the ratchet-wheel W, provided with the lug *i* and beveled shoulder *l*, the pawl P, lever L, needle-cylinder A, and a cam or ratchet connected with said cylinder or its spindle, substantially as shown and set forth.

8. The combination of the tubular thread-guide *c*, the blow-pipe *p*, combined knife and valve K, thread-lifter *m*, and mechanism for imparting an intermittent movement to said thread-lifter and knife, as specified and shown.

9. The combination of the thread-guide *c*, blow-pipe *p*, combined knife and valve K, and mechanism for operating the same, curved bar *a*, sliding block *m*, the wheel W, provided with the arm *e*, and mechanism for imparting motion to the wheel W, substantially as described and shown.

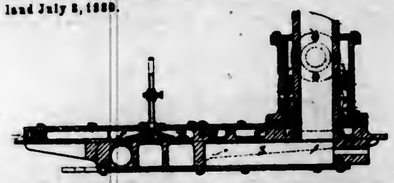
255,946. WATER-ELEVATOR. HENRY DICKINSON, Lowell, assignor to Louisa C. Warner, Crown Point, Ind. Filed Oct. 28, 1881. (No model.)

Brief.—The spout C is made of cast metal and separate from the receiver, which has uniformly-tapering sides.



Claim.—In a water-elevator, the casing *a*, cast spout C, and uniformly-tapering sheet-metal receiver-funnel B', all combined and operating substantially as set forth.

255,947. WASHING-MACHINE. JOHN C. DIENELSHELDER, Cincinnati, Ohio. Filed Jan. 26, 1882. (No model.)



255,947.

Claim.—A clothes-washer consisting of the imperforate conical shells A D and an intermediate slotted cone, E F, which latter has deflecting-plates G, the free ends of which are secured to the inner surface of the cone A, said shells A D E being attached to a common axial support, B, substantially as herein described.

255,948. PROCESS OF AND APPARATUS FOR CARBURETING AIR. HARDLEY LOUIS CHARLES, Comte D'Ivernois, Paris, France. Filed Aug. 25, 1881. (No model.) Patented in England July 8, 1880.

Claim.—1. The method of carbureting air for gas-engines and utilizing the waste gases from said engines by vaporizing the hydrocarburet, mixing the vapor with air, conducting the mixture to the cylinder of the gas-engine, where it is exploded, and conducting the hot products of explosion into the carbureting apparatus to heat the same, substantially as described.

2. The combination of the carbureting-chamber provided with a vaporizing-plate and air inlets or passages with a pipe for delivering the hydrocarbon terminating in a series of small tubes above said plate and extending to different portions thereof, substantially as described.

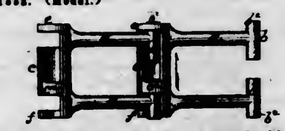
3. The combination, with a carbureting-chamber provided with a vaporizing-plate and a pipe for delivering the hydrocarbon, of a series of air-inlet openings extending the width of said plate and a common valve for regulating the flow of air through said openings, substantially as described.

4. The combination of a delivery-pipe for the hydrocarbon and the carbureting-chamber provided with a vaporizing-plate adapted to be heated, and also with inlet and outlet openings just above the level of said vaporizing-plate, on opposite sides of the same, so that the air sweeps in a broad belt over the surface of said plate and carries off the hydrocarbon as it volatilizes, substantially as described.

5. The combination, with the volatilizing-chamber provided with air-inlets and a vaporizing plate or body, of a mixing-chamber having a series of perforated diaphragms for securing the thorough mixture of the air with the hydrocarbon vapors as they pass through said chamber, substantially as described.

6. The combination of the corrugated or roughened plate, passages for admitting air in contact therewith, and a pipe terminating above said plate for dropping hydrocarbon thereon, substantially as described.

7. The combination, with the pipe for delivering hydrocarbon and the volatilizing-chamber having inlet for air and outlet for the mixture of air and hydrocarbon vapor, of an S-shaped flue beneath said chamber, substantially as described.

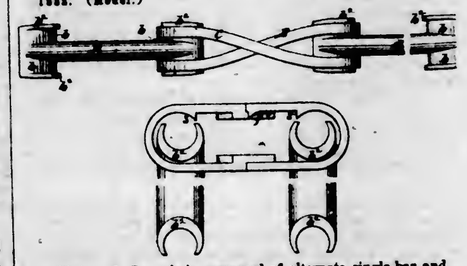


8. The combination, with the vaporizing-chamber, of a mixing-chamber connected with the vaporizing-chamber and a flue communicating with the space under the latter and passing through the mixing-chamber for maintaining the temperature thereof, substantially as described.

9. The combination, with the vaporizing-chamber provided with inlets for the air and outlets for the mixture of air and vapor, of the mixing-chamber communicating with the latter and having a check, perforated plates, and wire-gauze therein, substantially as described.

10. In an apparatus for carbureting air, a vaporizing-chamber the bottom of which is formed by the plate by which the vaporization of the hydrocarbon is effected, and two opposite sides of which contain the one air-inlets and the other outlets for the air and vapor, the air in passing through said chamber sweeping over the top of said plate, substantially as described.

11. In an apparatus for carbureting air, a volatilizing-chamber provided with a plate adapted to be heated for effecting the volatilization of the hydrocarburet liquid, means for admitting the latter into contact with said plate in regulated quantities, inlets or passages for admitting external air into said chamber, a flue or passage beneath said plate adapted to convey heat thereto, and devices for effecting the thorough admixture of the air and hydrocarbon vapor, substantially as described.

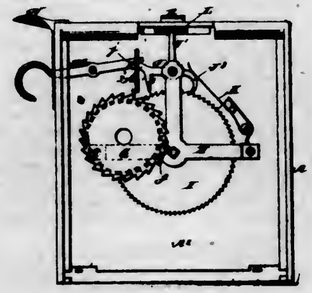


255,949. DRIVE-CHAIN. JAS. H. DODGE, Chicago, Ill. Filed Jan. 26, 1882. (Model.)

Claim.—1. A chain-link formed at one end with a divided end bar and lateral extensions b^3 thereof, and provided at the other end with a main coupler device, *c c'*, partially open and partially closed, as specified, and two auxiliary coupler devices, one at either side of the link, and the two in line with the main coupler.

2. A detachable chain composed of duplicate parts, each of which is a link having a divided end bar at one end and three coupler devices *d c'*, *e*, and *f*, at the other end, substantially as set forth.

255,950. CHAIN. JAS. H. DODGE, Chicago, Ill. Filed Jan. 26, 1882. (Model.)

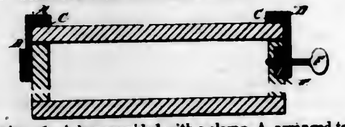


Claim.—1. In a chain composed of alternate single-bar and double-bar links, a link composed of two open bars or devices, B and C, adapted for arrangement crosswise of each other, and operating, when so arranged, to accommodate within their adjacent ends the pintle-like devices of the single-bar links, substantially as set forth.

2. In combination with a double-bar link having loop-like ends to form the female members of articulation, a single-bar link having at its end a pintle-like device, *b*, provided with a retaining-flange, b^2, the whole constructed to operate substantially as set forth.

3. In combination with a link composed of two parts, B and C, and a link having a pintle-like device, *b*, the enlargements or projections *e* of the two-part or double-bar link, for the purpose of preventing the backing out from its bearings in the ends of the two-part link of the pintle of the single-bar link.

255,951. BALLOT-BOX. THOMAS F. DODGE, Lawton, Mich. Filed July 18, 1881. (No model.)



Claim.—1. In a registering ballot-box, the pivoted verge J, provided with a horn, J', an arm, J², an impulse-pallet, and a detent-pallet, in combination with ballot-hole slide L, engaged by said horn, lever M, which operates on said arm, and ratchet-wheel I, which is advanced by said impulse-pallet, and also slightly advanced at each engagement of said detent-pallet, for the purpose set forth.

2. Dial-casing C, provided with fastening-hooks, and lock C', in combination with slotted partition A³ and recessed sliding bottom A', substantially as set forth.

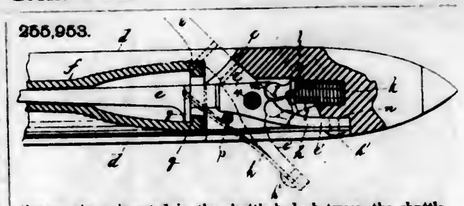
3. In a ballot-box, the combination of a ratchet-wheel forming part of the registering mechanism, and an operating-lever with a verge actuated by said lever, and provided with two pallets, both of which bear on the inclined faces of said teeth, substantially as and for the purposes set forth.

4. In a ballot-box, the combination of a ratchet-wheel forming part of the registering mechanism, and an operating-lever, with a verge having a detent-pallet which acts against the inclined faces of the teeth of said wheel, so as to operate to some extent as an impulse-pallet also, for the purpose set forth.

255,952. BOX-FASTENER. WILLIAM H. DUCKER, Brooklyn, N. Y. Filed Dec. 14, 1881. (No model.)

Claim.—1. A box provided with a clamp, A, arranged to slide in a recessed plate fastened to one side of the box, in combination with a screw-clamp, D, on another side of the box, such clamp D attached to the side of the box by a suitable screw to fasten the same to the box, which screw acts also as a pivot on which to turn the clamp D out of the way when not in use, such clamps having shoulders to catch over the lid and fasten the same to the box, substantially as described and shown.

2. A box having a clamp, A, provided with a shoulder to catch over the edge of the lid, in combination with a recessed plate, B, on the side of the box, within which the clamp slides up, to permit the lid to be fastened under its shoulder and slides down and out of the way when the lid is withdrawn, substantially as described and shown.



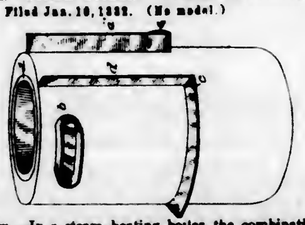
3. The combination, with a box, of a clamp, D, provided with a shoulder to catch over the edge of the lid, such clamp D fastened to the side of the box by a suitable screw, which screw also acts as a pivot on which to turn the clamp out of the way, substantially as shown, and for the purposes described.

4. The combination, with a box provided with clamps to hold the lid to the box, of the saddles C, having shoulders fitted to receive the holding-lips of the clamps and prevent the lid from moving sidewise, whereby the bearing part of the lid is strengthened and cleats to hold the lid in position are dispensed with, substantially as described and shown.

5. The combination, with a box and a clamp provided with a shoulder to catch over the edge of the lid, of a re-enforce plate for the side of the box, each clamp and plate provided with coincident recesses and projections to interlock when the parts are adjusted to hold the lid and with a screw to fasten the same, substantially as shown, and for the purposes described.

6. The combination, with a box and a clamp with a shoulder to hold the lid to the box, of the screw F, having a part of its shank at the head and at the point provided with threads, and an intermediate part of a smaller diameter without threads to hold the clamp in position, substantially as shown, and for the purposes described.

255,953.



tionary pin *p*, inserted in the shuttle-body between the shuttle-spindle and its spring, substantially as and for the purposes set forth.

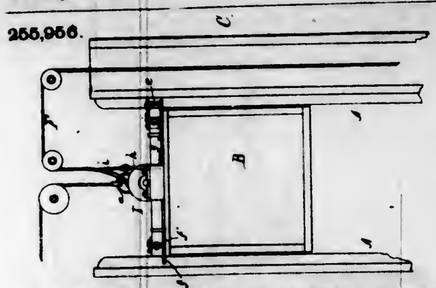
2. The combination of a bobbin pressing and binding spring, *b*, constructed to bear against the outside of a bobbin, and the shuttle-spindle *c*, provided with the bobbin-holding shoulder *g*, and curved recess *m*, with spring *b* and knuckle *l l'*, substantially as and for the purposes set forth.

3. The combination of a shuttle-spindle provided with a shoulder, *g*, and a bobbin-holding spring adapted to press against the outside of a bobbin provided with an internal shoulder and hold the same in engagement with the shoulder *g* upon the spindle, with means for relieving the pressure of the spring, substantially as set forth.

255,954. STEAM-BOILER. WILLIAM B. DENNING, Geneva, N. Y. Filed Jan. 10, 1882. (No model.)

Claim.—In a steam-heating boiler, the combination of the annular boiler, the inner and outer smoke-chambers, the tubes *b*, near the upper end of the boiler, connecting such inner and outer smoke-spaces, partitions *d d*, forming a vertical flue and the horizontal partitions *e e*, extending from the said vertical partitions partially around the boiler, whereby the products of combustion are caused to circulate around the boiler, first above and then below the horizontal partitions, to the flue or passage formed by the vertical partitions.

255,955. DENTAL PLUGGER. EDWARD ENU, Cedar Rapids, Iowa. Filed Aug. 31, 1881. (Model.)

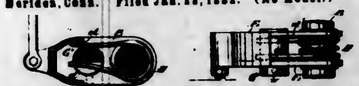


Claim.—1. The combination, with the casing E and the operating mechanism, of the casing B and the plunger A, held loosely within the said casing, substantially as and for the purpose set forth.

2. The combination, with the casing E and the operating mechanism, of the casing B, the plunger A, held loose in said casing, and the spring D, interposed between the top of the plunger and casing, substantially as and for the purpose set forth.

3. The combination, with the dental-engine hand-piece G, of the shaft M, the crank-shaft H, the bevel-gear wheels K and L, the connecting-rod J, the casing B, the spring D, and the plunger A, contained in the casing B, substantially as herein shown and described, and for the purpose set forth.

255,956. CONSTRUCTION OF CORD-ELEVATORS. ANSON M. ENGLISH, Providence, R. I., assignor of one-fourth to Clarence E. Chandler, Meriden, Conn. Filed Jan. 23, 1882. (No model.)

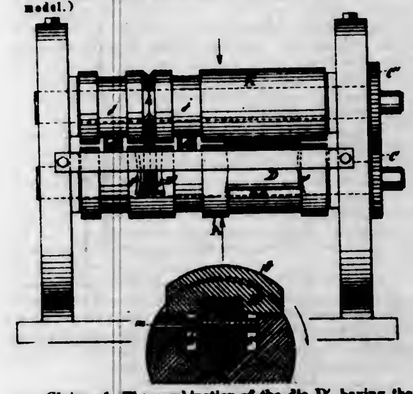


5. The combination of the cord F, spool I, separating-cord *i*, and screw-shaft H with the traveling nuts *d*, levers *b*, and clamping guide-shoes *e*, substantially as described.

6. The combination of the springs *c* with the levers *b*, shoes *e*, screw-shaft H, traveling nuts *d*, and guideways A, on which the shoes act, substantially as described.

7. The combination of the elevator-cage, the screw-shaft H, and cord F with the air-tube C, weight or plunger D, and a tripping device between the elevator-cage and the said cord, substantially as described.

255,957. FRICTION-CLUTCH. ANSON M. ENGLISH, Providence, R. I., assignor of one-fourth to Clarence E. Chandler, Meriden, Conn. Filed Jan. 23, 1882. (No model.)

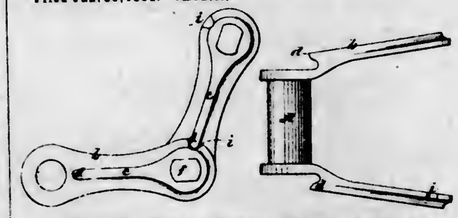


Claim.—1. An improved friction-clutch consisting of a band or wire coiled around a shaft and having its end or ends projecting from the shaft for receiving the power, substantially as shown and described, whereby when the said end or ends are turned the coil is tightened upon the shaft and both coil and shaft are turned together, as set forth.

2. In a friction-clutch, the combination, with a band or wire coiled around a shaft and having its ends projecting from the shaft, of a shifter or device for holding either of the ends of this wire or band, substantially as herein shown and described, and for the purpose of adjusting the clutch to operate in either direction of rotation, as set forth.

3. In a friction-clutch, the combination, with the wire or band D, coiled around a shaft, and having its ends *d d'* projecting from the shaft, of the casing E, loosely mounted on the shaft, and of a shifter or cam-shaft, G G', in this casing, substantially as herein shown and described, and for the purpose of adjusting the clutch to operate in either direction of rotation, as set forth.

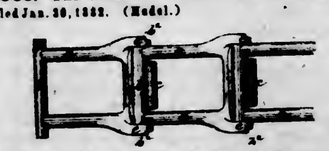
255,958. ROLLING-MILL FOR TAPERING SPRING-POINTS. WILLIAM EVANS, Philadelphia, Pa. Filed Oct. 26, 1881. (No model.)



Claim.—1. The combination of the die D', having the circumferential annular rib *g* and flat marginal surfaces *i i*, block *b'*, adjusting-screw E', and roller A, with the roller A', having an annular groove, *h*, for ribbing the tapered ends of the springs, the die being held in its adjusted position by means of the key *f'*, substantially as described.

2. The combination of the roller A, provided with dies D and D', with the roller A', having an annular groove, *h*, and gear-wheels C and C', with unequal numbers of teeth, this combination being such that the surfaces which come in contact with the springs shall vary in their relative positions, substantially as and for the purpose set forth.

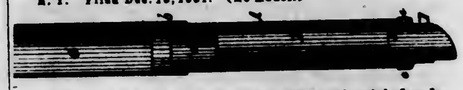
3. The combination of the segmental dies D and D', having blocks *b* and *b'*, the screws E and E', and keys *f* and *f'*, with the roller A, having recesses *e* and *e'*, substantially as and for the purpose set forth.



255,959. DRIVE-CHAIN. WILLIAM D. EWART, Chicago, Ill. Filed Jan. 30, 1882. (Model.)

Claim.—1. A chain-link composed of one tubular end bar and two side bars, said side bars being provided with keepers *d d* and a notch or cut-out, *i*, and formed either parallel with each other or otherwise, substantially as and for the purpose specified.

2. A chain composed of duplicate links each formed with one end bar and two side bars, as specified, and provided with keepers *d d* and a notch, *i*, the said links being hinged together by a suitable pintle.



255,960. DRIVE-CHAIN. WILLIAM D. EWART, Chicago, Ill. Filed Jan. 30, 1882. (Model.)

Claim.—1. A chain-link having the projections or extensions b^2 b^2 at one end and provided with an open coupler-hook, *c*, and prongs or keeper devices *e e* at the other end, the whole constructed and adapted to operate as described.

2. A drive-chain composed of links each of which has the projections b^2 b^2 at one end and the open hook *c* and keeper devices *e e* at the other end, and all of which are coupled and held together by the insertion of the end bar, *b*, within the coupler-hooks *c*, and the partial encirclement of the projections b^2 b^2 by the keepers *e e*, as set forth.

255,961. PEN-HOLDER. EBERHARD FABER, Port Richmond, N. Y. Filed Dec. 15, 1881. (No model.)

Claim.—1. The combination, substantially as hereinbefore described, of the anti-nervous material A, the internal tubular support, B, for the same, the staff or handle C, having a projecting part extending over and surrounding the upper end of the anti-nervous material to conceal and protect the edge thereof, and a flange on the tip D surrounding the lower edge of the anti-nervous material, as set forth.

2. The combination, substantially as hereinbefore described, of the anti-nervous material, the tubular support, the handle, the pin formed on said handle and fitting the interior of the tubular support, the ferrule secured to the handle and projecting over the inner edge of the anti-nervous material and the tip.

3. The combination, substantially as hereinbefore described, of the anti-nervous material, the tubular support, the handle connected to the tubular support, the tip D, and the cap *c*, formed on said tip and constructed to conceal and protect the outer edge of the anti-nervous material.

255,962. CORN-PLANTER. JOHN FELDMEIR, Oskaloosa, Kans. Filed Sept. 10, 1881. (Model.)

255,958. LOOM-SHUTTLE. SUMNER A. DUDLEY, Wilkinsonville, Mass. Filed June 27, 1881. (No model.)

Brief.—The shuttle-spindle is formed with a shoulder upon one side, which engages with a shoulder upon the interior of a bobbin placed thereon. A spring secured to the heel of the spindle presses against the outside of the bobbin, when the spindle is depressed into the shuttle-body and holds the bobbin thereon. A pin in the shuttle-body holds back the spring as the spindle is elevated to release its pressure upon the bobbin. A spring-pressed block or knuckle having a rounded head bearing in a notch formed in the spindle-heel acts to maintain the spindle in its elevated or depressed position.

Claim.—1. The combination, with shuttle-body *d*, of shuttle-spindle *c*, provided with shoulder *g* on one side thereof, spring *b*, adapted to press upon the outer periphery of a bobbin, and sta-

255,956. CONSTRUCTION OF CORD-ELEVATORS. ANSON M. ENGLISH, Providence, R. I., assignor of one-fourth to Clarence E. Chandler, Meriden, Conn. Filed Jan. 23, 1882. (No model.)

5. The combination of the cord F, spool I, separating-cord *i*, and screw-shaft H with the traveling nuts *d*, levers *b*, and clamping guide-shoes *e*, substantially as described.

6. The combination of the springs *c* with the levers *b*, shoes *e*, screw-shaft H, traveling nuts *d*, and guideways A, on which the shoes act, substantially as described.

7. The combination of the elevator-cage, the screw-shaft H, and cord F with the air-tube C, weight or plunger D, and a tripping device between the elevator-cage and the said cord, substantially as described.

255,957. FRICTION-CLUTCH. ANSON M. ENGLISH, Providence, R. I., assignor of one-fourth to Clarence E. Chandler, Meriden, Conn. Filed Jan. 23, 1882. (No model.)

Claim.—1. An improved friction-clutch consisting of a band or wire coiled around a shaft and having its end or ends projecting from the shaft for receiving the power, substantially as shown and described, whereby when the said end or ends are turned the coil is tightened upon the shaft and both coil and shaft are turned together, as set forth.

2. In a friction-clutch, the combination, with a band or wire coiled around a shaft and having its ends projecting from the shaft, of a shifter or device for holding either of the ends of this wire or band, substantially as herein shown and described, and for the purpose of adjusting the clutch to operate in either direction of rotation, as set forth.

3. In a friction-clutch, the combination, with the wire or band D, coiled around a shaft, and having its ends *d d'* projecting from the shaft, of the casing E, loosely mounted on the shaft, and of a shifter or cam-shaft, G G', in this casing, substantially as herein shown and described, and for the purpose of adjusting the clutch to operate in either direction of rotation, as set forth.

255,958. ROLLING-MILL FOR TAPERING SPRING-POINTS. WILLIAM EVANS, Philadelphia, Pa. Filed Oct. 26, 1881. (No model.)

Claim.—1. The combination of the die D', having the circumferential annular rib *g* and flat marginal surfaces *i i*, block *b'*, adjusting-screw E', and roller A, with the roller A', having an annular groove, *h*, for ribbing the tapered ends of the springs, the die being held in its adjusted position by means of the key *f'*, substantially as described.

2. The combination of the roller A, provided with dies D and D', with the roller A', having an annular groove, *h*, and gear-wheels C and C', with unequal numbers of teeth, this combination being such that the surfaces which come in contact with the springs shall vary in their relative positions, substantially as and for the purpose set forth.

3. The combination of the segmental dies D and D', having blocks *b* and *b'*, the screws E and E', and keys *f* and *f'*, with the roller A, having recesses *e* and *e'*, substantially as and for the purpose set forth.

255,959. DRIVE-CHAIN. WILLIAM D. EWART, Chicago, Ill. Filed Jan. 30, 1882. (Model.)

Claim.—1. A chain-link composed of one tubular end bar and two side bars, said side bars being provided with keepers *d d* and a notch or cut-out, *i*, and formed either parallel with each other or otherwise, substantially as and for the purpose specified.

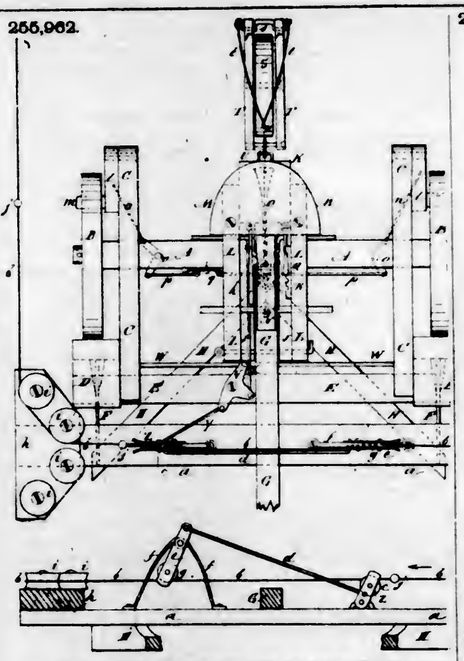
2. A chain composed of duplicate links each formed with one end bar and two side bars, as specified, and provided with keepers *d d* and a notch, *i*, the said links being hinged together by a suitable pintle.

255,960. DRIVE-CHAIN. WILLIAM D. EWART, Chicago, Ill. Filed Jan. 30, 1882. (Model.)

Claim.—1. A chain-link having the projections or extensions b^2 b^2 at one end and provided with an open coupler-hook, *c*, and prongs or keeper devices *e e* at the other end, the whole constructed and adapted to operate as described.

2. A drive-chain composed of links each of which has the projections b^2 b^2 at one end and the open hook *c* and keeper devices *e e* at the other end, and all of which are coupled and held together by the insertion of the end bar, *b*, within the coupler-hooks *c*, and the partial encirclement of the projections b^2 b^2 by the keepers *e e*, as set forth.

255,961. PEN-HOLDER. EBERHARD FABER, Port Richmond, N. Y. Filed Dec. 15, 1881. (No model.)



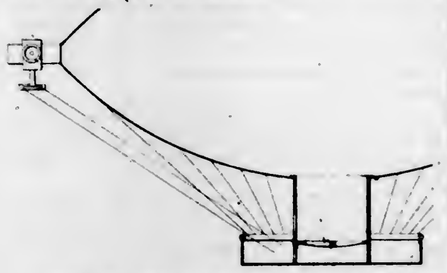
Claim.—1. The combination, substantially as hereinbefore described, of the anti-nervous material A, the internal tubular support, B, for the same, the staff or handle C, having a projecting part extending over and surrounding the upper end of the anti-nervous material to conceal and protect the edge thereof, and a flange on the tip D surrounding the lower edge of the anti-nervous material, as set forth.

2. The combination, substantially as hereinbefore described, of the anti-nervous material, the tubular support, the handle, the pin formed on said handle and fitting the interior of the tubular support, the ferrule secured to the handle and projecting over the inner edge of the anti-nervous material and the tip.

3. The combination, substantially as hereinbefore described, of the anti-nervous material, the tubular support, the handle connected to the tubular support, the tip D, and the cap *c*, formed on said tip and constructed to conceal and protect the outer edge of the anti-nervous material.

255,962. CORN-PLANTER. JOHN FELDMEIR, Oskaloosa, Kans. Filed Sept. 10, 1881. (Model.)

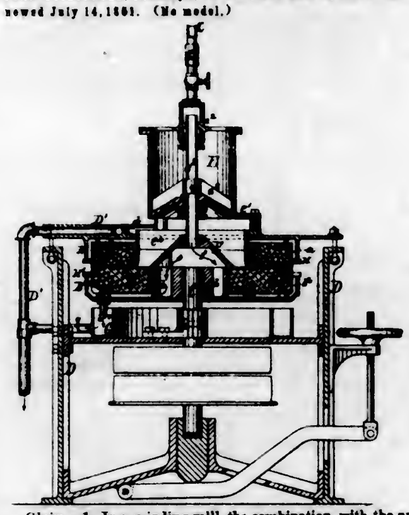
255,962.



Claim.—1. The combination, with the tongue G, of the parallel pivoted bars J, passing under the axle A and carrying at their rear ends the central hopper K, as shown and described.

2. The lever N, combined with the bars J, hoppers D K, runners F O, tongue G, and braces H, whereby the hopper K and runner O will be lifted as the hoppers D and runners F are depressed, for the purpose set forth.

3. The combination, with the three-armed lever V, which operates the seed-slides, of the lever Z, the rod Y, pivoted to levers V Z, the forked and hinged cross-bar *a*, the cheek-rods *b*, having knobs *f* and carrying pivoted pulley *c*, the hinged and forked lever *e*, carrying pivoted pulley *g*, the rod *d*, pivoted to levers *e* Z, and the pulleys *i* on the cross-heads *h* of bar *a*, as and for the purpose set forth.

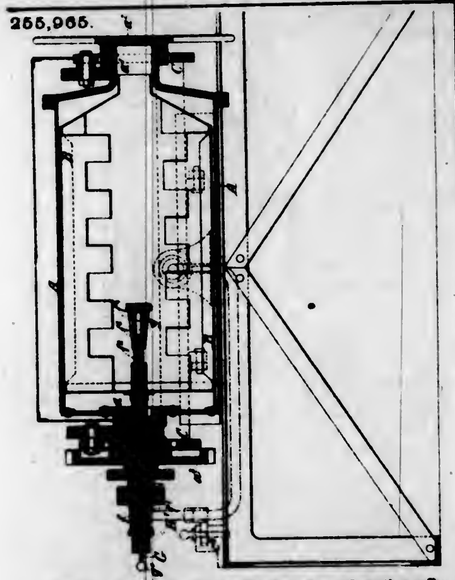


255,963. BALLOON. CHARLES P. PEET, Philadelphia, Pa. Filed Oct. 10, 1881. (No model.)

Brief.—The same medium which inflates the balloon also serves for its propulsion and guidance. To this end a valve, *i*, controllable from the gallery D, is provided with ports *n*, adapted to register with corresponding ports in the branches *g g'* *h*, but no two of which can at the same time communicate with the port *m* of the supply-branch *d*. The rear branch propels, the side branches vary the course, and all three of them are grooved to increase the impact of the gas upon the atmosphere.

Claim.—The within-described steering device for aerial vessels, the said device comprising a valve, *i*, and a valve-chest having discharge-branches with spiral grooves, as set forth.

255,964. COOLING MECHANISM FOR GRINDING-MILLS. JOHN FITZGERALD, Brooklyn, N. Y. Filed Dec. 4, 1880. Renewed July 14, 1881. (No model.)



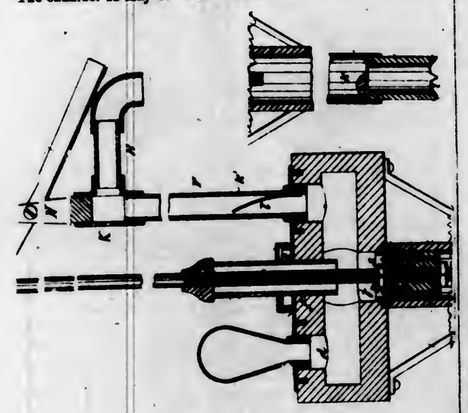
Claim.—1. In a grinding-mill, the combination, with the upper or stationary grinding-stone, A, of the casing A' and ring H, said casing being of greater diameter than the stone, and having the circular projection *a'* upon its inner face, as described, thus constituting a circumferential chamber, *a*, about the periphery and a chamber upon the back of the stone, said circumferential chamber being divided by radial partitions into chambers more or less in number, each subdivision being provided with an inlet-pipe about midway between the ends thereof, and with a gate at each end thereof opening into one of each of the chambers into which the aforesaid chamber on the back of the stone is divided by means of radial partitions, as shown, and which subdivisions are of such a number and arrangement relatively to the subdivisions of the circumferential chamber as to be in pairs, as specified, each pair being provided with a common outlet-pipe, all as described, and for the purpose set forth.

2. In a grinding-mill, the combination, with the lower or moving stone, B, of the casing B' and ring H', said casing being of greater diameter than the stone, and having the circular projection *b'* upon its inner face, as described, thus constituting a circumferential chamber, b^9, about the periphery of the stone and a chamber upon the back of the stone, said chamber on the back of the stone being divided by radial partitions into chambers more or less in number, each subdivision having an inlet-gate, b^{13}, leading into it from a chamber, *b*, about the hub or center of the stone, and a gate, b^{14}, leading from it at a point in its opposite wall most remote from said inlet-gate into a subdivision of the aforesaid circumferential chamber on the periphery of the stone, which subdivision is provided with a discharge-opening, b^{17}, at a point in the wall thereof most remote from the gate b^{14}, as described, and for the purpose specified.

3. In a grinding-mill, the combination, with the lower or moving stone, B, of the casing B' and ring H', said casing being of greater diameter than the stone, and having the circular projection *b'* upon its inner face, as described, thus constituting a circumferential chamber, b^9, about the periphery of the stone and a chamber upon the back of the stone, said chamber on the back of the stone being divided by radial partitions into chambers more or less in number, each subdivision having an inlet-gate, b^{13}, leading into it from a chamber, *b*, about the hub or center of the stone, and a gate, b^{14}, leading from it at a point in its opposite wall most remote from said inlet-gate into a subdivision of the aforesaid circumferential chamber on the periphery of the stone, which subdivision is provided with a discharge-opening, b^{17}, and pipe b^{18} at a point in the wall thereof most remote from the gate b^{14}, together with the trough O, as described, and for the purpose specified.

255,965. PROCESS OF AND APPARATUS FOR ROASTING COFFEE. FRANCIS G. FLEURY and EDWARD D. BARBER, London, England, assignors of one-third to Thomas Davies, same place. Filed Apr. 6, 1881. (No model.) Patented in England June 24, 1880, and in France Dec. 24, 1880.

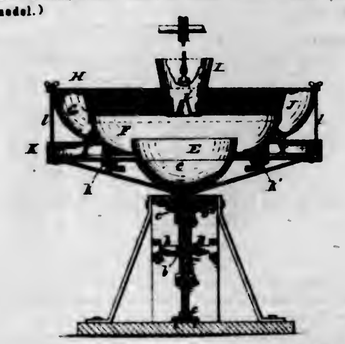
255,965.



Claim.—1. The improvement in the process of roasting coffee, consisting in charging the roasting-cylinder with compressed air or gas under a pressure in excess of the atmospheric pressure before the roasting commences, whereby the volatile liquids and essential oils contained in the coffee and ordinarily vaporized and expelled by the roasting-heat will be retained in great part in the berry itself, substantially as herein described.

2. The air-tight rotating roasting cylinder or vessel A B, provided with hollow journals *a a'* for respectively admitting and discharging the coffee-berries and the compressed air or gas used to retain the volatile liquids and essential oils contained in the berries, such cylinder being mounted in the skeleton-frame C, provided with hollow trunnions *c c'* for the passage through them of the air-pipes H H', such cylinder being, moreover, furnished with a tube, *f'*, closed at its inner end by a laterally-slotted conical shell, *f''*, into which fits a similarly-slotted plug, *f'''*, bored to admit the receiver *g*, attached to the test-rod G, which rod serves to withdraw samples from time to time during the roasting operation, as set forth.

255,966. PUMP. MOSES GAYMAN, Canal Winchester, Ohio, assignor to himself and O. P. Gayman, same place. Filed Nov. 19, 1881. (No model.)



Brief.—The air-chamber E is adjustable on the piston-rod D. The chamber A may be wood or iron.

Claim.—1. The combination, with the externally end-threaded pipes F H and fulcrum-post N, of the three-way joint K, internally screw-threaded at each of its openings, as and for the purpose specified.

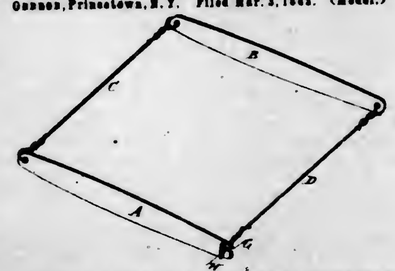
2. The combination, with the discharge-pipe F, having waste-hole *h'*, of the plate-spring fastened at bottom, arranged to cover the hole when the pump is in operation and to spring away from the hole as soon as the pump ceases to work, as shown and described.

255,967. CENTRIFUGAL MACHINE FOR SEPARATING ORES. GILBERT GLASS, White Oaks, N. Mex. Filed July 30, 1881. (No model.)

Claim.—1. In a centrifugal machine, receptacle F, provided with filter J, and concave receptacle E, combined and operating substantially as set forth.

2. In a centrifugal machine, receptacle F, provided with filter J and cover H, and concave receptacle E, combined and operating substantially as set forth.

3. In a centrifugal machine, receptacle F, provided with filter J, and amalgamated receptacle E, combined and operating substantially as set forth.



4. In a centrifugal machine, receptacle F, provided with filter J and cover H, and amalgamated receptacle E, combined and operating substantially as set forth.

5. A centrifugal machine consisting of the receptacles E, F, and G, filter J, cover H, and suitable revolving mechanism, all combined and operating substantially as and for the purpose set forth.

6. A centrifugal machine consisting of receptacles E, F, and G, filter J, cover H, reservoir K, and suitable revolving mechanism, substantially as described.

7. In a centrifugal machine, a revolving cover, H, having hooks *m*, and ropes having hooks *m'*, combined and operating substantially as set forth.

255,968. HAY AND COTTON BALING BAND. WILLIAM S. GORDON, Princetown, N. Y. Filed Mar. 3, 1881. (Model.)

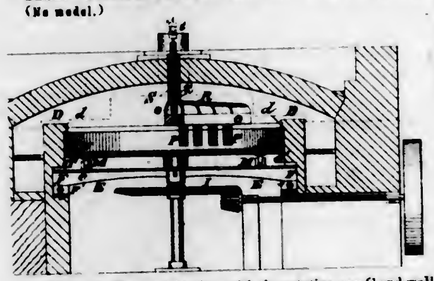
Claim.—1. A baling-band made substantially as herein shown and described, and consisting of two bars or slats united by two wires or chains, one of which is provided with a hook or key for locking its end to the end of one of the bars, as set forth.

2. In a baling-band, the combination, with two bars or slats, of two transverse connecting-pieces, one of which is provided with a T-shaped key for locking its end to the end of one of the bars, substantially as herein shown and described, and for the purpose set forth.

3. In a baling-band, the combination, with the bar or slat B and the bar or slat A, provided at one end with a transverse slot, E, and a slot or recess, G, at right angles to the slot E, and extending from this groove to the end of the bar A, of the wires C and D, the latter provided with a T-shaped key, H, substantially as herein shown and described, and for the purpose set forth.

4. In a baling-band, the combination, with the bar or slat B and a bar or slat, A, provided at one end with a transverse slot, E, transverse grooves F in the outer surface, and a slot or recess, G, of the wires C and D, the latter provided with a T-shaped key, H, substantially as herein shown and described, and for the purpose set forth.

255,969. STATION-INDICATOR. SOCRATES E. GRAVES and DAVID J. EIKEMAN, Winchester, Ill. Filed Jan. 27, 1882. (No model.)



Claim.—1. The combination of a series of station-indicators, each one of which is provided with a grooved wheel, with the bell-rope, which passes through the groove in the wheel, the rope being provided with a series of projections for the purpose of operating the wheels when the rope is pulled toward the front of the train, substantially as shown.

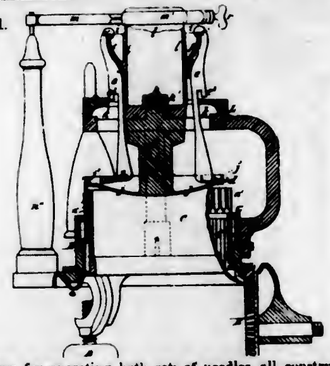
2. In a station-indicator, the combination of the frame A, provided with a station-indicating mechanism, the wheel L, having a grooved edge and hooked corners, with the rope P, having the projections O, and a spring for taking up the slack of the rope, substantially as set forth.

3. In a station-indicator, the combination of the frame A, provided with the wheel L, which has the hollow hub J projecting through the frame, the removable frame H, rollers D, having the square shafts I, the rope P, and stops O, substantially as described.

255,970. APPARATUS FOR THE MANUFACTURE OF RED LEAD. NORRIS B. GREGG, St. Louis, Mo. Filed Dec. 20, 1880. (No model.)

Claim.—1. The combination, with the rotating pan C and wall D *d*, the sides of the pan and the wall being so constructed relatively to each other as to form an annular air-passage, *d'*, of the adjustable spider E, for regulating the flow of air through the passage *d'*, and the supporting-wheels M, substantially as set forth.

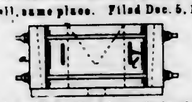
2. The combination, with the fixed stirrer-bar O, of the semi-cylindrical covering-tiles R, vertical flue R', and induction air-tube S, as and for the purposes set forth.



255,971. KNITTING-MACHINE. HENRY J. ORISWOLD, London, County of Middlesex, England. Filed July 15, 1879. Patented in England Oct. 8, 1873, and in France Apr. 8, 1874.

Brief.—The machine is adapted to knit either a flat or tubular web, ribbed or plain. The needles may be adjusted or thrown out of action without removing the loops from the same. The claims fully define the invention.

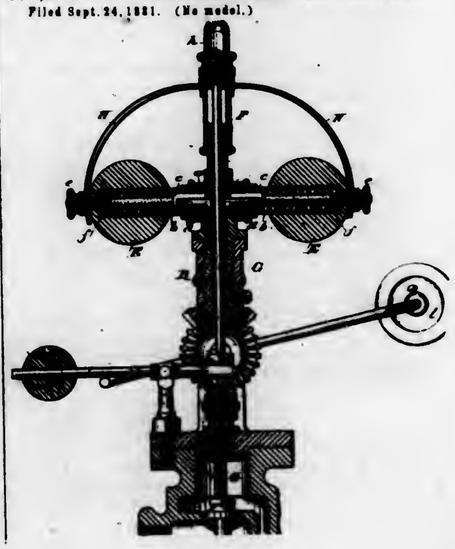
Claim.—1. The combination, with the suspended jacks carrying needles and having lips *c*², of the revolving ring L, adjustable flanged cams *g h*, and plain cam *a*, carried by said ring, as set forth.



2. The combination, in a knitting-machine, of the cylinder provided with needles, a ribbing attachment carrying radial needles, cams for operating both sets of needles, all constructed to permit the knitting to be effected by revolving the cylinder in either direction, and appliances whereby the attachment may be adjusted and secured relatively to the cylinder with its needles, either opposite or between those of the cylinder, substantially as set forth.

255,971.

3. The within-described improvement in the art of manufacturing stockings, the same consisting in first forming the ribs with the ribbing-needles opposite the posts between the cylinder-needles, successively removing cylinder-needles adjacent to the ribbing-needles, putting the stitches over the adjoining needles, and, when a number of needles equal to the ribbing-needles are removed, then adjusting the ribbing device to bring the needles opposite the grooves of the needles removed, substantially as specified.

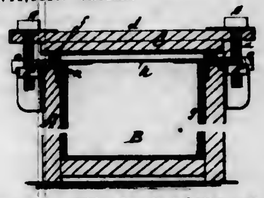


255,972. MOLD FOR MAKING TUBULAR BRICKS. ADAM HANN, Keystone Junction, Pa., assignor of one-half to James Jacob Hoblitzell, same place. Filed Dec. 5, 1881. (No model.)

Claim.—1. A mold for forming tubular bricks, having a hollow core or cores provided with an upper cutting-edge, substantially as and for the purposes described.

2. A mold for forming tubular bricks, having a hollow core or cores provided with an upper cutting-edge, and removable side or end pieces, substantially as and for the purpose described.

255,973. STEAM-GOVERNOR. JOSEPH J. HAHN, Canton, Ohio. Filed Sept. 24, 1881. (No model.)

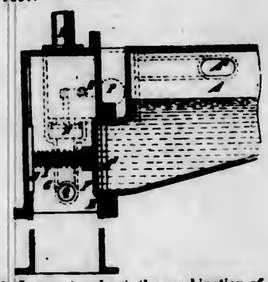


Claim.—1. In a steam-governor, the hollow arms *b b* on which the governor-balls are supported and are free to move thereon toward and from the center of motion, as set forth.

2. In a steam-governor, the hollow arms *b b*, with the balls E E mounted thereon, in combination with the spiral springs *f f* and plungers *c c*, located therein, and set-screws *e e*, whereby the springs are kept from direct contact with the balls, and a more perfect working of the balls toward and from the center of motion is secured, and the amount of force necessary to move the balls is regulated or adjusted, as set forth.

3. In a steam-governor, the driving-shaft B, provided with the hollow arms *b b*, in combination with the spiral springs *f f* and plungers *c c*, located within said hollow arms *b b*, balls E E, elliptical spring H, set-screws *e e*, sleeve F, and valve-stem G, as set forth.

255,974. BUTTER-CASE. JOHN E. HAMLIN, Philadelphia, Pa. Filed Apr. 18, 1881. (Model.)



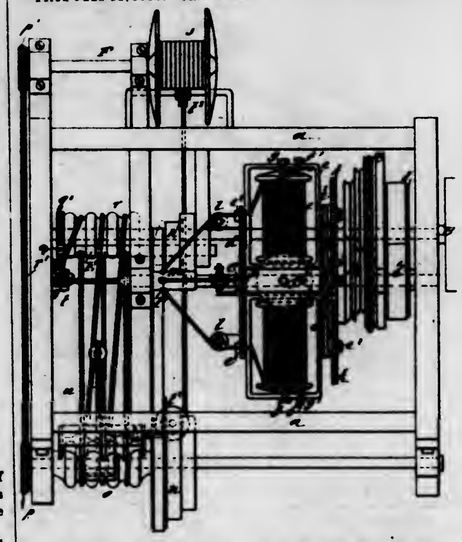
Claim.—1. The within-described butter-case, consisting of casing A, lining B, cover C, paraffine-coated rubber strips *f*, slides *g*, faced with borax-covered muslin, and means for securing the top, substantially as and for the purposes specified.

2. The combination, with a butter-case, of the slides *g*, coated with paraffine, and covered with muslin saturated with a solution of borax, substantially as described, whereby the slides are prevented from rusting, and the moisture and buttermilk absorbed, as set forth.

3. The cast or malleable iron rim *a*, combined with the box A, and its metal lining, substantially as and for the purposes described.

255,975. WATER-CLOSET. THOMAS HANSON, New York, N. Y. Filed July 7, 1881. (No model.)

Claim.—1. In a water-closet, the combination of a basin, a valve-chamber connected thereto, a vertically-arranged valve-seat at the juncture of the basin and chamber, a slide-valve operating in conjunction with said seat to control the escape of the contents of the basin, a guide for said valve, and a guideway parallel with said valve-seat, upon which said guide works, substantially as specified.



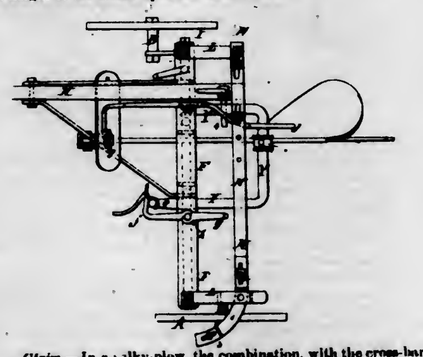
2. In a water-closet, the combination of a basin, a valve-chamber connected thereto, a vertically-arranged valve-seat and slide-valve for controlling the escape of the contents of the basin, a resistance-piece having a sliding connection with the stem of said valve, and a spring arranged between said resistance-piece and valve, substantially as specified.

3. In a water-closet, the combination of the basin A, valve-chamber G, slide-valve F, arm K, rock-shaft D, and pull-rod B, substantially as specified.

4. In a water-closet, the combination of the basin A, valve-chamber G, slide-valve F, with its tubular stem, the resistance-piece J, with its stem fitting in the tubular stem of the valve, and the spring I, substantially as specified.

5. In a water-closet, the combination of the basin A, valve-chamber G, slide-valve F, resistance-piece J, spring I, overflow-outlet A^2, conduit L, overflow-chamber M, valve N, lever O, and float P, all substantially as specified.

255,976. ROPE-MACHINE. JOHN HARRIS, Columbus, Nebr. Filed June 30, 1881. (No model.)

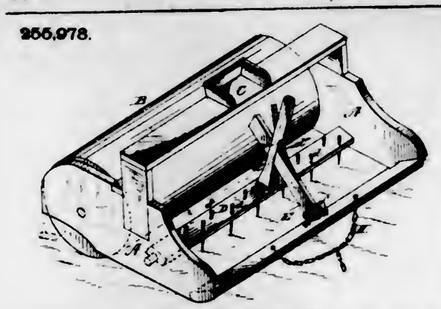


Claim.—1. The combination, with the shaft B, pulleys *b b'*, the belt connecting said pulleys, the pulleys *c b*, and the belt connecting them, the laying-shaft C, the spider *d*, the flier *e*, provided with gudgeons e^2, and spindle *g*, of the gear-wheels *i k*, whereby the fliers and spiders are given opposite motions, as described.

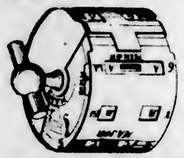
2. The shafts B C, pulleys *c b*, gears *i k*, spiders *d*, gudgeons e^2, fliers *e*, spindles *g*, tension-plates *l*, tubular journal *m*, pulleys *t t' t² t³*, rollers *o r*, shaft E, gear *q q'*, pulleys *p p'*, shaft F, and connecting-straps, as set forth, and combined for operation, as described.

255,977. SULKY-PLOW. THOMAS T. HARRISON, Ambroy, Kans. Filed Oct. 27, 1881. (Model.)

Brief.—Land-wheel attached to a swiveled post to aid turning short with the plow in the ground. A crank-screw adjusts the height of the frame upon the furrow-wheel.



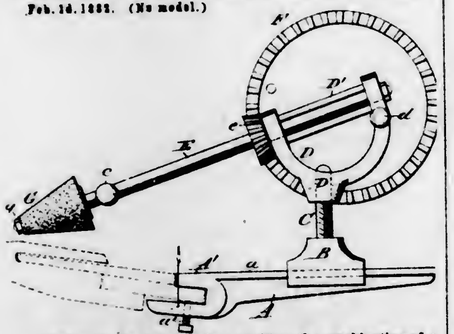
Claim.—In a sulky-plow, the combination, with the cross-bar M, having curved extension 1 upon its landside end, and the bar L, attached to the upper end of the landside axle D, of the keeper 2 and the stops 3, substantially as herein shown and described, whereby the machine can be turned at a right angle without raising the plow from the ground, as set forth.



255,978. COMBINED HARROW AND ROLLER. JOHN HARVEY, Woody's Corner, Ind. Filed Aug. 8, 1879.

Claim.—The harrow-frame A, provided with roller B and seat C, and having the rocking bar D, in which are set the teeth *d*, and the centrally-fixed and upwardly-projecting arm *d'*, slotted at *d''*, combined with the spring *g*, hinged and notched stay-arm E, and crusher-board F, substantially as set forth.

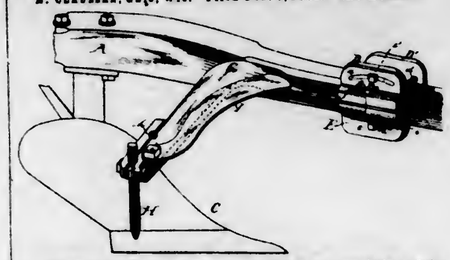
255,978.



255,979. MUSIC SCALE AND CHORD INDICATOR. CHAS. H. HAUSCHEL, New York, N. Y. Filed Sept. 16, 1881. (No model.)

Claim.—The combination, in a scale and chord indicator, of an interior reed-cylinder, arranged substantially as described, with an exterior cylindrical casing provided with transverse slots for the egress of the air, recessed heads for exposing the entire scale, and mechanism for indicating at pleasure the major and its relative minor chord, all substantially as described.

255,980. MACHINE FOR SHARPENING MOWER AND REAPER KNIVES. CHAS. W. HERSHAW, Middleway, W. Va. Filed Feb. 14, 1882. (No model.)

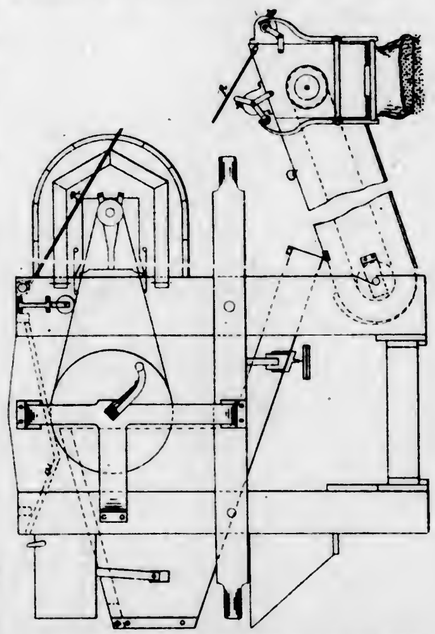


Claim.—1. In a sharpening-machine, the combination of a flanged clamping-bar, a recessed block adapted to slide thereon, a threaded standard secured to said block and adapted to be inclined forward and back, a bearing adjustable upon said standard and carrying a gear-wheel, and a shaft having a pinion meshing with said wheel and a grinding-cone secured to the end of said shaft, substantially as shown and described.

2. In a sharpening-machine, the combination, with the flanged bar A, having clamp A', of the recessed block B, adjustable upon said bar, the threaded standard C, secured thereto, and the set-screw *b*, for adjusting the inclination of said standard, substantially as shown and described.

3. In a sharpening-machine, the combination, with the bar A, block B, and threaded standard C, of the adjustable bearings D D', gear-wheel F, and shaft E, having pinion *e* and grinding-cone G, substantially as shown and described.

4. In a sharpening-machine, the combination of the bar A, having flange *a* and clamp A', the recessed block B, adjustable thereon, and provided with threaded standard C and set-screw *b*, for adjusting the inclination of said standard, the adjustable bearings D D', attached to said standard and provided with handle *d*, gear-wheel F, journaled in bearing D' and having handle *f*, and the shaft E, journaled in bearing D and provided with pinion *e*, loose-fitting handle *c*, and grinding-cone G, substantially as shown and described.



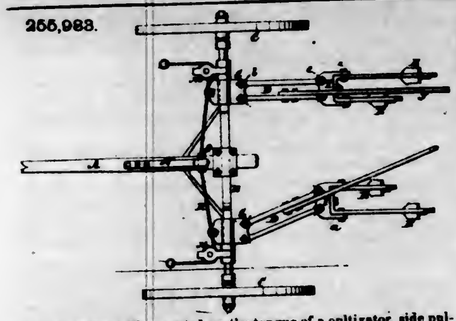
255,981. PLOW ATTACHMENT. PAUL P. HERRERS and PETER H. CLAUSSEN, Gale, Wis. Filed Feb. 6, 1882. (No model.)

Claim.—1. The attachment to a plow-beam, consisting of the clamp-plates D D' and adjustable plate E, with clamp-socket *b f*, in combination with arm G, pin H, and plate I, all constructed and arranged substantially as described and shown.

2. The attachment to a plow-beam, consisting of clamp D and adjustable plate E, with clamp-socket *b f*, in combination with arm G, having clamp-plate *h*, for holding pin H, and plate I, secured by bolt *i*, all arranged substantially as shown and described.

255,982. GRAIN-SEPARATOR. PAUL P. HERRERS and PETER H. CLAUSSEN, Gale, Wis. Filed June 17, 1881. (No model.)

Claim.—The combination, with a grain-separator and a grain-elevator provided with a sack-holder, of the ropes R, roller S, ratchet-wheel *s*, and pawl *j'*, for adjustably suspending the elevator-head, substantially as set forth.



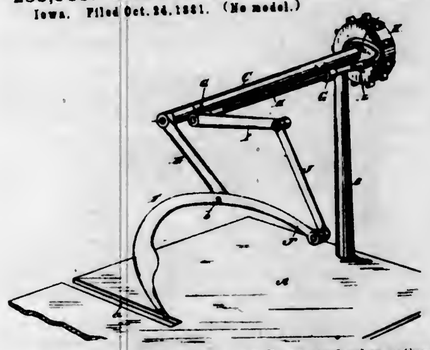
255,983. CULTIVATOR. LESLIE P. HIATT, Peru, Iowa. Filed Dec. 20, 1881. (No model.)

Brief.—Draft-equalizer pulley upon a spring-support, double-beams with two pivotal points keeping the shovels always at right angles to the line of draft.

Claim.—1. In a cultivator, the combination, with the axle B and the coupling G, of the coupling I, provided with the arms *a*, the shovel-shanks E, formed of a single piece and secured between the said arms, and the divided beam D, pivoted at each end to the said couplings, substantially as and for the purpose set forth.

2. The hitching device composed of a puller, O, carried by a spring-support, N, mounted on the tongue of a cultivator, side pulleys, M M, connected with the axle, and the rope or chain R, substantially as shown and described.

255,983.

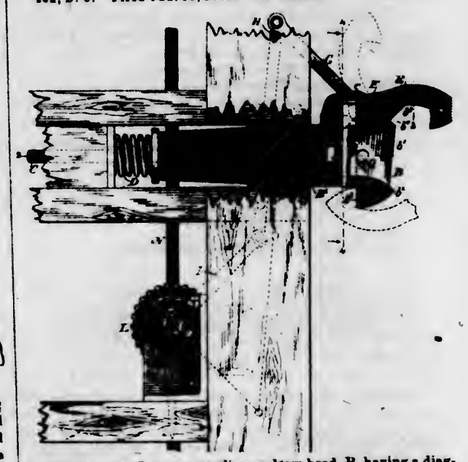


255,984. CAR-COUPLING. THOMAS J. HILLIARD, Conway, Ark. Filed Jan. 16, 1882. (Model.)

Claim.—The curved gravitating coupling-hooks having pointed or double-beveled self-coupling hooked ends and hooked shoulders on their backs, in combination with beveled hooks formed on the free ends of the buffer-bars, to which said coupling-hooks are pivoted, substantially as described.

255,985. GRAIN-BINDER. PLINY F. HOBBS, Davenport, Iowa. Filed Oct. 24, 1881. (No model.)

Claim.—1. The oscillating arm I and mechanism acting to positively oscillate the same, in combination with the crank-arm E, the binding-arm F, and the link J, connecting the oscillating arm with the extension J' of the binding-arm, for arresting the rearward sweep of the latter and positively raising it, substantially as described.



2. The rock-shaft H, oscillating arm I, connected therewith, and mechanism acting to rock said shaft and oscillate the arm in a positive manner, in combination with the crank-arm E, the binding-arm F, and the link J, connecting the oscillating arm to the extension J' of the binding-arm, substantially as described.

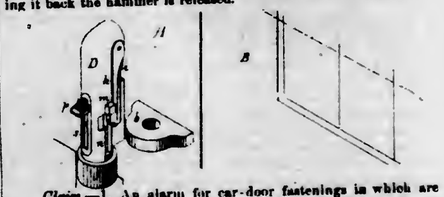
255,986. SHOE-HOLDER. WILLIAM P. HOLLIDAY, Detroit, Mich. Filed Feb. 21, 1881. (Model.)

Claim.—In a shoe-holder, the combination of the bed-piece composed of the broad plate B, provided with screw-holes *a a*, and cheek-piece A', having lug *b*, and a stud, C, having a pivot-pin, D, projecting therefrom, of the jaw-piece E, provided with the knob, and a cheek-piece, E', which is pivoted upon said pivot-pin, and the spring C', coiled around said stud C, and having one end bearing upon the upper side of the lug *b* and the other end bearing against the under side of the jaw-piece in the rear of its pivotal point, as described.

255,987. CAR-COUPLING. GEORGE H. HOLLISTER, Washington, D. C. Filed Jan. 16, 1882. (No model.)

Claim.—1. In a car-coupling or draw-head, B, having a diagonal face, *b'*, a V-shaped recess, *b'*, and pointed projections *b' b'*, substantially as described and shown.

2. In a car-coupling, the combination, with a draw-head, B, having a diagonal face, a V-shaped recess, and pointed projections, as described, of a pivoted hook, E, as set forth.



3. The draw-head B, having the draw-bar B', provided with a recess extending its entire length and flaring from its front to its rear end, as shown and described, combined with the draw-rod C, having its head arranged in the draw-head as a pivotal point for said draw-bar and extending throughout the recessed draw-bar, substantially as specified.

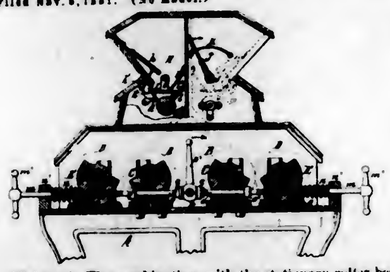
4. In a car-coupling, the draw-head B, having a transverse recess or slot, combined with the coupling-hook E, having the cam or projection *e*, and the sliding bolt P, fitting in said transverse recess and adapted to be operated by said cam or projection *e* on the backward movement of the hook E, whereby the said bolt P will be positively thrown outward, and thereby disengage the hook of the opposite coupling, as set forth.

5. The combination, with the draw-head B, of the pivoted hook E, arm G, link H, arm I, shaft J, gear-wheels L and M, and shaft N, having levers O on its opposite ends, substantially as set forth.

255,988. CAR-DOOR BURGLAR-ALARM. JAS. D. HOLLISTER, Savannah, Ga., assignor of one-half to the Hooke Smelting Company, Philadelphia, Pa. Filed Feb. 6, 1882. (No model.)

Brief.—The reciprocating hammer having a lug upon it is supported by a trigger when the hasp is out of locking position, but when in locking position a lug on the hasp throws the trigger out of engagement with the hammer-lug, and said hammer is supported by the hasp-lug, so that upon unlocking the hasp and throwing it back the hammer is released.

Claim.—1. An alarm for car-door fastenings in which are combined the following elements, namely: a casing, D, on the car,



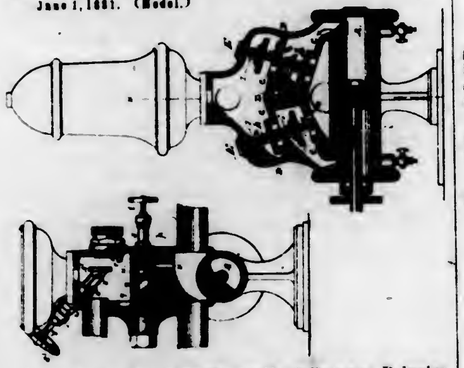
a hammer adapted thereto, means for supporting said hammer, and a hasp, *n*, having a lug or shoulder, whereby on closing the hasp the hammer is tripped and supported by said lug or shoulder and is released on opening the hasp, as set forth.

2. The combination of the car A, having the casing D, with hammer and hammer-support, and the door B, with a hasp, *n*, having a hood or plate, F, adapted to fit closely to the casing D, and having a hammer tripping, supporting, and releasing lug or shoulder, *w*, as set forth.

3. The combination of the casing D, its trigger *h*, and hammer *d*, with lug *w*, and the hasp *n*, having a hood, F, with lug *w*, as set forth.

4. The combination of the casing D, the hammer *d*, and nipple *g* with a percussion-cap, *x*, having a sealing-ring adapted to embrace the nipple and free to slide thereon, as specified.

255,989. ROLLER-MILL. NOAH W. HOLT, Buffalo, N. Y., assignor to Richard K. Noye and E. Hayward Noye, same place. Filed Nov. 8, 1881. (No model.)



Claim.—1. The combination, with the stationary roller-bearings C and sliding roller-bearings E, of adjusting-screws whereby the sliding bearings are adjusted toward and from the stationary bearings, sliding bolts and eccentrics whereby the sliding bearings are separated from the stationary bearings without disturbing the adjustment, and springs whereby the sliding bearings are automatically returned to their former position when released, substantially as set forth.

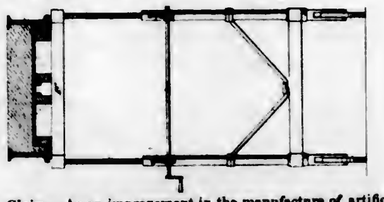
2. The combination, with the fixed roller-bearings C, sliding roller-bearings E, and frame A, having lugs *a'*, of the adjusting-screws *m*, springs *s*, sliding bolts *o*, and eccentrics *p*, substantially as set forth.

3. The combination, with the fixed roller-bearings C and movable roller-bearings E, of eccentrics *p*, sliding bolts *o*, provided with adjustable heads *q*, and screw-bolts *m*, whereby motion is transmitted from the sliding bolts to the movable bearings, substantially as set forth.

255,990. PUMP. WILLIAM D. HOOKER, Oakland, Cal. Filed June 1, 1881. (Model.)

Claim.—1. In a pump, the outside shell or case, B, having the central upright partition, D, and the inclined partitions C C, that separate the induction and eduction chambers at each end of the pump, said partitions C C, being so arranged that while they incline toward the said central partition, D, they are also parallel with each other, in combination with the passages E in the top of the shell, directly over and in line with the valve-seats in the partitions C C, substantially as described and set forth.

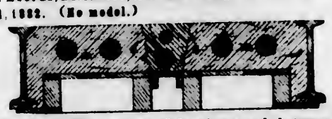
2. The improvement in mounting valves upon valve-seats, consisting in connecting the upper ends of their guide-spindles to a transverse rod, I, the ends of which are supported by bearings in the sides of the case, substantially as described.



3. The rod I, having the guide-spindle *f* attached to it, in combination with the socket *j* on the case or shell B and the removable cover K, with its sockets *e*, substantially as and for the purpose described.

4. In a pump, the transverse passage or orifice *p*, connected by the vertical passage *q* with the discharge-chamber of the pump, and also connected by another and independent vertical passage, *r*, with the suction-chamber of the pump, in combination with the valve or piston *u*, arranged to move in the horizontal passage and open or close communication between the vertical passages, substantially as specified.

5. The plug-valve arrangement for closing the discharge-opening, consisting of the valve A', attached loosely to the screw-rod V, said screw-rod passing diagonally through a stuffing-box, *x*, in the side of the case and connected by a rod, *n'*, with the sleeve of the stuffing-box, in combination with the lug or bead *z* around the discharge-opening, substantially as described.



6. The cover K, having the steady-pins *a*, provided with a threaded portion near their bases which screw into threaded holes in the cover, while the projecting portion or pin is plain, for the purpose specified.

255,991. MANUFACTURE OF ARTIFICIAL STONE. WILLIAM H. HOOPES, Baltimore, Md. Filed Aug. 12, 1881. Renewed Mar. 14, 1882. (No model.)

Claim.—As an improvement in the manufacture of artificial stone, a rolling support adapted to be placed beneath and adjusted vertically to position with reference to the space to be filled and to sustain the plastic stone while hardening, substantially as and for the purpose specified.

255,992. MANUFACTURE OF ARTIFICIAL STONE. WILLIAM H. HOOPES, Baltimore, Md. Filed Aug. 12, 1881. Renewed Mar. 14, 1882. (No model.)

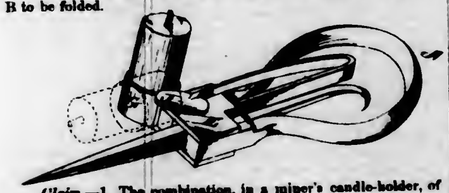
Claim.—1. The method of forming panels between beams or girders by placing in position a central block or keystone and filling the space between the same and each girder with artificial stone in a plastic state, substantially as and for the purpose specified.

2. A keystone or key-block provided upon its sides with grooves or ribs for engagement with the adjacent material, substantially as and for the purpose shown.

255,993. HAT-SWEAT AND OTHER CORDED-EDGED FABRICS. JAMES S. HOOMER and PHILETUS C. LAVEROP, Gloversville, N. Y., assignors to said Hoomer. Filed Mar. 9, 1881. (No model.)

Claim.—As a new manufacture, a sweat for hats or other cord edged fabric, in which the sweat-leather or other fabric has attached to its edge a reed, cord, or wire (either covered or uncovered) by means of a single thread, constituting a stitch, formed by successively drawing the loop formed by the thread on the needle below the fabric up over the edge of the fabric and locking said loop by the next descent of the needle, as and for the purpose specified.

255,994. DRIVE-CHAIN. EUGENE L. HOWE, Chicago, Ill. Filed Jan. 30, 1882. (Model.)

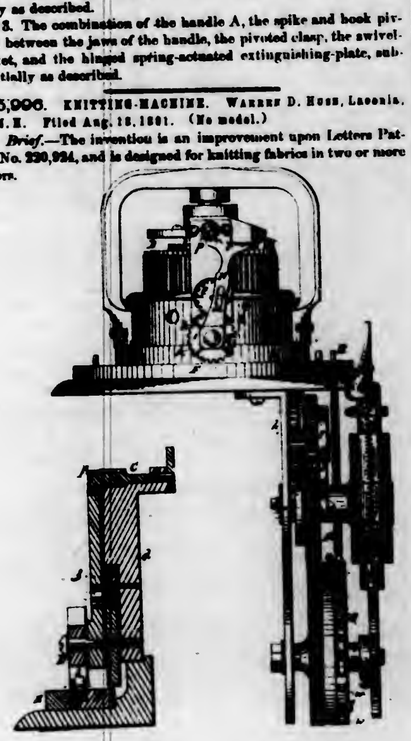


Claim.—1. A chain-link having plain side and end bars and formed with an open coupler-hook at one end, the throat of which is slightly wider throughout its length than the bar at the opposite end of the link is thick, and the lip of which has extensions *f f*, adapted to overlap the side bars of a link engaged with said coupler, all substantially as and for the purpose set forth.

2. A chain composed of duplicate links, each of which has a plain bar at one end and an open coupler-hook, *a*, at the other, the said coupler-hook being formed with projections at *f f'* and the links being combined and operating in the manner described.

255,995. MINER'S CANDLESTICK. JOHN C. HUME and THOMAS A. TATE, Leadville, Colo. Filed Feb. 10, 1882. (No model.)

Brief.—The clasp E can be swung around to allow the spike B to be folded.



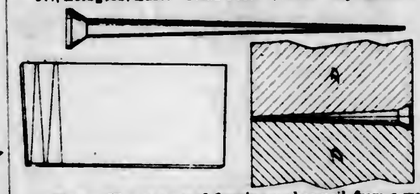
Claim.—1. The combination, in a miner's candle-holder, of the handle A, the hook and spike, one or both, pivoted between the jaws of said handle, the pivoted clasp E, and the socket applied to this clasp, substantially as described.

2. The combination of the clasp E, pivoted to the handle A, and the socket G, connected by a swivel, *b*, to the clasp, substantially as described.

3. The combination of the handle A, the spike and hook pivoted between the jaws of the handle, the pivoted clasp, the swivel-socket, and the hinged spring-actuated extinguishing-plate, substantially as described.

255,996. KNITTING-MACHINE. WARREN D. HOSS, Laconia, N. H. Filed Aug. 18, 1881. (No model.)

Brief.—The invention is an improvement upon Letters Patent No. 220,934, and is designed for knitting fabrics in two or more colors.

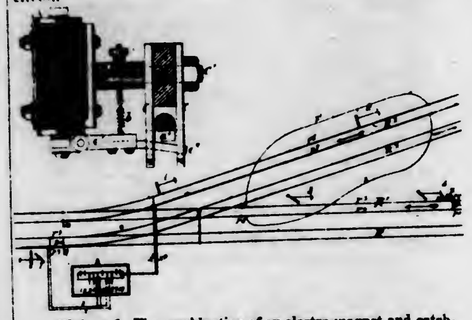


Claim.—1. The combination of the thread-guide C, rack-bar N, crank-pinion *f*, pinions *p* and *e*, tappet-disk D, and means for operating the said disk, substantially as and for the purpose herein specified.

2. The cam-plate I' and means for reciprocating the same, in combination with the rings E F and means for connecting the cam-plate and rings, substantially as and for the purpose herein specified.

3. The two tappet-rings E F, provided with pins *i i*, in combination with the cam-plate I', means for operating the same and connecting it with the rings, the tappet-disk D, and needle-cylinder, substantially as and for the purpose herein specified.

4. The combination of the rings E F, rod R, adapted to ascend between the two rings, sprocket-wheel S, Jacquard chain Q, tappet-disk D, and the needle-cylinder, substantially as and for the purpose herein specified.



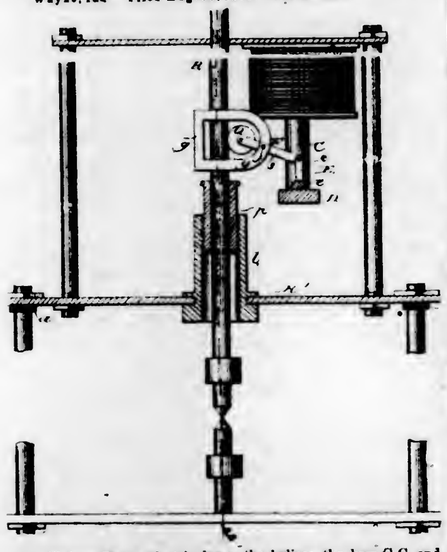
255,997. METHOD OF MAKING SHOE-NAILS. JOHN HYSLOP, Jr., Abington, Mass. Filed Feb. 17, 1881. (Specimens.)

Claim.—The process of forming a shoe-nail from a wedge-shaped blank, which consists in compressing the metal along the whole length of the opposite edges toward the center and condensing it until the body below the head is cylindrical in cross-section, of a continuous taper, and adapted to clinch properly, no matter in what direction the point is turned, as set forth.

255,998. RAILWAY SWITCH AND SIGNAL LOCKING APPARATUS. CALEB H. JACKSON, Allegheny, Pa. Filed Jan. 3, 1882. (No model.)

Brief.—The catch-rod of a switch, signal, or lock-bar lever is locked by the armature of an electro-magnet in a normally-closed track-circuit, whereby when a train has entered such circuit the current is short-circuited, and the control of the lever is thereby taken from the signalman until the train has passed off of such circuit.

Claim.—1. The combination of an electro-magnet and catch-rod of a railway switch, signal, or lock-bolt lever with reference to the locking and unlocking of the latter by the former, substantially as set forth.



2. The combination of a track-circuit, a switch, signal, or bolt moving lever, a catch-rod, and an electro-magnet arranged to lock and unlock the catch-rod, substantially as set forth.

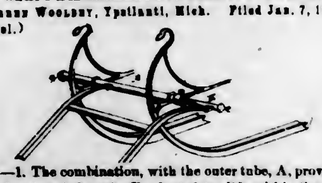
3. In combination with the signal-moving lever of an interlocking-machine, a normally-closed track-circuit and an interposed electrically-actuated lock suitably arranged for the locking of the lever on the short-circuiting of the track-circuit, substantially as set forth.

4. In combination with a switch-shifting lever, 10, an electro-magnet and lock, and a combined track and wire circuit, R' R² *x x'*, which shall include sections of two tracks, substantially as set forth.

5. In combination with a closed track-circuit, a home and distant signal, the levers for operating them, and an electrically-actuated lock on each lever, when the electro-magnets of both locks are actuated at the same time by the same battery, substantially as set forth.

256,999. ELECTRIC LAMP. CHARLES D. JENNEY, South Bend, assignor to the Fort Wayne Electric Light Company, Fort Wayne, Ind. Filed Aug. 30, 1881. (No model.)

Claim.—In an electric lamp, the helices, the bars C C, and fixed armature D, in combination with the candle-supporting rod R, surrounding yoke *g*, cam-clutch F, provided with roller Q, and adjusting thimble or collar *p*, moving in nut *l*, all constructed, arranged, and operated as set forth.

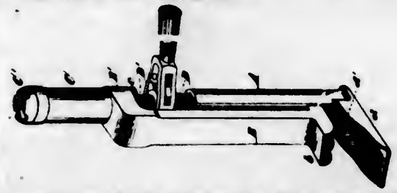


256,000. MANUFACTURE OF ARTIFICIAL STONE AND MARBLE. THOMAS JEWELL, Alexandria County, Va. Filed Feb. 24, 1882. (No specimens.)

Claim.—1. The compound herein described, consisting of water, feldspar saturated with fluoric acid, marble-dust saturated with acetic acid, iron filings saturated with sulphuric acid, powdered porcelain saturated with fluoric acid, protoxide of lead, alum, wood-ashes, and common salt, combined with the agglutinants described, as gum-mastic, gum-ammoniac, marine glue, gelatine, and dextrine dissolved in their proper solvents, substantially as set forth.

2. Artificial stones composed of Portland or other hydraulic cement and sand dampened with the above-described chemical compound and agglutinants and pressed compactly into suitable molds to secure the desired forms and patterns, as set forth.

3. A composition in imitation of natural marble, consisting of Keen's cement suitably colored, and united and solidified by dampening with the above-described chemical compound and agglutinants, and pressed into form, as fully set forth.



256,001. SHAFT ATTACHMENT FOR SLEIGHS. FRANK JOHNS and WARREN WOOLDEY, Ypsilanti, Mich. Filed Jan. 7, 1882. (No model.)

Claim.—1. The combination, with the outer tube, A, provided with a slitted end, and the tube E, adapted to slide within the tube A, of a collar adapted to surround the slitted end of the tube A, and a thumb-screw for decreasing the diameter of the said tube at this point.

2. The combination, with the tube A, secured to the sleigh or vehicle in any suitable manner, and provided with the openings or holes *a b* for the reception of a shank of a thill-coupling, and a slitted end, a collar surrounding the said slitted end, and a thumb-screw for decreasing the diameter of the said slitted end, of a smaller tube, E, provided with the openings *d* for the reception of a shank of a thill-coupling, and adapted to slide within the tube A, substantially as set forth.

256,002. LIFTING-JACK. JACOB O JOYCE, Dayton, Ohio. Filed Feb. 13, 1882. (No model.)

Claim.—1. A lifting-jack combining in its structure a tubular base, A, having an interior screw-thread, a hollow platen, C, internally threaded in a direction opposite to the threads in the tubular base, an arm, B, connected with the said platen and projecting downward therefrom, and having a foot-piece, *b*, a right-and-left-hand screw, D D', arranged in the threaded tubular base and hollow platen, and a screw-head, *d*, secured to the said right-and-left-hand screw, substantially as described.

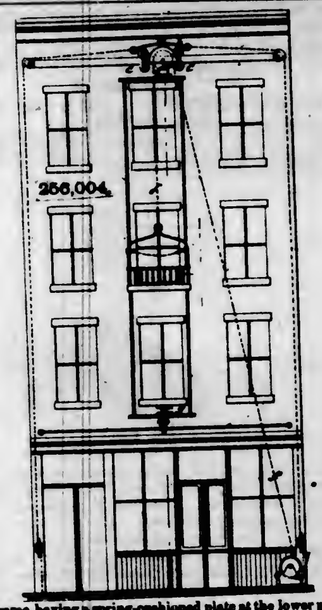
2. A lifting-jack combining in its structure a tubular base, A, having an interior screw-thread, a hollow platen, C, internally threaded in a direction opposite to the threads in the tubular base an arm, B, connected with the said platen and projecting downward therefrom, and having a foot-piece, *b*, a right-and-left-hand screw, D D', arranged in the threaded tubular base and hollow platen, and a screw-head, *d*, secured to the said right-and-left-hand screw, and constructed with the annular groove *e* and sockets *f*, for receiving the arms H and lug I of a wrench, F, substantially as described.

3. In combination with the right-and-left-hand screw-jack, the downwardly-projecting arm B and foot *b*, suspended upon the screw-platen C, and having the guides *a'* and *b'* formed upon the base A and arm B, substantially as herein set forth.

256,003. OVERSHOE-FASTENING. JOSEPH L. JOYCE, New Haven, Conn. Filed Feb. 27, 1882. (No model.)

Claim.—1. The herein-described improvement in fastenings for arctic overshoes, consisting in the strap extending from the quarter at one side over the instep, provided with a button, combined with a cord attached by one end to the other quarter, and the hook with which the said cord may be engaged after having been passed around the button to draw the quarters together, substantially as described.

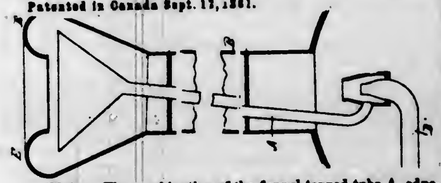
2. The herein-described improvement in fastenings for arctic overshoes, consisting in the strap extending from the quarter at one side over the instep, provided with a button upon both the out and in sides of the strap, combined with a cord attached by one end to the other quarter, and the hook with which the said cord may be engaged after having been passed around the button to draw the quarters together, substantially as described.



3. The herein-described improvement in fastenings for arctic overshoes, consisting in the strap extending from the quarter at one side over the instep, provided with a button, combined with a hook attached to the other quarter, and a cord one end of which is secured to the quarter through the shank of the hook, the other provided with a stop to engage with the hook after the cord has been passed around the button on the strap, substantially as described.

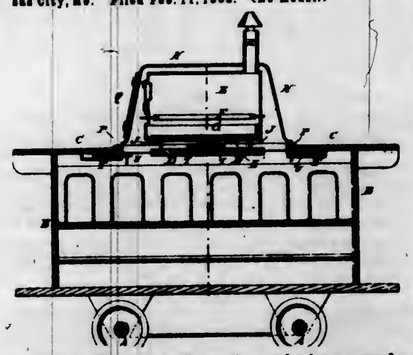
256,004. FIRE-ESCAPE. JOSEPH KELLNER, Jersey City, N. J., assignor to himself, Henry Stedentop, and Peter Micclay, same place. Filed Jan. 27, 1882. (No model.)

Brief.—The guide-frame for the hoist moves on fixed guide-rails at the top and bottom, and is provided with a spring-cushioned plate at the bottom to break the fall of the hoist.



Claim.—1. In a fire-escape, the combination of fixed top and bottom guide-rails, a traversing guide-frame, means for moving the same in either direction on the guide-rails, a vertically-movable safety-basket guided on the traversing-frame, and means for hoisting or lowering the basket, substantially as described.

2. In a fire-escape, the combination of a vertical traversing



guide-frame, having a spring-cushioned plate at the lower part, with a vertically-movable safety-basket and means for hoisting or lowering the same, substantially as set forth.

256,005. SPARK-ARRESTER. ALEXANDER M. KERR, Westminster, Ontario, Canada. Filed Aug. 15, 1881. (No model.) Patented in Canada Sept. 17, 1881.

Claim.—The combination of the funnel-topped tube A, ebullition-chamber F, and jet-pipe D with the stack B, having an inturned marginal flange, E, substantially as and for the purposes set forth.

256,006. HEATER FOR CARS. DAVID M. KIRKPATRICK, Kansas City, Mo. Filed Feb. 11, 1882. (No model.)

Claim.—1. The combination, with a car having a covered recess or chamber in the roof, of a stove arranged in said chamber, and provided with a bed-plate recessed at the ends and sides, whereby the heat may be carried from the stove to the inside of the car, as described.

2. A car-stove having the bottom pivot, H, with double incline on its lower surface and the studs J J on the front and rear of bottom, in combination with a bed-plate having a seat with a double incline corresponding to that of the pivot and the inclined arc-grooves L K, whereby the stove can turn only a half-revolution and always be brought into position to suit the direction into which the car is to travel, as described.

3. In a car-heater, the combination, with the apertured roof C, of the bed-plate D, having inclined and recessed grooves K, the stove E, having conical pivot H and studs J, and the collar I, substantially as herein shown and described, whereby the stove will be securely supported and can be readily reversed, as set forth.

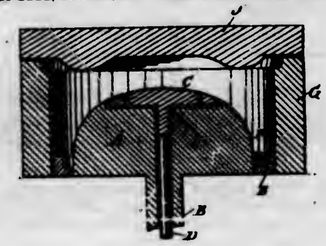
4. In a heater for railway-cars, the combination, with the apertured roof C and the ends of the bed-plate D, of the aprons U, substantially as herein shown and described, whereby the space below the forward end of the heater can be readily closed, as set forth.

5. In a heater for railway-cars, the bed-plate D, constructed with curved grooves K, having inclines and recesses in their bottoms, and provided with the double-inclined pivot-seat, and the collar I, substantially as herein shown and described.

6. In a heater for railway-cars, the stove-plate E', provided with central pivot, H, in combination with the bed-plate D and the collar I, substantially as herein shown, whereby the heater can be readily turned and will be securely held, as set forth.

7. In a car, the combination, with the apertured roof C and the pivoted stove E, of the cross-bars O and the cover N, substantially as herein shown and described, whereby the said cover is supported from and carried around by and with the said stove, as set forth.

256,007. APPARATUS FOR PRODUCING ILLUSORY DRAMATIC EFFECTS. JAS. W. KNELL, Boston, Mass. Filed Mar. 22, 1880. Renewed Mar. 8, 1882. (No model.)



Claim.—1. The combination of the panoramic scene *a* and the endless path *d*, substantially as described, and for the purpose set forth.

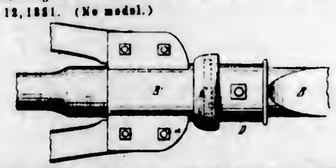
2. The combination of the panoramic scene *a*, the endless path *d*, and the screen *f*, substantially as described, and for the purpose set forth.

3. The combination of the panoramic scene *a*, endless path *d*, vehicle *h*, and stay *i*, substantially as described, and for the purpose set forth.

256,008. MAKING PORCELAIN AND CHINA PASTE-BOXES. ELIAS LEAK, Trenton, N. J. Filed Oct. 18, 1881. (No model.)

Claim.—1. The combination, with the mandrel A, having a rounded upper surface and a tubular handle, of a removable plate, C, having a roundel surface flush with that of the mandrel, and provided with a rod, D, projecting from its lower surface through said tubular handle, as shown and described.

2. The combination, with the molding-mandrel A, of the plate C in its roundel or molding surface, and of the handle-rod D, attached to this plate, substantially as herein shown and described, and for the purpose set forth.



3. The combination, with the molding-mandrel A, of the plate C, the handle-rod D, and the tubular handle B, substantially as herein shown and described, and for the purpose set forth.

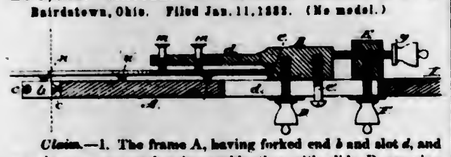
4. The combination, with the molding-mandrel A, of the loose grooved or annularly-recessed ring E, substantially as herein shown and described, and for the purpose set forth.

5. The combination, with the molding-mandrel A, provided with a removable plate, C, of the outer die, G, and the top die, J, substantially as herein shown and described, and for the purpose set forth.

6. The combination, with the molding-mandrel A, of the outer die, G, the top die, J, and the loose grooved ring E, interposed between the mandrel A and the die G, substantially as herein shown and described, and for the purpose set forth.

256,009. VEHICLE-REACH. JOSEPH LE ROY, Belleville, Mich., assignor of one-half to C. S. Whipple, same place. Filed Dec. 12, 1881. (No model.)

Claim.—1. In combination, with the bound-plates B', made in two detachable sections, each having a semi-cylindrical groove or channel, the sleeve D, provided with a flange to fit in the channels in the bound-plates, substantially as and for the purpose specified.

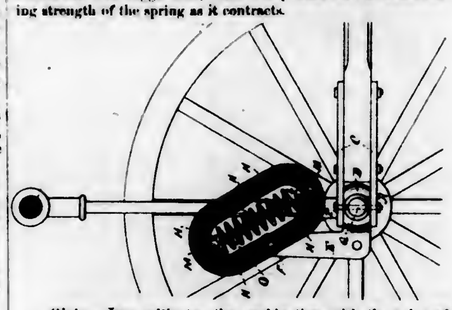


2. In combination, with the separate bound-plates B' B', provided with the channels *b*, the sleeve D, provided with a flange, *c*, to fit in said channels *b*, both the bound-plates and the sleeve being provided with an unobstructed opening to allow the free passage through them of the reach, substantially as and for the purpose specified.

256,010. TOY. SAMUEL LEWIS, Louisville, Ky., assignor of one-half to A. W. Hamaker, same place. Filed Feb. 13, 1882. (No model.)

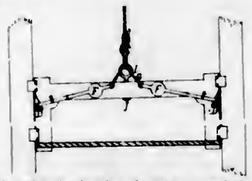
Claim.—The balancing toy herein shown and described, composed of the base A, having needle-pointed standard or pivot B C, balance-figure D, having pin E, and detachable weighted pins F F' F F', pointed to admit of their insertion into the substance of the figure D, as set forth.

256,011. CIRCULAR-SAW JOINTER. ALEXANDER LONG, Bairdstown, Ohio. Filed Jan. 11, 1882. (No model.)



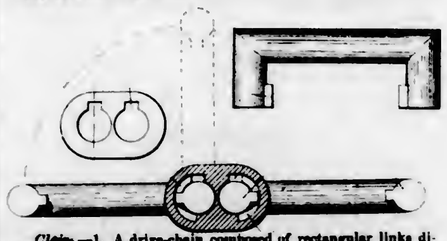
Claim.—1. The frame A, having forked end *b* and slot *d*, and carrying screws *c* and *a*, in combination with slide B, carrying screw *m*, guide-bolt *c'*, thumb-screw D, and plate H, all substantially as and for the purposes specified.

2. In a circular-saw-filing machine, the frame A, constructed as described, carrying screws *c* and *a*, in combination with the slide B, carrying screw *m*, the screw D, bolt *c'*, screw F, and stud E, carrying screw G, all substantially as and for the purposes specified.



256,012. CULTIVATOR-SPRING. JOHN M. LONG, Hamilton, Ohio. Filed Jan. 27, 1882. (No model.)

Brief.—The springs for raising the drag-bars are placed in connection with toggle-bars, which compensate for the diminishing strength of the spring as it contracts.



Claim.—In a cultivator, the combination, with the axle and frame, of pivoted beam B, arm or housing E, toggle system H, fixed pivot N, moving pivot F, and spring O, substantially as and for the purpose set forth.

256,013. AUTOMATIC SAFETY-BRAKE FOR ELEVATORS. CHRISTOPHER S. LONGSTREET, New York, N. Y. Filed Feb. 11, 1882. (No model.)

Claim.—A safety-brake for elevators, consisting of a movable wedge automatically, upon detachment of the hoisting-cable, brought by a weighted lever into action between the adjacent sides of the elevator and its guide to stop the falling elevator.

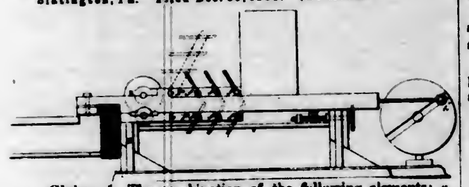
256,014. DRIVE-CHAIN. CHARLES H. LOW, Sandwich, Ill., assignor of one-half to J. Phelps Adams, same place. Filed Dec. 22, 1881. (No model.)

Claim.—1. A drive-chain composed of rectangular links divided lengthwise, provided with lugs or enlargements on the end bars of the link-sections, and couplers provided with end openings corresponding with the end bars and adapted to receive them when in an unusual relative position, whereby these parts may be coupled and uncoupled by bringing them into a position different from their working position, substantially as described.

2. The link-sections having end bars provided with lugs, in combination with short couplers having end openings corresponding therewith, and an interior recess within which the said end bars and lugs may turn freely when coupled, substantially as described.

256,015. CUFF-BUTTON. DAVID LUBIN, Sacramento City, Cal. Filed Jan. 31, 1882. (No model.)

Claim.—1. The combination, in a cuff or collar button, of a face-piece having a screw-threaded pin rounded at its outer end,



256,015.

with a back piece consisting of a disk, a shank internally bored and threaded, as shown, and an approximately elliptical head, substantially as shown and described.

2. In a cuff or collar button, a back piece consisting of a disk, a shank of a triangular or square form in cross-section, provided with a flaring threaded bore, and an approximately elliptical head, for the purposes herein set forth.

256,016. SLATE-DRESSING MACHINE. FRANCIS W. HALLETT, Slatington, Pa. Filed Dec. 30, 1881. (No model.)

Claim.—1. The combination of the following elements: a wheel having its rim provided with a grinding-surface in a plane substantially parallel with the plane of the wheel, the said rim having a space within it, into which the blanks will pass after having been operated upon by the grinding-surface, guides to receive and conduct the blanks in a plane parallel with the grinding-surface of the said wheel, and a feeding device, substantially such as described, outside the grinding-wheel, to force the blanks successively through the guides radially over the grinding-surface, substantially as described.

2. The combination of the following elements: a wheel having its rim provided with a grinding-surface in a plane substantially parallel with the plane of the wheel, guides to receive and conduct the blanks in a plane parallel with the grinding-surface of the said wheel, and a feeding device, substantially such as described, to force the blanks successively through the guides over the grinding-surface, with stationary cutters arranged at opposite edges of the slate, substantially as and for the purpose described.

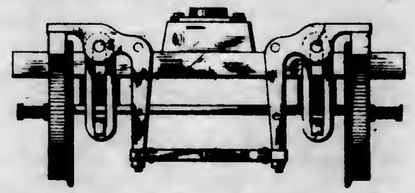
3. The combination of the following elements: a wheel having its rim provided with a grinding-surface in a plane substantially parallel with the plane of the wheel, guides to receive and conduct the blanks in a plane parallel with the grinding-surface of the said wheel, and a feeding device, substantially such as described, to force the blanks successively through the guides over the grinding-surface, and an adjusting device, substantially such as described, to adjust the guide and feeding mechanism relatively to the grinding-surface, substantially as described.

4. The combination of the following elements: a wheel having its rim provided with a grinding-surface in a plane substantially parallel with the plane of the wheel, guides to receive and conduct the blanks in a plane parallel with the grinding-surface of the said wheel, and a feeding device, substantially such as described, to force the blanks successively through the guides over the grinding-surface, a receiver for the blanks to be ground, and a reciprocating follower moving through slots in the said receiver at the bottom to successively take the blanks from the bottom and deliver them to said guides, substantially as described.

5. The combination of the following elements: a wheel having its rim provided with a grinding-surface in a plane substantially parallel with the plane of the wheel, a follower to which a reciprocating movement is imparted in a plane parallel with the surface of the grinding-wheel, guides to receive the blank to be ground, extending over the grinding-surface, and feed-rolls to force said blanks over the grinding-surface of the wheel, substantially as described.

256,017. CAR-BRAKE. JOHN F. HALLINCKRODT, Denver, Colo., assignor of one fifty-second to P. H. Van Diest, same place. Filed Sept. 13, 1881. (No model.)

Claim.—1. In a car-brake, the combination, with a vertically-movable bolster and spring-board, the latter provided with equalizing-bars, of bell-crank brake-levers and stirrups connected at their upper ends with the short arms of the brake-levers and at their lower ends with the opposite ends of the equalizing-bars, substantially as set forth.



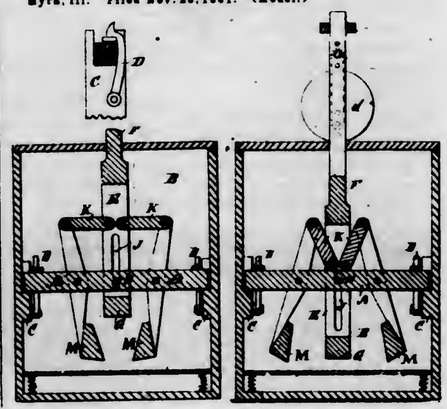
2. The combination, with the vertically-movable and swinging bolster, of bell-crank brake-levers pivoted upon rods or journals, the outer ends of said rods being secured to the side beams of the truck-frame and their inner ends supported in bars attached to the cross-beams of the truck, substantially as set forth.

3. The combination, with the swinging bolster having recesses formed near its ends, of the brake-lever-supporting bars secured to the cross-beams of the truck, said bars serving as stops to limit the endwise movement of the bolster, substantially as set forth.

4. The combination, with the bell-crank brake-levers having studs on their lower ends, of brake-beams removably secured to said studs, substantially as set forth.

5. The combination, with the brake-levers, of adjustable stop-plates interposed between the cross-beams and brake-levers, substantially as set forth.

256,018. CAR-BRAKE. JOHN F. HALLINCKRODT, Denver, Colo., assignor of one fifty-second to P. H. Van Diest, same place. Filed Sept. 13, 1881. (Model.)



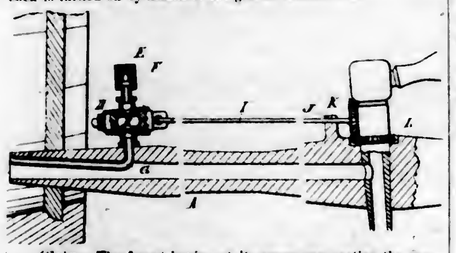
Claim.—1. The combination, with a vertically-movable bolster and spring-board connected therewith, of brake-levers and stirrups connecting the brake-levers and spring-board, and toggle-arms for actuating the brake-levers, substantially as set forth.

2. The combination, with a vertically-movable bolster, spring-board connected therewith, and springs interposed between the bolster and spring-board, of two pairs of brake-levers, each pair having their outer ends connected by a brake-bar and their inner or lower ends connected by a brake-beam, and stirrups connected with the brake-levers and spring-board, substantially as set forth.

3. The combination, with a vertically-movable bolster having a spring-board connected therewith, and cross-beams located on opposite sides of the bolster, of brake-levers and stirrups connecting the brake-levers and spring-board, said stirrups being located between the bolster and cross-beams, substantially as set forth.

4. The combination, with two pairs of brake-levers and a vertically-movable bolster suspended therefrom by stirrups, of brake-beams connecting the lower ends of the brake-levers, and toggle-arms and brake-rod for releasing the brakes, substantially as set forth.

256,019. WASHING-MACHINE. MICAJAH C. HALDEN, Palmyra, Ill. Filed Nov. 28, 1881. (Model.)



Claim.—1. In a washing-machine, the combination, with the bar A, carrying the reciprocating and swinging pounders, of the box B, provided with the recessed brackets C and the pivoted hooks D, substantially as and for the purpose set forth.

2. In a washing-machine, the combination, with the box B, the bar A, provided with the pins H and the operating mechanism, of the forked dasher-rod F, provided with the block G and the slots J, the arms K, pivoted to the dasher-rod, and the levers I, provided with the blocks M, and pivoted to the said bar and to the arms K, substantially as and for the purpose set forth.

256,020. BEER-FAUCET. JOHN MAPPES, Cincinnati, Ohio. Filed Jan. 14, 1882. (No model.)

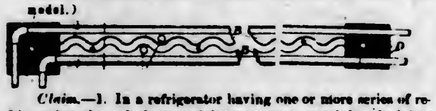
Brief.—The valve-guarded inlet G is opened when the faucet-cock is turned on by means of the geared connections.

Claim.—The faucet having at its upper rear portion the supplementary cock D, provided with the valve-guarded inlet E F G, and the geared connection I K L, with the spigot, substantially as set forth.

256,021. VENTILATOR FOR BUILDINGS. JOHN MCDONOUGH, Philadelphia, Pa. Filed Oct. 25, 1881. (No model.)

Brief.—Utilizes the hollow supporting-columns of galleries, &c., for distributing refrigerated air through them to interior of halls, &c.

Claim.—In a ventilating apparatus for buildings, the combination, with the forcing apparatus, the main pipe, and the distributing-pipes, of the hollow slotted columns located within the room to be cooled, substantially as specified.



256,022. BOOK-BINDING. ANDREW J. MEGEE, Philadelphia, Pa., assignor of one-half to Francis H. Miller, same place. Filed Dec. 5, 1881. (No model.)

Claim.—1. An album or like book composed of leaves having two hinges, *x*, between the back of the book and the main sheet A of the leaf, as set forth.

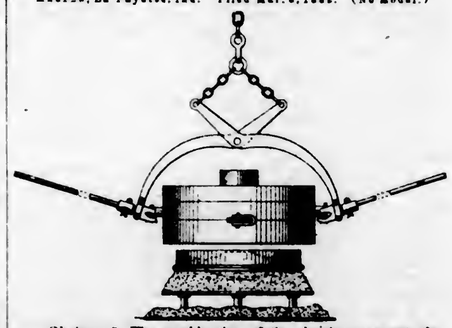
2. A leaf for albums or like books, said leaf having two ribs or guards, *a a'*, with flexible connections *x'*, as set forth.

256,023. REFRIGERATOR COOLED BY AMMONIA AND OTHER VOLATILE LIQUIDS. REUBEN A. MESSENGER, Medford, assignor of one-half to John H. Watson, Brookline, and Samuel W. Johnson, Medford, Mass. Filed Jan. 31, 1882. (No model.)

Claim.—1. In a refrigerator having one or more series of refrigerating-pipes, the boxes or joint-protectors containing the joints of said pipes, said boxes being entirely disconnected from the interior of the preserving-chamber and adapted to protect the joints of the pipes from contact with the external air, as set forth.

2. The boxes or joint-protectors containing the joints of the refrigerating-pipes and provided with pipes for the escape of leaking gas, as set forth.

3. The boxes or joint-protectors containing the joints of the refrigerating-pipes and provided with a packing of asbestus or other suitable material around said joints, as set forth.

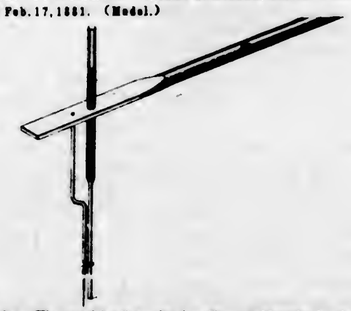


4. In a refrigerator, the combination of a preserving-chamber, refrigerating-pipes arranged along the walls thereof, practically air-tight casings inclosing the pipes and shutting them off from contact with the air in the chamber, and air-passages passing through said casings and communicating with the upper and lower portions of the chamber, whereby direct contact between the air in the chamber and the pipes is prevented, as set forth.

5. The combination of the preserving-chamber, the double series of refrigerating-pipes, and the divided casings containing said pipes, the proximate sides of the divisions of the casings being corrugated and forming air-passages communicating with the upper and lower portions of the preserving-chamber, as set forth.

6. The casings B, inclosing the refrigerating-pipes and provided with outlets extending outside of the chamber for the escape of leaking gas, as set forth.

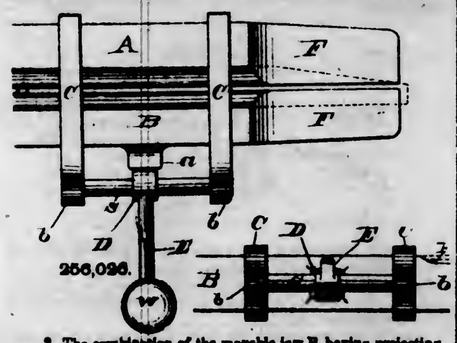
7. The combination of the refrigerating-pipes, the casings B, surrounding said pipes, and a filling of rock-salt or other solid conductor of heat, as set forth.



256,024. GRAPPLING-IRON. MUNSON MICHAEL and PHILO W. MASTEN, La Fayette, Ind. Filed Mar. 8, 1882. (No model.)

Claim.—1. The combination of the clasping-segment, the hook, the trunnion, and the tenon formed thereon, substantially in the manner and for the purposes described.

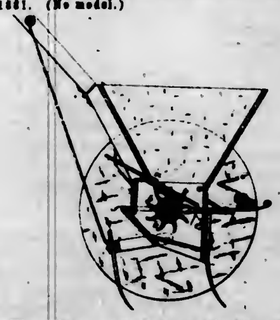
2. The combination of hoisting-tongs having hooks or eyes A A, the clasping-segments, the hooks formed with lips, the flanged trunnions, and means for attaching turning-handles thereto, substantially in the manner and for purposes described.



256,025. PIVOT-GAGE. THOMAS S. MILLER, Carlinville, Ill. Filed Feb. 17, 1881. (Model.)

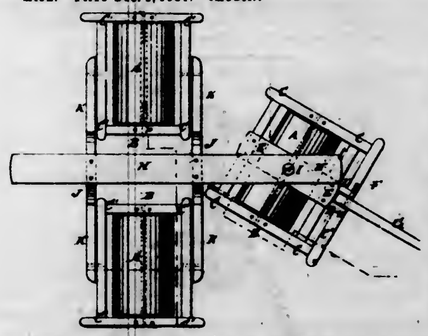
Claim.—The combination of a handle, a guide-wire having a curl or eye and rigidly secured to the handle, a wire parallel to the guide-wire and sliding in the curl, and provided with a screw passing through a threaded opening in the handle, substantially as and for the purpose set forth.

256,026. CLAMP FOR HOLDING RAILROAD-RAILS. WILLIAM J. MORGAN, Chicago, Ill. Filed Dec. 31, 1881. (No model.)



Claim.—1. In a railroad-iron-clamping device, the jaws A and B, forming opening O, and beveled off at F, substantially as and for the purpose set forth.

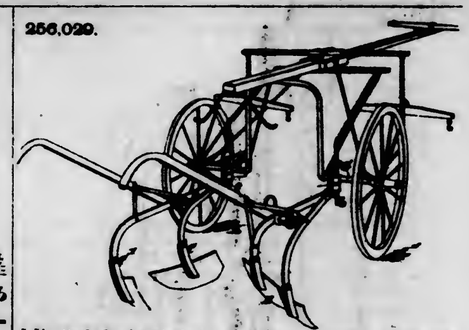
256,026.



2. The combination of the movable jaw B, having projecting piece *a*, and the stationary jaw A, said jaws beveled at F and cast so as to form the opening O, with the yokes C C, having bearings *b b*, shaft S, cam D, lever E, and weight W, substantially as and for the purpose described and shown.

256,027. COTTON-PLANTER AND GUANO-DISTRIBUTER COMBINED. BENJAMIN F. MORGAN, Greenville, S. C. Filed Nov. 17, 1881. (No model.)

Claim.—The agitator-plate E, in combination with the adjustable extensible side-plate F, substantially as described.



256,028. FIELD-ROLLER. ANDREW E. MOORE, Charlotte, Mich. Filed Dec. 6, 1881. (Model.)

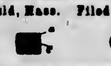
Claim.—The combination, with the frame C, provided with the plank E, of the rear frames, C', the cross-bars K, between which the rear frames are pivoted, the standards J, and the plank H, pivoted to the plank E and rigidly secured to the standards J and projecting in the rear of the said frames C', substantially as and for the purpose set forth.

256,029. CULTIVATOR. GIDEON MOORE, Moline, Ill., assignor to Deere and Company, same place. Filed Nov. 6, 1881. (No model.)

Claim.—1. In a cultivator, and in combination with the pivoted shovel-beams, the brackets H H', having slotted face-plates

256,029.

A A', attached respectively to said beams and adjustable on each other by means of slot, bolt, and nut, substantially as set forth.



2. In a cultivator, the bracket H H', consisting of two parts having respectively faces *h h'*, slotted at h^3, and adjustable by bolt h^3 and nut h^4, and adapted to be secured on the shovel-beams, all substantially as set forth.

256,030. METALLIC COUNTER-SUPPORT FOR BOOTS AND SHOES. VREA B. MORTON, Louisville, Ky. Filed Oct. 24, 1881. (No model.)

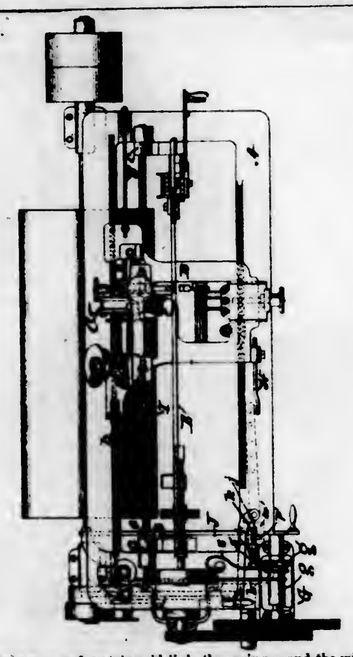
Claim.—The counter-stiffener herein described, consisting of the body B, having duplex fingers *b* turned inward at b^2 and provided with cross-heads *c*, arranged parallel with the longitudinal plane of the sole, and having back finger, *a*, turned inward and provided with cross-head *c*, arranged transversely, and the whole, adapted to serve without screws or other fasteners, as specified.

256,031. WHIP-CORE. HENRY HOLLIS and JAMES HOGLE, Jr., Westfield, Mass. Filed Dec. 14, 1881. (No model.)

Claim.—The within-described whip-core, consisting of a core of rawhide folded upon itself and having its folds solidly united by the interposition of suitable cement, substantially as set forth.

256,032. LATHE FOR TURNING IRREGULAR FORMS. EDWARD HYNES, Cincinnati, Ohio, assignor to the Lane & Bodley Company, same place. Filed Feb. 16, 1881. (No model.)

Brief.—The work-carrying frame may be swung back from the cutter by cams on a rock-shaft working against the frame. The clutch mechanism operating the winding-shaft (by which the cutter-frame is drawn from end to end of the work) is uncoupled by a pin on the frame moving back a spring-bolt. The same pin actuates the mechanism which swings back the work-frame.



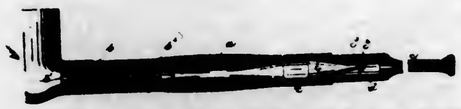
Claim.—1. The combination, with the vertical work-carrying frame E, arranged independently of the driving mechanism of the lathe, of a rock-shaft arranged at one side of said frame and provided with cams *c c* and lever mechanism, such substantially as described, connected with the rock-shaft and under control of the operator, whereby the rock-shaft can be rotated and the cams caused to move and retain the work-carrying frame away from the cutters at any stage of the cutting operation, substantially as described.

2. The combination, with the vibratory work-carrying frame E and the horizontal rock-shaft I, provided with the cams *c c* and crank *c*, of the lever J, pivoted at one end to the frame A, the pivoted link *d*, connected with the lever and with the crank of the shaft I, and the weight *w'*, arranged to draw the lever downward, substantially as described.

3. The combination, with the vibratory frame E and the cam-shaft I, of the lever J, the vertical link K, connected with the lever, the push-pin *p*, arranged to engage the link and sustain the same, the springs S S', and the traveling carriage connected with the winding-drum and clutch mechanism, substantially as described.

4. The link K, connected with the lever J and having the wedge-shaped upper end, in combination with the push-pin *p*, ar-

256,032.



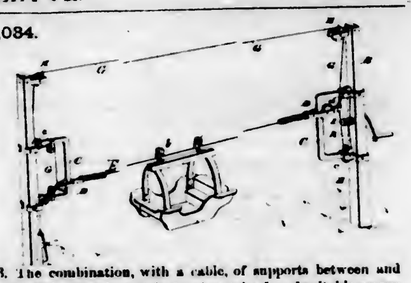
ranged to engage and sustain said link, the spring *s*, and the winding-shaft G, provided with the loose arm *g* and clutch *g'*, all substantially as described.

5. The independent spring *s*, encircling the push-pin *p*, in combination with the link K, connected with the lever J, the winding-shaft G, provided with the loose drum *g* and clutch *g'*, and the spring *s*, arranged to act on the clutch, all substantially as described.

6. The link K, connected with the lever J, and the spring-actuated push-pin *p*, arranged to engage and sustain the link, in combination with the hand-lever *j*, arranged to disengage the push-pin from the link, substantially as described.

256,033. COMBINED PIPE-STEM AND CIGAR-HOLDER. JAMES MAUGHTER, Dayton, Ohio. Filed Jan. 12, 1882. (No model.)

Claim.—In a pipe, the combination, with the stem *a*, having the outer portions of its bore expanded, of the shell *b*, having tube *b'*, and the cone *c'* and its cap *c''*, arranged within the nipple *c*, which fits over the end of the stem *a*, substantially as and for the purposes set forth.

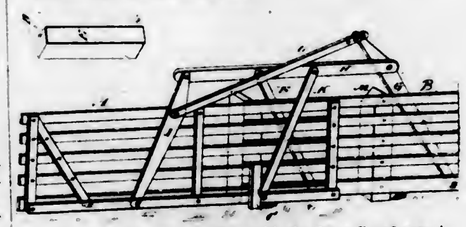


256,034. ELEVATED WAY. NELSON NEWMAN, Springfield, Ill. Filed Jan. 3, 1882. (No model.)

Brief.—A cable on which is suspended a car is stretched between suitable supports and secured by means of a strap provided with rollers adapted to travel on a frame secured to the supports. The cable is raised and lowered by means of a cord passing over a system of pulleys and attached to the straps, and having at one end a weight and at the other a shaft adapted to operate the device.

Claim.—1. A cable stretched between suitable supports, in combination with a suspended car and automatically co-operating mechanism to simultaneously change the relative vertical positions of its ends, so as to cause said car, by the action of gravity, to automatically pass from one end to the opposite end of said cable, substantially as and for the purpose specified.

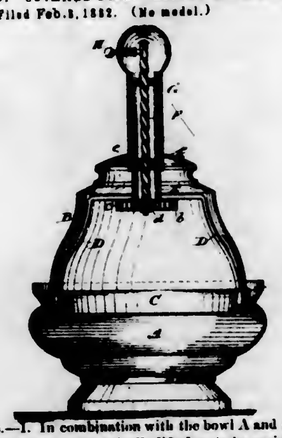
2. A cable stretched between suitable supports, in combination with means, substantially such as described, whereby its ends may be simultaneously moved in vertically-opposite directions, so as to give to said cable an inclination in either direction, substantially as and for the purpose shown.



256,034.

3. The combination, with a cable, of supports between and upon which the same is stretched and sustained, and suitable means whereby its ends may, from one of said supports, be simultaneously moved vertically in opposite directions, substantially as and for the purpose set forth.

4. In combination with the cable E, the frames C, the rolling supports *d* D, the cord G, the guide-rollers H, and means whereby said rolling supports may be raised or lowered, substantially as and for the purpose shown and described.



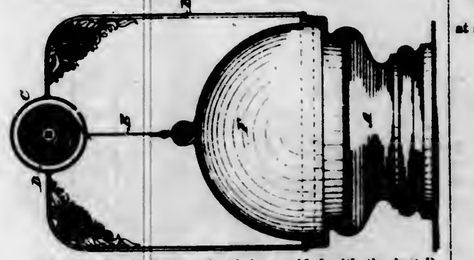
256,035. SLIDING GATE. ALEXANDER NICOL, Ayton, Ontario, assignor to William J. Watson, same place, and James Nicol, Owen Sound, Canada. Filed Dec. 5, 1881. (Model.) Patented in Canada Jan. 22, 1880.

Claim.—1. The combination, with the fence B and gate A, of the bars F and G, pivoted to the bottom of the fence, the bars J and K, pivoted to the bottom of the gate, the bar H, pivoted to the bars F, G, J, and K, and the diagonal bar L, pivoted to the end bars, J and G, substantially as herein shown and described, and for the purpose set forth.

2. The combination, with the gate and the fence B, provided with posts M, having beveled tops, of the bars F G, pivoted to the bottom of the fence, the bars J K, pivoted to the bottom of the gate, the bar H, pivoted to the bars F G J K, and of the diagonal bar L, pivoted to the top of the bar G, and to the bar J, a short distance from the top of the same, substantially as herein shown and described, and for the purpose set forth.

256,036. COVERED DISH. EDMUND A. PARKER, Meriden, Conn. Filed Feb. 3, 1882. (No model.)

Claim.—1. In combination with the bowl A and cover B, the latter adapted to be automatically lifted or to be positively locked in a closed position, a tubular handle, G, the vertical movement



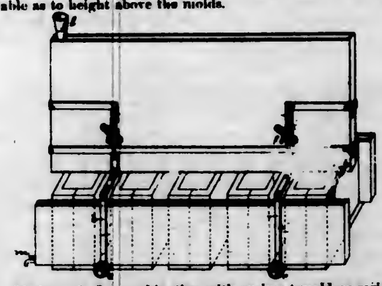
of which causes the interior worm-shaft to be rotated, and which also serves as a means for carrying the bowl, substantially as described.

2. The bowl A, provided with a seat for a cover, and having a bail, J, provided at its top with a tube, E, having slots *f f*, spring *e*, and worm-shaft F, in combination with the cover B, terminating at its top in a tubular handle, G, provided with inwardly-projecting wings *e e* and a suitable lock or latch, H, substantially as and for the purpose set forth.

3. In combination with the bowl A, adapted to vertical movement upon the frame I, and provided with a bail, J, spring *e*, and worm-shaft F, the cover B, rigidly secured to the frame I, and provided with the tubular handle G, slotted or indented at *f*, and having wings *e e* and the guide-tenons *i i* on the frame, all substantially as and for the purpose set forth.

4. The bowl A, provided with a frame or bail, D, arranged underneath the cover B, the latter adapted to the passage centrally through the same of the bail D or an extension thereof, substantially as and for the purpose set forth.

256,037. COVERED DISH. EDMUND A. PARKER, Meriden, Conn. Filed Feb. 3, 1882. (No model.)

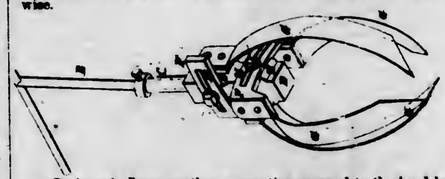


Claim.—1. The dish or bowl A, provided with the bail B, spring-case C, and spring D, in combination with the cover F, flexible connecting band or chain E, and suitable latch, F', substantially as and for the purpose described.

2. The dish or bowl A, provided with the bail B, spring-case C, and spring D, in combination with the flexible band or chain E, adapted for securement to the cover F, substantially as hereinbefore set forth.

256,038. INGOT-MOLD SHIELD. JOHN PARDEE, Pittsburg, Pa. Filed Feb. 27, 1882. (No model.)

Brief.—Shields are arranged above the molds between the melters; also on the sides of the molds. The upper shield is adjustable as to height above the molds.



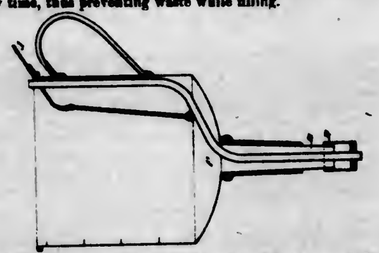
Claim.—1. In combination with an ingot-mold or series of molds, a shield adapted to fit over the mold or molds and protect each melter from the heat of the crucible teemed by the opposite melter, substantially as set forth.

2. A shield for ingot-molds, formed of a top shield adapted to fit over the top of the mold or molds, and one or more lower shields adapted to fit along the sides of the molds, substantially as and for the purposes set forth.

3. In ingot-mold shields, the combination of the frame-work or carriage with the top shield fitting over the mold or series of molds and vertically adjustable in the carriage, substantially as and for the purposes set forth.

256,039. EARTH-AUGER. CARL A. F. PETERS, St. Louis, Mo. Filed Feb. 23, 1882. (No model.)

Brief.—The cutting-blades are adjusted through curved slotted arms at their upper ends, said arms moving between curved guides, and being secured by bolts passing through the curved slots and into the head-piece. The operating-stem is adjustable lengthwise.



Claim.—1. In an earth-auger, cutters secured to the head by bolts and lugs with curved slots, substantially as set forth.

2. In an earth-auger, the combination of curved cutters G and curved legs F, projecting from the cutters and adjustable upon bolts passing through the legs and into or through the head.

3. In an earth-auger, an adjustable stem, B C, substantially as and for the purpose set forth.

256,040. FUNNEL. OSCAR T. PETZOLD, Schmitz, Saxony, Germany. Filed Sept. 19, 1881. (No model.)

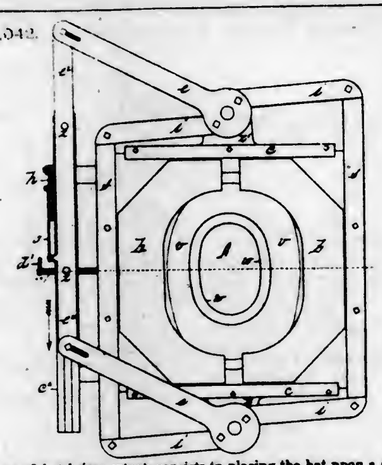
Brief.—The flow of the liquid may be interrupted immediately at any time, thus preventing waste while filling.

Claim.—The combination, with a funnel having neck B, of the side-apertured cap D, fitting over the end of said neck, the tube F, passing through and made fast to the bottom of said cap, extending up to the top of funnel and bent about the middle, and the lever J, connected by a pivoted rod with the tube and slotted at H to receive the upper end of tube, as and for the purpose specified.

256,041. BREECH-LOADING BOMB-GUN. EBENEZER PIERCE, New Bedford, Mass. Filed Mar. 11, 1881. (No model.)

Claim.—1. In a breech-loading bomb-gun, the combination of a hinged barrel with the breech-piece carrying firing devices, a sliding rod adapted to connect with and actuate the firing devices by impact, as described, said rod being arranged in guides on the hinged barrel to move therewith during the act of inserting a cartridge or charge in the barrel of the gun when it is turned on its hinge, as and for the purpose set forth.

2. The combination, with a breech-loading bomb-gun, of the divided sliding rod, which operates the mechanism employed for firing the charge by impact, one portion of said rod being supported by a guide upon the breech-piece and the remaining part of the rod being supported by guides upon the barrel, whereby the barrel can be turned back on its hinge without disconnecting either of the rods, substantially as described.



256,042. HAT-PLANKING MACHINE. LAUREN S. PLUMB and GEORGE W. HARCHANT, Palmer, Mass.; said Harchant assignor to Robert L. Goddard, same place. Filed July 28, 1881. (No model.)

Claim.—1. The hollow steam-table A, the brim-clamps *b b*, having their under faces curved to conform to the brim-flange form on the sides of the die *v*, the levers *c c*, the connecting-bars *d*, bar *c'*, lever *b*, and the dies *x* and *v*, all combined and operating substantially as set forth.

2. The combination, with the steam-table A, the brim-clamps *b b*, and the dies *x* and *w*, of the posts *x'*, the base *x*, cam *d''*, shaft *d*, and lever *d'*, substantially as set forth.

3. The within-described improved process for shaping the

256,042.

flanges of hat-brims, which consists in placing the hat upon a die having a border conforming to the shape of the hat-brim, placing a second die upon the upper side of the hat-brim, having a border upon which to form the said brim-flanges extending partially under said flanges, then heating said dies and hat and moving the clamps *b b* under pressure over the surfaces of said flanges from the outer edges of the brim toward the hat-body, and by mechanism substantially as described lifting and forcing said flanges against the under side of said clamps, substantially as set forth.

256,043. MOLDING ARTICLES OF INDIA-RUBBER AND OTHER VULCANIZABLE GUMS. CONRAD POPPENBURG, Hamburg, Germany. Filed Dec. 14, 1881. (No specimens.) Patented in Germany Jan. 11, 1881.

Claim.—1. The method of molding articles of india-rubber or other vulcanizable gum, consisting in filling the mold with liquid to exclude all air therefrom and displacing the liquid by pressing the compound into the mold so filled, substantially as and for the purpose herein described.

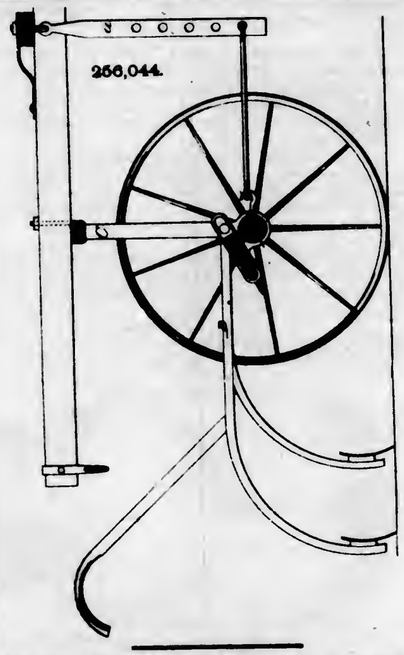
2. The method of molding articles of india-rubber or other vulcanizable gum, consisting in filling the mold with linseed-oil to exclude all air therefrom and displacing the liquid by pressing the compound into the mold so filled, substantially as described.

256,044. CULTIVATOR. CHARLES W. POST, Springfield, Ill. Filed Nov. 16, 1881. (No model.)

Brief.—The drag-bars are secured to a cross-shaft, which is journaled in blocks that reciprocate in oblique brackets keyed upon the axle. Springs retain these bearings in their normal position, while a heavy strain, as of hard earth, will cause the front end of the drag-bars to descend, and thus bring the shovels nearer a vertical position.

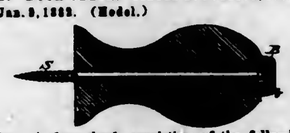
Claim.—1. In a cultivator, the combination of the drag-bar with the axle or frame by means of a yielding or movable coupling adapted to permit the front end of the drag-bar to fall or rise as the shovels or teeth encounter a greater or less resistance from the soil, thereby causing the shovels to stand more or less vertical to the ground, substantially as described.

2. In a cultivator, the combination, with the drag-bars, of yielding or movable couplings connecting the drag-bars with the axle, and adapted to permit the forward ends of said drag-bars to fall and the shovels to automatically adjust themselves toward a vertical position as the resistance of the soil increases independently of the hitch of the team, substantially as described.



3. The combination, in a wheel-cultivator, of the beam or drag-bar and a movable coupling at its front end, the bearing of which reciprocates at an angle of approximately forty-five degrees, substantially as described.

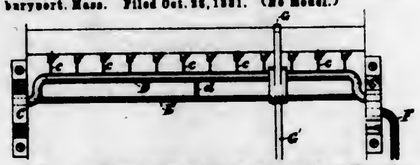
4. The combination, with the axle of a cultivator and the oblique guide-bracket, of the shovel-beam, and the shaft to sustain the same in said bracket, substantially as described.



5. The combination, with the shaft supporting the beam and with the oblique guide-bracket, of a spring-seated reciprocating block forming a bearing for said shaft, substantially as described.

6. The shaft supporting the beam and the slotted oblique guide-bracket, in combination with the reciprocating bearing-block, the guide-rod, and the coiled expansion-spring, substantially as described.

256,044.

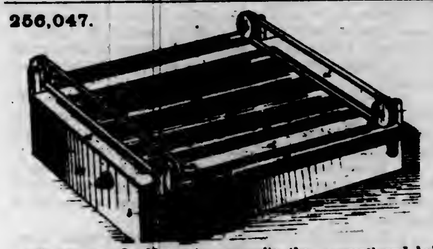


256,045. DOOR-CHECK. ISRAEL P. POULSON, Greenfield, Ind. Filed Jan. 9, 1882. (Model.)

Claim.—A door-check consisting of the following parts, to wit: a stud, P, made longer than an ordinary door-knob, and having the bore *p'* and enlargement *a*, provided with a sharp corner, *c*, at the bottom, the rubber cup B, made of a size to snugly fit the enlargement or recess *a*, and the bolt S, passing through the cup and stud and having a screw-thread for securing the device in place, all as set forth.

256,046. LIGHTNING-ARRESTER. ALMON B. PRESCOTT, Newburyport, Mass. Filed Oct. 26, 1881. (No model.)

Claim.—1. The swinging rod D, in combination with a wire or series of wires, *c*, of a telegraphic or telephone line and the ground-connection F, and adapted to be operated as and for the purpose specified.

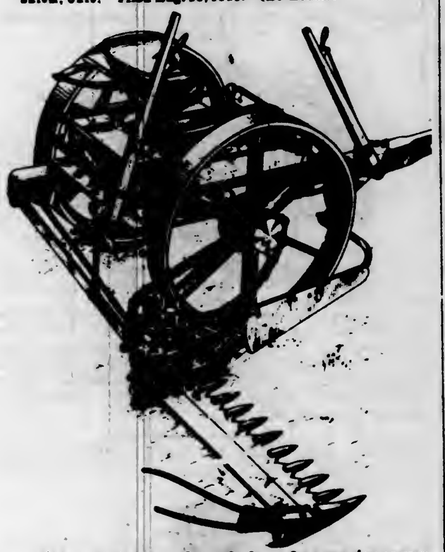


2. The combination of the swinging rod D, provided with the arms G G', the wires *c c*, the bracket C, and the conducting-rod F, substantially as and for the purpose set forth.

256,047. ROLL SUCTION-BOX FOR PAPER-MAKING MACHINES. JAS. RANDALL, Norwich, Conn. Filed Feb. 18, 1882. (No model.)

Claim.—1. The combination, in a suction-box, of the perforated metal rolls, journaled in its sides, and the solid exterior rolls, A A, for supporting the wire-cloth of a paper-machine, all as and for the purposes set forth.

2. The combination of felt packing upon the edges of the suction-box and the endless rubber belts passing over band-pulleys



256,047.

at the corners of said box to move with the wire-cloth and hold it down, all substantially as herein set forth.

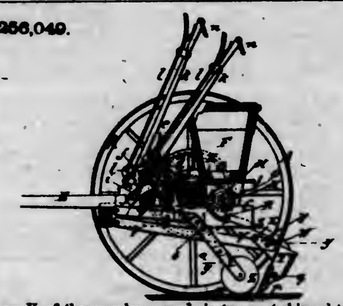
3. In combination with the hollow perforated rolls of a suction-box, the loose perforated sleeves for adapting the same length of rolls to be used with varying widths of paper, all substantially as described.

256,048. MOWING AND REAPING MACHINE. AMOS RANK, Salem, Ohio. Filed Aug. 26, 1880. (No model.)

Claim.—1. A rectangular main frame for a mowing or reaping machine, made wholly of wrought metal and the ends of the side bars projecting as described, to wit: the rear end of the left-hand side piece projecting outward and downward, the rear end of the right-hand side piece projecting outward and upward, and the front end of the right-hand side piece projecting outward and downward, substantially as and for the purpose shown and described.

2. In a two-wheeled hinge-joint mowing or reaping machine, a vibrating drag-bar constructed of an iron rod having a rectangular cross-section, combined with the adjustable and removable grain-board, substantially as shown and described.

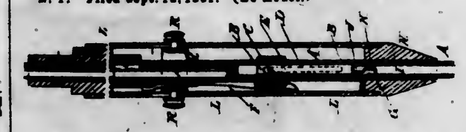
3. The combination, in a two-wheeled hinge-joint mowing or reaping machine, of a vibrating drag-bar constructed of square-shaped iron, with the adjustable and removable spring chain-guide mounted on said drag-bar, substantially as shown and described.



256,049. WHEAT-DRILL. ADRIAN L. REESE, Chase, Kans. Filed Nov. 26, 1881. (Model.)

Claim.—1. The combination, with the draw-bar V and pins H W, of the pivoted standard T, having slotted arm U, and the slotted draw-bars Y, having pins *a b*, as and for the purpose specified.

2. The combination, with a cross-bar, *c*, made in two parts hinged together, of the hinged connecting-rod *d*, the shaft *f*, having arm *e*, the rods *g*, and the shaft *i*, having arms *h*, as and for the purpose specified.



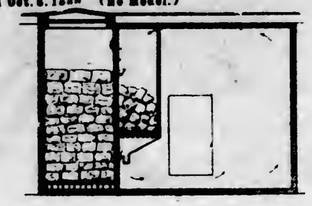
3. In a wheat-drill, the combination, with the colter draw-

256,049.

bars Y, of the cross-bar *c*, made in two parts hinged to each other, the connecting-rods *d g*, the arms *e h*, the shafts *f i*, and the levers *h h*, substantially as herein shown and described, whereby the plows and colters can be adjusted to uneven ground, and can be raised from the ground, as set forth.

256,050. DENTAL DRILL. CASSIUS M. RICHARDS, New York, N. Y. Filed Sept. 15, 1881. (No model.)

Claim.—1. The combination, with the slotted hollow rod A, of the stem B, having its forward end halved or rabbeted and a groove across the inner part of the rabbet, the pin C, the ring E, and the spring-catch F, substantially as herein shown and described, whereby a tool can be readily attached and detached and will be securely held, as set forth.

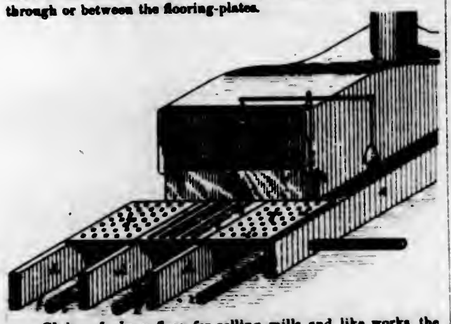


2. The combination, with the tool-holding rod A and the spring-catch F, of the hand-piece L M N, the interior ring, Q, and the pins R, substantially as herein shown and described, whereby the tool-holding rod can be conveniently handled and the tool readily attached and detached, as set forth.

256,051. BOILER-FURNACE. GERARD E. RICKETTS, Proctorville, Ohio. Filed Oct. 19, 1881. (No model.)

Claim.—The combination, with the boiler A, having tubes *a*, opening into the uptake *c*, and the dampers *b b*, of the fire-box B, connected by a flue, *d*, controlled by said dampers, with a smoke flue, *h*, communicating with tubes *a*, and the outer shell having a flue, C, open at the rear and connecting at front with the ash-pit *g*, whereby the air enters flue C, is heated from the shell of furnace to thoroughly ignite the fuel in the fire-box, and then passes with the products of combustion through flue *d*, smoke-flue *b*, and tubes *a* to the uptake *c*, as shown and described.

256,052. REFRIGERATING-ROOM. HENRY A. ROBERTS, Detroit, Mich., assignor to Gustavus F. Swift, Chicago, Ill. Filed Oct. 6, 1880. (No model.)

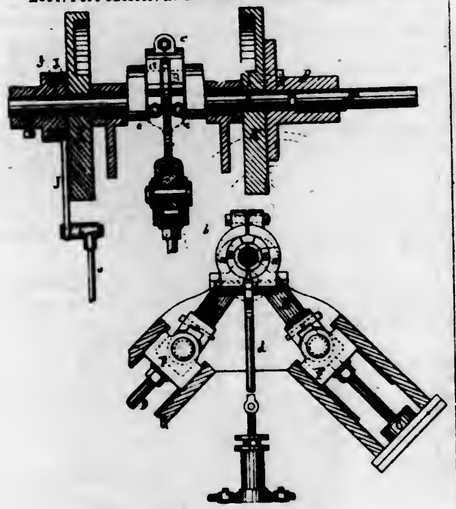


Claim.—1. In combination with the preserving-compartment (one or more) of a refrigerator and a receptacle (one or more) for the refrigerant, a compartment (one or more) for the storage of surplus ice, arranged with relation to each other substantially as described.

2. An inclosed chamber divided into vertical preserving or refrigerating compartments having receptacles for the ice or other refrigerant, and vertical ice-storage compartments adjoining such preserving-compartments, all of such compartments being disconnected and having independent doors, substantially as and for the purpose set forth.

3. In combination, vertical preserving-compartments, vertical compartments for the storage of surplus ice adjoining such preserving-compartments and not connected therewith, and receptacles for the refrigerant opening into such storage-compartments, substantially as described and shown.

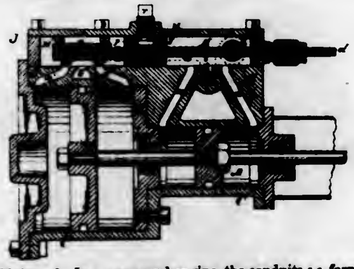
256,053. FLOOR FOR ROLLING-MILLS, GLASS-HOUSES, &c. WILLIAM ROGERS, Lenshurg, Pa., assignor to himself and William H. Rogers, same place. Filed Jan. 14, 1882. (No model.)



Brief.—The floor is kept cool by air introduced through pipes into air-chambers under it, the air being discharged into the works through or between the flooring-plates.

Claim.—1. In a floor for rolling-mills and like works, the combination of metal plates supported above an air space or chamber and air pipe or pipes in said air-chamber adapted to discharge air in such manner as to rise through or between said plates, substantially as and for the purposes set forth.

2. In a floor for rolling-mills and like works, the combination of metal plates supported above an air space or chamber and air-discharging pipe or pipes in said air-chamber, the metal plates having perforations or openings for the escape of air from the air-chamber, substantially as and for the purposes set forth.



256,054. DOUBLE-CYLINDER STEAM-ENGINE. JOHN B. ROOT, Port Chester, N. Y. Filed Jan. 31, 1881. (No model.)

Claim.—1. In a compound engine, the conduits *e e*, formed in the walls of the steam-chest, in combination with the exhaust-port *b* of the cylinder A, substantially as and for the purpose set forth.

2. In combination with the steam-chests of a compound engine, an aperture partly surrounding the valve-rod *d* and adapted to receive steam-packing, a plate, *p*, and screw *r*, substantially as and for the purpose set forth.

256,055. COMPOUND ENGINE. JOHN B. ROOT, Port Chester, N. Y. Filed Oct. 9, 1880. (No model.)

Claim.—1. In combination with a friction-bushing on the crank of an engine having two double-acting cylinders placed at right angles to each other, two pitmen whose crank ends are semicircular, and binding-straps, substantially as and for the purpose set forth.

2. In combination with the eccentric of an engine having two double-acting cylinders placed at right angles with each other, eccentric-rods J J, whose connecting ends are semicircular, and a binding-ring, *f*, substantially as and for the purpose set forth.

3. In combination with binding-straps, by which the ends of the pitmen are secured to the crank of an engine, an auxiliary pitman, *d*, whereby the straps are held in position, substantially as described.

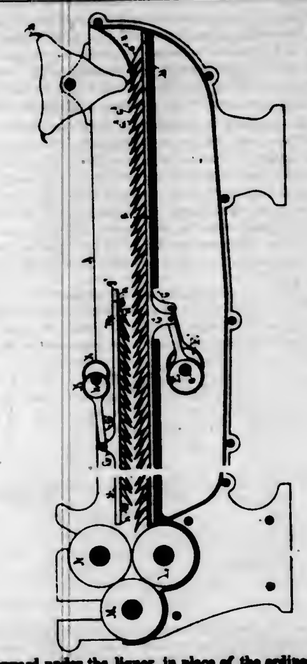
4. In combination with the crank-shaft of an engine having two double-acting cylinders at right angles with each other, two counterbalance-wheels whose combined counter-weight is equal to the weight of the reciprocating parts of one of the engines, substantially as and for the purpose described.

5. In combination with a yoke pivoted in the sleeve M and provided with levers A A, a rod, *j*, and swivel-link *p*, by which the yoke is connected with the lever N, as means for adjusting the eccentric, substantially as set forth.

256,056. BUTTON. EDWARD H. ROYCE, FREDERICK W. ALLEN, and MYRON H. FULLER, Providence, R. I. Filed Feb. 28, 1882. (No model.)

Claim.—1. As an improvement in the art of making buttons from sheet metal, first coating the formed button with a layer of contrasting composition, and then producing a design composed of characters or figures by the removal of a portion of composition to expose the metal underneath, leaving the design surrounded and protected and producing immediate contrast, substantially as hereinbefore set forth.

2. As an improvement in the art of making sheet-metal buttons, first coating the formed button with a layer of contrasting composition and then ornamenting the same by cutting away a portion of the composition and slightly into the metal underneath, substantially as and for the purposes hereinbefore set forth.

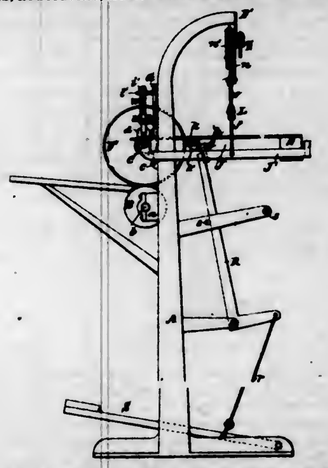


3. As a new article of manufacture, a sheet-metal button coated with a layer of composition of contrasting color, a portion of the composition and of the underlying metal being removed to form a design substantially as hereinbefore set forth.

256,057. WOOL-WASHER. FREDERICK G. SARGENT and ALLAN G. SARGENT, Graniteville, Mass. Filed June 18, 1881. (No model.)

Claim.—1. The combination of the bowl A and squeeze-rolls M N with the submerged conveyors C C', placed horizontally in the bottom of the washing-space of the bowl, substantially as described.

2. The combination of the trough of a wool-washing machine with a series of reciprocating toothed bars, placed substantially horizontal in the bottom of the washing-space and adapted to feed



256,057.

the fiber forward under the liquor, in place of the ordinary over-head-rakes, all substantially as and for the purpose set forth.

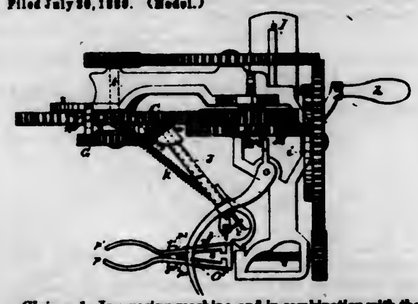
3. The combination of the bowl A, squeeze-rolls M N, plunger B, conveyors C, and conveyors G, substantially as described.

256,058. LEATHER-MEASURING MACHINE. WILLIAM A. SAWYER, Dansversport, assignor of two-fifths to Arthur B. Claflin, Newtonville, Mass. Filed Aug. 27, 1881. (No model.)

Claim.—1. A machine for measuring sides of leather and similar surfaces, consisting of a suitable registering device, a series of weights, and a series of wheels or rollers, the wheels or rollers being adapted to automatically move the weights while the surfaces to be measured are being passed under them, substantially as described.

2. The roller B and the series of wheels or rollers F, placed loosely upon the rod or shaft C, in combination with the series of weights H, the registering device N, and connecting mechanisms substantially as and for the purposes set forth.

3. The combination, with the rods A and the sliding weights carried by suspended frame J, of the series of rollers or wheels F and the main roller B, as and for the purpose described.



4. The series of wheels or rollers F, formed with the grooved hubs *e*, and placed loosely upon the rod or shaft C, in combination with the series of wheels *d* and the series of weights H, provided with arms *h*, substantially as and for the purposes set forth.

5. The combination, with a registering device, substantially as described, of the suspended frame J, weights H, rods A, wheels *d*, vertically-movable rollers F, having hubs *e*, and the main roller B, as and for the purpose specified.

6. The vertically-movable rollers F, formed with the grooved hubs *e*, in combination with the corresponding spring-pressed grooved rollers *d* and the weights H, formed with the rods A, substantially as and for the purposes set forth.

7. The arms T, provided with the steps *s s*, in combination with the levers R, foot-lever S, suspended frame J, and the weights H, the upper ends of the levers R being provided with the cross-piece *q*, substantially as and for the purposes set forth.

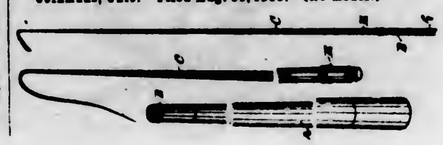
256,059. APPLE-PARER. ROBERT P. SCOTT, Newark, N. J. Filed July 30, 1880. (Model.)

Claim.—1. In a paring-machine, and in combination with the mechanism thereof, a paring-knife having a backward-and-forward movement, substantially as and for the purpose set forth.

2. The table-wheel C, in combination with the worm-wheels M, spur-wheels *h h'*, spur-wheel G, with teeth *e*, knife-arm J, with foot *l*, arm *o*, lever *n*, and cam *g*, substantially as and for the purpose set forth.

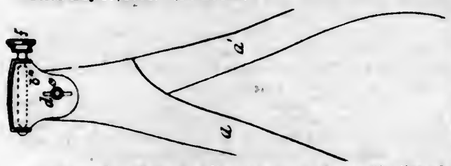
3. In a paring-machine, the combination, with the paring-knife, of mechanism, substantially such as described, for oscillating said knife, as set forth.

256,060. CONSTRUCTION OF WOODEN PIPES. JOHN B. SHAGRAW and FRANK W. LEWIS, Worcester, Mass. Filed Aug. 16, 1881. (No model.)



Brief.—A wooden pipe composed of two or more segmental sections is provided at each end of the section with a longitudinal rib and groove adapted to slide into a corresponding rib and groove of the contiguous section and form an interlocking joint, thereby obviating displacement by lateral strain.

Claim.—1. The pipe consisting of section B, provided with rib *d* and groove *c*, and section C, provided with rib *a* and groove *a*, combined and united as shown.



2. As an article of manufacture, a wooden pipe composed of segmental sections, each provided with longitudinal rib on each edge, said ribs being interlocked, substantially as set forth.

256,061. COMBINED WHIP AND CANE. LOUIS C. SELTZER, Columbus, Ohio. Filed Aug. 31, 1881. (No model.)

Claim.—A combined whip and cane consisting of the hollow stock A and tip C, the latter provided on its larger end with a ferrule, E, externally threaded to screw into a ferrule, B, of the stock, whether said tip is jointed to the stock to form a whip or placed in a reverse position in the stock to form a cane, as shown and described, whereby the use of detachable plugs, caps, or ferrules is rendered unnecessary.

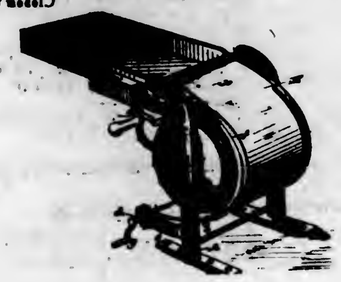
256,062. CALIPERS. EDWARD C. SMITH, Brooklyn, N. Y. Filed May 19, 1881. (No model.)

Claim.—In calipers or caliper-compasses, the combination of the head-piece *b*, legs *a a'*, rod *f*, adjustable plate *b''*, pin *e*, and thumb-nut *d*, all arranged and operating substantially in the manner and for the purpose set forth.

256,063. JEWELRY-SETTING. HARRISON B. SMITH, New York, N. Y. Filed Jan. 25, 1882. (No model.)

Brief.—The stone is set in a narrow band, through which it projects to show the back as well as the front.

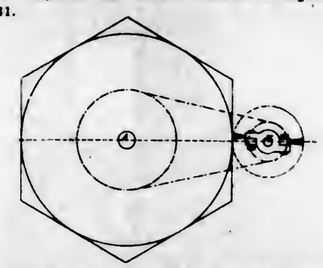
Claim.—An improved jewelry-setting consisting of the narrow beveled band or ring B, adapted to receive and fit upon the edge of the stone, and provided with the cramps *a*, for securing it to the same, and with the eye *b* between two of the said cramps, for receiving the ear-wire, substantially as herein shown and described, whereby both the front and back of the stone project through the band and the stone is displayed to the best advantage, as set forth.



256,064. WRAPPER AND PACKAGE FOR BUTTER, &c. SETH H. SMITH, Delta, Ohio, assignor to the Smith Manufacturing Company, same place. Filed Jan. 13, 1882. (Model.)

Claim.—1. The wrapping or packing sheet A, scored at B E, as and for the purpose set forth.

2. A wrapper or package composed of the sheet A, scored at B E, and folded as as to form a box-like package, the ends of which are formed by the parts F of said sheet embraced by the scoring B E, said parts being turned upward and inward to form ends or braces, as set forth.

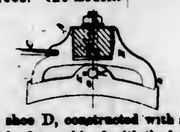


256,065. MACHINE FOR COLORING AND FLAVORING CIGARS. LEWIS SPINDLER, Cumberland, Md. Filed Jan. 30, 1882. (No model.)

Claim.—1. In a machine for coloring and flavoring cigars and tobacco, the combination of the rotary cylinder having a facing of yielding and absorbent material, the concave composed of flexible material and rendered more or less yielding to the cigars as they are carried around by the cylinder, and means for increasing and diminishing the tension of the concave, substantially as described.

2. In a machine for coloring and flavoring cigars, the combination of the rotary cylinder having a facing of absorbent material with the flexible concave E, having a sliding connection with the curved rods *b*, and secured at one end to a roller-shaft, *d*, adapted to be turned so as to wind the material forming the concave upon it, so as to render the concave less yielding or to be turned so as to unwind the said material, and thereby render the concave more yielding to the cigars carried around by the cylinder, and suitable devices for checking the rotation of said roller-shaft, substantially as described.

256,066. APPARATUS FOR BRUSHING POLYGONAL BOLTS. FREDERIC STANSFIELD, Bradford, County of York, England. Filed Nov. 21, 1881. (No model.) Patented in England Oct. 13, 1881.

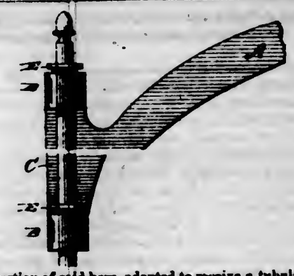


Claim.—1. The combination, with a rotary polygonal bolting or dressing frame, of a brush fixed upon a spindle arranged parallel to the axis of the said frame, and revolving in the same direction therewith at a speed proportioned to that of the frame in the manner described, to cause the points of the brush to travel over and rub the surface of the frame at a substantially uniform pressure, as and for the purpose set forth.

2. The combination, with a rotary polygonal bolting or dressing frame, of a brush fixed upon a spindle arranged parallel to the axis of the said frame, and mechanism for revolving the brush in the same direction as the said frame at a speed proportioned to that of the frame in the manner described, to cause the points of the brush to travel over and rub the surface of the frame at a substantially uniform pressure, as and for the purpose set forth.

3. The combination, with the rotary polygonal bolting or dressing frame, of a brush fixed upon a spindle arranged parallel to the axis of said frame, and connecting mechanism, such as described, between the frame and the brush-spindle, for revolving the brush in the same direction as the frame at a speed proportioned thereto in the manner described, to cause the points of the brush to travel over and rub the surface of the frame at a substantially uniform pressure, as and for the purpose set forth.

256,067. BRAKE-SHOE. HENRY STEBBINS, New York, N. Y. Filed Feb. 18, 1882. (No model.)



Claim.—The shoe D, constructed with a transversely-perforated ear, E, on its back, combined with the holder B, the two constructed with recesses and projections on the bearing-points between them to prevent transverse movement of the shoe upon its holder, and the L-shaped bolt F, one arm of which extends through the holder, the other arm through the perforation in the ear E, whereby the said shoe is clamped upon its bearings on the holder, substantially as described.

256,068. DEVICE FOR THE COMPENSATION OF WEAR IN NEEDLE-BARS. ROSWELL H. ST. JOHN, Toledo, Ohio, assignor to the Union Manufacturing Company, same place. Filed Jan. 21, 1882. (No model.)

Claim.—1. In a sewing-machine, the combination of an arm, A, a bearing, B, a concave seat, *c*, formed at the lower end of the bore through this bearing, and a female screw-thread formed at

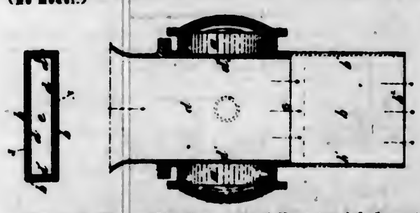
256,068.

the upper portion of said bore, adapted to receive a tubular nut for compressing a double beveled longitudinally-split bushing, substantially in the manner and for the purposes explained.

2. The combination of the bearing B, formed on the arm of a sewing-machine, the needle-bar C, playing vertically through said bearing, the beveled seat *c*, formed on the bearing, the longitudinally-split bushing D, having beveled ends, and the tubular nut E, having a countersunk end and tapped centrally into the said bearing for the purpose of acting directly on the bushing and contracting the same about the needle-bar, all constructed and arranged to operate substantially as described.

256,069. COMBINED HAND SEED-PLANTER AND FERTILIZER-DISTRIBUTER. OWEN STODDARD, Busti, N. Y. Filed Oct. 8, 1881. (No model.)

Brief.—The boxes are detachably connected, and each has a seed or fertilizer cylinder with attached gear-wheel to engage a rack upon its operating-slide. Stop-blocks upon the slides are connected by a pin, so that the slides will move together. The boxes may be disconnected and used separately.



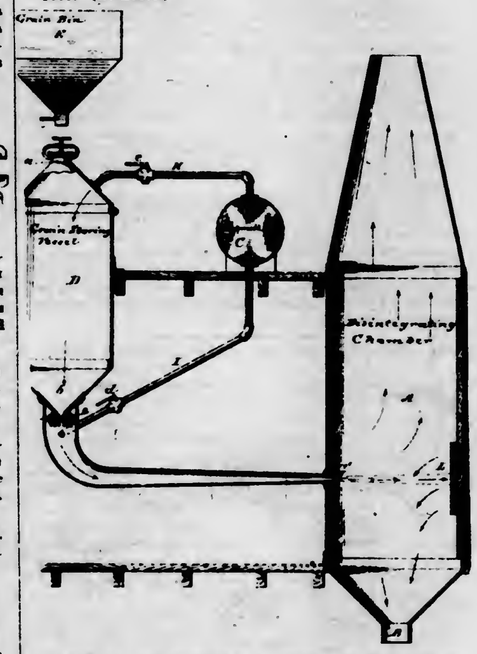
Claim.—In a combined hand seed-planter and fertilizer-distributer, the combination, with the boxes A B, having slotted inner walls, and provided with the flanged plates C and the spring-plates E E, of the dropping-cylinders I, the gear-wheels P, and the slides R, provided with the racks Q, and the sliding blocks S, connected by the dowel-pin *a*, substantially as and for the purpose set forth.

256,070. SECONDARY VOLTAIC CELLS. JOSEPH WILSON SWAN, Newcastle-upon-Tyne, County of Northumberland, England. Filed Jan. 19, 1882. (No specimens.) Patented in England Dec. 15, 1881.

Claim.—The method of preparing lead plates for use in secondary voltaic cells by subjecting the same to the combined action of acetic acid and atmospheric air, and subsequently reducing the carbonate of lead formed to metallic lead, substantially as described.

256,071. APPARATUS FOR PULVERISING GRAIN, ORES, &c. FRANCIS TABOADY, Brooklyn, N. Y. Filed Feb. 15, 1882. (No model.)

Claim.—1. The combination substantially as hereinbefore set forth of the tube *d*, having at the end an orifice, *c*, that is long and narrow, a chamber for compressed air, and a jet-mouth adjacent to the end or orifice of said tube, with a tube, *b*, having at the end an orifice, *b'*, that is long and narrow, and an abutment or surface of resistance, for the purpose specified.



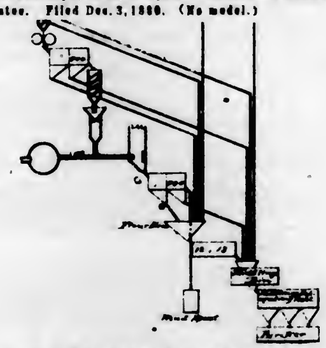
2. The combination, in apparatus for disintegrating or comminuting frangible substances and collecting the product, of a chamber for compressed air, with an ejector having separate and distinct long and narrow jet orifices or mouths *c c*, a tube, *d*, having an elongated orifice, *c*, a tube, *b*, of corresponding form, and an abutment, *a*, the nozzle end of said tube *d* being joined at its narrowest sides, *b'*, with the corresponding sides of the tube *b*, whereby to form the said separate and distinct ejector-orifices, for the purpose specified.

3. In an apparatus for disintegrating or comminuting grain and frangible substances and collecting the product, the combination substantially herein set forth of an ejector adapted to deliver air in separate and distinct thin wide sheets, a tube, *d*, adapted to deliver the substance or granules in a thin wide sheet, a chamber adapted to deliver air under pressure in thin wide sheets, and a tube, *b*, adapted to deliver the separate air-jets in thin wide sheets, with an abutment, for the purpose specified.

4. In an apparatus for impelling substances through a tube by the action of air or other aeriform fluid, the combination, with the tube *d*, having the flattened orifice *c* of the tube *b*, forming with said orifice *c* the independent ejector-orifices *c c* on opposite sides of the said tube *d*, substantially as described, for the purpose specified.

5. In an air-ejector, the combination of exterior and interior tubes, *b* and *d*, wider in one direction than in the other, joined together at the narrow sides *b' b'*, substantially as herein described, for the purpose specified.

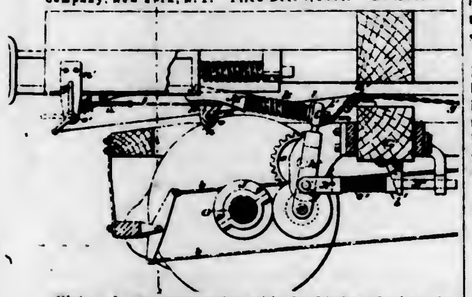
256,072. MACHINE FOR DISINTEGRATING GRAIN AND OTHER SUBSTANCES. FRANCIS TABOADY, Brooklyn, N. Y., assignor to Charles R. Knickerbocker, Trustee. Filed May 25, 1880. (No model.)



Claim.—1. The combination, in apparatus for pulverizing or reducing grain and other frangible substances, with an ejector, a hard abutment, and a chamber inclosing said abutment and ejector-orifice, of an air-tight storing and supplying vessel, a positively-moving feed, and a chamber filled with air under high compression communicating with said air-tight vessel above the substance, and with the ejector-pipe under said positively-moving feed, substantially as set forth.

2. In apparatus for reducing or pulverizing grain and other frangible substances, the combination with an air-tight storing and supplying vessel, a chamber within which compressed air is stored, an ejector, a hard abutment, and a chamber inclosing said abutment and ejector-orifice, of feed-rolls arranged to deliver the substance under pressure in regulated quantities from said air-tight supplying-vessel, substantially as described.

3. In apparatus for disintegrating grain and other frangible substances, the combination, with an air-tight storing and supplying chamber, D, of a chamber, A, open at top and bottom, a chamber, C, for compressed air, an ejector, G', a hard abutment, L, a positively-moving feed device, e e, arranged within the ejector-pipe, tapering from its junction with the storing-vessel to and forming the ejector-orifice G', and the valved pipes H I, substantially as described.



256,073. ART OF MANUFACTURING FLOUR. FRANCIS TAGGART, Brooklyn, N. Y., assignor to Charles R. Knickerbocker, Trustee. Filed Dec. 3, 1880. (No model.)

Claim.—1. The process of manufacturing flour which consists in reducing the grains or particles of grain by projecting them with force against a solid abutment or obstacle by means of a current of compressed air or other aeriform fluid escaping in a continuous stream from a storing-chamber, then collecting the broken particles while the spent air or other aeriform fluid is permitted to escape, then separating the particles so collected, and again subjecting the coarser particles to further similar reduction and separations, and so on by successive operations of reduction and separation until the necessary degree of reduction has been obtained, substantially as set forth.

2. The process of manufacturing flour which consists in first breaking up the organization of the grains by passing them between rollers, and then reducing by blowing the same by means of a continuously-flowing current of air or other aeriform fluid against a solid abutment, and then separating the particles produced thereby and subjecting the coarser to further breaking by blowing and successive separations and breakings, if necessary, until sufficiently reduced, substantially as set forth.

256,074. AUTOMATIC CAR-BRAKE. STEPHEN P. TALLMAN, Dunellen, N. J., assignor to the Tallman Automatic Car Brake Company, New York, N. Y. Filed Dec. 9, 1881. (No model.)

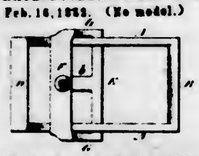
Claim.—1. The combination, with the friction-wheel on the car-axle and the swinging friction-wheel, of the operating-lever, mounted as shown, the operating-bar, the cushion-spring on the said bar, the draw-bar, and suitable lifting mechanism for raising the free end of the operating-bar, all arranged to operate substantially as set forth.

2. The operating-lever *h*, provided with the eye *i*, mounted in a socket in the end of said lever, substantially as set forth.

3. In an automatic brake for cars, the combination of the operating-lever *h*, the eye *i*, operating-bar M, cushion-spring *k*, shaft *o*, and lifter *p*, all arranged to operate substantially as set forth.

4. In an automatic brake for cars, the combination, with the draw-bar, the operating-bar, the operating-lever, and cushion-spring, of the lifter *p*, shaft *o* and *o'*, provided with arms *r r'*, the connecting-rod *s*, and its spring *u*, all arranged to operate substantially as set forth.

5. The combination of the shaft *o*, provided with an arm, *r*, and lifter *p*, the shaft *o'*, provided with an arm, *r'*, a cam, *v*, and an operating-handle, *q*, the eye *i*, connecting-rod *s*, and spring *u*, with the draw-bar, the operating-bar, and the operating-lever, and the spring *w*, all arranged to operate as set forth.



6. The combination, in an automatic car-brake having two sets of braking mechanism operated independently by the draw-bars at opposite ends of the car, of the operating-shafts *o' o'*, provided with oppositely-set arms *x x* and *x' x'* and handles *q*, and the flexible connectors *y y'*, all arranged substantially as shown.

7. The combination, in an automatic car-brake having two sets of braking mechanism at opposite ends of the car and actuated from the draw-bars, of the operating-shafts *o' o'*, each provided with a cam, *v*, having faces 1 2, two arms, *x x'*, set oppositely, and a handle, *q*, the connectors *y y'*, and the spring *w*, all constructed and arranged substantially as set forth.

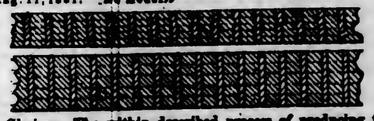
8. In an automatic car-brake employing an operating-lever actuated from the draw-bar to force together the friction-wheels for setting the brakes, the said operating-lever provided with an elastically-yielding fulcrum, and mechanism, substantially as shown, for increasing the resistance to the movement of said fulcrum in direct proportion to the weight of the car-body and its load, for the purposes set forth.

9. The combination of the following coactive elements, viz: the operating-lever mounted or fulcrumed in a slotted bearing in the bracket, the pressure-rod arranged to press against the fulcrum-stud on which the lever is mounted, the sliding block and spring mounted in the pressure-rod, and the wedge mounted on the bolster or car-body and arranged to compress the spring on the pressure-rod when the bolster descends, whereby the braking-pressure is regulated in proportion to the weight of the load on the car, as set forth.

256,075. TRACE-BUCKLE. JOHN THOMAS, Cedar Rapids, Iowa. Filed Feb. 16, 1882. (No model.)

Claim.—1. The herein-described buckle, consisting of the frame A A B D, the sides curved outward at their rear end, combined with the loop E F G G, arranged transversely around the frame, the frame introduced through the loop, bringing one bar, E, of the loop upon the back of the frame, the other bar, F, upon the front of the frame, the loop deeper than the thickness of the frame, the depth of the loop permitting it to turn forward for the insertion of the trace, the said bar F provided with a stationary stud, *a*, and the tongue *b* on the inner bar extending toward the outer bar, substantially as described.

2. The herein-described buckle, consisting of the frame A A B D, the sides curved outward at their rear end, combined with the loop E F G G, arranged transversely around the frame, the frame introduced through the loop, bringing one bar, E, of the loop upon the back of the frame, the other bar, F, in front of the frame, the loop deeper than the thickness of the frame, the depth of the loop permitting it to turn forward for the insertion of the trace, the said bar F provided with a stationary stud, *a*, substantially as described.

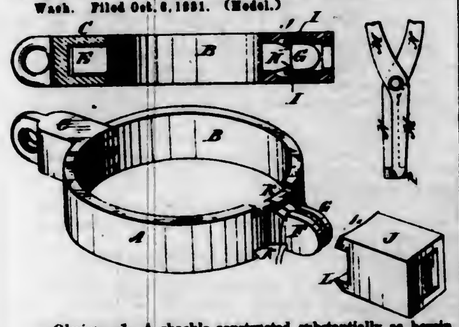


256,076. REVOLVING HEEL-PLATE. JUDSON L. THOMSON, Syracuse, N. Y., assignor of one-half to Samuel S. Hartwell, Wantage, N. J. Filed Aug. 25, 1881. (No model.)

Claim.—1. The combination, with a revolving boot or shoe heel plate, of the metal plate *r*, secured to said heel-plate by the tubular stud *s*, attached to the metal plate and expanded within a tapering countersink in the opposite side of the revolving heel-plate, substantially as described and shown.

2. The combination, with a revolving boot or shoe heel plate, of the metal plate *r*, countersunk in said heel-plate, and prevented from turning by spurs *c* on the face of the metal plate, and secured to the revolving heel-plate by the tubular stud *s*, which is attached to the plate *r*, and expanded within a tapering countersink in the opposite side of the revolving heel-plate, substantially in the manner described and shown.

256,077. MANUFACTURE OF SOLES, TAPS, AND HEELS FOR BOOTS AND SHOES. JUDSON L. THOMSON, Syracuse, N. Y., assignor of one-half to Samuel S. Hartwell, Wantage, N. J. Filed Aug. 11, 1881. (No model.)



Claim.—The within-described process of producing from scrap and inferior parts of leather soles, taps, and heels for boots and shoes, the same consisting in first moistening the said inferior material, then trimming off the fleshy and uneven side thereof, then passing it through heavy press-rollers, then dieing out from its soles, taps, or heels, then again moistening said soles, taps, or heels with a water-proof glutinous liquid, then driving into the same numerous wooden pegs close together, then trimming off the protruding ends of said pegs and planing or otherwise smoothing the sides of the said soles, taps, or heels, and, finally, while the same are still moist, subjecting them to heavy pressure against opposite sides, so as to split and distort the pegs inside of the leather, substantially in the manner herein described.

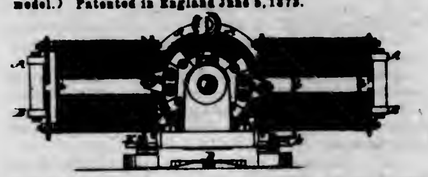
256,078. DRILL-HOLDING DEVICE. JOHN C. TITUS, Marion, Ohio. Filed Dec. 12, 1881. (Model.)

Claim.—The spindle-collet A, having a cylindrical hole in it to receive the round shank of the drill and an enlarged hole to receive the driver or bushing E, in combination with this driver or bushing, the square centrally-arranged socket in this driver, and the square tenon C at the base of the drill-shank, substantially as described.

256,079. SHACKLE. JAMES H. TRACKWELL, Skookumchuck, Wash. Filed Oct. 6, 1881. (Model.)

Claim.—1. A shackle constructed substantially as herein shown and described, and consisting of the half-ring parts A B, having socket C and lug E at one end and notched lugs F G at the other end, and the lock J, having interior spring-catches, I, as set forth.

2. In a shackle, the combination, with the ends of the half-ring parts A B, having notched parallel lugs F G, of the lock J, having end apertures and interior spring-catches, I, substantially as herein shown and described, whereby the said parts are secured against lateral and longitudinal separation, as set forth.



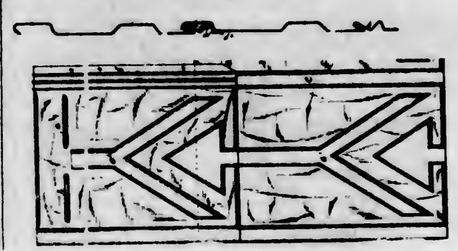
3. In a shackle, the combination, with the lock having spring-catches I I, of the cross-pivoted levers M N, having the reverse hooks O P at their ends, whereby these hooks may be pressed apart and upwardly against the catches, for the purpose specified.

256,080. FEED-WATER HEATER. RICHARD P. VALENTINE, Boston, Mass., assignor of one-half to Peter Collamore. Filed Dec. 16, 1881. (No model.)

Claim.—In a feed-water heater, the combination, with the jacket B, provided with the heads *b* and the steam-exit pipe *i*, the inlet water-pipe *d*, and the outlet water-pipe *e*, of the water-chamber A, provided with the heads *a*, the feet *c*, and the U-shaped pipes C, having their ends received in the lower head of the said water-chamber, and the exhaust-pipe *f*, passing through the head of the jacket and coupled by a slip-joint to the head of the said water-cylinder directly under the end of the said tubes, substantially as and for the purpose set forth.

256,081. DYNAMO-ELECTRIC MACHINE. FRIEDRICH VON HEFNER-ALTENECK, Berlin, Germany. Filed Jan. 14, 1882. (No model.) Patented in England June 5, 1879.

Claim.—1. The curved bars A and B, with coils *a a* and *b b* arranged on each side of the central pole constituting the electro-magnets of a dynamo-electric machine, as and for the purposes described.



2. The curved bars A and B, with coils *a a* and *b b* arranged on each side of the central pole constituting the electro-magnets of a dynamo-electric machine, in combination with an armature capable of revolving within the cylindrical space between the magnets, whereby a circulation of air is caused between the revolving armature and the magnets and cross-currents are prevented.

256,082. PREPARING TABLETS OF COFFEE. ADALBERT VON HOFMANN, Augsburg, Bavaria, Germany. Filed Dec. 21, 1880. (No specimens.) Patented in Germany Sept. 20, 1880, in Italy Dec. 15, 1880, in England Jan. 20, 1881, in France Feb. 9, 1881, in Belgium Feb. 14, 1881, in Spain July 14, 1881, in Austria Sept. 14, 1881, in Portugal Oct. 19, 1881, and in Denmark Dec. 14, 1881.

Claim.—The method of preserving ground coffee by mixing the roasted coffee with a fat or oil which is tasteless, tasteless, and free from acid; moreover, by adding to the coffee monocarbonate or bicarbonate of soda or of potassa or any other equivalent alkaline carbonate, and finally by compressing the so prepared coffee-powder into blocks or tablets by means of a suitable press, substantially as and for the purpose described.

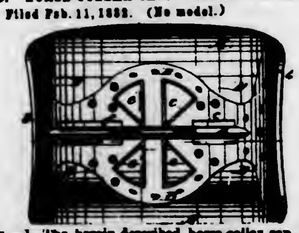
256,083. METAL ROOFING-PLATE. JOHN WALKER, Nashville, Tenn., assignor to himself and Charles R. Cooper, same place. Filed Dec. 29, 1881. (No model.)

Brief.—The peculiar-shaped corrugations direct the water to the lower sides of the plates and a transverse seam is formed by lapping the plates, leaving a space between them to prevent capillary attraction. The side edges of the plates are made so that when joined they form a covered gutter.

Claim.—1. The combination of two sheet-metal roofing-plates adapted to be arranged with other similar plates in horizontal overlapping layers, and formed at their lapping horizontal edges substantially as shown, to constitute a transverse anti-capillary seam, and provided with central longitudinal corrugations fitting one upon the other across the transverse seam at right angles, and formed to divert the water and direct it toward the side edges of the plate, substantially as shown and described.

2. A sheet-metal roofing-plate having one of its lateral edges formed with two parallel corrugations to form a gutter, and the other lateral edge formed with a broad corrugation adapted to make a seam with the corrugations and a cap for the gutter of a corresponding plate, substantially as shown and described.

3. A sheet-metal roofing-plate having a gutter formed by corrugations at one side and a perforated flange at the side of the gutter, whereby it shall be nailed to the roof of a house, and a broad corrugation at the other side adapted to form a seam with the adjacent edge of a corresponding plate, substantially as shown and described.

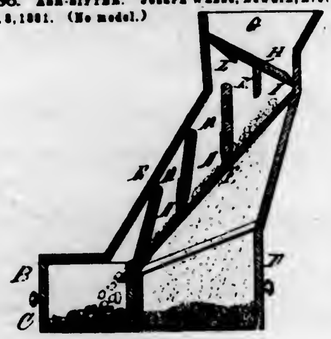


4. The combination of two sheet-metal roofing-plates, each having corrugations shaped like an inverted Y and an arrow-head, and so arranged that the arrow-head corrugation of one plate shall form a continuation of the Y-shaped corrugation of the other, substantially as shown and described.

256,084. METHOD OF PRESERVING FOOD. ALEXANDER WARNER, New York, N. Y. Filed Feb. 23, 1881. (No specimens.)

Brief.—Applies a wrapping of fabric or paper and covers with a paste composed of one hundred pounds of paper-pulp and twenty-five pounds of mucilage of gum-tragacanth or gum-arabic. The articles may be dipped twice or more until the coating is of the desired thickness.

Claim.—The method, substantially as herein described, of preserving hams and other articles of food, consisting in coating their exteriors with paper-pulp and a vegetable gum which is rendered adhesive by the addition of water, such coating when dried forming an air-tight seamless integument, as herein set forth.



256,085. HORSE-COLLAR CAP. ANDREW WAUGH, Carthage, N. Y. Filed Feb. 11, 1882. (No model.)

Claim.—1. The herein-described horse-collar cap, consisting of the flexible cap A, and the metal brace-plate B, having narrow neck portions D and widened end portions and provided with the loops or eyes C, substantially as set forth.

2. In horse-collar caps, the cap A, having secured thereto a re-enforcing brace-plate, B, constructed with narrow neck portions between its central enlargement and its widened end parts, substantially as herein shown and described, whereby the central end portions, D, of the cap A are rendered sufficiently flexible and the cap held to shape, as set forth.

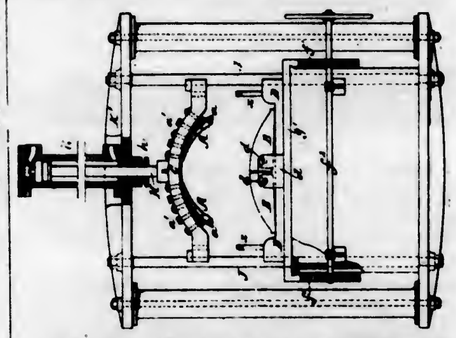
256,086. ASH-SIFTER. JOSEPH WELLS, Newark, N. J. Filed Sept. 8, 1881. (No model.)

Claim.—1. In combination with the frame E and screen F, the swing-valves M, substantially as and for the purpose set forth.

2. The combination of the frame E, screen F, valves M, and the apron N, substantially as and for the purpose named.

3. In combination with the inclined screen F, the hopper G, having a valve-cover, I, hung centrally and provided with the projection K, substantially as and for the purpose specified.

4. In combination with the hopper G, valve-cover I, and projection K, the bar L, substantially as and for the purpose named.



5. The combination of the base B, frame E, screen F, valves M, hopper G, and boxes C and D, substantially as and for the purpose specified.

256,087. HARNESS. CHARLES F. WINDEMEYER, Springfield, Ill. Filed Feb. 10, 1882. (No model.)

Claim.—The hereinbefore-described device, in which the housing A, provided with the tongue a, the latch B, having the lug *b* and hooked end *b'*, the spring C, and the bar D, provided with the notch *d'* and tongue *d*, are constructed and combined to operate in the manner and for the purpose substantially as shown.

256,088. MACHINE FOR MAKING SPRINGS. GEORGE W. WILLFORD, Sheffield, County of York, England. Filed July 5, 1881. (No model.) Patented in England Mar. 23, 1879.

Claim.—1. In a spring-bending machine, the combination of two dies with devices, substantially as described, for moving one of the dies toward or from the other at the center while keeping the ends of the dies in substantially the same relation, as and for the purpose set forth.

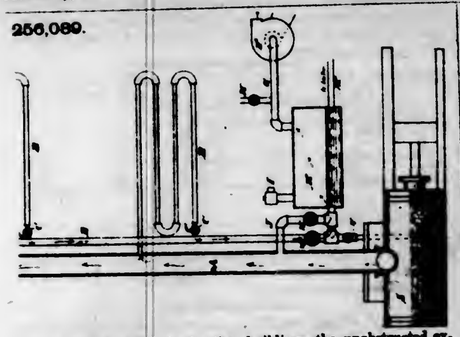
2. In a bending-machine, the combination of the upper dies with a plate, D, and die B, made in two parts, and provided with devices for raising and lowering the two parts in the center, substantially as specified.

3. The combination of a die, B, with dies A, spring-plate carrying the latter, cross-head, and devices, substantially as described, for adjusting the spring-plate.

4. The combination of movable dies A B and plate D with movable table *g g'*.

5. The combination of the guides J, cross-head C, plate D, and dies with movable table *g g'*.

6. The combination of the dies, cross-head C, plate D, and fastening devices *z* with movable supports for said plate D.



7. The combination of dies and support D with two-part table *g g'*, having racks at the end, and gear-wheels *f f'*, all substantially as set forth.

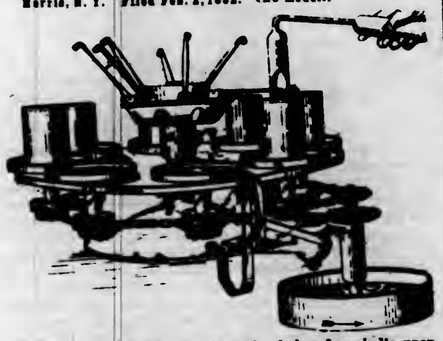
256,089. HEATING APPARATUS. NAPOLEON W. WILLIAMS, Philadelphia, Pa. Filed Dec. 31, 1881. (No model.)

Claim.—1. In apparatus for heating buildings, the unobstructed exhaust-pipe and heating-coils opening from it, in combination with a bleeder-pipe connecting with said coils and opening at the bottom into a hot-well in which a partial vacuum is maintained, substantially as and for the purpose specified.

2. In apparatus for heating buildings, the unobstructed exhaust-pipe and heating-coils opening into it, in combination with a bleeder-pipe connecting with said coils and means to create a suction in said bleeder-pipe, substantially as and for the purpose specified.

256,089.

3. In apparatus for heating buildings, the unobstructed exhaust-pipe A, heating-coils B, bleeder-main D, hot-well E, suction or exhaust fan F, and feed-water pipe N, substantially as and for the purpose specified.



4. In apparatus for heating buildings, the combination of an exhaust-pipe with heating-coils B or their equivalent, bleeder pipe or main D, provided with valve I, hot-well E, pipe J, with its valve K, exhaust-fan F and its pipe G, and feed-water pipe N, substantially as and for the purpose specified.

5. In apparatus for heating buildings, an exhaust-pipe and steam-heating apparatus, in combination with means to suck steam from said exhaust into or through said heating apparatus, substantially as and for the purpose specified.

6. The combination of exhaust-pipe A, heaters B, bleeder-main D, hot-well E, vacuum-valve I, and vacuum-pump F, substantially as and for the purpose specified.

7. In apparatus for heating buildings, a steam-main into which steam is fed, in combination with steam-heating apparatus and means to create a suction through said heating apparatus to draw steam from the main into said heating apparatus.

256,090. CAN-CAPPING MACHINE. JOHN C. WISTERT, Mount Morris, N. Y. Filed Feb. 2, 1882. (No model.)

Claim.—1. A table provided with a hub and a spindle upon which it is supported, can-holders arranged upon spindles in said table, loose pulleys upon said last-named spindles, a driving-wheel, and an endless chain driven therefrom and inclosing the loose pulleys, combined substantially as shown and described, whereby a positive rotation is imparted to said table without affecting the can-holders.

2. A table provided with a hub and a spindle upon which it is supported, can-holders and their spindles, having their bearings in said table, said loose pulleys and fast gears upon such last-named spindles, combined with an endless chain band on said pulleys, a driving-wheel for said chain to rotate the table, and gearing to successively engage the pinions of the can-holder spindles to rotate said can-holders as they are brought into mesh with such gearing, substantially as described.

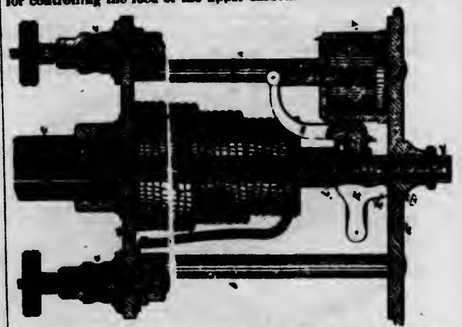
3. A table provided with a hub and a spindle upon which it is supported, can-holders and their spindles, having bearings in said table, and loose pulleys and fast pinions on said last-named spindles, combined with an endless chain band on said pulleys, a driving-wheel to move said chain positively to rotate the table, a stopping device to arrest the rotation of the table as each can-holder is brought to a given point, and gearing driven from the shaft of the driving-wheel to engage the pinion of and thus rotate the can-holder at the point of stoppage of the table substantially as described.

4. A can-capping-machine table, a spindle upon which it is rotatable, can-holders and their spindles, having bearings in said table, loose pulleys on said can-holder spindles, and an endless band supported on said pulleys to rotate the said table, combined with a driving-wheel for said band, and a pivoted support for such wheel, movable to adjust the band-driving wheel in the arc of a circle to take up the slack of the band, substantially as shown and described.

5. A can-capping-machine table, a spindle upon which it is rotatable, can-holders and their spindles, having bearings in said table, loose pulleys and fast pinions on said can-holder spindles, a driving-band supported on said pulleys, and a driving-wheel for said band, combined with a support for such driving-wheel, a pivot for such support, and gearing on the said support to transmit motion from the driving-wheel to the fast pinions on the can-holder spindles to rotate said can-holders, whereby said driving-wheel can be so moved as to serve as a belt-tightener for the driving-band without interfering with the rotation of the table or the can-holders, substantially as shown and described.

6. A can-capping-machine table and means to rotate the same, and independently-rotated can-holders thereon, combined with pivoted can-cap hold-downs fast upon and revolving with said table, and a stationary cam engaging the ends of all of said hold-downs simultaneously to positively operate the same to hold and release the cans at given intervals, substantially as described.

7. A can-capping-machine table provided with a hub, can-holders in the table, and means to rotate the table and can-holders, combined with a head fast to but rotating with said hub, levers or arms pivoted in said head, and a stationary cam automatically acting in succession upon each of said levers to positively raise and lower said levers at given intervals, substantially as and for the purpose described.



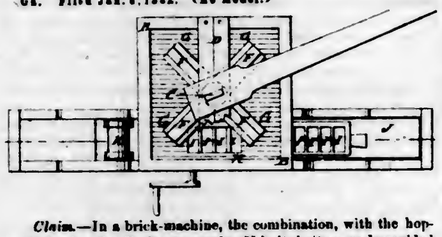
8. A can-capping-machine table, can-holders thereon, means to rotate and stop said table, and connected means to independently and intermittently rotate the can-holders, combined with a head fast to but rotating with said table, can-cap hold-downs pivoted in said head and arranged to register with the can-holders, and a stationary cam in constant engagement with all of said hold-downs to automatically and positively depress and hold said hold-downs over cans being operated upon, and similarly to raise and retain in elevation said hold-downs after the soldering of the cans, substantially as described.

9. A can-capping-machine table having a hub and a spindle upon which it is rotated, and can-holders in said table, combined with can-cap hold-downs, a head in which all of said hold-downs are pivoted, means to adjustably secure said head upon the table-hub, and a cam adjustable on the table-spindle for raising and depressing such hold-downs, whereby the machine is adapted for operation upon cans of different heights, substantially as described.

10. The combination of a can-capping-machine table, loose pulleys thereon, a driving-band sustained by said pulleys to rotate the table, a driving-wheel for said band, and a pivoted support for such driving-wheel movable to take up slack in said band, substantially as set forth.

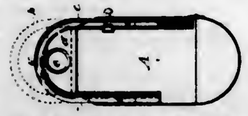
256,091. ELECTRIC LAMP. JAMES J. WOOD, Brooklyn, N. Y. Filed Jan. 14, 1881. (No model.)

Brief.—A single current regulator with clutch and dash-pot for controlling the feed of the upper carbon.



Claim.—1. An electric lamp constructed with two fixed frame heads, *a a'*, in combination with a carbon-holder moving through the same, and a depending solenoid, *f f*, fixed to the upper head,

and with gravitating cores n s, guided in the tubes of the solenoid parallel with the carbon-holder, and joined by a cross-bar, g, which approaches the lower head, with a clutch-pawl, k, pivoted on said cross-bar to engage the carbon-holder by an upward movement, and adapted to seat directly against the lower head when retracted to release the holder, substantially as herein shown and described.



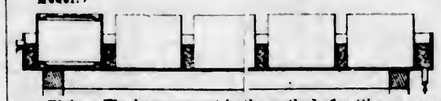
2. The combination, with the carbon-holder d and solenoids f f, with the cores n s and connecting cross-bar g, embracing the carbon-holder and provided with the clutch-pawl k, of the dash-pot n and curved overhanging arm m, connecting the dash-piston with the clutch and core-bar g, substantially as and for the purpose set forth.

256,092. BRICK-MACHINE. MILTON WRIGHT, Fort Valley, Ga. Filed Jan. 6, 1882. (No model.)

Claim.—In a brick-machine, the combination, with the hopper H, having the discharge-opening H in its bottom, and provided with radial stirrers F and inclined paddles G, of the mold-carrying platform J, having the upper surface of its middle part flush with the top of the molds, and provided with the rack-bar L, secured to its under side, the gear-wheel M and the rollers K, journaled to the base under the rack-bar and provided with an annular groove around their middle parts to receive the said rack-bar and guide the platform, substantially as and for the purpose set forth.

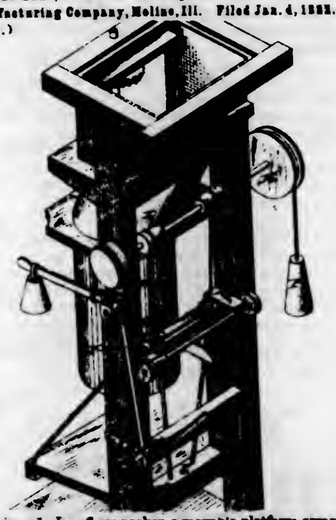
256,093. COMBINED POCKET-CASE AND CIGAR-CLIPPER. ARTHUR P. YATES, Syracuse, N. Y. Filed Jan. 18, 1882. (No model.)

Claim.—1. The improved match-safe and cigar-clipper combined, consisting of a pocket match-safe having projecting outward from its end a fixed blade provided with an aperture for the reception of the end of the cigar to be clipped, and a cutting-blade, also connected to the end of said match-safe, and adapted to slide rectilinearly over the fixed blade, all constructed and arranged to operate on the end of the match-safe and exclude from the interior thereof the cigar-clippings, substantially as shown and specified.



2. The combination, with the pocket-case A, of the blade a, fixed to the end thereof and provided with the eye e, the combined guard and guide-rods c, having a cross bar or bow, r, over the end of the fixed blade, the blade b, attached to the guide-rods c, and the spring s, applied to the end of said rods, all substantially as described and shown, for the purpose set forth.

256,094. BLANK FOR POCKET-BOOKS. ADOLPHUS Y. ARBUCKLE and HENRY RUAN, Philadelphia, Pa., assignors to the Bark Manufacturing Company, (Limited,) same place. Filed Feb. 20, 1882. (No model.)



Claim.—As a new article of manufacture, the within-described ready-skived blank of morocco or thin leather, the said blank having a defined portion or portions reduced uniformly in thickness, and the reduced portion or portions presenting a downy or plush-like surface, as set forth.

256,095. METHOD OF PUTTING UP CAUSTIC ALKALI. BENJAMIN T. BABBITT, New York, N. Y. Filed Jan. 17, 1882. (No model.)

Claim.—The improvement in the method of putting up caustic alkali in cans or canisters, consisting in subjecting the cans or canisters to artificial cooling during the operation of filling them by pouring in the alkali in a molten state, substantially as and for the purpose herein described.

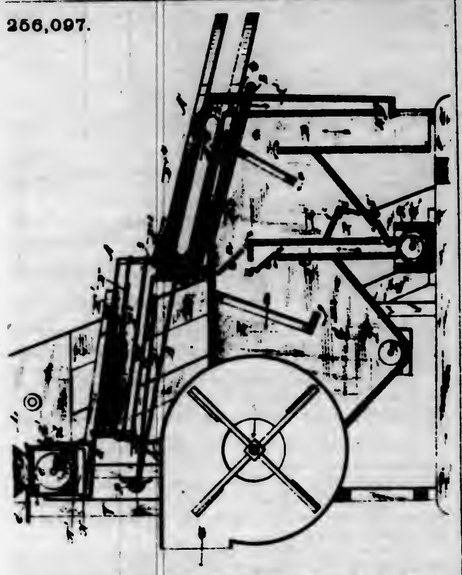
256,096. FLOUR-PACKER. HERMAN A. BARNARD, Moline, and J. SILAS LEAS, Rock Island, assignors to the Barnard & Leas Manufacturing Company, Moline, Ill. Filed Jan. 4, 1882. (No model.)

Claim.—1. In a flour-packer, a movable platform arranged to travel upon friction-rollers, substantially as specified.

2. The combination, with the uprights of a flour-packer and the movable platform, of the friction-rollers arranged in front and at the rear of said platform, and adapted to travel vertically upon the uprights, substantially as specified.

3. In combination with the movable platform of a flour-packer, the grooved pulleys mounted on said platform, the chain passing around the same, the cone-pulleys to which the ends of said chain are attached, and the shaft upon which said cone-pulleys are mounted, the whole arranged to operate substantially as set forth.

4. In combination with the movable platform, the grooved pulleys, the chain and cone pulleys, and the shaft provided with a counterbalance-pulley and a friction-pulley, and mechanism, as described, for automatically operating the friction-pulley, substantially as specified.



5. In a flour-packer, a movable platform and mechanism, as described, for automatically lowering the barrel away from the stationary packing-tube, substantially as specified.

6. In combination with the movable platform and the mechanism for elevating and lowering the same, the friction-pulley and its strap, the weighted lever and bar connecting the same with the bent lever, the bracket having an inclined face, and the trip for moving the bent lever, the whole arranged to operate to automatically lower the barrel when packed, substantially as specified.

7. In combination with the movable platform of a flour-packer, the grooved pulleys mounted on said platform, the chain passing around the same, and the shaft, the whole arranged to operate substantially as set forth.

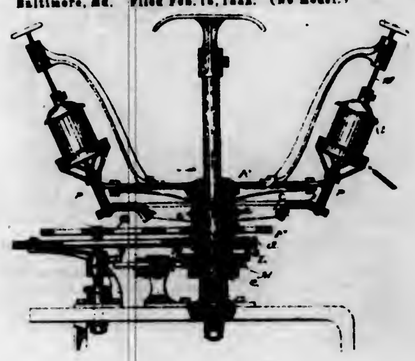
256,097. GRAIN-SEPARATOR. HERMAN A. BARNARD and JOHN B. CORNWALL, Moline, and J. SILAS LEAS, Rock Island, assignors to the Barnard & Leas Manufacturing Company, Moline, Ill. Filed Nov. 21, 1881. (No model.)

256,097.

Claim.—1. The combination of the screenings-box E, the separating-trunk F', the division e', and valve i, forming a chamber, R, which communicates with the lower part of said trunk, the air-inlets o', and a conveyer, substantially as described.

2. The combination, with the separating-trunk F' and the screw-conveyer at the lower end thereof, of the elevator L and the feed-conveyer box e' and screw-conveyer therein, substantially as described.

3. The combination of the feed-conveyer, the screenings-box G, the fans and air-passages V, leading from the said screenings-box to the feed-conveyer box, substantially as described.



4. The combination of the feed-conveyer, the adjustable feeders thereof, the shakers A A', the down-passage C, the trunk D, screenings-box E, trunk F', conveyer J, and the elevator leading up to the said feed-conveyer, substantially as described.

5. The combination of the feed-conveyer having the chutes N', the adjustable pivoted feeders N, attached thereto, and reciprocating shakers or screen-boxes, substantially as described.

6. The combination of the screenings-boxes E G, the down-flow-passage C, the bottomless trunk D, the separating-trunk F', having a passage near its lower open end, the chamber R, the valves a b, and a fan, substantially as described.

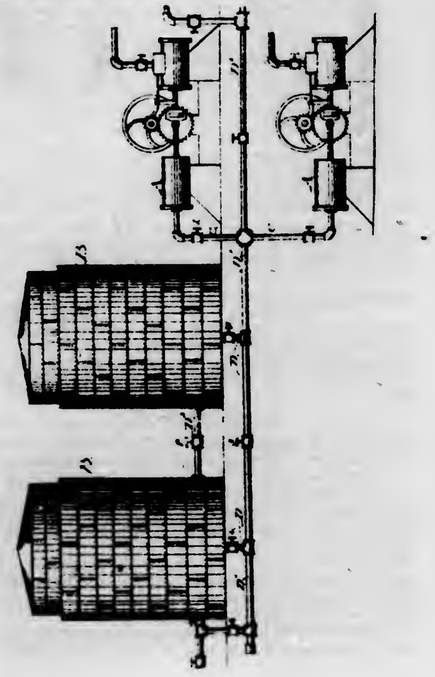
7. The combination of a feed-conveyer, two alternately-reciprocating screen-boxes or shakers provided with laterally-discharging chutes and arranged in close relation to each other, an elevator, the means for supplying the material to this elevator, a down-flow-passage, a bottomless trunk, two screenings-boxes, a separating-trunk, and one or more fans, substantially as described.

256,098. CAN-SOLDERING MACHINE. WILLIAM D. BROOKS, Baltimore, Md. Filed Feb. 16, 1882. (No model.)

Claim.—1. In a can-soldering apparatus, the combination, with the table and the supporting-post, of the revolving table E, carrying the can-holders, suitable mechanism for imparting step-by-step motion to the same, rotary can-holders having pinions upon the lower end of the spindles thereof, and wheel C, adapted to mesh into said pinions, and provided with teeth gearing directly into a pinion upon the main driving-shaft, substantially as described.

2. In a can-soldering apparatus, the combination of the revolving table E, carrying the revolving can-holders, and provided with a sleeve, c, a ratchet fixed thereto, a wheel, C, driven directly from the main shaft and driving the pinions of the can-holders, and gear-wheel F, connected with said wheel C, and through intermediate mechanism, as described, operating the moving pawl of the ratchet-wheel, whereby the table E receives intermittent motion from the wheel C, substantially as described.

3. The combination, in a can-soldering machine of substantially the form described, of the pinions F G, receiving motion from the wheel C, the lever K, provided with a cam-loop, the shaft g, and the arm h, the spring-pawl, and ratchet-wheel, whereby step-by-step motion is imparted to the table E, all substantially as described.



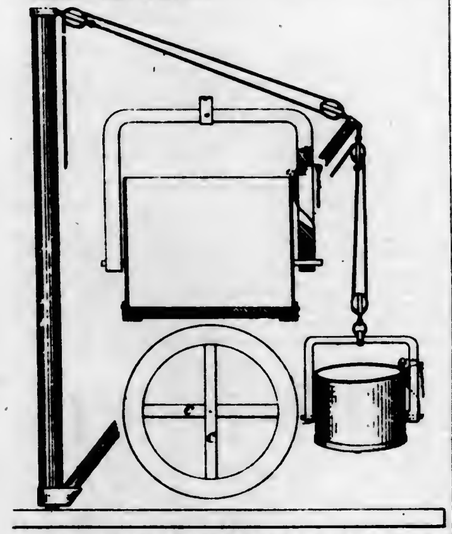
4. In combination with the table E in the described machine and the sleeve c, the ratchet I, the lever K, with its spring-pawl engaging with said ratchet, the wheel M, fixed to said ratchet, pawl m, and spur 9 upon the shaft g, the parts being constructed and operating substantially as described.

5. The combination, in a can-soldering apparatus, of the outer shell, P, provided with braces 13, connected rigidly to the sleeve p, the annular plates Q and R, supported upon and in combination with the spindle 17, said spindle being connected to the rotating mechanism, substantially as described.

6. In combination with the revolving table and rotating can-seats, the lever 24, pivoted upon the bracket 25, and connected to the lever K, substantially as described.

256,099. PNEUMATIC ELEVATOR. CHARLES E. BUELL, New Haven, Conn. Filed Dec. 16, 1881. (No model.)

Brief.—The air-holders B are extensible and compressible. Air from the compressors at a suitable operating-pressure is forced through pipes c and D' into the air-holders B, expanding the latter, and into the main D², through which it is conveyed to the several stations to operate the elevating machinery. The pipe c permits air, on the downward movement of the elevator, to escape and this escape may be used for ventilating purposes, &c.



Claim.—1. The combination, in a pneumatic-elevator system, of a central station having located thereat an air-compressing apparatus, one or more extensible and compressible air-holders to receive and hold the compressed air, suitable air-pipes to convey air from said compressors to said air-holders, and a main air-pipe to convey the air away from said central station, with one or more outlying elevator-stations at a distance from said central station, each provided with a pneumatic-elevator motor connected with said main air-pipe, and with appliances, substantially as described, for governing the flow of compressed air from said main pipe to said elevator-motor, substantially as described.

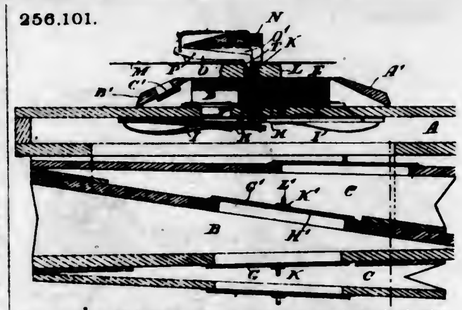
2. In a pneumatic-elevator system, the combination, with air-compressing machinery and an elevator-motor substantially as described, of air-pipes connecting said compressing machinery and elevator-motor, and of one or more expansible and compressible air-holders connected in said air-pipes, substantially as set forth.

3. The combination, with the compressed-air main D[2] and the tank *s*, and with appliances, substantially as described, for admitting air to and from said tank, of the escape-pipe *c*, substantially as set forth.

256,100. ELEVATOR-BUCKET. GEORGE W. CALKINS and JOHN WOODHILL, Cleveland, Ohio; said Woodhill assignor to said Calkins. Filed Oct. 8, 1879.

Claim.—1. A hoisting-bucket suspended upon pivots located so as to be above the center of gravity of the empty bucket and below the center of gravity of the loaded bucket, whereby the loaded bucket, when released from its latching devices, will automatically dump and empty itself at either side, and when emptied the bucket will automatically return to and latch itself in an upright position, substantially as and for the purposes described.

2. The combination of a pivoted bucket having a notched catch with a bail provided with a recess or slot, and having a spring-latch arranged in the recess or slot, the devices and combination operating in the manner described, whereby rapid charging and discharging of the bucket is accomplished, substantially as set forth.



256,101. MECHANICAL MUSICAL INSTRUMENT. JOSEPH HERBERT CHASE, Montreal, Quebec, Canada, assignor to Walter F. Abbot, New York, N. Y. Filed Aug. 15, 1881. (No model.)

Claim.—1. In combination with a perforated sheet of paper, &c., the reeds of a treble clef, D, set opposite to and intermediate with the reeds of a bass clef, E, substantially as and for the purpose set forth.

2. In combination with a perforated sheet of paper, &c., the reeds of a treble clef, D, set opposite to and intermediately with the reeds of a bass clef, E, provided with swell-boards A' and B', substantially as and for the purposes set forth.

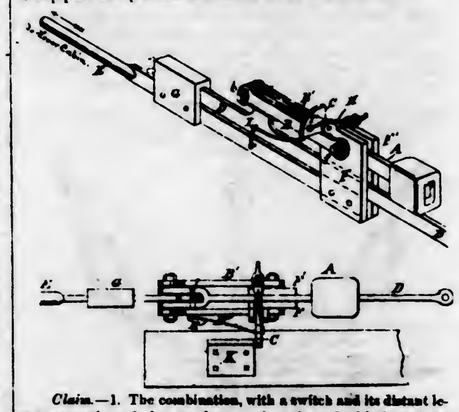
3. The combination, in a mechanical musical instrument, of the perforated music-sheet M, finger O, push-pin K, valve H, and

256,101.

reed-chamber F, having reduced air-passage and provided with reed, the whole constructed, arranged, and operating as described, for the purposes set forth.

4. In a mechanical musical instrument, the combination of the pivoted finger O, provided with incline T, link R, spring S, and perforated paper M, substantially as and for the purposes set forth.

5. The combination, with a mechanical musical instrument constructed as described, of a perforated music-sheet having the treble notes placed in rows on said sheet, with the bass notes placed in rows on said sheet, and said rows being furthermore alternately the one a bass and the next a treble row, substantially as and for the purposes described.



6. In the construction of valves to feeders and bellows, the combination, with the opening E', of the sheet of flexible material H', board G', and knee L', the whole constructed, arranged, and operating substantially as described.

7. In combination with a perforated sheet of paper, &c., the reeds of a treble clef, D, set opposite to and intermediate with the reeds of a bass clef, E, provided with swell-board A' and swell-board B', having tremulant C', substantially as and for the purposes set forth.

8. In the construction of valves to feeders and bellows, the combination, with an opening, E', of a sheet of flexible material, H', and board G', governed in their lift substantially as described.

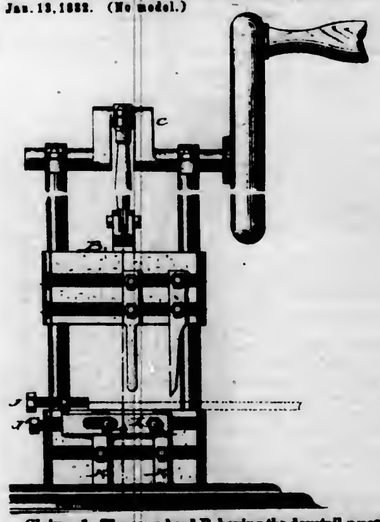
256,102. SWITCH-OPERATING DEVICE. ALBERT G. CUMMINGS, Harrisburg, Pa., assignor to the Pennsylvania Steel Company, of Pennsylvania. Filed June 23, 1881. (No model.)

Brief.—The switch-operating rod extending to the distant lever carries guides, through which slides the switch-operating bar, a hand-lever being pivoted to the bar and to links secured to the guides, whereby the switch may be actuated independently of the distant lever. To prevent restoring the connection when the switch is wrongly set a chain with the securing-padlock is employed. When being operated by hand the weighted hasp falls in front of a stop-plate and prevents movement by the distant lever.

Claim.—1. The combination, with a switch and its distant lever-connection, of a lever and connections thereof, with the switch-bar adapted to operate the switch independently of and without operating the distant lever-connection, substantially as and for the purposes set forth.

2. The combination of the hand-lever and distant lever-connection with a locking device so constructed and arranged, that when the hand-lever is locked the distant lever-connection is free to operate, and when the hand-lever is released the distant lever-connection is retained in a fixed position.

3. The combination of bar E, connected with a distant lever, housings F, F', and G, bar D, hand-lever A, and bars B B', connected with lever A and housings F F', substantially as and for the purposes set forth.



4. In a switch-operating device, a weighted-lever hasp pivoted to housing F, in combination with a fixed angle-iron or stop, K, substantially as and for the purpose set forth.

5. The chain H, in combination with bars D and E and weighted-lever hasp G, substantially as and for the purposes set forth.

256,103. MANUFACTURE OF ARTIFICIAL STONE. VICTOR EIPAUER, Baltimore, Md., assignor to the Neopes Artificial Stone, Cement, and Paint Company, same place. Filed Aug. 16, 1881. Renewed Mar. 14, 1882. (No specimens.)

Claim.—An artificial stone composed of carbonate of soda, carbonate of potash, calcined quartz-sand, oxide of calcium, oxide of magnesium, clay, and siliceous sand, combined in the manner and proportions substantially as and for the purpose specified.

256,104. MACHINE FOR BENDING METAL LINKS. ROBLEY D. EVANS and RICHARD H. GREEN, Washington, D. C. Filed Jan. 13, 1882. (No model.)

Claim.—1. The cam-head B, having the dovetail grooves and the independent adjustable cutter and bender attached thereto by bolts having correspondingly-dovetailed heads, in combination with similarly-grooved die-block, and the standards carrying anti-friction rolls attached thereto and independently adjustable in a similar manner, substantially as described.

2. The combination, with the standards and the anti-friction rolls attached thereto, of the slotted plate I and the screws J J', substantially as described.

256,105. SPELTER RETORT-FURNACE. DIEDERICH W. JANSEN, Joplin, Mo., assignor of one-half to Gottlieb Schmierer, same place. Filed Nov. 19, 1881. (No model.)

Claim.—In a spelter retort-furnace, the flue C, having the opening *d* at its lower end, and the arched receptacle B, provided with the discharge-opening *e*, in combination with the flue *l*, connecting the flue C and furnace F, and the inclined retort D, within the flue C, having the obliquely-cut lower end, and the tapering removable condenser G, fitted thereto, substantially as specified.

256,106. COMPOUND FOR TREATING GOODS, &c., TO RENDER THEM WATER AND MOTH REPELLENT. DANIEL H. LAMB, New York, N. Y. Filed Dec. 28, 1880. Renewed Mar. 7, 1882. (No specimens.)

Brief.—Improvement on Letters Patent No. 224,297, dated February 10, 1880.

Claim.—1. The process of preparing a waterproofing compound, consisting in first dissolving paraffine and a hydrocarbon gum in a light hydrocarbon solvent, then subjecting the solution so formed for a period of from three to ten days to the action of gas formed by the union of sulphuric acid and chloride of sodium in the proportion of about one pound of each ingredient to each gallon of the solution, then subjecting the solution to a powerful agitation of a current of air, and then washing said solution with water and an alkaline solution, substantially as described.

2. A waterproofing solution formed by dissolving paraffine and a hydrocarbon gum in any suitable light hydrocarbon solvent, then subjecting the solution so formed for a period of from three to ten days to the action of gas formed by the union, in the proportions mentioned, of sulphuric acid and chloride of sodium, and then subjecting the solution to the action of air and a washing process, substantially as described.

3. A fabric having an invisible water-proof coating composed of the solution of paraffine and a hydrocarbon gum, treated as herein described, fixed thereto by heat, substantially as described.

256,107. COMPOUND FOR TREATING GOODS, &c., TO RENDER THEM WATER AND MOTH REPELLENT. DANIEL H. LAMB, New York, N. Y. Filed Dec. 28, 1880. Renewed Mar. 7, 1882. (No specimens.)

Brief.—Improvement on Letters Patent No. 224,296, dated February 10, 1880.

Claim.—1. The process of preparing a waterproofing compound, consisting in first dissolving a hydrocarbon gum in a light hydrocarbon solvent, then subjecting the solution so formed for a period of from three to ten days to the action of a gas formed by the union of sulphuric acid and chloride of sodium in the proportion of about one pound of each ingredient to each gallon of the solution, then subjecting the solution to a powerful agitation of a current of air, and then washing said solution with water and an alkaline solution, substantially as described.

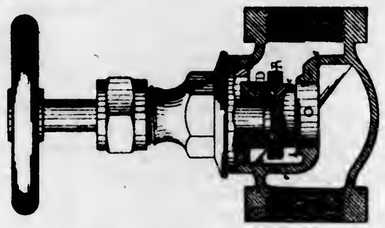
2. A waterproofing solution formed by dissolving a hydrocarbon gum in any suitable light hydrocarbon solvent, then subjecting the solution so formed for a period of from three to ten days to the action of gas formed by the union of sulphuric acid and chloride of sodium in the proportions mentioned, and then subjecting the solution to the action of air and a washing process, substantially as described.

3. A fabric having an invisible water-proof coating composed of the solution of hydrocarbon gum treated as herein described, fixed thereto by heat, substantially as described.

256,108. COMPOUND FOR TREATING GOODS TO RENDER THEM WATER-REPELLENT. DANIEL H. LAMB, New York, N. Y. Filed Dec. 28, 1880. Renewed Mar. 7, 1882. (No specimens.)

Brief.—Improvement on Letters Patent No. 224,295, dated February 10, 1880.

Claim.—1. The process of preparing a waterproofing compound, consisting in first dissolving paraffine in naphtha or other light hydrocarbon solvent, then subjecting the solution so formed for a period of from three to ten days to the action of a gas formed by the union of sulphuric acid and chloride of sodium, in the proportion of about one pound of each ingredient to each gallon of the solution, then subjecting the solution to a powerful agitation of a current of air, and then washing said solution with water and an alkaline solution, substantially as described.

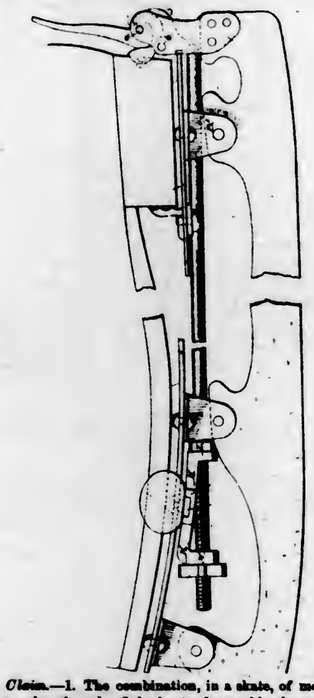


2. A waterproofing solution formed by dissolving paraffine in any suitable light hydrocarbon solvent, then subjecting the solution so formed for a period of from three to ten days to the action of gas formed by the union of sulphuric acid and chloride of sodium in the proportions mentioned, and then subjecting the solution to the action of air and a washing process, substantially as described.

3. As a new article of manufacture, a fabric having an invisible water-proof coating composed of the solution of paraffine treated as herein described, fixed thereto by heat, substantially as described.

6

256,109. STEAM GLOBE-VALVE. NATHANIEL C. LOCKE, Salem, Mass. Filed Dec. 10, 1881. (No model.)



Brief.—When the valve is seated the soft metal ring rests upon the raised seat *b* and the depending portion *c* of the valve projects into the valve-port.

Claim.—In a globe-valve having a raised seat, the valve-disk D, provided with a depending central portion, *c*, and with a soft metallic ring, E, which ring is adapted to close upon the raised seat, substantially as set forth.

REISSUES.

10,068. SKATE. ALPHEUS S. HEUTER, Newburg, N. Y., assignor to Everett H. Barney and Robert Gibson. Filed Feb. 23, 1882. Original No. 91,539, dated June 22, 1869; antedated June 19, 1869.

Claim.—1. The combination, in a skate, of movable clamps for grasping the sole of the boot, of movable clamps for grasping the heel at the back part thereof, a spur or abutment for the breast of the heel, a pivoted hand-lever adapted to operate both sets of clamps simultaneously, and a regulating-screw independent of said lever for adjusting the same, substantially as set forth.

2. In a skate, the combination of movable clamps for grasping the sole of the boot, movable clamps for grasping the heel at the back part thereof, a spur or abutment for the breast of the heel, and a pivoted vibratory hand-lever adapted to operate the same, substantially as set forth.

3. The combination, in a skate, of movable clamps for grasping the sole of a boot, movable clamps for grasping the heel at the back part thereof, a pivoted hand-lever adapted to operate both sets of clamps, and a regulating-screw independent of said lever for adjusting the same, substantially as set forth.

10,069. BOTTLE-WRAPPER. HENRY J. MARK and WILLIAM F. MARTINEK, St. Louis, Mo., assignors to Mark and Martinek Manufacturing Company, same place. Filed Feb. 3, 1880. Original No. 230,710, dated Aug. 3, 1880.

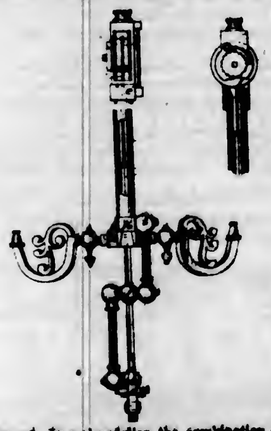
Claim.—1. A wrapper for bottles, &c., made of a veneer of wood having corrugations cut across the grain of the wood, substantially as described.

2. A wrapper for bottles, &c., having spiral or diagonally-arranged corrugations, substantially as described.

10,070. GASALIER. JOHN H. BRAHAM, Brooklyn, N. Y. Filed Feb. 13, 1882. Original No. 116,268, dated June 27, 1871.

Claim.—1. In a chandelier, the combination of an upper stationary tube, a lower sliding burner-support, means adapted to prevent the rotation of the burner-support relative to the stationary tube-section, a spring-barrel, and a cord connected with the spring-barrel and with the sliding burner-support, substantially as set forth.

2. In a chandelier, the combination of an upper stationary tube, a lower sliding burner-support, means adapted to prevent the rotation of the burner-support relative to the stationary tube-section, a spring-barrel, and a cord passing through the upper stationary tube and connected with the spring-barrel and the lower sliding burner-support, substantially as set forth.



3. The combination, in a chandelier, with a sliding burner-support and a hollow fixed guide, which are arranged to always overlap each other, of the spring-barrel and cord connection, substantially as set forth.

4. In combination with a fixed guide projecting downward from the fixed part of the chandelier, a sliding stem to which the branches are connected, and which has within it an internal sheath or guide cut off from the gasway of the stem and open at the top to receive the fixed guide, substantially as hereinbefore described.

5. In combination with the fixed guide and the sliding stem with its internal guide, the folding gas-pipe, which connects the gasway of the stem with that of the fixed part connected with the source of supply, substantially as described.

6. The combination, with the sliding pipe and the guide therefor, of the folding pipe-connection having a single middle joint and pivoted to the sliding part and the fixed part substantially as set forth, to have the axis of its pivotal connection with the sliding part in a vertical plane other than that of the axis of its pivotal connection with the fixed part, whereby the pipe-connection can be folded close to the stem.

10,071. GASALIER. JOHN H. BRAHAM, Brooklyn, N. Y. Filed Feb. 13, 1882. Original No. 116,269, dated June 27, 1871.

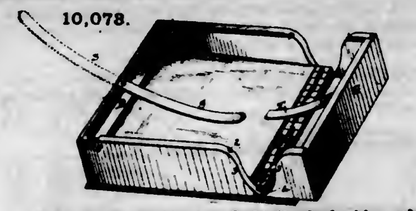
Claim.—1. In a chandelier, the combination of a stationary tube-section, a burner-support adapted to slide relatively thereto and arranged to always overlap the same, a spring-barrel, a cord, which passes through the stationary tube-section and connects the spring-barrel with the burner-support, and a guiding-pulley adapted to direct the cord from the spring-barrel to the tube-section, substantially as set forth.

2. In a chandelier, the combination, with the stationary tube-section, the sliding burner-support, the spring-barrel, and cord, of a ratchet and pawl arranged, substantially as set forth, to hold the spring at different tensions and to permit the tension thereof to be adjusted independently of the burner-support.

3. In combination with a pendant or chandelier for burning gas, a movable branch pipe, a sliding guide-rod attached to said movable pipe, and a stationary stem having an internal guideway for said rod cut off from the gasway, substantially as set forth.

4. In combination with the movable branch, sliding rod, and a stem with an internal guide cut off from the gasway, the folding gas-pipe, whereby an extensible metallic gasway is obtained between the gas center and the movable branch, substantially as described.

5. The spring-barrel and cord, arranged substantially as shown, in combination with the stem, the guideway within the stem, and the sliding rod which supports the movable part of the chandelier.



10,072. HAY-KNIFE. SPENCER F. WEYMOUTH, Dresden, assignor to Hiram Holt, Farmington, Me. Filed Nov. 10, 1881. Original No. 112,609, dated Mar. 7, 1871.

Claim.—A hay-knife the blade whereof is provided with suitable handles and has an outwardly-curved edge provided with serrations integral with the blade and sharpened on their edges near-est the blade-point, substantially as set forth.

10,073. TEMPORARY BINDER. BLOOMFIELD BREWER, New York, and JOHN P. ADAMS, Irvington, N. Y.; said Adams assignor to said Brewer. Filed Sept. 26, 1881. Original No. 193,169, dated June 19, 1877. Reissue No. 8,277, dated June 11, 1878.

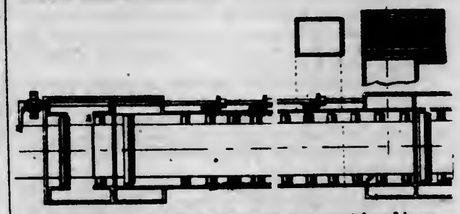
10,078.

Claim.—1. The combination of a binding-back with a series of adjustable index-leaves, and with a box formed with a bottom, two sides, and a back, provided with grooves to receive and retain the said binding-back in said box, and from which it can be removed vertically, substantially as described.

2. A removable binding-back formed with plates *a*, connected together, combined with a series of adjustable index-leaves, each having affixed to its back edge a plate or rod having projections 1, operating in connection with said plates *a*, substantially as described.

3. The combination of a binding-back provided with plates *a*, connected together, with a series of index-leaves, each having affixed to its back edge a plate or rod having projections 1, operating in connection with said plates *a*, with a box having a bottom, two sides, and a back, and provided with grooves for the reception and retention of said binding-back, substantially as described.

4. The combination of a binding-back with a series of adjustable index-leaves, and with a box having a bottom, two sides, and a back, provided with grooves to receive and retain the said binding-back in said box, and from which it can be removed vertically, and with a swinging spring, S, attached to said box so as to bear upon the free ends of said index-leaves to hold them or swing away to release them, substantially as described.



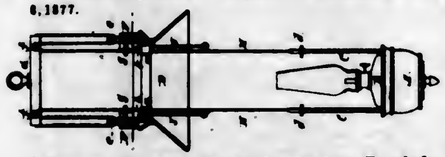
5. The combination, with a box having a bottom, two sides, and a back, of a series of adjustable index-leaves held therein at one end, and a swinging spring, S, constructed so as to bear upon the free ends of said index-leaves to hold them or swing away to release them, substantially as described.

6. The combination of a pivoted spring, T, with the cover, the box A, and a series of index-leaves, substantially as described.

7. A series of index-leaves the outside leaf of which is provided with a binding cord or band, *c*, the free ends of which are temporarily attached thereto and adapted for operation substantially as described.

8. The combination of a cover having a spring, E, attached thereto, with a series of adjustable index-leaves, and a box having a bottom, two sides, and a back, substantially as described.

10,074. METHOD OF AND APPARATUS FOR MANUFACTURING PAPER AND PASTEBOARD. NIKOLAUS KAISER, Grellingen, Switzerland, assignor to Society for the Manufacture of Wood Pulp, same place. Filed Mar. 1, 1882. Original No. 232,919, dated Jan. 27, 1880.



Claim.—1. The method of drying paper or pasteboard in continuous sheets by subjecting it to the direct action of hot air or other gases without any essential draft or stretch which could prevent the free shrinkage of the paper while drying.

2. The apparatus for drying paper or pasteboard in continuous sheets, consisting of a closed chamber in which hot air or gases are introduced, or in which air is heated by any apparatus, in combination with an apparatus by which paper or pasteboard in continuous sheets is led through the said chamber without subjecting the paper or pasteboard to any essential drawing or stretching action.

3. In an apparatus for drying paper or pasteboard in continuous sheets, a number of rotating rollers over and by means of which the paper or pasteboard is not so much drawn forward but pushed forward, so as not to be subjected to any essential drawing or stretching action.

4. In an apparatus for drying paper or pasteboard in continuous sheets, the plates *i*, combined with the carrying-rollers *g*, all as and for the purpose set forth.

10,075. HANGING LAMP. ELIJAH C. LAWRENCE, Boston, Mass. Filed Aug. 20, 1881. Original No. 188,938, dated Feb. 6, 1877.

Claim.—1. The combination of a hanging lamp, B, a shade, D, supported at a suitable distance above the lamp and adapted to move up and down with the same, cords or chains H, having their upper ends secured at a suitable distance above the lamp, and at their lower ends connected with the latter, sheaves *f*, and a counterbalancing-weight provided with sheaves *e*, substantially as and for the purpose described.

2. In a hanging lamp provided with means for raising and lowering the same, the combination of a lamp, a counterbalancing weighted rim, E, a shade, D, a locking device between the rim and the shade for connecting and disconnecting them, and means for supporting the shade when detached, whereby the shade may be caused to move with the lamp or with the rim, substantially as and for the purpose described.

3. In a hanging lamp, the combination, with the lamp B, of the cross-bar G, cords H H, weighted rim E, shade D, and locking-shafts *J J*, whereby the said weighted rim can be elevated with or without the shade, substantially as specified.

10,076. CULTIVATOR-TOOTH. JOHN S. ROWELL, Beaver Dam, Wis. Filed Oct. 27, 1881. Original No. 232,850, dated Oct. 5, 1880.

Claim.—1. The double-pointed reversible tooth described, consisting of the tooled shank S, having fixed similarly-curved shovel-points T at its opposite ends, the whole constituting a unitary structure of substantially the usual length of seeder-teeth, combined with a slipping plate adapted to hold the teeth by clamping near its upper point, substantially as described.

2. In combination with a beam and with a plate having a slipping connection with the beam, a double-bladed tooth, S T, detachably and reversibly secured to the slipping plate by a fastening independent of the fastening which secures the plate to the beam, whereby the teeth may be reversed without disturbing the plate, substantially as described.

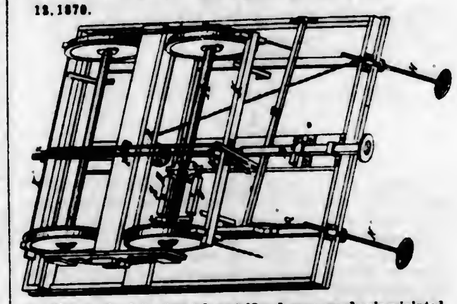
3. The combination of the cleft-beam A, slipping plate B, clamped within and extending out of the beam-cleft, the double-pointed reversible teeth S T, fitted to the protruding portion of the slipping plate, and mechanism for detachably securing the teeth to the exposed part of the plate, substantially as and for the purpose specified.

4. In combination with a cultivator-beam and with a double shovel-pointed reversible tooth, S T, an intermediate plate having a slipping connection with the beam, a fastening for rigidly but detachably securing the teeth to the plate, and means for guarding the upper teeth-point, substantially as set forth.

5. In combination with the beam and with a double-pointed reversible teeth, S T, having similar curved shovel-points, a plate having a slipping attachment with the beam, and a fastening for holding the teeth by its upper end to the plate, said slipping plate being extended to afford a guard to the unused teeth-point.

6. In combination with a beam and with a double shovel-pointed reversible teeth, S T, a plate having a slipping connection with the beam and rigid detachable connection with the teeth, said plate being extended and arranged to hold the teeth at the rear of the beam, substantially as described.

7. The slotted beam A, the pivoted slipping plate B, slotted to receive the binding-bolt *b* and provided with the clamping-bolt C, and shoulders outside of the beam, combined with the adjustable or reversible teeth S T, rigidly but removably secured thereto, substantially as described.



8. The slipping plate B, adapted to be pivoted at its front end by bolt *p* and provided with slot *i*, whereby the clamping-bolt *b* may pass through said plate, combined with a hooking-shoulder, P', and hook-headed clamp-bolt C, whereby the shank S may be firmly but detachably held, substantially as described.

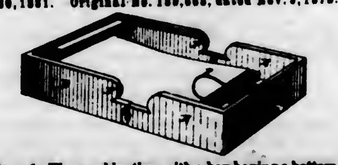
9. Combined with the reversible tooth S T, a slipping plate, B, adapted to be located in a cleft in the beam A and provided with a hooking-shoulder, P, offset laterally from said plate, and the clamp-bolt C, whereby the shank S will be held in line with said plate, but capable of adjustment up and down thereon, as shown.

10. Combined with the reversible tooth S T, the slipping plate B, constructed with laterally-projecting flanges along its rear edge, whereby the unused tooth is guarded while the machine is in operation.

11. A slipping plate, B, pivoted and clamped within a cleft in the beam A by separate bolts and provided with a holding-shoulder, P, and clamp-bolt C, in combination with the reversible tooth S T, as set forth.

10,077. RAILWAY-CAR BRAKE. EDWARD P. VIVIAN, Omaha, Nebr. Filed Mar. 6, 1882. Original No. 101,791, dated Apr. 12, 1870.

Claim.—1. A horizontal centrifugal governor having jointed arms, weights, and a spring arranged on the axle of a car, in combination with the draw-bar of the car and with an interposed stop or detent arranged to be actuated by the governor, substantially as and for the purpose above set forth.



2. The arrangement of the governor G, the grooved wheel W, the collar U, forked lever C, and the lever L, in such manner as to force the front end of the lever L outwardly when the train is in rapid motion, allowing the bar B to be pressed back upon the lever M, as above set forth, thus applying the brakes to the wheels of the car.

3. The construction and arrangement of the bar B, in combination with the lever M, brakes K and K', rod R, and draw-bar D, when used and operated substantially as above described.

4. The arrangement of the rods R P and levers M N, in combination with bar B, to operate the brake either by hand or automatically, substantially as herein described.

5. The arrangement of the brake-stand H' and chain Q, in connection with the bar B, as above set forth, for the purpose of preventing the operation of the automatic brake when desired.

10,078. PERMANENT LETTER-FILE. JOHN F. ADAMS, Irvington, assignor to Bloomfield Brewer, New York, N. Y. Filed Sept. 20, 1881. Original No. 189,665, dated Nov. 9, 1875.

Claim.—1. The combination, with a box having a bottom, two sides, and a back, and provided with a vertical groove or grooves, of a series of adjustable sheets, made of card-board or suitable stiff paper, each sheet being attached to a piece of stiff material having a projection or projections fitting into said groove or grooves, substantially as and for the purpose described.

2. The combination of the cover provided with a spring, P, with a box having a bottom, two sides, and a back, and the series of adjustable sheets K, substantially as shown and described.

STROBRIDGE *v.* LANDERS *et al.*

1. REISSUE NO. 7,583—STROBRIDGE v. LINDSAY (2 FED. REP.) FOLLOWED.

The conclusions of the court in *Strobridge* v. *Lindsay* (2 Fed. Rep., 692) upon the questions of novelty and patentability adopted, it appearing that the same facts exist in this case as in that.

2. SAME—COMBINATION—AGGREGATION.

It appearing that some of the elements of the combination claim formed a new combination of parts to secure a useful result, it became immaterial to inquire whether all the elements of the claim are strictly in combination and not merely aggregated.

Messrs. Bakewell & Kerr for the plaintiff.

Mr. B. F. Thurston and *Mr. C. E. Mitchell* for the defendant.

BLATCHFORD, *J.*:

This suit is brought on Reissue Letters Patent No. 7,583, granted to the plaintiff March 27, 1877, the original Patent No. 159,467 having been granted to him as inventor February 2, 1875, and reissued to him (No. 7,174) June 13, 1876. The drawings of the original and of No. 7,583 are the same.

The following is the specification of No. 7,583, reading what is outside of brackets and what is inside of brackets and omitting what is in italics:

Figure 1 is a vertical section of a coffee-mill embodying my invention. Fig. 2 is an under view of the cover, and Fig. 3 is a perspective view of the hopper.

Like letters refer to like parts wherever they occur.

My invention relates to the construction of coffee [and] or spice [mills in such manner that the hopper is inclosed in the box, and may be closed in turn by a sliding gate or cover, whereby a compact and neat mill is obtained.] *grinders; and it consists in suspending the hopper by means of the top of the box and securing it in position by means of screws, which pass through the cover and through lugs or a projecting flange upon the hopper, whereby a covered hopper is obtained and the construction and attachment of the device simplified; also, in providing the covered hopper with a sliding or movable gate, centered with the shank of the grinding-nut and sliding upon the periphery or flange of the hopper, whereby hinges, springs, or catches are dispensed with, and the gate slides aside, leaving an unobstructed opening for the admission of the article to be ground, and also in providing the hopper with projections or points which bite into the cover of the box and prevent the slipping or turning of the hopper, in connection with a cover projecting so as to rest upon the top of the box, and bind upon the upper edge of the hopper.*

* * * * * * *

A indicates the box, with its drawer B, of any suitable construction. The top C of the box is cut away, [so that] *for the admission of the hopper* [may be suspended therein,] *which I introduce from above, suspending it* by means of a projecting flange or lugs on the [hopper.] *hopper, and to* [To] facilitate the suspension of the hopper I preferably bevel the opening in top C to correspond with the curve of the hopper, as shown at [*c*.] *c, which.* [This,] also, will diminish the liability of the splitting of the wood when the screws which secure the cover are [introduced] *introduced. (when a cover is used and secured as shown.)*

D represents the hopper or grinding-shell provided with a flange or lugs, *d*, by which it is suspended [in] *upon the top C of* the box [A. The hopper is fastened down, and also prevented from turning, by the screws *g*.] *A, and through which pass the screws g, which hold the hopper down and prevent it from turning.* The hopper has the usual grinding-face, *d'*, and a series of projections or points, *e*, which I provide for the purpose of taking hold upon the beveled edge c of the top C, to assist in preventing any movement of the hopper. These points, if sufficiently numerous, will of themselves prevent a change of position of the [hopper, so that screws may be omitted. This will be found the cheapest and most convenient way of suspending the] hopper. E is the cover, having a central opening for the passage of the shank of the grinding-nut, and a sunken or recessed rim for the accommodation of the lugs *d* or the flange of the hopper, so that the lower edge of the cover rests evenly upon the top C, and at the same time binds upon the hopper. This cover E is provided with a sliding gate or door, F, which is pierced as at *f* for the passage of, or made to rest against, the shank of the grinding-nut, upon which it turns or bears, said gate F resting, by its lower edge, upon the upper edge of the hopper, and sliding or moving within or without the cover E, so as to be out of the way when the opening in the cover is unclosed.

G represents the grinding-nut, having a tapering shank, H, which passes through the cover, projecting portion of gate F, and the crank, and is secured above by the usual tightening-nut I.

The devices are put together as follows: The cover and gate are placed upon the hopper, the shank of the grinding-nut passed through the hopper, cover, and crank, and secured by the tightening-nut. The lugs or screw-openings in the flange of the hopper are made to register with those in the cover, after which the operative parts are dropped into the opening in the top of the box, and screwed by a single set of screws, which pass through the cover and lugs or flange of the hopper. The projecting points on the outside of the hopper will bite into the top of the box, and as the cover binds upon the upper edge of the hopper, these will of themselves, if sufficiently numerous, be sufficient to prevent any movement of the hopper, so that, if desired, the screws need not pass through the flange of the hopper.

The hopper may be suspended, as shown, and the cover replaced by a bridge, to support the shank of the grinding-nut. The grinding shell or hopper and the cover may be secured by a separate set of screws. The lower part of the grinding-shell may be formed with lugs or projections, to guide and steady the grinding-nut.

Among the advantages of my invention are the simplicity of construction and the readiness with which the several parts and the box may be adjusted or set up, whereby time and labor are saved and a serviceable article produced.

Reading in the foregoing what is outside of brackets, including what is in italics, and omitting what is inside of brackets, gives the text of the original specification.

There are eight claims in No. 7,583. Only claim 1 is involved in this suit. It is as follows:

1. A coffee or similar mill having a detachable hopper and grinding shell formed in a single piece and suspended within the box by the upper part of the hopper or a flange thereon, substantially as and for the purpose specified.

The original patent had four claims, as follows:

1. The hopper and grinding-shell D, provided with points or projections *e* on its outer surface, in combination with cover E, projecting so as to rest upon the top of the box and bind upon the upper edge of the hopper, substantially as and for the purpose specified.

2. In coffee or spice mills, the combination of box A, having a top, C, with the hopper D, suspended within the box by means of lugs or projections, which rest upon or take into top C, and a cover, substantially as specified.

3. The combination of the hopper and grinding-shell D, grinding-nut G, having shank H, and cover E, having a sliding gate or door F, substantially as and for the purpose specified.

4. The combination of cover E and grinding-shell or hopper D, the latter provided with lugs or a flange, so that the two parts may be secured to the box by a single set of screws, substantially as specified.

So far as can be discerned in the drawings of the original and the reissue the hopper and the grinding-shell are represented as a single piece, without any indication of ever having been in two pieces. It is not stated in the reissue that they are cast in one piece. The text

says that D is the hopper or grinding-shell, and that it has the usual grinding-face, *d'*. That grinding-face is shown in the drawings as extending down from the lower part of the hopper part proper and as having the grinding-nut revolving within it. The grinding-face is the inner face of the grinding-shell. There is nothing else on the point till we come to claim 1, where it is said that "the hopper and grinding-shell" are "formed in a single piece."

The elements which appear to be necessary in claim 1 are: (1) A mill in the form of a box; (2) a hopper and grinding-shell formed in a single piece; (3) the combined hopper and grinding-shell detachable; (4) such hopper and grinding-shell suspended in the box by the upper part of the hopper or a flange thereon; (5) an arrangement of these features substantially as and for the purpose specified.

The defendant's structure, which is claimed to infringe claim 1 of the reissue, is constructed in accordance with the description and drawings of a patent granted to Rodolphus L. Webb, No. 204,865, June 11, 1878, so far as anything involved in this case is concerned. That patent shows a box-mill with a cast-metal top projecting as a lateral flange horizontally from the top edge of the hopper on all four sides and extending outwardly beyond the tops of the sides. The top is of one piece with the hopper proper, and the latter is of one piece with the grinding-shell, as shown in the drawings, and this is the construction in the article put in evidence as infringing. The hopper and grinding-shell are sunk in the box, so that there are covers which, when closed, rest on the upper face of the metal top. The patent states that the grinding-shell may be cast as a part of the hopper or may be attached thereto. The patent claims merely an arrangement for adjusting the grinding-nut up and down, so as to make it run nearer to or farther from the grinding-shell, and thus vary the quality of the grinding. This arrangement does not appear to be embodied in the mills produced and put in evidence as specimens of those made by the defendant.

The defendant's article is a mill in the form of a box. It has a hopper and a grinding-shell formed in a single piece, they being cast in one piece. The combined hopper and grinding-shell and top are detachable from the box by unscrewing screws which go through the sides of the box into lugs depending on the inside of the box from the under side of the top. The hopper and the grinding-shell, through their connection with the metal top, are suspended in the box. Every point of advantage resulting from the combination of the features in claim 1 of No. 7,583 exists in the defendant's article.

Some question is made as to what is meant by the word "detachable" in claim 1. It is not used in the descriptive part of the specification; but screws are shown and described which go through the lugs or flange on the hopper and into the wood of the box on top, and thus fasten the hopper to the box. Of course these are wood-screws, and removable at will, and so the hopper and shell are detachable. The defendant's hopper and shell and top are detachable in the same way, being attached in the same way. The defendant urges that its structure does not infringe because the hopper is not detachable from the top of the box. All that the defendant has done is to enlarge the size of the flange on the hopper. The sides of the box support the top of the box. When the flange is smaller than the top it hangs in the top. When it is so large as to itself form a top and overlap the sides the sides support the whole—that is, the flange-top, the hopper, and the grinding-shell. The change is merely formal, and does not avoid infringement. The flange on the hopper may be gradually enlarged and the top of the box be gradually cut away until the wood of the top is all gone, and the flange replaces it, without in any manner affecting the principle of the Strobridge invention embodied in claim 1. This is all that the defendant has done.

The answer sets up that the reissue is not for the same invention as that described in the original, and that the reissue contains new matter not found, suggested, or described in the original. This objection is not tenable. The statement in the reissue of that to which the invention relates is true, and is found in substance in the original. There is no statement in the reissue of what the invention consists in. The statement in the original as to what the invention consists in is omitted in the reissue. It was narrower than the real invention. The drawings of the reissue and the original are the same. There is no new matter introduced into the reissue. The reissue truly describes the article and its parts. To say that the hopper is suspended in the box, when the original says that it is suspended from the top of the box, is not new matter within the meaning of section 4,916 of the Revised Statutes.

The answer also sets up that in view of the previous state of the art, as shown in various patents set forth in the answer, the reissue shows no novelty and discloses no patentable subject of invention, and that the reissue is invalid for want of patentable quality.

This reissued patent was adjudicated upon in the suit of *Strobridge* v. *Lindsay*, (2 Fed. Rep., 692,) in the Circuit Court for the Western District of Pennsylvania, by Judge Acheson. The defendant's mill in that case was of the same construction as the mill of the defendant in this case. The defenses there insisted on were non-infringement and want of patentable invention. The mill was held to infringe claim 1 of the reissue. The question of the extension of the flange on the hopper was fully considered. Everything that is introduced into this case by the defendant on the questions of novelty and patentability was in the Lindsay case, except a mill called "Domestic Coffee-Mill." In this the hopper is elevated and not sunk in the box. There is a cast-metal cover covering the box and forming its top. The hopper is not of one piece with the cover, but rests on it, and is secured to it by rivets. The grinding-shell is loose, and has a flange at its upper edge, and is dropped into a depression surrounding the central hole in the cover, and has the hopper above it. Lugs on it fitting into corresponding recesses in the cover prevent it from turning. The grinding-shell is supported against lateral strain or displacement by the cover. This structure has not a hopper suspended in the box, nor a grinding-shell and hopper formed in a single piece, and neither meets claim 1 nor shows the defendant's arrangement.

The question of novelty and patentability was fully considered by Judge Acheson, especially in regard to the French mill and the elevated-hopper mill. Box coffee-mills existed—such as the elevated-hopper mill, the Livingston and Adam's mill, and the Brown mill—in which the hopper and the grinding-shell were formed in one and the same piece, and box coffee-mills existed—

such as the French mill, the Hartz mill, and the Clark mill—in which the hopper was suspended in the box; and in the Domestic coffee-mill the metal top, which carried the hopper and the grinding-shell, was attached to the box by wood-screws; but no coffee-mill existed combining all the features embodied in claim 1 of No. 7,583. It was, however, urged in the Lindsay suit that it did not, in view of the prior structures, require invention to pass to a structure with the combined features of claim 1 of No. 7,583. Judge Acheson held that it did. The entire record in the Lindsay suit is in evidence in this suit.

There is nothing new in this suit as to the matters considered and passed upon in the other suit in regard to patentability and novelty, and the Domestic coffee-mill presents no features in regard to forming the hopper and grinding-shell in a single piece and in regard to a hopper suspended in the box which were not presented by structures among those which were before Judge Acheson.

Under these circumstances it would be proper, as it is usual, to follow the former decision on final hearing in another circuit court; but, irrespective of this, I entirely concur in the views of Judge Acheson.

It is strongly urged that claim 1 of No. 7,583 cannot be sustained, because the old devices aggregated in it do not by their combination produce a novel result which is the fruit of the combination. It is a sufficient answer to this view to say that a hopper and grinding-shell formed in a single piece and suspended in the box by the upper part of the hopper or a flange thereon did not exist before combined in a mill. The evidence shows that the suspension in the box requires, in order to dispense with the yoke or bridge which is below the grinding-shell in the French mill, that the grinding-shell and the hopper should be formed in a single piece, because when the hopper is sunken the grinding-shell no longer has the lateral support of the box-cover. Hence the combination of those features does produce a novel result as the fruit of the combination. If that combination had existed before, the question whether adding to that the feature of detachability made another patentable combination might arise; but it does not arise now. The defendant, down to 1877, was not making a mill with a sunken hopper. In that year Webb, who was in its employ, having before him the French mill and a mill made by the Charles Parker Company in accordance with the Strobridge patent, entered into the manufacture of the infringing mill. It desired to make a mill with a sunken hopper which should be a cheaper mill than the French mill. It substantially copied the Charles Parker mill, merely extending the flange of the hopper. It formed the hopper and the grinding-shell in one piece and got rid of the lower supporting-yoke of the French mill. In the Strobridge mill the only lateral support of the grinding-shell is the hopper. Therefore there must be a strong, unyielding union between the grinding-shell and the hopper. Where the hopper is elevated the grinding-shell is sustained laterally against the strain of grinding by the top of the box. The advantages thus resulting from Strobridge's arrangement have been availed of by the defendant by the use of what is covered by claim 1 of No. 7,583.

There must be a decree for the plaintiff for an account of profits and damages, and a perpetual injunction, with costs.

U. S. Circuit Court—District of Maryland.

THE AMERICAN BALLAST LOG COMPANY OF NEW YORK *v.* BARNES *et al.*

Decided December 3, 1881.

1. PATENT NO. 126,938—BALLAST LOGS—PATENT CONSTRUED.
The complainants' device is essentially a combination of two counterbalance-weights, and cannot be construed to cover all methods by which vessels may be kept in an upright position while in port, by means of contrivances fastened on the outside and floating in the water, but only such as are substantially identical with the device described in a patent in construction, form, and principle of operation.

2. SAME—SAME—COMBINATION—SUBSTITUTING NEW ELEMENT.
Defendant having dispensed with one of the essential elements of the combination, and having substituted therefor a new mode of accomplishing the same object, not a mechanical equivalent, and not similar in principle of operation, there is no infringement.

IN EQUITY—BEFORE JUDGES BOND AND MORRIS.

Mr. J. Nevett Steele and *Mr. Sebastian Brown* for the complainant.

Hon. Wm. Pinkney Whyte, Mr. J. H. Barnes, and *Mr. R. D. Williams* for the respondents.

By the COURT:

This bill of complaint is filed for an alleged infringement of Patent No. 126,938, granted May 21, 1872, to Demartini and Chertizza, for improvement in methods of ballasting vessels in port, which has been assigned to the complainant.

The patentee's specification states that—

Under the [then] present practice, when a vessel arrives in port and discharges her cargo, ballast must be immediately taken in to prevent careening and consequent injury to herself and other craft, as well as to facilitate repairs and other operations incident to preparation for a new voyage. To avoid the loss of time and the expense, &c., attending this course, we employ ballast-logs connected with the vessel by ropes or chains, that lie alongside thereof, and yet float in the water, as hereinafter described.

The specification then describes the logs as single pieces of timber, or several smaller sticks bolted to each other, made proportioned to the size and weight of the vessel, and, if necessary, weighted with lead or iron.

The logs are in all cases designed to float or be self-sustaining in the water, and thus made capable of being towed from place to place or vessel to vessel. They are attached to the vessel by ropes or chains passing through eyebolts B or other convenient devices and over the deck or around any suitable part of the frame-work, or otherwise secured as found practicable or convenient.

The logs are not intended to hold the vessel down in the water, but merely to act as counter or balance weights when she attempts to keel over from any cause, either when being towed or lying alongside a wharf; and it is evident the chains on one side will be taut only when those on the other are slack, and vice versa, the tendency being to raise the log upon the rising side out of the water. The weight of the log will always prevent this being done, and consequently the vessel will be held in an upright position.

The claim is:

The method of ballasting vessels by means of floating logs of suitable size, weight, and construction attached to said vessels by ropes or chains and arranged alongside thereof, substantially as specified.

The device described in this patent has been introduced by the complainant into very general use in the ports of Boston, New York, Philadelphia, and Baltimore among vessels requiring ballast to keep them upright in port when empty, and particularly among grain vessels, which are required to be completely emptied and sealed before receiving cargo.

The defendants deny in their answer that the device used by them is an infringement, and also charge that the complainant's patent is invalid by reason of long prior knowledge and public use. The device used by the defendants is one for which a patent has been granted to them, No. 232,425, dated September 21, 1880,

for harbor-ballast for ships. It is also to be attached to the outside of the ship, but on one side only. It consists of a floating water-tight box or ponton divided into an upper and a lower compartment, the lower being filled with water and the upper one is air-tight and empty. It is attached to one side of the ship by means of chains or ropes, one fastened to the ship's deck and the other carried under her keel and up the other side. If the ship careens away from the side on which it is attached, the weight of the box and of the water in the lower compartment pulls the ship back to an upright position. If the ship careens toward the side on which it is attached, the buoyant power of the empty air-tight compartment is sufficient to check the tendency of the ship to overturn toward that side.

The conclusion to which we have arrived is that there is no infringement. The device of the complainant's is a combination of two counterbalance-weights. That the weights float in the water is only an incident of their usefulness and has nothing to do with the essential principle of their action. As stated in the specification of the patent, it is only the resistance of the weight of the log when the vessel in keeling over attempts to lift it from the water, which produces the result intended. It is the two counterbalance-weights which the inventor relied upon, and one without the other would be useless.

The defendants' device makes use of but one weight, and the counter-balance is produced by the buoyant power of the air-tight chamber of the ponton. This is made efficient by having the ponton not loosely floating by the side of the ship, as is the case with the ballast-logs, but so secured to the ship that it cannot remain floating in the water when the ship careens toward it, but is carried down and submerged until its buoyant power checks the ship and returns her to an upright position. This, it seems to us, is a different invention from that described and claimed in complainant's patent. It may have been the result of a study of the complainant's device, stimulated by its success; but the defendants have rejected one of the essential elements of complainant's combination and substituted in its place a new mode of accomplishing the same object, which, in our judgment, is not a mechanical equivalent, and is not similar in principle or operation. The buoyancy of the air-chamber on one side of the ship does not perform the same function as was performed by the weight which is dispensed with on the other side. The function of the weight was to drag down the side of the ship by which it was being lifted from the water. The function of the air-chamber is to resist the tendency of the ship in careening to bury it under the water. The quality of buoyancy is not called into action at all in complainant's device. It is useful to that device only so far as it renders the logs easy of transportation to the ship and so far as it renders the logs inactive when the vessel is in an upright position. Its use in any other way or for any other purpose is not suggested in complainant's specification or claim.

Complainant's patent cannot be construed to cover all methods by which vessels may be kept in an upright position while in port by means of contrivances fastened on the outside and floating in the water, but only such as are substantially identical with the device described in the patent in construction, form, and principle of operation. (*Case* v. *Brown*, 2 Wall., 320.)

Being clearly of opinion that the charge of infringement is not sustained, and that there can be no decree in favor of the complainant, it is not necessary for us to consider the defense of want of novelty set up by the answer.

Bill dismissed.

U. S. Circuit Court—Eastern District of Pennsylvania.

THE AMERICAN BALLAST LOG COMPANY *v.* COTTER.

PATENT NO. 126,938 FOR BALLAST-LOGS SUSTAINED.

The conclusions of the Circuit Court for the Eastern District of New York and the Circuit Court for the District of Maryland, with respect to the patentability of the invention, adopted, and the validity of the patent sustained, notwithstanding certain testimony offered to show the prior use of the invention.

Mr. J. Warren Coulston and *Mr. Henry Baldwin, Jr.*, for the complainant.

Mr. Thomas J. Diehl for the defendant.

BUTLER, *J.*, MCKENNAN, *J.*, concurring.

Very little need be said in disposing of this case. Two only of the several grounds of defense set up in the answer were pressed on the argument—first, want of patentability in the invention, and, second, anticipation. The first of these points was passed upon and decided in favor of the patent by the Circuit Court for the Eastern District of New York in the suit of *Demartini et al.* v. *Abramovic et al.* in 1879, and again by the Circuit Court for the District of Maryland in a suit by the plaintiffs here against Barnes and Gatto. The respect due to these judgments and the importance of consistency and uniformity of decision in courts of co-ordinate jurisdiction, where the same subject-matter is involved, requires this court to adopt the judgments referred to. The second question alone, therefore, is open for consideration. A large amount of testimony bearing upon this was taken and is produced by each of the parties. A written analysis of this testimony here would serve no useful purpose. It is sufficient to say that while the general statements of the defendant's witnesses on examination in chief, considered alone, would be fully sufficient to overcome the presumption of novelty arising out of the patent, they are so shaken by the cross-examination in some instances, and generally by the rebutting testimony produced by the plaintiffs, that they cannot justly be accorded such weight. While it is true that the plaintiffs' testimony principally is negative in character, the circumstances are such that it is little if any less valuable than the direct testimony of the other side. Considering the occupations and experiences of the plaintiffs' witnesses it seems virtually impossible that the prior use alleged could have existed without their knowledge.

For the reasons stated a decree will be entered for the plaintiffs.

12,862.—FONT OF PRINTING-TYPE.—*Carl Müller*, Chicago, Ill., assignor to *Marder, Luse & Co.*, same place. Application filed November 18, 1881. Term of patent 7 years.

12,863.—CARPET.—*Thomas Onslow*, Philadelphia, Pa., assignor to *Horner Brothers*, same place. Application filed March 8, 1882. Term of patent 3½ years.

12,864 and 12,865.—CARPET.—*Julius Peyel*, New York, N. Y., assignor to *The Hartford Carpet Company*, Hartford, Conn. Applications filed February 23, 1882. Term of patents 3½ years.

12,866 to 12,868, inclusive.—FINGER-RING.—*Nathaniel L. Ripley*, Boston, Mass. Applications filed March 2, 1882. Term of patents 3½ years.

12,869.—PRINTING-TYPE.—*John K. Rogers*, Brookline, Mass. Application filed April 28, 1881. Term of patent 3½ years.

12,870.—FINGER-RING.—*Nathaniel L. Ripley*, Boston, Mass. Application filed March 2, 1882. Term of patent 3½ years.

12,871.—FIRE-PLACE-LINING PLATE.—*Joseph A. Read*, Philadelphia, Pa., assignor to *Gilbert Combs* and *John Bowden*, both of Freehold, N. J. Application filed March 6, 1882. Term of patent 7 years.

12,872.—WALL-PAPER.—*Ida F. Clark*, Albany, assignor to *Warren, Fuller & Co.*, New York, N. Y. Application filed February 13, 1882. Term of patent 3½ years.

12,873.—HANDKERCHIEF.—*Henry Doherty* and *Joseph Wadsworth*, Paterson, N. J. Application filed March 11, 1882. Term of patent 3½ years.

12,874.—GATE.—*Henry Feller*, Middle Village, assignor to *John Timmes*, Brooklyn, N. Y. Application filed February 24, 1882. Term of patent 7 years.

12,875.—LAMP-SHADE.—*Marshall W. Gleason*, Brooklyn, N. Y. Application filed January 25, 1882. Term of patent 7 years.

12,876.—[Withdrawn.]

12,877.—CARPET.—*Julius Pegel*, New York, N. Y., assignor to *The Hartford Carpet Company*, Hartford, Conn. Application filed February 23, 1882. Term of patent 3½ years.

12,878.—WALL-PAPER.—*Candace Wheeler*, New York, N. Y., assignor to *Warren, Fuller & Co.*, same place. Application filed February 13, 1882. Term of patent 3½ years.

12,879.—[Withdrawn.]

12,880.—CASKET OR BURIAL-CASE.—*George Ferguson*, Moravia, N. Y. Application filed March 2, 1882. Term of patent 14 years.

12,881 to 12,886, inclusive.—OIL-CLOTH.—*Charles T. Meyer* and *Victor E. Meyer*, Bergen, N. J., assignors to *Edward O. Sampson*, New York, N. Y. Applications filed March 11, 1882. Term of patents 3½ years.

TRADE-MARKS.

[Certificates of registration of Trade-Marks numbered 8,191 and upward are registered under the act of March 3, 1881.]

9,272.—ANILINE CHEMICAL DYES.—*Albany Aniline & Chemical Works*, Albany, N. Y. Application filed March 9, 1882.
"The words 'JAMES HENDRICK,' arranged as an autograph."

9,273.—CIGARS.—*Juan Custo y Ca.*, New York, N. Y. Application filed March 17, 1882.
"The words 'LA FLOR DE NAVES.'"

9,274.—CIGARS, CIGARETTES, AND CUT TOBACCO.—*F. P. del Rio y Ca.*, New York, N. Y. Application filed March 17, 1882.
"LA LEGITIMIDAD."

9,275.—TOILET PREPARATIONS.—*E. Brantley Dupree*, Cincinnati, Ohio. Application filed March 18, 1882.
"The arbitrarily-chosen words 'OIL OF BEAUTY.'"

9,276.—CIGARS.—*Estanillo y Ca.*, New York, N. Y. Application filed March 17, 1882.
"LA OPORTUNA."

9,277.—WHISKY.—*W. A. Gaines & Co.*, Frankfort, Ky. Application filed January 9, 1882.
"The word 'HERMITAGE.'"

9,278.—WHISKY.—*W. A. Gaines & Co.*, Frankfort, Ky. Application filed January 9, 1882.
"The words 'OLD CROW.'"

9,279.—CIGARS.—*Garcia y Montero*, New York, N. Y. Application filed March 17, 1882.
"The words 'FLOR DE JOAQUIN ORTIZ.'"

9,280.—CIGARETTES.—*S. Jacoby & Co.*, New York, N. Y. Application filed March 15, 1882.
"The arbitrary word 'MATCH-LESS.'"

9,281.—WATCHMEN'S TIME-DETECTORS.—*Elias Imhauser*, New York, N. Y. Application filed March 17, 1882.
"Three squares erected on the sides of a right-angled triangle."

9,282.—CIGARS.—*Lopez, Fernandez y Ca.*, New Orleans, La. Application filed March 17, 1882.
"The term 'FLOR DE MANUEL LOPEZ Y CA.'"

9,283.—CIGARETTE-PAPER OF ALL KINDS.—*May Brothers*, New York, N. Y. Application filed March 14, 1882.
"The arbitrary word 'JOB.'"

9,284.—CIGARS.—*Louis Marx*, New York, N. Y. Application filed March 17, 1882.
"The arbitrarily-selected word 'CALIOPE.'"

9,285.—COOKING-OIL.—*J. J. Powers & Co.*, St. Louis, Mo. Application filed March 15, 1882.
"The representation of a cotton-plant."

9,286.—SOAP.—*Warren Provost*, Brooklyn, N. Y. Application filed March 17, 1882.
"The word 'CREAM.'"

9,287.—SILK AND MOHAIR BRAIDS.—*S. Rosenberg & Co.*, New York, N. Y. Application filed March 4, 1882.
"The symbol of the crown, cross, and eagle."

9,288.—CEMENT, LIME, LAND-PLASTER, AND CALCINED PLASTER.—*Sherman, Weeks & Co.*, New York and Kingston, N. Y. Application filed March 6, 1882.
"The representation of an arrow."

9,289.—CEMENT, LIME, LAND-PLASTER, AND CALCINED PLASTER.—*Sherman, Weeks & Co.*, New York and Kingston, N. Y. Application filed March 6, 1882.
"The arbitrarily-selected word-symbol 'ROSENDALE.'"

9,290.—CIGARS, CIGARETTES, AND SMOKING-TOBACCO.—*G. Schlueter & Mendez*, Brooklyn, N. Y. Application filed March 20, 1882.
"The words 'LOS DOS AMIGOS' and a translation—the words 'THE TWO FRIENDS'—and the three letters 'L D A.'"

9,291.—WRITING-PAPER AND ENVELOPES.—*John Walker & Co.*, London, England. Application filed March 11, 1882.
"The arbitrarily-selected words 'MOROCCO LEATHER.'"

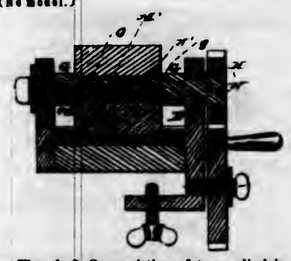
9,292.—LEAF-TOBACCO.—*Weiss, Eller & Kaeppel*, New York, N. Y. Application filed March 31, 1881.
"The representation of a rose with a single leaf upon each side of the stem."

9,293.—BACON.—*John White & Company*, Bristol, England, and New York, N. Y. Application filed March 20, 1882.
"The arbitrary word 'VICTORIA.'"

LABELS.

2,661.—Title: "ROCHESTER BLOOD AND BONE GUANO."—*William H. Battelle*, Rochester, N. Y. Application filed March 11, 1882.

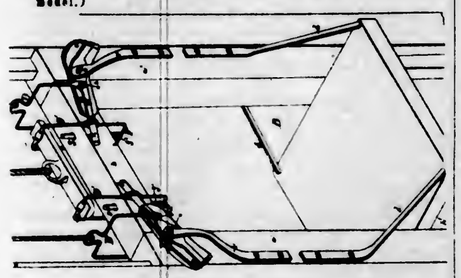
2,662.—Title: "KENDALL'S BLISTER."—*B. J. Kendall & Co.*, Enosburg Falls, Vt. Application filed March 17, 1882.



2,663.—Title: "THE SALEM MANILA CIGAR."—*C. H. & J. Price*, Salem, Mass. Application filed March 8, 1882.

2,664.—Title: "OLD DR. HAGAN'S OIL LINIMENT, THE GREATEST REMEDY IN THE WORLD FOR RHEUMATISM."—*Joseph Purcell*, Martin's Ferry, Ohio. Application filed December 31, 1881.

PATENTS



GRANTED APRIL 11, 1882.

256,110. ADJUSTABLE SHAFT FOR GRINDSTONES AND THE LIKE. WILLIAM J. ARNDT, Detroit, Mich. Filed Feb. 18, 1882. (No model.)

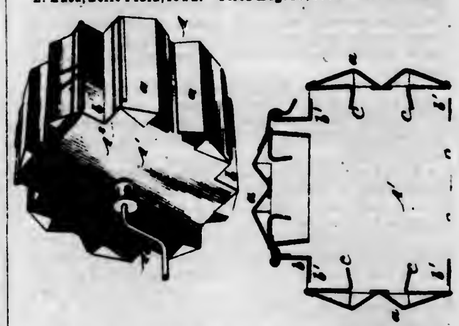
Claim.—The shaft G, consisting of two cylindrical sections having square portions M' N' and longitudinal openings or recesses O Q, the latter of which is screw-threaded, in combination with the set or adjusting screw P, working in the latter and serving to hold the two sections together, substantially as herein shown and specified.

256,111. ELEVATOR. JOHN B. ATWATER, Chicago, Ill., assignor to Peter J. Sipper, same place. Filed Feb. 15, 1882. (No model.)

Claim.—1. An elevator having mechanism, as described, for arresting the sudden descent of its cab, constructed to work in connection either with one cable or with two cables, substantially as described.

2. In combination with the power-spring mechanism, as at *g'*, the jawed levers E, provided with a handle, *h*, extended beyond their axis of articulation, whereby either two cables or a single cable can be used, substantially as described.

3. The jawed lever E, applied to the cab B, and having longitudinal and transverse wedging or tapered bearing-surfaces, in combination with one or more cables and a power-spring mechanism, substantially as and for the purpose set forth.



256,112. BOOT-STRAP. JOHN H. BALCOM, Charlotte, Mich. Filed Feb. 8, 1882. (No model.)

Claim.—The boot-strap consisting of the double loop A A, attaching-strap D, and diagonal stays B B, constructed as described, and adapted to be applied to a boot-leg in the manner set forth.

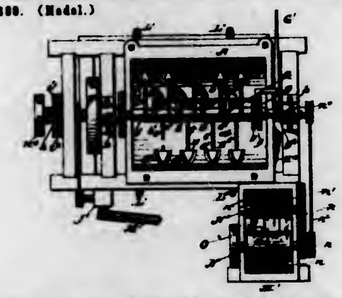
256,112.

256,113. WASHING-MACHINE. ASEL H. BELL and WILLIAM L. HESS, Belle Plain, Iowa. Filed Aug. 18, 1881. (No model.)

Claim.—In a washing-machine, the cylinder A, consisting of the ends A', having each an angular recess, A^2, at each corner, and connected together thereat by the angular bars *b*, having their apices arranged between the inwardly-projecting plates *c* and within the chambers *b'*, the plates secured to the inner sides of the cylinder and curved or bent one toward the plate next to it on the adjoining side, and the buckets *a*, substantially as and for the purpose set forth.

256,114. BILLIARD-TABLE. MOSES BENSINGER, Chicago, Ill. Filed Feb. 13, 1882. (No model.)

Claim.—1. The base for a billiard-table, consisting of four legs, F, each having a lateral brace, *f*, which braces connect with a central column composed of sections G, L, and M, the whole to be constructed and arranged substantially in the manner set forth.



2. The central column for a billiard-table base, consisting of frame G, to which are connected the foot-brace extensions *f* of the cap L, having bowel *l*, and of the foot M, having screw *m*, all of which to be constructed and arranged substantially as described and shown.

3. The legs F, having brace-extensions *f*, secured to the central frame, G, by tenons *g*, with wedges *h*, and by bolts H, substantially as and in the manner set forth.

4. The base for a billiard-table, composed of the legs F, hav-

ing extensions *f*, secured to frame G by means of tenons *g*, with wedges *h*, and by bolts H, in combination with the cap I, having dowel *l*, and fork M, having set-screw *m*, the whole of which to be constructed and arranged substantially in the manner set forth.

256,115. REDUCING AND MIXING MACHINE FOR FERTILIZERS. Stephen B. Burrell, Abington, Pa. Filed Oct. 16, 1880. (Model.)

Claim.—1. In a reducing and mixing machine, the arms *d'*, formed upon or attached to the ends of the shanks or handles *c* of the mixing-spades E, the said arms *d'* projecting from said shanks *c* at right angles to the axis of said shanks, and also at right angles to the plane of the spade-blades, substantially as described.

2. In a reducing and mixing machine, the combination of the shaft B, having eyes or sockets *b'*, with the shanks or handles *c* of the mixing-spades E, said shanks *c* being loosely pivoted in the eyes or sockets *b*, and provided with arms *d* at right angles to the axis of said shanks, substantially as described, for the purpose specified.

3. In a reducing and mixing machine, the sliding collar F, situate upon the shaft B, within the drum A', and provided with the peripheral groove *f*, and having connecting rods or bars F' connected thereto, substantially as described, for the purpose specified.

4. In a reducing and mixing machine, the combination of the mixing-spades E, having shanks *c*, provided with the arms *d'*, with the connecting-bars F', sliding collar F, and shaft B, having eyes or sockets *b'*, substantially as described.

5. In a reducing and mixing machine, the combination of the sliding collar F, having the peripheral groove *f* and situate upon the shaft B, with the shipper G, having the bifurcated end *g*, said shipper passing through the end of the mixing-drum and attached to and operated by the lever G, substantially as described, for the purpose specified.

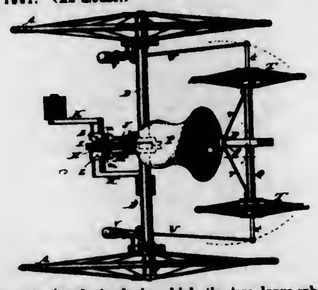
6. In a reducing and mixing machine, the combination of the mixing-drum A', having outlet *a'* and provided with the adjustable mixing-spades E, with the conical rotating screen I, provided upon its outside with the adjustable metallic brushes L and upon its inside with the brush K, attached to the frame K', pendent upon the shaft I', substantially as described, for the purpose specified.

7. In a reducing and mixing machine, the combination of the mixing-drum A', having adjustable mixing-spades E, with the conical rotating screen I, having adjustable brushes L and brush K, chutes or spouts J, O, and M, elevator J', and reducing-drum M', having cylinders N N', provided with teeth *n n'*, substantially as described, for the purpose specified.

256,116. PROCESS OF MAKING LACING-STUDS. Hellen Bray, Newton, Mass. Filed Dec. 16, 1881. (No model.)

Claim.—The process of forming lacing studs or hooks which consists in cutting a cylindrical blank from a wire of a diameter about equal to the desired diameter of the shank of the stud or hook to be made, bending one portion of said blank at right angles to the other portion, and embossing or swaging said bent-over portion by means of suitable dies to give contour to the parts which are to constitute the neck and the outer or button head, bending the neck to bring the button-head over the shank and inner head, and then drilling out the center of the shank, substantially as and for the purposes described.

256,117. MANUFACTURE OF TUBULAR RIVETS. Hellen M. Bray, Boston, Mass. Filed Feb. 13, 1882. (No model.)



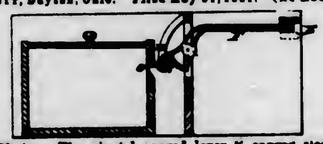
256,117.

Claim.—1. The blank A, cut in the form shown, and provided with the slits or incisions *a*, *b*, and *c*, from which to form a tubular capped headed rivet, substantially as described.

2. The process of forming tubular rivets from sheet metal by first cutting a blank to the form shown in Fig. 1, and forming therein the slits or incisions *a*, *b*, and *c*, bending or rolling one section or portion of said blank into the form of a tube, turning or bending the other section or portion of said blank and a portion of the end of the rolled-up or tubular section outward at right angles, or nearly so, to the axis of the tube, swaging the section so turned outward into a concavo-convex form, bending said concavo-convex section over upon the flanged end of the tubular section to form a cap thereto, and turning the outer edge of said cap-section down around the edge of the flange of the tube and then under said flange, substantially as and for the purposes described.

256,118. VELOCIPEDE. James O. Brown, Bangor, Me. Filed Oct. 5, 1881. (No model.)

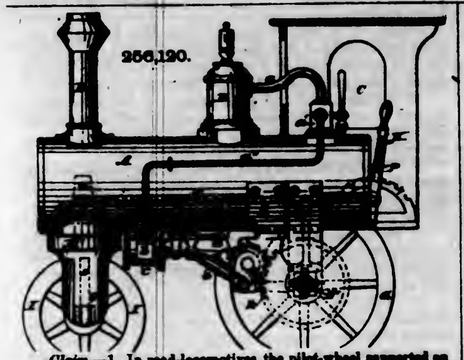
Claim.—1. A velocipede in which the two large wheels are secured upon independent axles, and one of said wheels alone acts as the propeller to the vehicle, substantially as and for the purpose specified.



2. A velocipede in which the two large wheels are secured upon independent axles, and one of said axles arranged and combined with means wherewith it can be rotated to propel the velocipede, substantially as and for the purpose specified.

3. In a velocipede, the axle-frame consisting of the two bearings D D, joined in the middle by a yoke or frame, C, one side of which is split, in combination with a bolt, whereby said bearings may be set at various angles, substantially as and for the purpose specified.

4. In a velocipede, the combination of frame D C, wheels A A, one of which is upon a shaft, E, and the other upon shaft F, provided on its inner end with a wheel, G, seat P, frames B M N, or their equivalent, crank-axle H, cranks K, adjustable bearings L, wheel I, and chain J, or its equivalent, steering-levers V, rod U, axle Q, arms *t*, steering-wheels T, projection R from axle Q, and pivot S, substantially as and for the purpose specified.

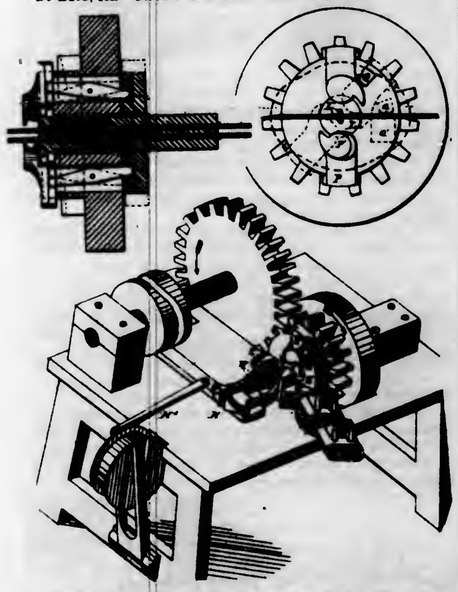


5. In a velocipede, the wheels A upon independent axles and provided with brake-wheels X, in combination with brake-levers W, frame D, with its lug *y*, and brake-strap Y, substantially as and for the purpose specified.

256,119. MECHANISM FOR AUTOMATICALLY FASTENING OR LOCKING A SERIES OF DRAWERS. Alexander B. Barnhart, Dayton, Ohio. Filed May 31, 1881. (No model.)

Claim.—The pivotal cogged lever F, cogged sleeve S, and shaft C, with projections *c*, in combination with cabinet-drawers and sliding top provided with block E, substantially as set forth.

256,120. ROAD-LOCOMOTIVE. Ryan P. Bayers, Burnt Chimney, assignor of one-half to C. B. Young, C. B. Horn, and Matt McBrayer, all of Rutherford County, N. C. Filed Mar. 6, 1882. (No model.)



256,120.

Claim.—1. In road-locomotives, the pilot-wheel supported on a saddle, M, recessed on its edge and fitting into a ring, *r*, secured to the boiler, and operated by mechanism from the cab, substantially as set forth.

2. In road-locomotives, the pilot-wheel I, supported on a saddle, M, recessed on its edge to fit into a ring, *r*, secured to the boiler, and provided with a pivot, *m*, to which the arm *n* is attached, and connected to a rod, *o*, operated by a lever, K, all substantially as specified.

3. The traction-engine herein described, consisting of the boiler A, supported upon the front pilot-wheel, I, and rear driving-wheels, G, the cylinders *c*, and engine-shaft having pinions *i* meshing with gears K on the drive-wheels, said cylinders and engine-shaft being secured to the under side of the boilers, and all arranged as set forth.

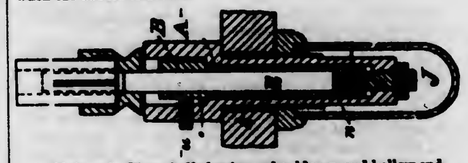
256,121. MACHINE FOR BARBING FENCE-WIRES. Frank P. Capy, Cleveland, Ohio, assignor to the Washburn & Moen Manufacturing Company, Worcester, Mass., and Isaac L. Ellwood, De Kalb, Ill. Filed Jan. 9, 1882. (No model.)

Claim.—1. The combination, with the barb-wire-feeding apparatus and the strand-wire-feeding apparatus, *of* an operating-lever common to and connected with both said apparatus, substantially as described.

2. In a machine for barbing fence-wires, the strand-wire clamps H and means for imparting thereto an intermittent reciprocating motion, in combination with slots or guides *h*, that shall close said clamps as they move forward and open them as they recede, substantially as and for the purposes shown.

3. In a wire-barbing machine, the combination, with the strand-wire clamps H, of the abutments or bosses *h'*, substantially as and for the purposes shown.

4. In a wire-barbing machine, the combination, with a barb-wire-feeding device, a strand-wire clamp, and a strand-wire-feeding apparatus, of a lever and means for connecting it with the aforesaid barb-wire-feeding device, strand-wire clamp, and strand-wire-feeding apparatus, substantially as and for the purposes shown.



5. The combination, with the barb-wire-feeding apparatus and an operating-lever, of devices for connecting the said apparatus with said lever, and for adjusting the point of connection nearer to or farther from the fulcrum of said lever to alter the feed of said apparatus, substantially as described.

6. The combination of the barbing-head and bending-fingers carried by the said head with levers pivoted to said head, so as to vibrate in planes parallel with the axis thereof, and a cam for operating said levers, substantially as described.

7. The combination of the barbing-head, the bending-fingers carried thereby, the stationary cam at the rear of said head, the levers pivoted inside the head and engaging at their front ends with said bending-fingers and at the rear end with said cam, substantially as described.

256,122. SPINDLE AND BEARING THEREFOR. William T. Carroll, Worcester, Mass., assignor, by direct and mesne assignments, to Henry W. Mason, same place, and William P. Draper, Hopedale, Mass. Filed May 7, 1881. (No model.)

Brief.—The bolster is tapered externally and fits its supporter snugly at its lower end, and is adjusted at the upper end by set-screws, whereby the spindle can be plumbed. A shoulder is formed upon the lower end of the spindle, which, when the bobbin is being doffed, prevents its removal by abutting against the lower end of the bolster, said bolster being also shouldered at its head, which shoulders engage with the set-screws, thus preventing its removal when the bobbin is doffed.

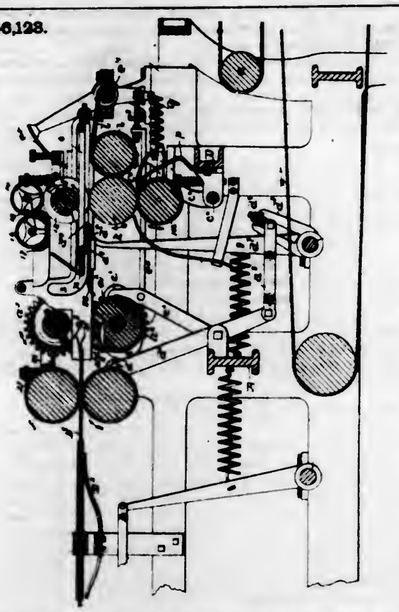
Claim.—1. The spindle having a shoulder, *n*, and hollow end, in combination with a bolster having a bearing for the shoulder *n*, and an adjustable screw, J, on which the hollow end of the spindle rests, as above described.

2. The combination of the supporter A with the tapering bolster B, whose lower end fits the interior of the supporter A, and whose upper end is capable of adjustment therein, and the screws *a a a*, in the manner and for the purposes substantially as set forth.

3. The spindle having a shoulder, *n*, and the bolster B, having shoulders *o o o*, in combination with the screws *a a a* and the supporter A, substantially as above described.

256,123. PAPER-BAG MACHINE. Clarence A. Chandler, East Bridgewater, Mass., assignor to the Eastern Paper Bag Company, Hartford, Conn. Filed Feb. 23, 1882. (No model.)

Claim.—1. The finger or nose *n*, extended backward and fixed to the cross-bar *d'*, combined with the folding-rolls *j*, *h*, and *l* and the two folding-blades, the said finger being extended between the rollers *j h* and over past the center of the roller *l*, substantially as described.



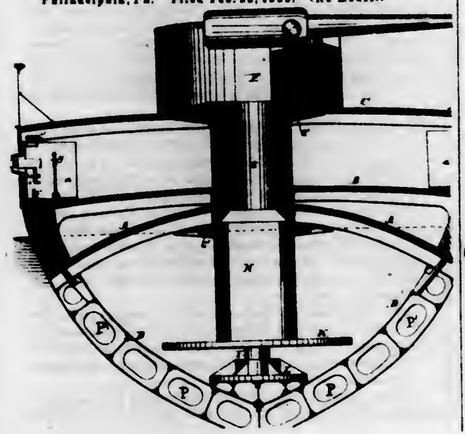
2. The finger or nose *n*, extended backward, and a cross-bar to which it is attached, combined with the rolls *h l*, located below the said finger, and with the folding-blade *d'*, slotted at its edge to pass below the said finger and back the paper bag between the said rolls to cross-fold the diamond fold, substantially as described.

3. The finger or nose to enter the tube and lay back one ply thereof in the formation of the diamond fold, and the roller *h* below the said finger, combined with the roller *j*, slotted to permit the said finger to be extended back between them, and with the diamond-fold pusher 10 12, connected with the said roller *j*, substantially as described.

4. The roll *h*, combined with the roll *j*, having part of its periphery cut away to permit the leading end of the diamond fold to be projected well under it before the diamond fold is caught between the said rolls to be drawn thereby under the said finger or nose, substantially as described.

5. The rollers *j h*, the finger or nose extended between them, and the movable tucking-blade, combined with the two rolls *l m*,

256,123.



arranged next the roller *k*, and with the two folding-blades c^3 c^4, substantially as and for the purpose described.

6. The rocker-shaft c^2, its arms, folding-blade, and adjustable head, in which the said rocker-shaft has its bearings, combined with the adjustable connecting-rod, the lever c^5, and cam to move it, substantially as described.

7. The roller *k* and its attached gear 31, the adjustable head D and its stud 40, and the gear 23 on the shaft of the tube-feeding roller, combined with the slotted lever 38 and its attached idle-gears, to operate substantially as described.

8. The roller *l*, having an annular central groove to prevent improper spreading of the paste applied to the diamond-folded part of the bag, combined with the metal plate *l'*, extended across the said roller, and between it and the roller *k*, and slotted at its ends, as described, to avoid coming in contact with the lines of paste on the rearmost end of the diamond fold, the said plate filling the said annular groove at the top of the said roller, thus furnishing a smooth surface over which the leading end of the diamond fold is fed before it receives its first cross-fold, substantially as described.

256,124. SHIELD FOR SHIP'S GUNS. NATHAN B. CLARK, Philadelphia, Pa. Filed Feb. 28, 1882. (No model.)

Claim.—1. A rotating turret for heavy guns, having the side in the rear of the gun of a semi-cylindrical form, as shown, and the front portion, through or over which the muzzle of the gun passes, of nearly a wedge or V shape, as shown and described.

2. A rotating turret for guns, having the side in the rear of the guns of a semi-cylindrical form, as shown, and the front portion, through which the muzzles of the guns pass, sloping or curving downward, substantially as shown and described.

3. A rotating shield for a gun, having its front portion, through which the gun passes, of the rounded wedge shape described, its rear open, and being pivoted to swing about a fixed point, as described.

4. The V-shaped shield, of substantially the form described, in combination with the pipe *e*, through which ammunition may be passed when said shield is made to pivot on said pipe, substantially as set forth.

5. The pivoted V-shaped shield carrying a gun, as described, in combination with the side of the vessel pierced with port-holes, through which the muzzles of the guns may pass, as set forth.

6. The V-shaped shield described, pivoted below on a tube passing downward through the deck, and having its upper pivot in the deck or framing above, substantially as described.

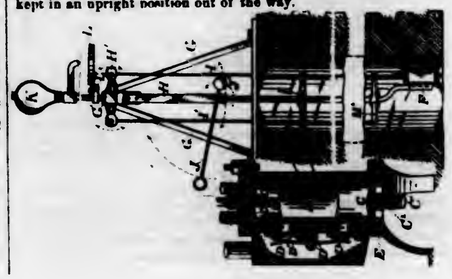
7. The V-shaped shield described, combined with the pinion *f*, fixed to the tube *e*, for rotating the shield by means of the shaft *s* and worm *d*, as set forth.

8. The V-shield described, in combination with shaft *s*, having its bearings in the sides of the shield, the worm *d*, pinion *f*, tube *e*, and operating-lever *g*, all the parts being constructed and relatively arranged substantially in the manner herein described and shown.

256,125. PUMP ATTACHMENT. HENRY CLAYTON, Dayton, Ohio, assignor of one-half to William O. McCabe, same place. Filed Jan. 18, 1882. (No model.)

Brief.—To permit the removal of any sediment which may collect within the spout or behind the strainer the band is furnished with an outlet, D, normally held closed by a spring, *g*.

Claim.—1. The herein-described attachment for pump-spouts, consisting of the band B, provided with lugs or projections, and the cap C, having a strainer, *a*, and notched, as explained.



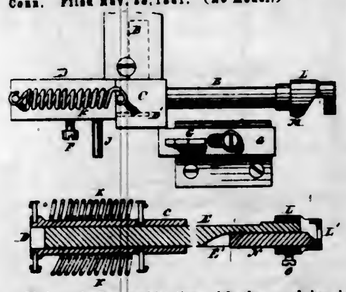
2. In combination, the spout A, the band E, constructed substantially as shown and described, whereby it is adapted to encircle the end of the spout, and strainer-cap C, applied substantially as shown and described.

3. In combination with a pump-spout and a strainer applied thereto, an outlet-valve in rear of the strainer, whereby the sediment can be discharged without removing the strainer.

4. In combination with a pump-spout, a strainer attachment consisting of band or ring B, provided with valve D, and strainer-cap C, all constructed and arranged substantially as shown and described.

256,126. PUMP. WILLIAM H. CLOUD, Detroit, Mich., assignor, by mesne assignments, to the Cloud Manufacturing Company, of Michigan. Filed Aug. 17, 1881. (No model.)

Brief.—Pivotal cross-bars H' and H², one end of each being connected to the plunger-rod I and the other ends being united by bar I', are actuated by a pendulum-lever, J, having a weight, J', at one end, by means of which the lever, when not in use, is kept in an upright position out of the way.



Claim.—1. The combination, with the plunger-rod of a double-acting pump, of the upper pivoted cross-bar having the pendulum-lever rigidly secured to its pivotal portion, the lower pivoted cross-bar having one end connected with the plunger-rod, and the rods connecting the ends of said pivoted cross-bars, substantially as described.

2. The combination, with the pendulum-lever, of a handle pivoted to its lower end and provided with a counterpoise-weight for causing the handle to stand vertical when not in use, substantially as described.

3. The combination, with the two outlet-valves, of the single strip-spring confined at its middle portion, and having its opposite ends bearings upon said valves, respectively, to hold them closed, substantially as described.

4. The combination, with the two outlet-valves of a double-acting pump and the intermediate bridge, D', of the flat strip-spring D^2, having its middle portion secured to said bridge and its opposite ends bearing upon said valves to hold them normally closed, substantially as described.

256,127. WOOD-SCREW MACHINE. ASA S. COOK, Hartford, Conn. Filed Nov. 25, 1881. (No model.)

Claim.—1. In combination with the revolving jaws A and the reciprocating arm B of a screw-threading machine, the longitudinally-moving bar E, provided with the head L, and the cutter N, constructed and arranged to push the blank into the jaws and to turn the point as the jaws revolve, substantially as described.

2. The combination of the block C, the yielding block D, the springs K, the bar E, the head L, and the cutting-tool N, the whole forming an inserting and pointing device, substantially as described.

3. The adjusting-gage G, in combination with the yielding block D, having a stop, J, the bar E, the head L, carrying the pointing-tool, and the frame H of the machine, substantially as described.

256,128. CAR-COUPLING. FOUNTAIN F. DUARING, Bellbuckle, Tenn. Filed Feb. 24, 1882. (No model.)

Claim.—The combination, with the draw-head having the longitudinal slot or recess B, having shoulders C F, forming respectively a guide-groove, D, in the top of the draw-head and a shallow recess, G, in the bottom thereof, of the slide arranged to work in recess or chamber B, and having a head, J, forming shoulders K L, the front edge of its head being so curved as to guide the coupling-link to the bottom of the draw-head, substantially as and for the purpose shown and specified.

256,129. TONIC BEVERAGE. JACOB W. DECASTRO, Mahwah, N. J. Filed Aug. 16, 1881. (No specimens.)

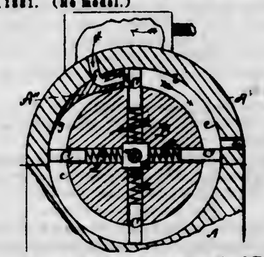
Brief.—A process of preparing beverages by which milk may be preserved in a normal condition or without immediate separation of its constituents.

Claim.—1. The process of manufacturing an aerated beverage of milk or containing milk which shall keep for a long time, which shall be free from odors foreign to the beverage, which shall not permanently separate, and which shall be free from objectionable foaming when drawn by supplying the milk in the form of condensed milk and then charging with carbonic acid and keeping under pressure, substantially as described.

2. The process of making an aerated self-preservative tonic beverage by mixing together a suitable spirituous, vinous, or other alcoholic liquor or essence, saccharine matter, and condensed milk, and charging the same with carbonic acid under pressure, whereby, the milk being supplied in the form of condensed milk, the usual and objectionable effects of carbonic acid upon milk are obviated, as set forth.

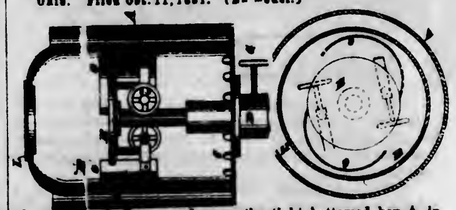
3. An aerated and self-preservative tonic beverage consisting of non-alkaline water, a suitable spirituous, vinous, or other alcoholic liquor or essence, saccharine matter, and condensed milk, the beverage containing carbonic acid being under pressure, the condensed milk being substituted for ordinary milk to obviate the objectionable effects of carbonic acid upon ordinary milk when the two are kept together for more than a very short time, and the ingredients being in suitable proportions, as described.

256,130. ADJUSTABLE STOVE-GRATE. FRANK H. DE GUERRE and WILLIS W. DE LANO, San Francisco, Cal. Filed Nov. 17, 1881. (Model.)



Claim.—1. The combination, with the bed-frame, the pivoted rod supported therein, and the rods L M, of the pivoted grate and the curved operating-lever having a stop, substantially as described.

2. The combination of the adjustable grate, the curved lever D, having a series of notches, and the ring H on the bed-frame, substantially as described.



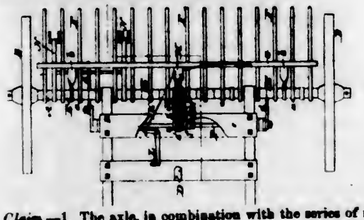
3. The described adjustable grate, mounted on pivoted supports, in combination with an operating-lever and a series of locking-stops.

256,131. ROTARY ENGINE. THOMAS H. DENISON, Newfane, assignor of one-half to Reuves Corwin, Coomar, N. Y. Filed July 11, 1881. (No model.)

Claim.—In a rotary engine, the power-wheel B, having a central square portion, *a'*, and flanges *b*, formed on its periphery, and provided with the openings *d*, extending from the periphery between the flanges down to the central portion, *a'*, for the reception of the springs *e* and valves C, in combination with said valves and with the casing A A', provided with the abutment A'', having the channel *f h*, as set forth.

256,132. GAS-FURNACE. FERDINAND DIECKMANN, Cincinnati, Ohio. Filed Oct. 11, 1881. (No model.)

Claim.—1. In a gas-furnace, the tight-bottomed box A, in combination with the sliding socket D, set-screw G, and perforated cover L, as and for the purpose set forth.



2. The gas-furnace described, consisting of the tight-bottomed box A, inner box, B, air-space H, air holes or indentations C, sliding socket D, set-screw G, perforated cover L, curved plates O O, and gas-burner E, substantially as and for the purpose described

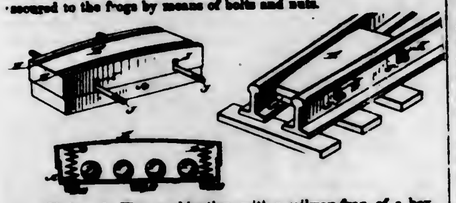
256,133. BURNER FOR LIQUID HYDROCARBONS. SILAS H. DOUGLAS, Ann Arbor, Mich. Filed Nov. 26, 1881. (No model.)

Claim.—A hydrocarbon-burner consisting of the casing having the steam and hydrocarbon chambers separated by a partition, the hydrocarbon-delivery pipe E', inclosed in the steam-chamber, opening through said partition and projecting through the opposite end of said steam-chamber, the steam-nozzle C', projecting from the steam-chamber and surrounding the end of said pipe, the valve B', arranged to close the inner end of said pipe, and the induction-conduits leading into the steam and hydrocarbon chambers, respectively, substantially as described.

256,134. HAY RAKE AND TEDDER. ALBURTIS EAGLE, Newtown, Pa. Filed Dec. 17, 1881. (No model.)

Claim.—1. The axle, in combination with the series of rake-teeth and separate series of tedder-arms hung on said axle, substantially as and for the purpose set forth.

2. The axle, in combination with the series of rake-teeth, the separate series of tedder-arms, and the rigid spur-wheel, all on said axle, substantially as and for the purpose set forth.



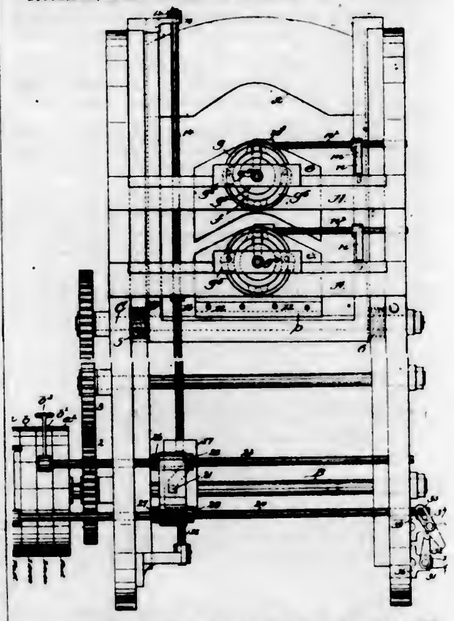
3. The axle, the rake-teeth, and the lifting-bar, in combination with the spring-catch H, the spur-wheel J, and arm M, said spur-wheel being fixed to the axle, the throw-off arm extending outward at the side of the spur-wheel, and the spring-catch being pivoted to the lifting-bar, overhanging the spur-wheel, and extended beyond the side of said wheel, substantially as and for the purpose set forth.

4. The rake-teeth, spur-wheel, and catch H, in combination with the arm M, having a notch, *d''*, substantially as and for the purpose set forth.

5. The axle A, rake-teeth F, the spur-wheel J, gearing *e*, straps *e'*, crank-shaft P, arms *d*, and tedder-arms N, combined and operating substantially as and for the purpose set forth.

256,135. SAFETY ATTACHMENT TO RAILWAY-FROGS. ELFORD S. EVELEIGH, Hamilton, Ontario, Canada. Filed June 29, 1881. (No model.)

Brief.—A box in which are placed springs and hollow elastic balls, and having a movable flanged cover provided with slots and secured to the frogs by means of bolts and nuts.



Claim.—1. The combination, with a railway-frog, of a box, A, secured to the rails, a movable cover, E, arranged over said box, and springs inclosed within the box and acting to normally retain the movable cover in an elevated position, substantially as described.

2. The combination, with a railway-frog, of a box, A, a flanged movable cover, E, arranged upon the same, springs inclosed within the box, and hollow elastic balls F, interposed between the cover and the box, substantially as and for the purpose described.

3. The combination of the box A, a movable flanged cover, E, arranged thereon, and provided with slots I, springs inclosed within the box, and transverse bolts J, for securing the parts in position, substantially as described.

256,136. CRIMPING-MACHINE. JOHN W. D. FIFIELD, North Brookfield, Mass. Filed Feb. 20, 1882. (No model.)

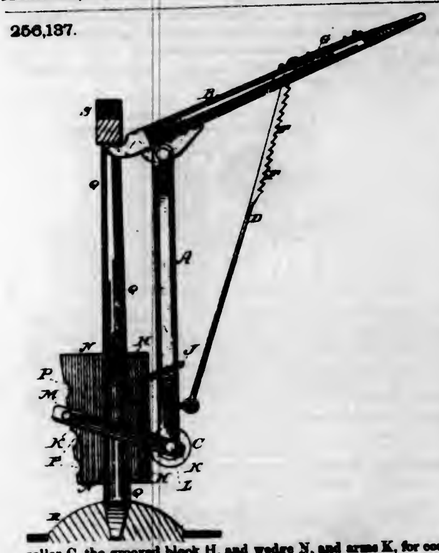
Claim.—1. The yielding jaws *e e'*, their carrying-pistons *f f'*, and springs, and devices to adjust the springs and control the forward movement of the pistons and jaws, combined with the vertically-reciprocating form, substantially as described.

2. The yielding jaws *e e'*, the pistons *f f'*, with which they are adjustably connected, their springs, and devices to limit the forward positions of the pistons, and the reciprocating form, combined with the wedge *m*, adapted to be reciprocated with the rack-bar, and with the rock-shafts *n'* and their arms, to separate the jaws as the form enters the upper thereon between the jaws, substantially as described.

3. The reciprocating form, and the lug 13, raised and lowered in unison with it, the rod 14, its collars, the cam-slide, pin 21, and block 22, combined with the two belt shippers or forks, and their rods 23 24, provided with collars, whereby the belt-shipper forks are automatically moved to place the driving-belts of the machine on the fast and loose pulleys in their proper order, to automatically reverse the direction of movement of the form at each end of its stroke, substantially as described.

4. The fast and loose pulleys, the shipper-rod 24, its fork, and one fast collar, and the shipper-rod 23, its fork, and two collars on the said rod, combined with the cam-slide having a reciprocating motion, and with the block 22, operated thereby, whereby the said block in its movement in one direction carries with it both rods and in the other direction but one rod, substantially as and for the purpose described.

5. The reciprocating cam-slide, the block 22, moved by it, the shipper-rod 23, its two collars, shipper-rod 24, and its single fixed collar, the fast and loose pulleys, and shipper-forks, combined with a lever to move the rod 24 in one direction to effect the reversal of shaft B, to depress the form, as set forth.

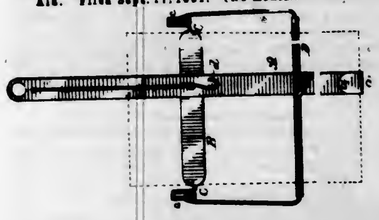


6. The jaws, and reciprocating form *d*, to carry the upper between them, combined with the yielding detachers adapted to come into position between the upper and form and detach the upper therefrom as the form rises, substantially as set forth.

256,137. TIRE-TIGHTENER. ALBERT P. GAYNIGHT and ANTHONY W. POTTS, Cooper, Ga. Filed Jan. 23, 1882. (No model.)

Claim.—1. In a tire-tightener, the combination of the forked rod A, having roller C and pivoted arms K, connected by a pin, M, the block H, having groove I, and the wedge N, having vertical groove O and transverse groove P, substantially as and for the purpose set forth.

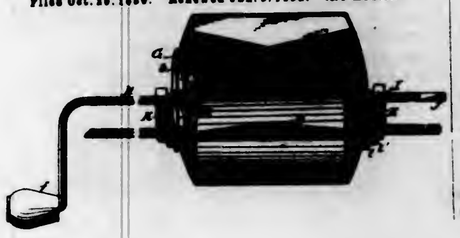
2. The combination of the forked rod A, having lever B and



256,137.

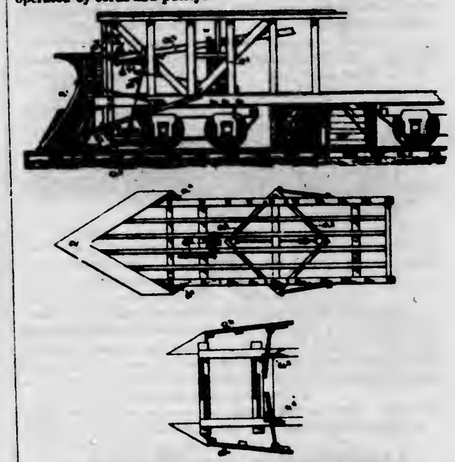
roller C, the grooved block H, and wedge N, and arms K, for connecting said block and wedge to the rod A, substantially as set forth.

3. As an improvement in tire-tighteners, the combination of the forked rod A, having roller C, pivoted arms K, connected by pin M, and ratchet-bar D, the forked lever B, having slot E and latch G, the vertically-grooved block H, having staple J, by which it is attached to rod A, and the wedge N, having vertical groove O and transverse grooves P, all arranged and operating, substantially as and for the purpose set forth.



256,138. PAPER-BAG HOLDER. THOMAS J. GRAHAM, Mobile, Ala. Filed Sept. 17, 1881. (No model.)

Claim.—1. In a paper-bag holder, the rod A, having formed upon its bottom the support *a* and its projection *a'*, and having secured across it the arms B, to which are attached the spring C, around the horizontal portion of which is the roller D, all arranged to operate as described.

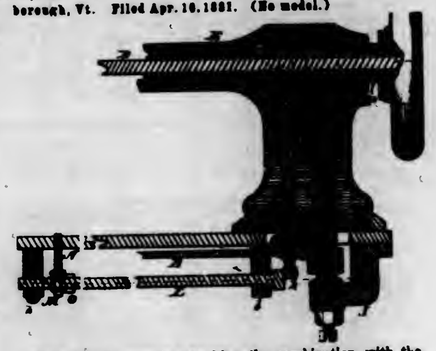


2. In a paper-bag holder consisting of the rod A, the support *a*, and its projection *a'*, and hook *d*, operating in combination with the spring C and roller D, adapted to retain the bags securely within the holder and to enable them to be easily withdrawn in desired quantities, as set forth.

256,139. COFFEE-ROASTER. NOAH HARRIS, Vincennes, Ind. Filed Oct. 26, 1880. Renewed Jan. 9, 1882. (No model.)

256,140. TRACK-CLEARING CAR. CHARLES L. HEYWOOD, Boston, Mass. Filed Oct. 31, 1881. (No model.)

Brief.—A plow is built on the forward part of a car and is provided with shoes on its lower timbers to ride upon the track and on each rear side edge with deflecting-boards. Between the trucks and beneath the car is secured an auxiliary plow adapted to work in both directions. The car is also provided with adjustable wings to widen the channel. A scraper is secured between the plow and forward truck, and is raised and lowered by a lever operated by cords and pulleys.

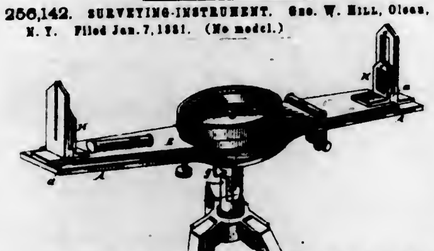


Claim.—1. In a track-clearing car, in combination with the truck and body of the car, the auxiliary plow *a'*, made substantially as described, for the purpose set forth.

2. In a track-clearing car having a snow-plow built on its forward part, the deflecting-board *a'*, made as described, in combination with the snow-plow and running-gear, as set forth.

3. A track-clearing car having a snow-plow at the front, an auxiliary plow beneath, and a wing on each side, as set forth.

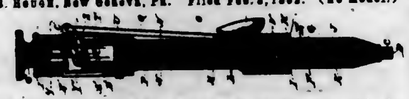
256,141. SEWING-MACHINE. LUTHER H. HIGBY, Brattleborough, Vt. Filed Apr. 16, 1881. (No model.)



Claim.—1. In a sewing-machine, the combination, with the shuttle-lever B, rigidly secured to the shuttle-lever shaft, of said shuttle-lever shaft actuated to a lateral reciprocating pivotal action

in the bearings I J by the connecting-rod G, and having arms F projecting therefrom, the lower arm passing through and working with said shuttle-lever, all said parts being constructed, arranged, and operating substantially as set forth and shown, for the purposes specified.

2. The combination, in a sewing-machine, with the driving-shaft D, of the rod G, connecting the eccentric G and crank upon the extremity of the feed-shaft L, and passing through arms projecting from a shuttle-lever shaft, the said shuttle-lever shaft working in the bearing I, hanging from the driving-shaft, and bearing J upon the bed-plate, and having the lower arm F, passing through the shuttle-lever, the shuttle-lever secured rigidly to the shuttle-lever shaft and actuated thereby, and the feed-shaft, all arranged and operating substantially as and for the purposes set forth and shown.

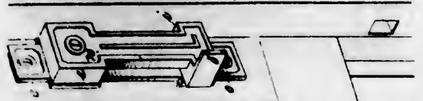


3. In a sewing-machine, the combination, with the driving-shaft D and shuttle-lever shaft A, having a lateral reciprocating oscillatory motion, of the bearing J, receiving the lower extremity of said shuttle-lever shaft, and the box I, suspended from said driving-shaft and supported thereby, and having a socketed bearing directly beneath said driving-shaft adapted to receive and receiving the upper extremity of said shuttle-lever shaft, the whole being arranged and operating substantially as and for the purposes herein set forth and shown.

256,142. SURVEYING-INSTRUMENT. GEO. W. HILL, Olean, N. Y. Filed Jan. 7, 1881. (No model.)

Claim.—In an instrument for measuring angles, the combination of the long plate A, having a graduated central circle and outer pair of sights, B, pivoted with rear lugs, *a*, and the short plate E, carrying an outer pair of sights, H, and a central compass and vernier, as and for the purpose set forth.

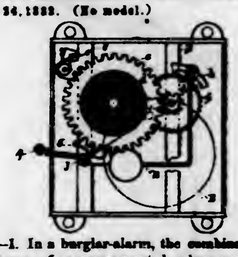
256,143. DENTAL PLUGGER. ALFRED JOHNSON and GUERSON B. HOUGH, New Geneva, Pa. Filed Feb. 8, 1882. (No model.)



Claim.—1. In a dental plugger, the combination, with the tubular casing having a transverse slot, of the tool or point holder provided with a wheel or disk having a milled edge projecting through said slot, so as to be capable of being rotated independently of handle of instrument, as set forth.

2. In a dental plugger, the herein-described mallet, consisting of a tube closed at its lower end and inclosing a spring, and provided near its upper end with vertical slots for the passage of a pin, which also passes through the sides of the casing, as set forth.

3. The combination of the handle or casing, the tool or point holder, the mallet having arm D', provided with notch E', the pin R, having lever S, the dog Y, having arm Z, the connecting-rod U, and slide V, and mechanism for tripping the dog at any desired point, as set forth.



4. In a dental plugger, the combination, with the mallet and its operating mechanism arranged as herein described, of the cap F', swiveled head G', and screw I, having lug J', working in a groove in the upper end of the handle, as and for the purpose set forth.

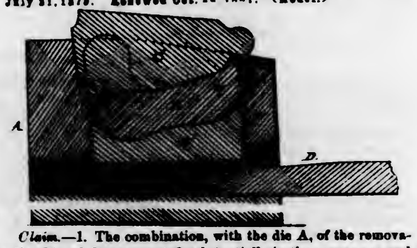
256,144. SASH-FASTENER. ALONZO JOHNSON, Springfield, Mass. Filed Sept. 23, 1881. (No model.)

Claim.—The within-described improved window-stop, consisting of the base plate *c*, having the broken ring *x* thereon, the latch *e*, having the circular notched socket e^2 and the arm *f* thereon, and the spring *h*, all combined substantially as set forth.

256,145. BURGLAR-ALARM. JOSEPH V. KNIGHT, Lynn, Mass. Filed Jan. 24, 1882. (No model.)

Claim.—1. In a burglar-alarm, the combination of a clock-spring, gearing *e a f*, an escapement, *h*, a hammer and a bell with a pivoted spring-pawl, 3, and a stop or button, 4, all constructed and adapted to be operated substantially as described.

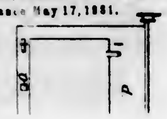
2. In a burglar-alarm, the combination of the pinion *e*, the spring, gearing *e a f*, escapement *h*, hammer, and bell with the spring-pawl 3, the button 4, and the locking-pawl 1, substantially as described.



256,146. BALANCED SLIDE-VALVE. HENRY C. KRIEBEL, Chicago, Ill. Filed Dec. 14, 1881. (No model.)

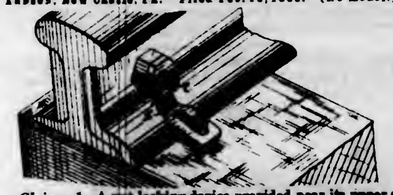
Claim.—1. The valve B, having a circular top, *g*, provided with an inner annular flange, *h*, and exterior annular or guard flange, *i*, in combination with the solid conical ring *j*, split conical ring *k*, the segmental wedge-block *l*, and the coiled springs *m*, for supporting said ring *k* and block *l*, substantially as and for the purpose described and shown.

2. The valve B, valve-plate *g*, having annular flanges *h i*, sockets *n* between said flanges, solid conical exterior ring, *j*, having its bread face resting against the under surface of the steam-chest cover D, the inner annular conical split ring, *k*, coiled springs *m*, resting within said sockets *n*, and operating to support and press upward said ring *k*, and the wedge-block *l*, also supported and pressed upward by a spiral spring, *m*, substantially as and for the purpose set forth.



256,147. DIE FOR MANUFACTURING THE TONGUES OF CAR-COUPLINGS. WARLLIM C. KROESSER, Allegheny, Pa. Filed July 21, 1879. Renewed Oct. 26 1881. (Model.)

Claim.—1. The combination, with the die A, of the removable dies B' and C, constructed substantially in the manner as and for the purpose herein shown and described.



2. The combination of the die A, provided with a key, D, with dies B' and C, substantially as herein described, and for the purpose set forth.

256,148. COMBINED BATH AND CAMERA. JOSEPH LEFEUVRIER, Mordrignac, France. Filed Oct. 17, 1881. (No model.) Patented in France May 17, 1881.

Claim.—The exposure-frame I', with its holders G, combined with and placed between the shutters A and B, together with the outer or bath chamber for holding baths, all substantially as described and illustrated, and for the purposes set forth.

256,149. NUT-LOCK. LEMUEL LOCK and EUGENE H. RICHARDSON, New Castle, Pa. Filed Feb. 15, 1882. (No model.)

Claim.—1. A nut-locking device provided near its upper end with an aperture adapted to pass over the bolt, and having its lower end extended outward and adapted to be secured to the sleeper, substantially as and for the purpose specified.

2. The nut E, provided with a threaded aperture and with a slotted projecting arm, substantially as and for the purpose specified.

256,150. SCOOP FOR GRAIN, SUGAR, &c. ALFRED B. MATTOON, Owasco, N. Y., assignor of one-half to Dorr Heald, same place. Filed Mar. 3, 1882. (No model.)

Claim.—1. The scoop formed of a single piece of sheet metal, with bottom B, rear end or back, D, and sides C C, the front edge of the latter being beveled and turned outwardly, as and for the purposes set forth.

2. The scoop having its upper edges turned or bent over and provided with the strengthening rim-wire fitting under these turned edges, consisting of but one piece, and so continued outwardly and inwardly as to form one or more loops or handles at the end of the scoop, as set forth.

3. The scoop having its upper edges turned or bent over, the strengthening rim-wire fitting under these turned edges, and provided with the bail, the ends of which are adjusted through openings in the sides of the scoop under the rim-wire, substantially as and for the purpose specified.

4. The scoop having its upper edges turned or bent over, the strengthening rim-wire fitting under these turned edges, and so continued outwardly and inwardly as to form a loop or handle at the rear of the scoop, and provided with the bail having its ends hooked or adjusted in openings in the sides of the scoop, near the front end thereof and under the rim-wire, as and for the purpose specified.

5. The combination of the scoop A B C C D, formed of a single piece of sheet metal, and having the front edges of its sides C C beveled and turned outwardly, and its upper edges turned or bent over, the single rim-wire forming loop or handle F, and the bail G, the ends of which are hooked in openings in the sides C C under the rim-wire, as set forth.

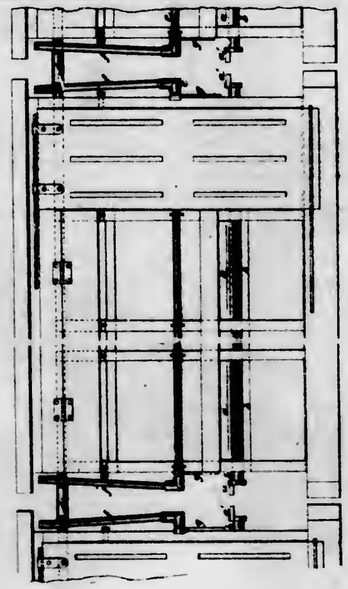
256,151. HARVESTING-MACHINE. DAVID MAXWELL, Paris, Ontario, Canada. Filed Aug. 29, 1881. (No model.)

Claim.—1. In a harvesting-machine, the combination, with the finger-beam, of a bar or rod connected at one end to the finger-beam, near the post or inner end of the beam, and at its other end to a bracket situated upon and attached to the finger-beam at a point outside of the rake-standard, and provided with means, substantially as described, to exert a pushing strain on said bar, as and for the purpose specified.

2. In a harvesting-machine, a bar or rod connected at one end to the finger-beam, at or near the inner end thereof, and extending obliquely in an upward direction to a point above the finger-beam and near the rake-standard, at which point it is adjustably connected to the finger-beam, in combination with means, substantially as described, by which a pushing strain can be exerted through the rod upon the two points connecting it to the finger-beam for the purpose of bracing the latter at the point where the rake-standard is carried.

3. In a harvesting-machine, in combination with the finger-beam, a bar or rod secured above said finger-beam, and means, substantially as described, for exerting a pushing strain on said bar or rod for the purpose of bracing the finger-beam, substantially as specified.

4. In a harvesting-machine, a bar or rod rigidly attached to the inner end of the finger-beam, and extending therefrom to a bracket attached to the finger-beam outside of the rake-standard, in combination with nuts I and I', screwed upon the rod and arranged to jam against the bracket F, substantially as and for the purpose specified.

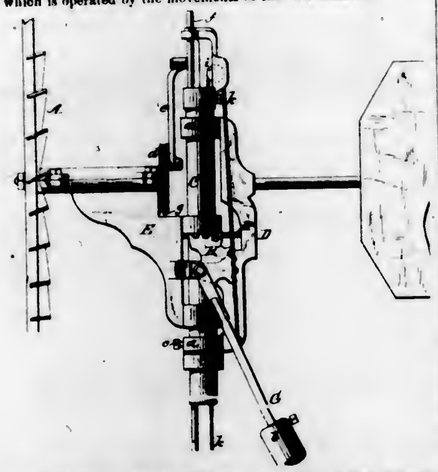


256,152. CAR-COUPLING. CHARLES D. MCCORMACK, Batesville, Ark. Filed Feb. 8, 1882. (No model.)

Claim.—1. In a car-coupler, the lever C, journaled in the under side of the car-frame, and passing above the draw-bar and provided with a central pin, E, adapted to enter and move in slots in the draw-bar, said lever extending from side to side of the car, substantially as shown, and for the purpose set forth.

2. In a car-coupler, the combination, with a hollow draw-bar having the slots *f f* in rear of the draw-head, of a lever, C, extending from side to side of the car above the draw-bar, in rear of the draw-head, and journaled in the car-frame, and provided with a central holding-pin, E, and pivoted rod H, substantially as shown, and for the purpose set forth.

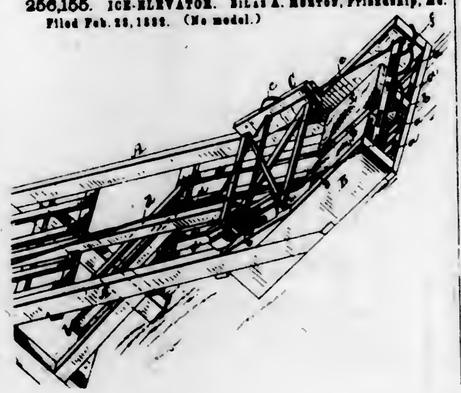
256,153. STOCK-CAR. JOHN R. MCPHERSON, Seabright, N. J. Filed Oct. 17, 1881. (No model.)



Claim.—1. As an improvement in means for supplying water to stock in transit in cars, the top supply-pipe, *c*, coupled throughout the train and having the distributing-pipe connections *f* of each car at the upper side or top part of said supply-pipe, substantially as described, for the purpose specified.

2. In railway-cars for the transportation of live stock, the means, substantially as herein described, for supplying water to the stock, consisting of the top supply-pipe, *c*, coupled throughout the train, the perforated side distributing-pipes, and the pipes *f f*, the latter connecting alternately one end of each distributing-pipe of each car with said supply-pipe at the upper side or top part thereof, substantially as described, for the purpose specified.

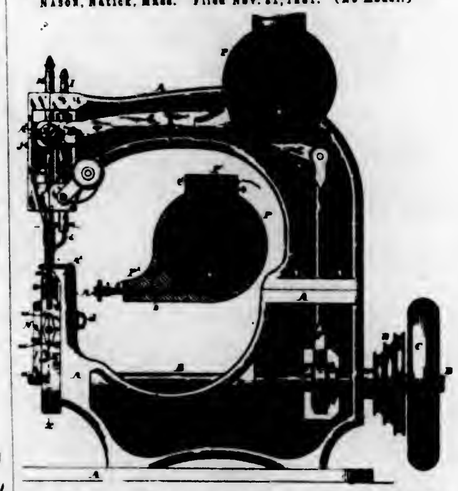
3. The combination, in a stock-car having side doors arranged alternately at each end, of the top coupled supply-pipe, *c*, the side distributing-pipe, and the pipes *f f*, arranged to connect one end of each distributing-pipe of each car with one end of said supply-pipe at its top part or upper surface, the said distributing-pipes having the relation to the doors substantially as described, for the purpose specified.



256,154. WINDMILL. GEORGE W. MILLER, Waterloo, Iowa. Filed Sept. 28, 1881. (Model.)

Brief.—A spring-brake, *g*, passes around a groove in the periphery of the disk *d* and is connected to a lever, *h*, the latter being pivoted to the turn-table E, so that the brake *g* is tightened around the periphery of the disk *d* by the action of the lever *h*, which is operated by the movements of the turn-table E.

Claim.—The turn-table E, supporting-wheel A, disk *d*, brake *g*, pivoted lever *h*, and the rack I, in combination with the bracket D, pivoted lever G, rack H, and cord or rope *k*, substantially as and for the purpose set forth.

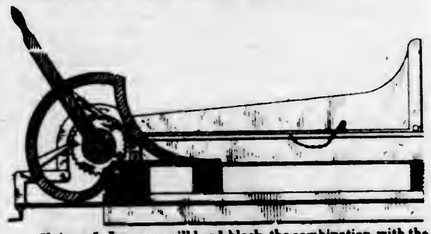


256,155. ICE-ELEVATOR. SILAS A. MORTON, Friendship, Me. Filed Feb. 28, 1882. (No model.)

Claim.—1. In an ice-elevator having the usual inclined tracks and bed for supporting the cakes of ice, the combination, with the truck C, of the swinging arms *e* and cross-beam or head D, carrying the curved rods *f*, substantially as and for the purpose set forth.

2. The combination, with the inclined tracks A, horizontal trough B, strips *a*, and timbers *b*, of the truck C, having pivoted thereto arms *e*, carrying cross-beam or head D, curved rods *f*, and spurs *g*, substantially as and for the purpose specified.

256,156. WAX-THREAD SEWING-MACHINE. HORACE P. NASON, Natick, Mass. Filed Nov. 21, 1881. (No model.)



Claim.—1. The combination, in a wax-thread sewing-machine, of the fixed post A', carrying the work-supporting plate A², the driving-shaft B, carrying the disk *a* and eccentric *c*, and the feed-bar E, provided with the recess *b* and rolls *c'* and *c²*, and adjustably pivoted at or near the middle of its length to said post A', and carrying the needle-bar M and cast-off bar O, all arranged and adapted to operate substantially as described.

2. The combination of the feed-bar E, pivoted at or near the middle of its length to the post A', and provided with the recess *b* and the rolls *c'* and *c²*, the shaft B, the crank *a a'*, the eccentric *c*, the needle-bar M, the connecting-rod N, provided with the slot *e*, the blocks *o' o'*, fitted within the slot *e* and adjustable therein by the screws *p p*, and the cast-off bar O, provided with the pin *n*, all arranged and adapted to operate substantially as and for the purposes described.

3. The looper *i*, having its main portion inclined obliquely downward, as from *q* to *q'*, and its extreme lower portion bent to a perpendicular, or nearly perpendicular, position, substantially as and for the purposes described.

4. The wax-tank P, provided with the covering-plug P', the orifice *t*, for the entrance of the thread, the nose P², the rubber tube *s*, and the screw-tube *s'*, all arranged, combined, and adapted to operate substantially as described.

256,157. SAW-MILL HEAD-BLOCK. EZRA PARKER and ISAAC D. PARKER, Plainfield, assignors to H. & F. J. L. Handy, Zanesville, Ohio. Filed Dec. 17, 1881. (No model.)

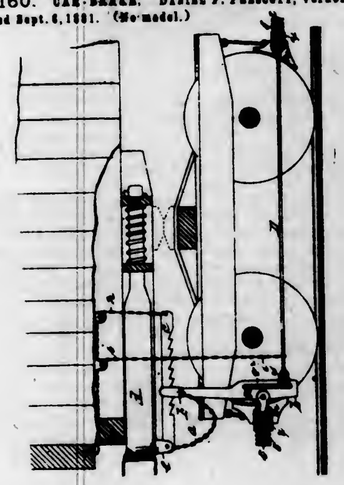
Claim.—1. In a saw-mill head-block, the combination, with the lever and its quadrant for adjusting the head-block, of two independent quadrants hinged upon the carriage, one on either side of the lever, and provided with bell-crank levers and adapted to raise the pawls that operate the ratchets which regulate the adjustment of the knees, substantially as set forth.

2. In a saw-mill head-block, the combination, with the lever and its quadrant, of two hinged quadrants adapted to raise the pawls that operate the ratchets, and connected by suitable devices to operating-rods, which latter pass through the carriage to the sawyer's position, substantially as set forth.

256,158. MANUFACTURE OF LAMP OR LANTERN GLOBES, CHIMNEYS, &c. ARCHIBALD W. PAULL, Wheeling, W. Va., and JOHN P. MILLER, Martin's Ferry, Ohio. Filed Jan. 19, 1882. (No model.)

Claim.—1. As a new article of manufacture, a lamp chimney or globe composed of glass and formed with a united lens which is of a greater thickness than the glass composing the body of the globe, substantially as herein described.

2. A sectional mold for the manufacture of lamp-chimneys or like articles, having the outlines of the chimney to be formed and provided with a recess, *a*, in each section of such construction for receiving and retaining the lens to be united, and a space around the lens for the admission of the molten glass to the lens in the process of forming the chimney, as set forth.



256,159. PADLOCK. ELIAS L. PERKINS, Geneva, Ohio. Filed Nov. 8, 1880. (Model.)

Claim.—1. The combination, with the shackle having two catches on opposite sides of its locking end, of two pivoted dogs, one provided with a lug which bears in a slot in the other dog, said dogs being adapted to simultaneously engage the catches of the shackle, suitable tumblers to engage the dogs, and a slotted plate-lever adapted to operate said dogs, substantially as set forth.

2. The combination, with the shackle and the hooked dogs D and C, the latter provided with the stud *f'* and lug *i*, of suitable tumblers arranged to govern said dogs, and a slotted plate-lever, G, provided with a passage for the key, substantially as set forth.

256,160. CAR-BRAKE. DANIEL P. PRESCOTT, Vernon, Vt. Filed Sept. 6, 1881. (No model.)

Claim.—1. In a car-brake, the combination, with the draw-bar *d* and the brake-beams *x x*, of the serrated arm *c*, pivoted to said draw-bar, the brake-lever *b*, and the brake-rod D, and appliances substantially as described, whereby said brake-beams may be moved toward or from the car-wheels by the movement of the long arm of said brake-lever in one direction, substantially as set forth.

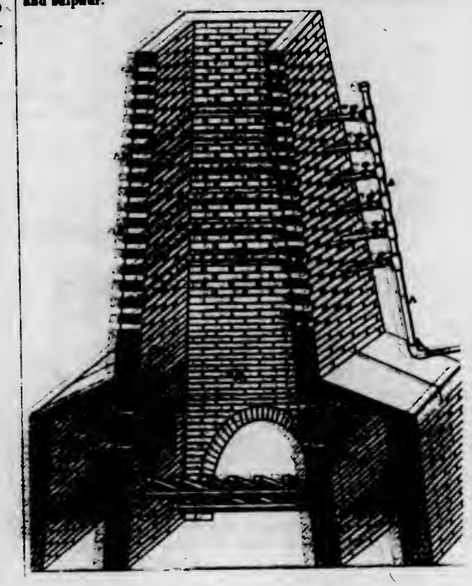
2. The combination, with the brake-lever *b* and the serrated arm *c*, of the chain *a*, substantially as set forth.

3. In combination, the brake-beams *x x*, the brake-rod D, having one end connected to the edge c^3 of the brake-lever and movable thereon to either side of the bolt *t*, brake-lever *b*, chain *a*, and the draw-bar *d*, substantially as set forth.

4. The combination, with the brake-beams *x x*, of the brake-lever *b*, having the partially-separated edge c^3, and the brake-rod D, having one end connected to said edge c^3 and movable thereon to either side of the bolt *t*, by which said lever is pivoted to the brake-beam, substantially as set forth.

5. In combination, the brake-beams *x x*, the brake-rod D, the brake-lever *b*, and chain *i*, substantially as set forth.

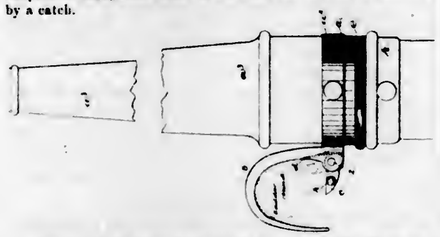
256,161. VEHICLE-SPRING. JORAM PRIEST, Detroit, Mich., assignor to Appleton S. Bridges, St. Louis, Mo. Filed Dec. 26, 1881. (No model.)



Claim.—1. In a vehicle, two springs arranged parallel to each other and projecting in opposite directions, in combination with the body having a T-bolt, which holds both springs against the body, and at the same time allows them to automatically adjust themselves, for the purpose set forth.

2. In a vehicle, the combination, with the body and frame, of curved springs arranged in pairs, projecting in opposite directions, and having their respective ends attached to the body and frame and their curve loosely attached to the center of the bottom of the body, forming a movable fulcrum, which automatically adjusts itself to the variant conditions of the body.

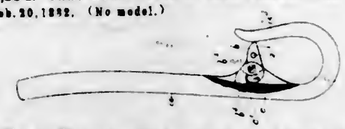
256,162. CALCINING-FURNACE. FERDINAND PROTZMAN, Allegheny, Pa., CHARLES ADAMS, St. Louis, Mo., and ALFRED LONGMORE, Allegheny, Pa. Filed Apr. 26, 1881. (No model.)



Brief.—Green or moist wood is piled alternately with layers of ore in a calcining-furnace. The temperature being kept below 400° Fahrenheit and salt being mixed with the charge, steam admitted at different heights in the furnace carries off phosphorus and sulphur.

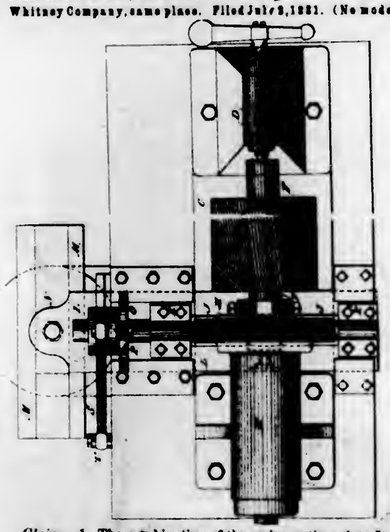
Claim.—The combination of a stack provided with the perforations B in its upper portion with the side furnace or furnaces, D, flues C, and the perforated pipes A, arranged at different elevations inside of the stack, substantially as shown.

256,163. HOSE COUPLING AND SUPPORT. JOHN W. REGAN, Boston, Mass. Filed Jan. 7, 1882. (No model.)



Brief.—The hook is secured to a screw-threaded ring, and is adapted to engage the round of a ladder, and is held in position by a catch.

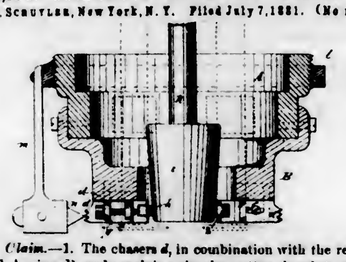
Claim.—1. The ring *a*, adapted to be secured to the discharge-pipe and to a hose-coupling, combined with the supporting-hook adapted to engage the round of a ladder, substantially as and for the purpose set forth.



2. The combination, with the threaded ring *a* and the hook thereon, of a fastening-catch adapted to extend across the opening of the hook to prevent its accidental disengagement from its support, substantially as described.

256,164. SNAP-HOOK. JOHN W. REGAN, Boston, Mass. Filed Feb. 20, 1882. (No model.)

Claim.—The combination, with the body of the snap-hook, of the pivoted tongue *b*, having the heel *b'* and curved surface 3, and the spring *c*, connected at one end with the tongue near its pivot and adapted to be wound about the curved part 3 of the tongue and its pivot, all substantially as described.

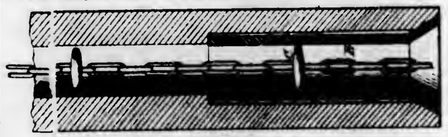


256,165. MACHINE FOR CUTTING GROOVES IN ROLLS. JOHN R. REYNOLDS, Hartford, Conn., assignor to the Pratt & Whitney Company, same place. Filed July 3, 1881. (No model.)

Claim.—1. The combination of the reciprocating plate I, the guide M, the worm J, and the wheel H with the fixed frame and bed-plate of a planing-machine, whereby the said worm is made to act as a rack to turn the wheel H, substantially as described.

2. The combination of the sliding plate and worm I J upon the moving bed-plate B with the ratchet and pawl O P, the connecting-levers S T, and the incline U upon the fixed frame A, substantially as described.

256,166. MACHINE FOR CUTTING SCREW-THREADS. ISAAC S. SCHUYLER, New York, N. Y. Filed July 7, 1881. (No model.)



Claim.—1. The chasers *d*, in combination with the revolving head A, ring B, and revolving circular cutters *b*, substantially as and for the purposes set forth.

2. The slides *c*, chasers *d*, and adjusting-screws *g*, in combination with the grooved ring B, revolving head A, and circular cutters *b*, substantially as and for the purposes set forth.

3. The screw-ring *l*, arm *m*, and finger *n*, combined with head A and adjustable chasers *d*, substantially as and for the purposes set forth.

256,167. CHAIN-PUMP. DAVID E. SHAW, Chatsworth, Ill. Filed May 14, 1881. (No model.)

Claim.—A chain-pump tube having the usual cylindrical bore, provided with a lining of rubber or other elastic or flexible material, and a closed or water-tight space interposed between the lining and pump-tube to allow said lining to adjust itself to the unevenness of the buckets, substantially as and for the purpose specified.

256,168. LAST FOR BOOTS AND SHOES. CYRUS P. SHERMAN, South Weymouth, Mass., assignor to the Dion Last Company, Nashua, N. H. Filed Nov. 3, 1881. (No model.)

Claim.—1. A last for a boot or shoe, containing two parallel grooves near the edge of its sole-surface, such grooves being separated from each other by a wall or partition of rubber or similar elastic material, substantially as shown and described.

2. A last for a boot or shoe, having upright spurs or points projecting from its sole-surface, such spurs or points being held in an upright position by an elastic support, substantially as and for the purpose herein set forth.

3. A last for a boot or shoe, having spurs *m n* projecting from its sole-surface, such spurs being enlarged between their points and the surface of the last, substantially as herein specified.

4. The last A, containing the elastic plug *i*, with the spur *m n*, having the head *m*, substantially as herein shown and described.

5. The last A, having the grooves *a a'*, the elastic plugs *i i*, and the spurs *m n*, substantially as shown and described.

256,169. NUT-LOCK. JOHN SHERMAN, Cleveland, Ohio. Filed Feb. 8, 1882. (No model.)

Claim.—In a nut-lock, the combination, with the nut D, having a shallow rabbet, *b*, of the spring pawl or dog C, consisting of a single coil of wire extending partially around the rabbet, sharpened at one end and fastened at the other end in a slot, *a*, the latter extending from the bolt-hole to the outer edge of the nut.

256,170. BOOT OR SHOE. CHARLES W. SHIPPEN, Milford, Mass. Filed Dec. 16, 1881. (No model.)

Claim.—A boot or shoe having the insole extended between the upper or vamp and the outer sole to their edges, and secured to the said upper or vamp by a row of stitching or fastenings going through it and each insole, and also by a second row of stitches or fastenings aside of the first row and going through the upper or vamp, insole, and on' *x* sole, all being substantially as set forth.

256,171. TREADLE FOR SEWING-MACHINES. JOHN STEWART, Jr., Chicago, Ill. Filed Aug. 3, 1881. (No model.)

Claim.—The combination, with the support B, provided with the end lugs, *b*, of the tie-rod passing through the said lugs, and the treadle A, journaled between the lugs of the support by the journal-pins *c c'*, passing through the lugs above the tie-rod, one of said pins being fixed and the other adapted to work through a screw-threaded opening in the lug, a jam-nut being fitted upon the outer end of the screw-threaded pin, and the support being held by set-screws upon the tie-rod, substantially as described.

256,172. METALLIC PAD FOR HORSE-COLLARS. ASA C. STAPLES, West Branch, Iowa. Filed Sept. 30, 1880. Renewed Mar. 6, 1882. (Model.)

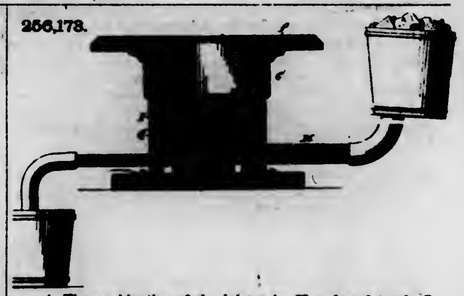
Claim.—1. The hinge-leaf C, attached to the collar, in combination with the slide D and hinge-pivots B', attached to the pad, substantially as set forth.

2. In combination with the hinge-pivots B', attached to the pad, the hinge-leaf C and the slide D, provided with the hooks *h h*, substantially as set forth.

3. In combination with the hinge-leaf C and hinge-pivots B', attached to the pad, the slide D, provided with the slots *i i* and hooks *h h*, substantially as set forth.

4. In combination with the pad A, provided with the hinge-pivots B, the hinge-leaf C, provided with the recess C' and hooks *l l*, for the purpose specified.

5. The pad A, provided with the rib J, and the hinge-pivots B B', cast as integral parts of the pad, substantially as set forth.



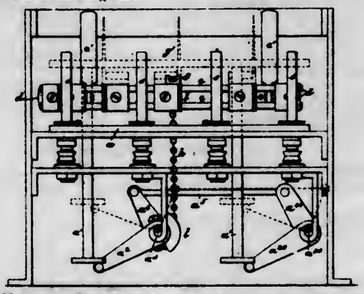
256,173. FREEZING-MICROTOME. THOMAS TAYLOR, Washington, D. C. Filed Oct. 18, 1881. (No model.)

Claim.—1. In a freezing-microtome, the combination of a stationary freezing-chamber or cylinder and a vertically-adjustable plate surrounding the same with a suitable base or support, and means for conducting a freezing medium into and out of the freezing-chamber, substantially as herein set forth.

2. In a freezing-microtome, the combination of a stationary non-conducting plug and a freezing-chamber supported thereon, with a base-plate and vertically-adjustable plate surrounding the freezing-chamber, substantially as and for the purpose set forth.

3. The combination of the vertical shell or cylinder having an external screw-thread and the internally-threaded sleeve or collar having a top plate or disk adjustably fitted on said shell with the freezing-chamber surrounded by said top plate, as and for the purpose set forth.

256,173.



4. The combination of the inlet-tube H and outlet-tube I, having an upwardly-turned end terminating above the inlet-tube, with the freezing-chamber of a microtome, as and for the purpose set forth.

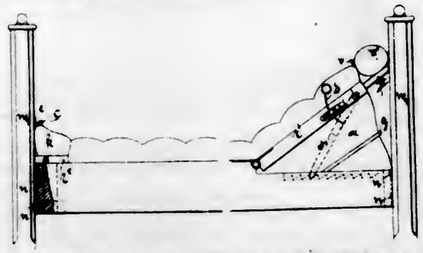
5. The method of producing cold in a microtome by admitting a freezing-solution of salt and water into the same, as and for the purpose set forth.

256,174. YARN-SEPARATOR FOR SPINNING-MACHINES. CHARLES R. THOMAS and JOHN P. WORRALL, Woonsocket, R. I. Filed Nov. 28, 1881. (No model.)

Brief.—The separator is operated simultaneously with, but independent of the ring-rail.

Claim.—1. The series of spindles, the separators *b*, extended centrally between adjacent spindles, the rocker-shaft with which the separators are attached, bearings to hold the rocker-shaft, and the connection A, combined with the hub *l*, and with means to rotate the same to wind and unwind the connection A, turn the rocker-shaft, and raise and lower the separators, substantially as described.

2. The rock-shaft, its collar and finger, the loose sleeve F, its finger 3 and hub *l*, and chain or connection A, combined with the separators, their holding rods or shaft, and the arm projecting therefrom, to which the said chain is joined, substantially as described.

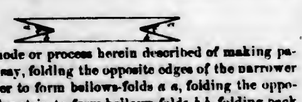


256,175. MAGAZINE FIRE-ARM. WILLIAM TRABUE, Louisville, Ky. Filed Dec. 9, 1881. (No model.)

Claim.—1. The bore of the breech B, provided with a notch, *a*, in the upper interior surface to catch the rim of the shell as it is forced up from the magazine, in combination with the incline I and extension J, substantially as and for the purpose set forth.

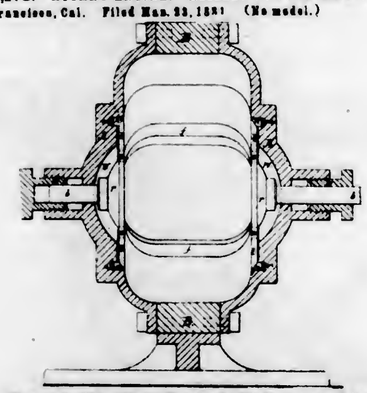
2. The extractor-hook K, pivoted to the head O of the bolt E, back of the longitudinal center of said hook, and having its rear end adapted to come in contact with the cam M, in combination with the bolt E, provided with the cam M, whereby the hook is held against or released from contact with the shell.

256,176. INVALID-BED. CARL MORITZ TURK, Chemnitz, Saxony, Germany, assignor to Paul Matthäe Herfurth, same place. Filed Jan. 10, 1882. (No model.)



Claim.—1. In a mattress which is definitely united to side boards, *r*, which are provided with ratchet-teeth, the combination of said side boards with the hinged frame r', hinged supports *s*, and adjusting string or wire *d*, substantially as described.

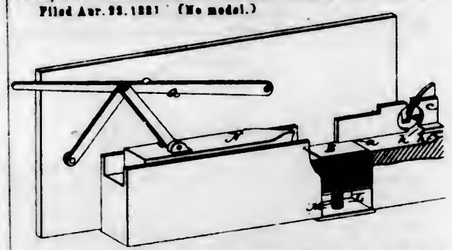
2. The combination of the frame *r*, hinged frame r', supports *s*, and string or wire *d* with the bagging-cloth *a* and elastic strap *g*, substantially as described.



3. The frame *r*, combined with vertically-movable board r^2, having legs *l*, and with the cushion *k*, straps *h*, braces *x*, and cords *c*, for operation substantially as specified.

256,177. METHOD OF MAKING PAPER BAGS. CASPER VAN HOESEN, New York, N. Y. Filed Oct. 13, 1881. (No model.)

Claim.—The mode or process herein described of making paper bags—that is to say, folding the opposite edges of the narrower of two strips of paper to form bellows-folds *a a*, folding the opposite edges of the wider strip to form bellows-folds *b b*, folding back the edges of the folds *b b* to form the lap-folds *c c*, pasting down the lap-folds onto the folds *a a*, and folding over and pasting one end of the united strips to form the bottom of the bag, as set forth.



256,178. ROTARY ENGINE. ALBERT W. VON SCHMIDT, San Francisco, Cal. Filed Mar. 23, 1881. (No model.)

Claim.—1. The cylinder B, formed with the grooves *p*, in combination with the side plates, *l*, and ring *n*, whereby steam, &c., is freely admitted and discharged, substantially as hereinbefore set forth.

2. In combination with the side-plates, *l*, having a beveled edge, *e*, the bearing *m*, and packing-ring *n*, the plates serving also as guides for the sliding valves, as hereinbefore set forth.

256,179. GRAIN-BINDER. JOS. L. WARD, Pine Island, Minn. Filed Apr. 22, 1881. (No model.)

Claim.—1. A grain-band fastening consisting of a sheet of metal coiled into a tubular form around the two ends of the band and compressed or flattened thereon at the middle only.

2. The band-fastening consisting of the coiled sheet metal compressed and bent at the middle in the manner substantially as shown and described.

3. A grain-band fastening consisting of sheet metal coiled into tubular form around the ends of the band and compressed thereon at the middle, and provided with a central indentation, as shown.

4. The sheet-metal band-fastening encircling the band and bent or curved longitudinally.

5. In a band-fastening mechanism, the combination of means for retaining the ends of the applied band in position and two curved cheeks constructed to encircle the ends of the band and engage with the two edges of a sheet-metal blank, substantially as shown, whereby the blank is caused to completely encircle the band.

6. In a grain-binding machine, circular cheeks adapted to substantially encircle the ends of the applied band, in combination with means for forcing a sheet-metal blank against and around the interior of said cheeks to the form of a complete tube.

7. In combination with the anvil having circular cheek-plates which substantially encircle the ends of the applied band, a reciprocating slide arranged to pass between said cheek-plates, substantially as described, whereby a sheet-metal blank may be coiled into a complete tubular form around the ends of the applied band.

8. The anvil provided with the curved cheeks *c* and notches *d*, in combination with a slide, N.

9. In a grain-binder, the combination of the circular cheeks, adapted and arranged to encircle the ends of the applied band, the magazine, and the slide, arranged to carry the blanks from the magazine and force them endwise around the interior of the cheeks, substantially as shown.

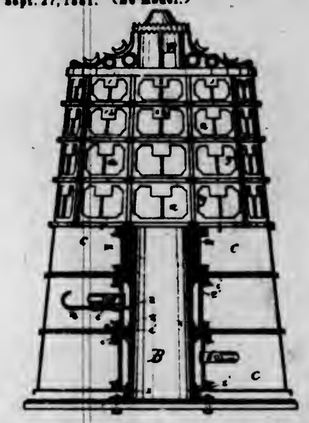
10. In combination with the anvil having curved cheeks *c*, the slide N, having the concave end and the extended lip or nose at the lower side.

11. In a grain-binder, the combination of two circular cheeks, arranged to encircle the ends of the applied band and engage with the edges of a sheet-metal blank, and a reciprocating carrier arranged to force the blank endwise within the cheeks and continue its movement until the tube thus formed is bent and driven from between the cheeks.

12. In a grain-binding machine, the combination of an anvil having two curved cheeks to curl a metal blank around a grain-band and the forked perforated binder-arm, substantially as described, adapted to compressing and holding the end of the band in position during the time that the band is being curled around the cord.

13. In a grain-binder, an anvil for carrying sheet-metal blanks around the applied band, provided with two curved cheek-plates adapted to engage with the extreme edges of the band.

256,180. MANUFACTURE OF CORSETS. I. DE VAR WARNER, Bridgeport, Conn. Filed Jan. 28, 1881. (Specimens.)



Claim.—1. The within-described improvement in the manufacture of corsets, the same consisting in boning the corset by placing the supporting bones or ribs between the outer and inner sheets of fabric, and then sewing the latter together close to the edges of the ribs, thereby securing the ribs in the pockets as the same are made, substantially as set forth.

2. The mode of boning corset-sections herein set forth, the same consisting in inserting the end portion of a continuous stiff supporting strip or rib between the outer and inner faces of the section, sewing the same together along the edge of the rib, and then sewing the rib prior to again inserting and sewing it in place, substantially as set forth.

3. In the manufacture of corsets the mode of finishing described, consisting in inserting the bones in pockets in the separate sections, pressing the same, and then sewing them into the corset, substantially as set forth.

256,181. REVOLVING SHOW-CASE. HENRY WESTPHAL, Chicago, assignor to himself and Andrew Dillman, Joliet, Ill. Filed Sept. 27, 1881. (No model.)

Claim.—1. In the revolving case described, the combination of the central column, B, having the concentric offsets or steps *a*, rings *i*, and radial partitions *c*, hinged therein and provided with the floor *f* and ends *g*, all arranged to operate in the manner and for the purpose set forth.

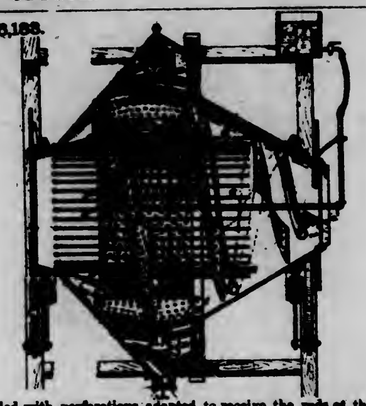
2. In the revolving case described, the central column, B, provided with the perpendicular row of holes *z*, in combination with the radial partitions *c* and spring-bolt *u*, for the purpose of locking the sections, in the manner and for the purpose set forth.

3. In the revolving case described, the combination of the radial partitions *c*, having the floors *f* and ends *g*, rings *i*, and set-bolt and nut S, held in place by the sockets S′ in the legs on the sides of the partitions *c*, for the purpose of holding the said partitions in place, as set forth.

4. In the revolving case described, the revolving sections described, consisting of the two concentric rings *i*, hinged radial partitions *c*, floor *f*, ends *g*, and bolts *o* and S, all combined and arranged to operate in the manner and for the purpose set forth.

256,182. DYNAMO-ELECTRIC MACHINE. WM. WORDELL, Concord, Mass. Filed May 23, 1881. (No model.)

Claim.—1. In a dynamo-electric machine or motor, the combination of the annular armature A and two or more coils, B B′, passing through it, with the frame C, having the conical or cylindrical parts x' x', substantially as set forth.



2. In a dynamo-electric machine or motor, the annular armature A, provided and fitted with the fixed journal-box *a a*, substantially as set forth.

3. In a dynamo-electric machine or motor, the annular armature A, having the fixed journal-box *a a* and driving-tire F, in combination with the coils B B′ and frame C, all being substantially as set forth.

256,183. ORE-SEPARATOR. JOHN H. WILHELM, Denver, Colo. Filed Oct. 24, 1881. (No model.)

Claim.—1. In a mineral-separator, the combination, with a circular chamber, of a cage of rods extending horizontally through it, and a conveyer winding spirally through the chamber and provided with perforations adapted to receive the rods of the cage and hold them in position, substantially as set forth.

256,183.

2. In a mineral-separator, the combination, with a circular chamber consisting of two conical shells, of a conveyer consisting of a flat metallic plate coiled to form a conical structure, which is placed with its base adjacent to one of said shells, substantially as set forth.

3. In a mineral-separator, the combination, with a circular chamber consisting of two conical shells, of a conveyer consisting of a perforated metallic plate coiled to form a conical structure, having an open cylindrical aperture extending axially through it, said structure being placed with its base adjacent to one of said shells, substantially as set forth.

4. In a mineral-separator, the combination, with a circular chamber consisting of two conical shells, of a mineral-receptacle located between said shells, and a screen adapted to isolate the circular chamber from the mineral-receptacle, and consisting in a perforated concaved annular plate provided with elongated slots extending from its central portion toward each edge, substantially as set forth.

5. In a mineral-separator, the combination, with a circular chamber consisting of two conical shells, of a concaved screen joining said shells and a series of horizontal dashers located within the screen, substantially as set forth.

6. In a mineral-separator, the combination, with a circular chamber consisting of two conical shells, of a mineral-receptacle located between said shells, an annular plate dividing the said receptacle into two chambers, a screen consisting of a perforated annular plate provided with elongated slots and adapted to isolate the mineral-receptacle and circular chamber, and elevators consisting of plates secured to the outer peripheral face of the said screen, substantially as set forth.

7. In a mineral-separator, the combination, with a mineral-receptacle, of a plate dividing it into two chambers, conical pipes inserted in said plate and adapted to admit mineral and débris from the apparatus into the mineral-receptacle and to return débris only into the apparatus, and an inclined plate located below said cones, substantially as set forth.

8. In a mineral-separator, the combination, with a mineral-receptacle, of an annular plate secured to one wall of the said receptacle and extending in downward inclination toward the opposite wall thereof, substantially as set forth.

9. In a mineral-separator, the combination, with a mineral-receptacle, of an annular plate secured to one wall of the said receptacle and extending in downward inclination toward the opposite wall thereof, and a series of flanges secured to the under face of said plate, substantially as set forth.

10. In a mineral-separator, the combination, with a mineral-receptacle, of an annular plate secured to one wall of the said receptacle and extending in downward inclination toward the opposite wall thereof, and alternating perforated flanges and stirrers secured to the under face of said plate, substantially as set forth.

11. In a mineral-separator, the combination, with a circular chamber consisting of two conical shells, of a water-chamber located adjacent to one of said shells, substantially as set forth.

12. In a mineral-separator, the combination, with two cones having their bases joined together, of a receiving-cone located within the smaller end of one of the said cones, and a screen adapted to form a water-chamber with the inner end of the receiving-cone and the wall of the cone in which the same is located, substantially as set forth.

13. In a mineral-separator, the combination, with a circular chamber consisting of two conical shells, of a water-chamber located adjacent to one of said shells, a screen forming the front wall of said water-chamber, and dashers attached to the outer face of the screen, substantially as set forth.

14. In a mineral-separator, the combination, with a circular chamber consisting of two conical shells, of a water-conduit consisting of a pipe coiled into the form of a cone the base of which is placed adjacent to one of said shells, substantially as set forth.

15. In a mineral-separator, the combination, with a circular chamber consisting of two conical shells, of a water-chamber located adjacent to one of said shells and a water-conduit consisting of a pipe coiled into the form of a cone, that end of the pipe which terminates at the base thereof being inserted in the water-chamber, substantially as set forth.

16. In a mineral-separator, the combination, with a circular chamber consisting of two conical shells, of a conveyer consisting in a perforated plate coiled to form a conical structure, the base of which is placed adjacent to one of said shells, and a water-conduit consisting of a pipe coiled to follow the path of the conveyer, substantially as set forth.

17. In a mineral-separator, the combination, with a circular chamber, of a cage of rods, a conveyer consisting of a coiled metallic plate centrally pierced to receive the said rods, and a water-conduit consisting of a pipe coiled around the said cage of rods, substantially as set forth.

18. In a mineral-separator, the combination, with two truncated cones having their bases joined together, of a ledge located just within the end of the cone which constitutes the discharge end of the apparatus, and an ejector mounted in said ledge and having its lower edge cut away, substantially as shown and described.

19. In a mineral-separator, the combination, with semicircular bearings provided with horizontal arms, of brackets to receive the latter, secured to the frame-work in which the apparatus is mounted, a shaft journaled in the outer ends of the said arms, and an eccentric and strap, or the equivalent thereof, connecting said shaft and brackets, substantially as set forth.

256,184. ORE SEPARATOR AND CONCENTRATOR. JOHN H. WILHELM, Denver, Colo. Filed June 24, 1881. (No model.)

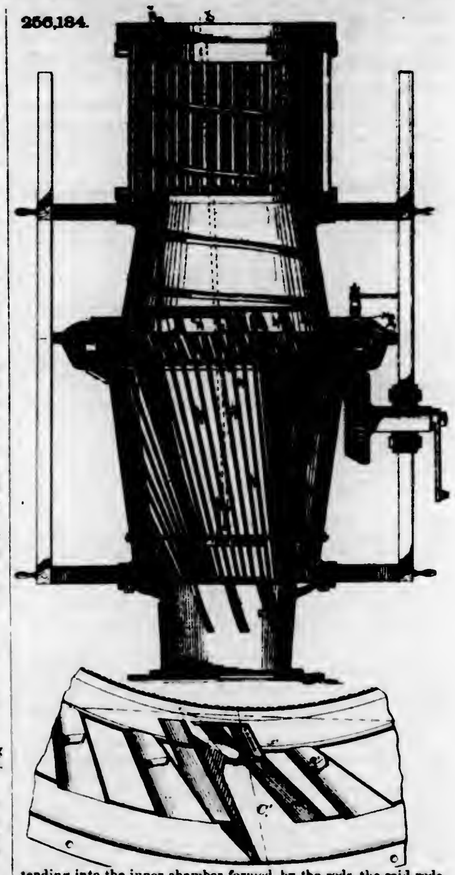
Claim.—1. In a mineral-separator, two cylinders arranged to have their inclined planes converge, and having a chamber of greater diameter than themselves interposed between them, substantially as set forth.

2. In a mineral-separator, two cylinders having their flaring inner ends united to form an interposing chamber of greater diameter than themselves, substantially as set forth.

3. In a mineral-separator, the combination, with a series of cylinders having a descending and an ascending plane, of a receiver attached to the cylinder or cylinders of the descending plane, and guides parallel with each other, but inclined to the axis of the receiver's rotation, secured to its inner periphery, substantially as set forth.

4. In a mineral-separator, the combination, with a series of cylinders having a descending and an ascending plane, of a series of rods located within the cylinder or cylinders of the descending plane and arranged to divide it into two chambers, substantially as set forth.

5. In a mineral-separator, the combination, with a series of cylinders having a descending and an ascending plane, of a series of rods located within the cylinder or cylinders of the descending plane and adapted to divide it into two chambers, and dashers arranged to extend into the inner of said chambers, substantially as set forth.



6. In a mineral-separator, the combination, with a cylinder, of dashers having their concaved inner portions extending toward the center thereof, substantially as set forth.

7. In a mineral-separator, the combination, with a cylinder, of a series of rods arranged to divide it into two concentric chambers, and imperforate dashers interposed between said rods and having their lower edges cut away, and their inner portions, which extend into the central chamber, concaved, substantially as set forth.

8. In a mineral-separator, the combination, with a series of cylinders having a descending and an ascending plane, of a series of rods located within the cylinder or cylinders of the descending plane and arranged to divide it into two chambers, concaved dashers extending into the inner of said chambers, and frames arranged to act in concert with said dashers in forwarding the ore being treated toward the ascending plane of the cylinders, substantially as set forth.

9. In a mineral-separator, the combination, with a cylinder, of a series of rods arranged to divide it into two chambers, and concaved dashers and frames interposed between said rods and extending into the inner chamber formed by the rods, the said rods and dashers being arranged to form a space between them wider than the space between any two rods to allow débris to pass from the outer chamber and be received on the concaved portions of the dashers, substantially as set forth.

256,184.

10. In a mineral-separator, the combination, with a cylinder, of a disk located therein and adapted to deflect throughout it the débris from the receiver, and a ring attached to the rear face of the said disk and adapted to support a steam or water pipe, substantially as set forth.

11. In a mineral-separator, the combination, with two cylinders the descending and ascending planes of which are arranged to converge, and having their flaring inner ends united to form a chamber or mineral-receptacle therein, of a screen adapted to separate the said mineral-chamber from the said cylinders between which it is interposed, substantially as set forth.

12. In a mineral-separator, the combination, with a mineral-receptacle, of two concentric plates dividing the receptacle into three compartments, and a series of conical passages interposed between the two plates and providing communication between the outer and inner of said compartments, substantially as set forth.

13. In a mineral-separator, the combination, with a mineral-receptacle, of two concentric plates dividing the receptacle into three compartments, said plates being transversely cut away to form passages between the inner and outer of the compartments, substantially as set forth.

14. In a mineral-separator, the combination, with a mineral-receptacle divided into two or more concentric compartments, of conical passages providing communication between said compartments, inclined annular rims located within and having their smaller ends contiguous to the larger ends of the said passages, balls adapted to engage with the smaller ends of the rims, and wires to retain the said balls within the conical passages, substantially as set forth.

15. In a mineral-separator, the combination, with a mineral-receptacle divided into two or more concentric compartments, of conical passages providing communication between said compartments, inclined annular rims located within and having their smaller ends contiguous to the larger ends of the said passages, balls adapted to engage with the smaller ends of the rims, and wires to retain the said balls within the conical passages, substantially as set forth.

16. In a mineral-separator, the combination, with a mineral-receptacle divided into two or more compartments by concentric plates, said plates being transversely cut away to form passages between the inner and outer compartments, of slides adapted to be reciprocated in said passages by the rotary motion of the separator, substantially as set forth.

17. In a mineral-separator, the combination, with a mineral-receptacle divided into compartments by concentric plates, said plates being cut away transversely to form passages connecting the inner and outer of said compartments, of screens covering spouts adapted to discharge water into the said passages, substantially as set forth.

18. In a mineral-separator, the combination, with a mineral-receptacle divided into compartments by concentric plates, said plates being cut away transversely to form passages, of slides adapted to reciprocate in said passages, and screens covering spouts adapted to discharge water into the passages, substantially as set forth.

19. In a mineral-separator, the combination, with a mineral-receptacle divided by plates into compartments which are connected by conical passages and transverse passages, of wings or agitators located in the inner of the compartments to agitate and direct its contents toward the said conical and transverse passages, substantially as set forth.

20. In a mineral-separator, the combination, with a mineral-receptacle consisting of a cylindrical chamber interposed between two chambers of lesser diameter, of a screen separating it from the chambers aforesaid, concentric plates dividing it into compartments, said plates being cut transversely to form passages in which slides are adapted to reciprocate, conical passages connecting the compartments, inclined annular rims located within and having their smaller ends contiguous to the larger ends of the said conical passages, and balls adapted to close the smaller ends of the rims and to be retained within the wings or agitators located in the inner compartment of the receptacle, substantially as set forth.

21. In a mineral-separator, the combination, with a mineral-receptacle divided by concentric plates into compartments which are connected by transverse passages cut in the said plates, of slides adapted to be reciprocated in said passages and having their lower ends cut away in order not to break the continuity of the outer compartment, substantially as set forth.

22. In a mineral-separator, the combination, with a mineral-receptacle consisting of a cylindrical chamber interposed between two cylinders of lesser diameter, of doors located in the sides of the receptacle, allowing the collected mineral to be withdrawn therefrom, substantially as set forth.

23. In a mineral-separator, the combination, with a cylinder forming the ascending plane of the separator, of guides parallel with each other, but inclined to the axis of the said cylinder's rotation, attached to its inner face and near its inner end, substantially as set forth.

24. In a mineral-separator, the combination, with a cylinder forming the ascending plane of the separator, of guides attached to its inner face and near its inner end, and a ledge encircling the cylinder at a point near the outer ends of the said guides, substantially as set forth.

25. In a mineral-separator, the combination, with a cylinder forming the ascending plane of the separator and having an inclined plane extending from its outer end to the top of a ledge encircling its inner peripheral face, of guides parallel with each other, but inclined to the axis of the cylinder's rotation and located between the inner end of the cylinder and the ledge aforesaid, substantially as set forth.

26. In a mineral-separator, the combination, with a cylinder forming the ascending plane of the separator, of a worm to carry débris forward up the ascending plane of the cylinder, said worm being adapted to allow fine particles of mineral to pass between it and the inner face of the cylinder to which it is attached.

27. In a mineral-separator, the combination, with a series of cylinders having their inclined planes converged and having a cylinder of greater diameter interposed between them, of a water-pipe inserted into the cylinders and adapted to project water into the ascending side of the interposing cylinder, substantially as set forth.

28. In a mineral-separator, the combination, with a series of cylinders having their inclined planes converged and having a cylinder of greater diameter interposed between them, of a water-pipe inserted into the cylinder to project water into the cylinder of the ascending plane, substantially as set forth.

29. In a mineral-separator, the combination, with a series of cylinders having their inclined planes converged and having a cylinder of greater diameter interposed between them, of a water-pipe provided with two spraying-arms and adapted to spray jets of water into the ascending side of the interposed cylinder and into the cylinder of the ascending plane, substantially as set forth.

30. In a mineral-separator, the combination, with a series of cylinders having their inclined planes converged and having a cylinder of greater diameter interposed between them, of a steam-pipe inserted into the cylinder, substantially as set forth.

31. In a mineral-separator, a cylindrical screen consisting of alternating fixed and radially-reciprocating rods, substantially as set forth.

32. In a mineral-separator, the combination, with a series of fixed rods, of a series of reciprocating rods interposed between them, and loops secured to the opposite ends of the screen-frame to support the ends of the reciprocating rods, substantially as set forth.

33. In a mineral-separator, the combination, with a series of alternating, fixed, and radially-reciprocating rods, of a hand or rod extending over the top of the screen and forcing the reciprocating rods down when they fail to fall of their own gravity, substantially as set forth.

34. In a mineral-separator, a screen consisting of a series of alternating, fixed, and radially-reciprocating rods and a trough to supply water to it, substantially as set forth.

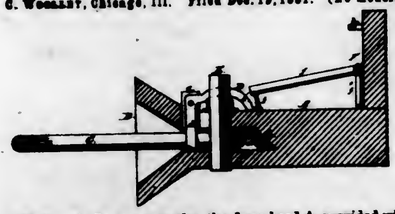
35. In a mineral-separator, the combination, with a screen consisting of a series of alternating, fixed, and radially-reciprocating rods, of a worm to carry débris through and to discharge it from the said cylinder, substantially as set forth.

36. In a mineral-separator, the combination, with a screen consisting of a series of alternating, fixed, and radially-reciprocating rods, of deflectors located under the screen and a sluice into which they converge, substantially as set forth.

37. In a mineral-separator, the combination, with a screen consisting of a series of alternating, fixed, and radially-reciprocating rods, of deflectors, a sluice, and a feeder, substantially as set forth.

38. In a mineral-separator, the combination, with a series of cylinders arranged to form a descending and ascending plane for the débris, of a series of face-teeth encircling one of the said cylinders and a spring-pressed pounder adapted to be actuated by the teeth as the cylinder revolves, substantially as set forth.

256,185. STOCK-CAR. HORACE S. WOLFE, Kalamazoo, Mich., assignor of two-thirds to Frank W. Cornell and Chester Kellogg, both of same place. Filed Feb. 23, 1881. (No model.)



Claim.—1. In a stock-car, the gate provided with the rest-plate at the base of the hinging-eye, the hinging-rod, the support-plate secured to the car in position to coact with said rest-plate in supporting the gate, and the channel and batten secured to the opposite side of the car to guide and receive the gate, all constructed and adapted to operate in combination, substantially as described.

2. In a stock-car, measuring grain-spouts provided with gates adapted to open and close the measures, and with means, substantially as shown, for operating said gates, the combination of said parts with a spring connected with the car and gates and adapted to automatically adjust and to hold the gates, all substantially as specified.

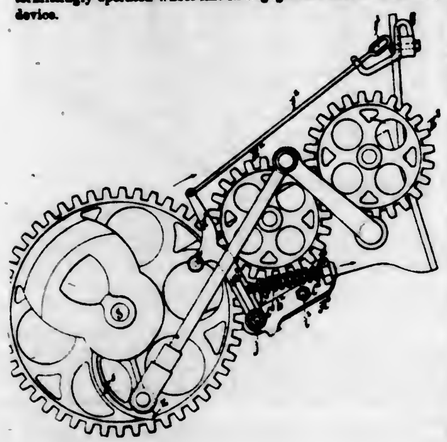
3. In a stock-car provided with measuring grain-spouts and

gates adapted for opening and closing the measures, a spout provided with the partition between the gates, and having either end located closely to said gates, yet detached therefrom, said spout also provided with a base having the hollow channels on each inclined side, and the thin partition terminating the converging inclines, and located as set forth, all substantially as described and shown.

256,186. CAR-COUPLING. EDWARD W. WOOLLEY and STARR C. WOOLLEY, Chicago, Ill. Filed Dec. 19, 1881. (No model.)

Claim.—1. In a car-coupler, the draw-head A, provided with the <-shaped recess *a*, rubber buffer *b*, and mouth-piece B, in combination with the link C, lever D, having its bearing in the uprights *c c*, and coupling-pin E, provided with slot *g*, all the parts constructed and operating substantially as described.

2. In a device for uncoupling cars, a spring-catch, A, and bar F, said bar provided with handles *f' f''* and arm *f*, in combination with chain *f*, lever D, and pin E, the parts constructed and operating substantially as described.

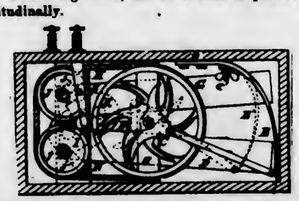


256,187. AXLE-LUBRICATOR. OSCAR B. YOUNG, Shreve, Ohio. Filed Aug. 18, 1879.

Claim.—As an improvement in axle-lubricators, the receptacle or chamber D and independent receptacle or chamber C, parallel to each other and situated on top the axle, each having a separate and independent groove, E G, for conducting the oil to the spindle, substantially as and for the purpose herein shown and specified.

256,188. GRAIN-BINDER. JOHN F. APPLEBY, Minneapolis, Minn., assignor to the Minneapolis Harvester Works, of Minnesota. Filed Jan. 31, 1882. (No model.)

Brief.—This invention comprises means for moving the intermittingly-operated wheel a little farther than it would be by the continuously-running driving device, thus preventing noise and wear of parts otherwise occurring by reason of the continuously-running driving device coming in contact with that part of the intermittingly-operated wheel last in engagement with said driving device.



Claim.—1. In combination with the intermittingly-moving mechanism of the binder and the continuously-running and automatically-unclutching driver devices thereof, means, substantially as described, for causing a slight further movement of said mechanism after its release from the influence of the said driver devices, as set forth.

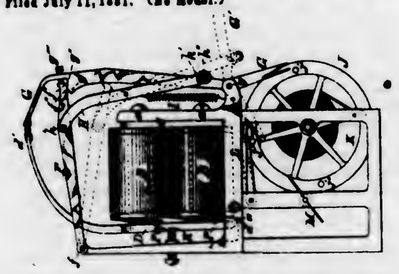
2. In combination with the automatic mechanism for causing the binder mechanism to move on after its release from the influence of the driver devices of the machine, a rod, *f''*, provided with an eye, *f'*, and two stationary eyes, *g*, the whole arranged to operate substantially as and for the purposes set forth.

256,189. MAGNETO-ELECTRIC GENERATOR FOR SIGNALING PURPOSES. JAMES G. ARNOLD, Worcester, Mass. Filed July 11, 1881. (Model.)

Brief.—A pin projecting from the crank-wheel engages with a spring-tumbler, which in its turn engages with a pin on the driving-wheel of the machine, the whole being so arranged that upon the tumbler being carried around a certain distance by the crank it is carried forward by its spring and gives a definite velocity of rotation to the armature of the generator. One end of the armature-shaft is so mounted between three grooved wheels, one of which is the driving-wheel, that it is held in position laterally and longitudinally.

Claim.—1. In a magneto-electric generator, the combination of a coil or coils with their frame or carrier, constructed substantially as described, whereby the coils may be brought close to their center of motion, or a single coil made to approximately coincide with its center of motion.

2. In a magneto-electric machine, the combination of the driven pulley I with the three grooved driving-wheels and their belt, whereby it is held against displacement both laterally and longitudinally, substantially as set forth.



3. The combination of a magneto-electric machine with the adjustable spring E, connected tilting piece C, operating on pin F of driving-wheel G, constituting a driving mechanism capable of adjustment to give definite velocity to the machine irrespective of the rapidity of the operator's action, and the operating-plate B, having a pin, B', whereby the said mechanism can be brought into action, substantially as and for the purposes described.

4. The combination of the adjustable spring E and connected tilting piece C with the magneto-electric or other machine for giving repeated movements of the same force, substantially as set forth.

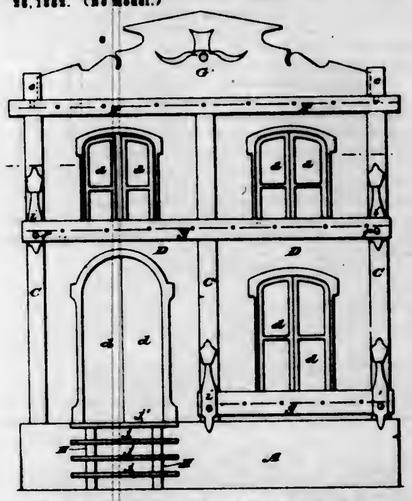
5. The combination of spring E, connected piece C, and the operating-plate B or its equivalent, substantially as and for the purposes described.

6. In a magneto-electric machine, the combination of the partially-revolving plate B with the automatic indicator, substantially as above set forth.

256,190. ANNUNCIATOR. JAS. G. ARNOLD, Worcester, Mass. Filed July 11, 1881. (No model.)

Claim.—1. The combination of the armature D, the supporting-ledges *a a*, and the cavity E, or its equivalent, securing the end of the screw F, substantially as and for the purposes set forth.

2. The combination of the drop G, having a pin, *h''*, the connection H, lever F, or its equivalent, and the spring I, substantially as set forth.



3. The combination of the drop G, having pin *h''* and incline *f'*, the slotted connection H, spring I, and the lever F, having incline *f''*, operating with *f'*, substantially as and for the purpose above described.

4. The combination of the drop G, having pin *h''*, incline *f'*, and holding-surface *f'*, slotted connection H, spring I, and lever F, having incline *f''* and holding-surface *f'''*, substantially as and for the purposes set forth.

5. The combination of an electric annunciator with an automatic resetting mechanism, consisting of the spring-wheel and fly and escape-catch and means for releasing said catch, as and for the purposes described.

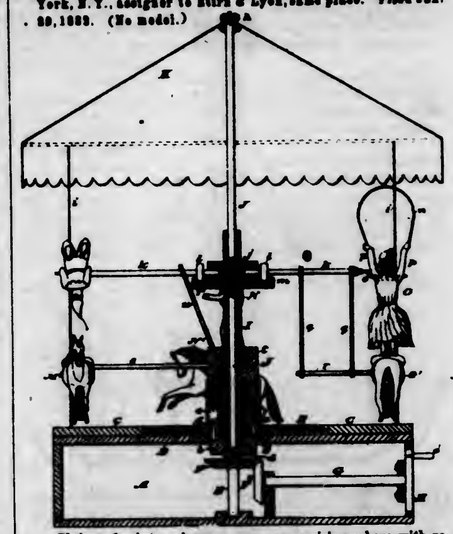
6. The combination, with the poles of an electro-magnet and the armature D, of the spring-plates P P between said armature and each pole of the magnet, substantially as and for the purposes above set forth.

256,191. TOY OR DOLL HOUSE. WESLEY W. BARNES, New York, N. Y., assignor to Stirn & Lyon, same place. Filed Jan. 26, 1882. (No model.)

Claim.—1. The sides of a toy house, constructed of panels arranged to slide in grooves in the posts, as shown, and provided with doors and windows cut in the said panels, and the pieces *d*, cut therefrom, provided with flexible hinges *e*, and hinged to said panels at the margins of the openings, substantially as shown.

2. The combination of the box having holes or sockets in its bottom to receive the tenons on the posts, the grooved posts with tenon-pins on their ends, the cover of the box having holes or sockets to receive the tenons on the upper ends of the posts and the panels arranged to slide into the grooves in the posts and provided with windows and doors cut from them and hinged substantially as shown, all arranged substantially as set forth.

3. The cornice of a toy house, constructed of the grooved pieces F, posts C, and frontispiece G, in combination with the roof B, all arranged substantially as set forth.



4. The combination, with a toy house, of the balcony constructed of the pins *f*, floor *h*, and ornamented with strip *g*, all arranged substantially as set forth.

5. The combination, with a toy house, of the steps comprising the horses H, provided with pins *i'* and recesses *h*, and the steps *j*, all arranged substantially as set forth.

6. The combination, with the elements of the superstructure of a toy house—namely, the tenoned and grooved posts and the panels—of the box A, constructed to serve as a basement for the same, and the cover B, constructed to serve as a roof for the same, substantially as set forth.

7. The combination, to form a toy house, of the inverted box A, provided with holes in its bottom to receive the tenons on the posts, and holes in its side to receive the pins on the horses of the steps, of the tenoned and grooved posts C C', the box-cover B, the panels D D' D², the cornice, the balcony, and the steps, all constructed substantially as set forth.

256,192. TOY CIRCUS OR ARENA. WESLEY W. BARNES, New York, N. Y., assignor to Stirn & Lyon, same place. Filed Jan. 26, 1882. (No model.)

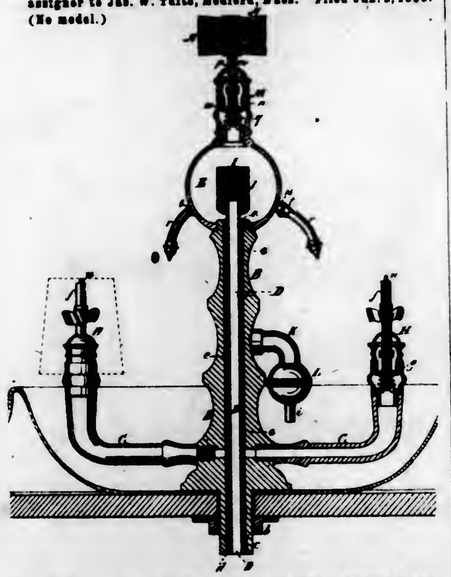
Claim.—1. A toy circus or arena comprising a base with rotative driving-gear, a vertical rotative shaft, a non-rotative standard bearing a track-disk, a radial shaft having a bearing in the base on the vertical shaft and bearing a wheel arranged to roll over the track-disk, and a figure fixed or mounted on the end of said radial shaft, all constructed and arranged to operate substantially as set forth.

2. In a toy circus or arena, the box in which the toy is packed, provided with a cover mounted on a pintle at its center, and arranged to turn horizontally on the box, as shown, and with two sides hinged to the cover, all as set forth, whereby an extended platform is formed from the materials of the box, substantially as and for the purposes set forth.

3. In a toy circus or arena, the combination, with a vertical rotative shaft and a non-rotative track-disk around the same, of a shaft, *k*, provided with a track-wheel, *l*, and crank *o*, and a figure, O, hung on said crank, and having its arms *p* fixed on said crank, all arranged to operate substantially as set forth.

4. In a toy circus or arena, the combination, with a vertical rotative shaft and a track-disk surrounding same, of a radial shaft, *k*, provided with a track-wheel to roll on the track-disk, a figure fixed on the end of said shaft *k*, suspenders *q*, hung on the said shaft *k*, and bearing a rod, *r*, the said rod *r*, and the figure of a horse or other animal fixed on the end of said rod *r*, all arranged to operate substantially as set forth.

5. The box A, arranged to form a base and receptacle for a toy circus or arena, in combination with the main driving-shaft, the vertical shaft, the bevel-gears, the recessed crank-wheel H, and the removable crank-pin *e*, all arranged substantially as set forth.



6. The combination, with the box A, provided with the bar D, and the pivoted cover B, of the tubular standard I, provided with a dowel or dowels, *g*, arranged to pass through the cover B and into sockets in the bar D when the cover is turned crosswise, whereby the standard is held in place and the cover prevented from turning, as set forth.

7. The combination, with the box and its pivoted cover and hinged sides, of the internal driving-gear, the doweled standard provided with a track-disk, *f*, the shaft J, having a forked end to take in a socket in the shaft E, the shafts *k k*, provided with wheels *l l*, and the vaulting figure fixed on the ends of the shafts *k*, all arranged to operate substantially as set forth.

8. In a toy circus or arena, the combination, with a horse or other animal borne around in a ring, of a vaulting figure with loosely-hinged legs mounted on the end of a radial rotating frictionally-driven shaft and borne around the ring over the horse, whereby the figure is caused to touch the horse with its feet at each vault, substantially as and for the purposes set forth.

9. The combination, with the shaft J, of the tent K, provided with a flexible elastic distending hoop and cords *i*, the box A, the pivoted box-cover B, and the hinged sides C, provided with slits to receive the tent-cords, substantially as set forth.

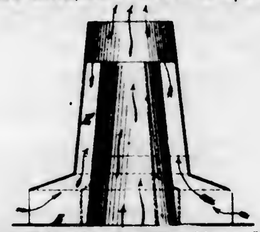
256,193. TUMBLER-WASHER. WALLACE E. BATE, Boston, assignor to Jas. W. Tufts, Medford, Mass. Filed Jan. 3, 1882. (No model.)

Claim.—1. In a tumbler-washer, the hollow standard B, provided at its upper end with a water chamber or receptacle, E, and the supply-pipe D, extending up through the standard, with a water-space, *e*, between them, communicating with the branch pipes G of the tumbler-washing devices, in combination with the strainer or filter I, secured to the upper end of the supply-pipe D and located within the chamber E, all constructed to operate substantially in the manner and for the purpose set forth.

2. In a tumbler-washer, the combination, with the standard B and chamber E, adapted to contain the water flowing from the supply-pipe, of a strainer or filter, I, secured to the supply-pipe and located within the chamber E, operating substantially in the manner and for the purpose set forth.

3. The combination, with a tumbler-washer provided with a series of tumbler washing and supporting devices, of a relief-valve adapted to prevent an increased pressure of the water upon the valves of the tumbler-washing devices when one or more tumblers are removed from their supports and the valves of their washing devices automatically closed, substantially as and for the purpose described.

4. In a tumbler-washer, the combination, with the pipe K, communicating with the water-supply, of the case or chamber L and the relief-valve A, contained therein, held against its seat by a spring, *l*, the pressure of which is regulated or adjusted by screwing the case L in or out upon the end of the pipe K, substantially as and for the purpose set forth.



5. In a tumbler-washer having a series of branch pipes, G, provided with tumbler washing and supporting devices, the combination, with the shell or casing M, with its valve 10, spring *g*, spindle *n*, and discharge-aperture for the water, of the brush N, applied to the valve-spindle *n* and adapted to fit the interior of the tumbler, whereby the valve is depressed to permit the flow of the water by the act of placing the tumbler over the brush, substantially as set forth.

6. In a tumbler-washer, the combination, with the pipe *r*, screwed into the aperture *s*, of the screw collar or nut *t*, provided with a conical end, 15, adapted to fit tightly into a correspondingly-shaped recess or countersink, 12, formed around the edge of the aperture *s*, whereby the pipe can be readily clamped at any desired angle with a water-tight joint, substantially as described.

7. In a tumbler-washer, the combination, with the valve-spindle *f* of the washing device, made hollow at its upper end, of a removable sliding supporting-pin, *u*, for the tumbler to rest upon, adapted to fit within the hollow end of the valve-spindle, substantially in the manner and for the purpose set forth.

256,194. CAP FOR CHIMNEY-FLUES. HERMANN BLACKMAN, Brooklyn, N. Y. Filed Dec. 28, 1881. (No model.)

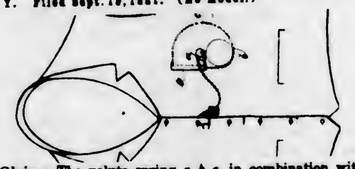
Brief.—The invention is designed not only to prevent the wind from interfering with the proper operation of chimneys, flues, stacks, and like devices, but to utilize it in stimulating their action.

Claim.—1. The combination, with a chimney, flue, or like device, of a pipe surrounding the same, flanges or ledges extending laterally one from the chimney, flue, or like device and the other from the surrounding pipe, and affording provision for the entrance of air between them around their entire circumference, partitions dividing the space between the chimney, flue, or like device and the surrounding pipe, and also between the flanges or ledges, into a number of uninterrupted passages having funnel-shaped mouths which include the whole space between said flanges or ledges around their circumference, substantially as herein specified.

2. A pipe adapted to form the continuation of a chimney, flue, or like device, a pipe surrounding the same, flanges or ledges extending laterally from adjacent portions of said pipes and affording provision for the entrance of air between them around their entire circumference, and partitions dividing the spaces between said pipes and flanges or ledges into a number of uninterrupted passages having funnel-shaped mouths which include the entire space between the flanges or ledges at their circumference, all being so combined as to form one structure, which may be applied to an existing chimney, flue, or like device, substantially as herein specified.

256,195. COTTON-GIN. THOMAS BOATWRIGHT, Bryan, Tex. Filed Feb. 10, 1882. (No model.)

Claim.—1. In a cotton-gin, a swinging front carrying a series of rollers, as set forth.

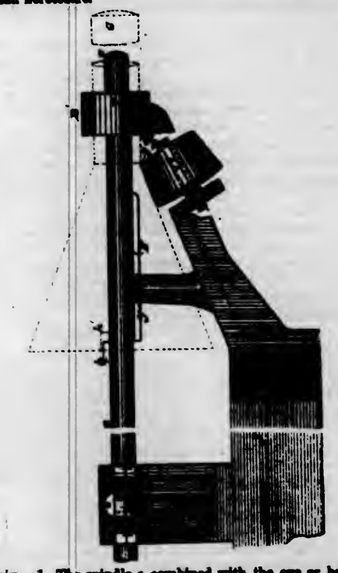


2. In combination with the gin-casing having lateral heads, the swinging front pivoted thereto and having a series of rollers, *c'*, as set forth.

3. In combination with the gin-casing having swinging front and rollers *c'*, pivoted therein, the driving-belts *d* and *f* and pulleys, as set forth.

4. In combination with the heads B, having slots *i'*, the rear rollers, *c''*, and side pieces, *l*, in which the rollers are journaled, as set forth.

5. In combination with the heads B, having studs *o* and the slots *i*, curved in the arc of a circle described about *c*, the swinging front and rollers *c'*, as set forth.



256,196. SAFETY-POCKET. SAMUEL E. BUSHNELL, Brooklyn, N. Y. Filed Sept. 19, 1881. (No model.)

Claim.—The volute spring *a b c*, in combination with the pocket for watches, having a vertical, or nearly vertical, opening or flap, the parts being constructed and applied substantially as set forth.

256,197. MACHINE FOR WINDING BOBBINS. GEORGE CAMPBELL and JOHN CLUTE, Cohoes, N. Y. Filed Feb. 23, 1881. (No model.)

Brief.—The bracket is provided with shaping-plates and a conical roller. The latter is supported at a slight angle from a vertical plane passing through the axis of rotation of the spindle. The said plates and roller press against the conical portion of the bobbin while it is being wound, and thereby cause the inner portion of the yarn next to the barrel of the bobbin to be wound more tightly than heretofore.

Claim.—1. The spindle *c*, combined with the eye or bearing B', conical roller C, and shaping-plates F, substantially as set forth and described.

2. A spindle, C, combined with a bracket, B, provided with a conical roller, and a shaping plate or plates to press against the conical portion of the bobbin while being wound, and a bearing adapted to receive the barrel of the bobbin and permit the same to revolve therein, as set forth.

256,198. GLOVE OR SHOE FASTENER. WILLIAM B. CARPENTER, Newark, N. J. Filed Feb. 16, 1882. (No model.)

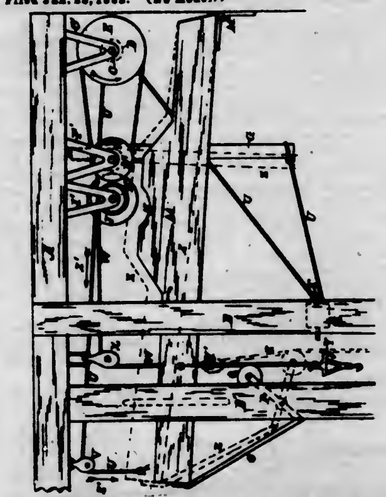
Claim.—1. An improved button or hook provided with a shank of soluble celluloid, substantially as shown and described.

2. A button or hook having a shank of soluble celluloid and provided with perforations or corrugations, as shown and described, for the purpose set forth.

3. As an improved manufacture, a strip of fabric provided with a series of buttons or hooks having shanks composed of soluble celluloid attached to the fabric by a solution of celluloid, adapted for use as described.

256,199. RAILROAD-TIE. JOSEPH CLARK, Green Point, N. Y. Filed Dec. 13, 1881. (No model.)

Brief.—The metallic tie consists of a flanged base-plate and semicircular adjustable bearing-plates resting therein and having depressed chairs. The bearing-plates are adjustably secured in the base-plates. A clamp extends around the bottom of the chair and over the base of the rails. Angular fish-plates recessed to form tongues at their outwardly-projecting parts are adapted to be sprung into the bearing-plates, and thereby secure the rails.

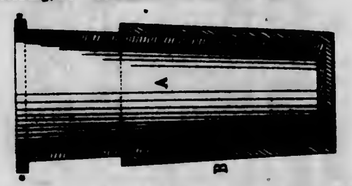


Claim.—1. In a metallic railroad-tie, the combination of the flanged base-plate A and of two separate arched bearing-plates, B B, with means whereby the latter are adjustably connected to the flanges of the base-plate, so as to be capable of lateral adjustment for setting the rails to the normal width of the track, substantially as specified.

2. In a metallic railroad-tie, the combination, with a flanged base-plate, A, and an arched bearing-plate, B, having a depressed chair, *d*, of a clamp, C, extending around the bottom of the chair and over the base of the rails at both sides of the same, substantially as set forth.

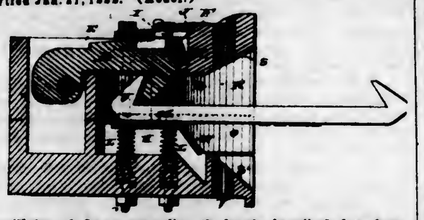
3. In a metallic railroad-tie, the combination of the flanged base-plate A and an arched bearing-plate, B, having a depressed chair, *d*, formed in one piece therewith, with a rail-joint having angular fish-plates D, which are recessed at the middle portions of their outwardly-projecting parts, so as to form tongues *e*, which are sprung into the arched bearing-plate, substantially as set forth.

256,200. HOG-HOIST. JOHN CUNNINGHAM, Cincinnati, Ohio. Filed Jan. 20, 1882. (No model.)



Claim.—1. In an animal-hoist, the hinged beam M, adapted to check the friction-pulley J, in combination with the friction-pulley J, rope W, having the animal-hook Y, and provided with the knot or stop Y', for raising the beam M, substantially as herein set forth.

2. In an animal-hoist, the shaft C, having the pulley E and spool D, in combination with shaft F, having the pulley H and journaled to the swinging lever G, and with rope or belt L and rope U, substantially as and for the purpose set forth.

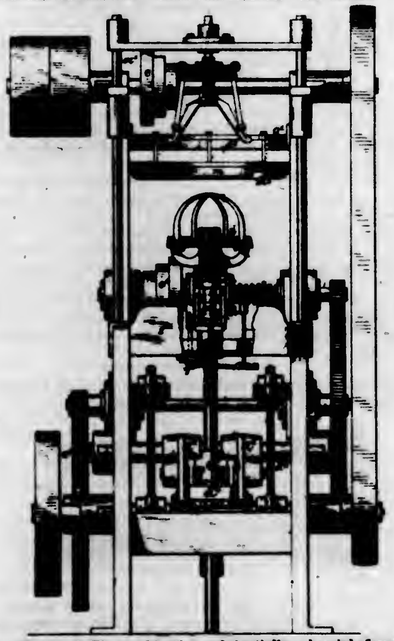


3. In an animal-hoist, the hinged beam M, having the arm O, and hinged lever P, in combination with the shaft C, having the spool D and pulley E, with shaft F, having pulley H, friction-pulley H', and swinging lever G, with the shaft I, having drum K and friction-pulley J, and with the belt L, rope U, and rope W, having the hook Y and knot or stop Y', substantially as herein specified.

256,201. EDGE-TOOL-TEMPERING POT. CHARLES E. DIXON, Pittsburg, Pa. Filed Feb. 28, 1882. (Model.)

Claim.—The wrought-iron tempering-pot A, tightly inclosed within the wrought-iron protecting-shell B, and having the wrought-iron band *s* tightly forged around its upper end, all constructed and combined as and for the purpose herein specified.

256,202. CAR-COUPLING. JOHN H. DOLAN, Butte City, Mont. Filed Jan. 21, 1882. (Model.)



Claim.—1. In a car-coupling, the herein-described plate, forming the floor of the draw-head, and having its front edge turned downwardly and outwardly, the whole capable of being depressed by the coupling-link or bar as it enters the draw-head, springs being interposed under the plate to force it to its normal position after passage of the link or bar, substantially as herein shown and specified.

2. The combination, with the coupling-hook pivoted in the top of the draw-head and adapted to be held rigidly in place by a spring-latch or other suitable means, of the plate arranged underneath the same and capable of being depressed and returned to its normal position by suitable springs arranged under the same, substantially as and for the purpose herein specified.

3. The combination, with the coupling-hook D, pivoted at the rear of the draw-head and working in a longitudinal slot, E, in the top thereof, and provided with a spring-latch, I, and shoulder H, adapted to engage respectively a notch or recess, J, and shoulder G in the front wall of slot E, of the plate M, having its front edge, N, turned downwardly and outwardly and held in its position under the hook D by wedges or securing pieces or strips O, the plate M being capable of depression and return to its normal position by action of springs L, interposed in a recess under the same, all arranged and operating substantially as and for the purpose herein shown and specified.

4. The combination, with the plate M, wedges or strips O, and springs L, of the vertical bolts Q, passing through perforations in the same to hold or secure them in position, as set forth.

256,203. HAT-STRETCHING MACHINE. RUDOLF EICKEMEYER, Yonkers, N.Y. Filed Jan. 16, 1882. (No model.)

Claim.—1. The combination, substantially as hereinbefore described, of rapidly-reciprocated stretching-fingers and a ribbed support for a hat-body, automatically placed into and out of working relations with each other and caused to gradually approach each other automatically during the stretching operation.

2. The combination, substantially as hereinbefore described, of rapidly-reciprocating stretching-fingers and a ribbed former which is automatically raised, with a hat-body thereon, to the stretching-fingers, gradually lifted after said fingers commence their stretching action, and then lowered for the removal of a stretched hat-body.

3. The combination, substantially as hereinbefore described, of rapidly-reciprocated stretching-fingers, and a ribbed support for a hat-body, automatically placed into and out of working relations with each other, and a stop-motion for maintaining them out of working relations after each stretching operation for the ready insertion and removal of a hat-body.

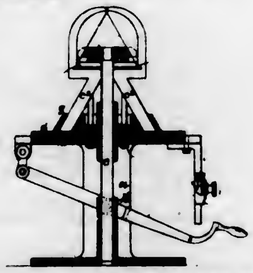
4. The combination, substantially as hereinbefore described, of stretching-fingers, a former which is automatically lifted to and lowered from the stretching-fingers, and a stop-motion which causes the former to rest in its lowest position after each reciprocation.

5. The combination, substantially as hereinbefore described, of tip-stretching fingers, a former, and clamping-rings by which a hat-body may be readily rotated during the stretching operation.

6. The combination, substantially as hereinbefore described, of tip-stretching fingers, a former, and weighted clamping-rings by which a hat-body may be readily rotated and stretched by the downward pull of the weighted rings.

7. The combination, substantially as hereinbefore described, of tip-stretching fingers, a former, and a clamping-ring mechanically rotated.

8. The combination, substantially as hereinbefore described, of tip-stretching fingers, a former, and weighted clamping-rings which are adjustable for varying the downward pull on a hat-body.



9. The combination of the tip-stretching fingers, the former and its spindle, the clamping-rings, the upper clamping-weight, and the adjustable weight and its lever connected with the lower clamping-ring, substantially as described.

10. The combination of the rapidly-reciprocating stretching-fingers, the ribbed former, its spindle, the levers, and the cam for reciprocating the former, substantially as described.

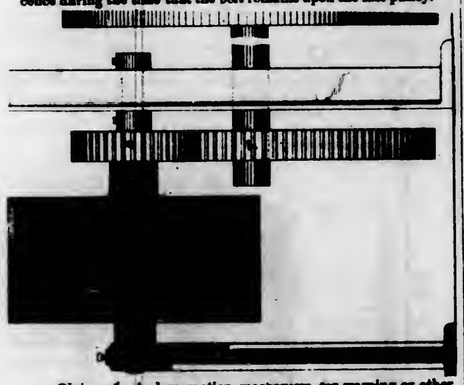
11. The combination of the hat-stretching fingers and former and a friction-clutch automatically controlled by the former-spindle for causing the latter to rest when at its lowest position, substantially as described.

12. The combination, with the tip-stretching devices, of clamping-rings readily attached and removed, substantially as described, for enabling adjustment of the machine to operate on hats of various diameters, as set forth.

256,204. RIBBED FORMER FOR HAT-STRETCHING MACHINES. RUDOLF EICKEMEYER, Yonkers, N.Y. Filed Jan. 16, 1882. (No model.)

Claim.—1. In a tip-stretching ribbed former for co-operating with hat-tip-stretching fingers, the combination, substantially as hereinbefore described, of tip-supporting ribs which are movable in radial lines, an expanding-spindle which is lifted and lowered independently of the ribs, and a lock for maintaining the ribs in an expanded condition.

2. In a tip-stretching ribbed former for co-operating with tip-stretching fingers, the combination, substantially as hereinbefore described, of radially-movable tip-supporting ribs, one or more conical blocks for expanding said ribs, and a lock for maintaining them in an expanded condition.



3. In a tip-stretching ribbed former for co-operating with tip-stretching fingers, the combination, substantially as described, of a series of tip-supporting ribs radially movable with a double-acting conical block or plate which not only expands but contracts said ribs.

4. In a tip-stretching ribbed former, the combination, substantially as hereinbefore described, of movable tip-supporting ribs, an expanding-spindle, the lever, and the lock by which the ribs are maintained in an expanded condition.

5. In a tip-stretching ribbed former, the combination, substantially as hereinbefore described, of the movable tip-supporting ribs, mechanism, substantially as described, for expanding said ribs, and a gage for determining the degree of expansion.

256,205. WARPER. THOMAS C. ENTWISTLE, Lowell, Mass., assignor to Phenix Machine Company, same place. Filed Dec. 8, 1881. (No model.)

Brief.—Improvement upon Letters Patent No. 242,617, dated June 7, 1881. When the driving-belt is shifted from the slow to the fast pulley the slow-motion mechanism in its entirety will be automatically arrested and caused to remain in a state of quiescence during the time that the belt remains upon the fast pulley.

Claim.—1. A slow-motion mechanism for warping or other machines, constructed, arranged, and operating substantially as hereinbefore set forth, so that when the power is transferred from the slow-motion mechanism to the device by which the machine is driven at its normal or fast speed said slow-motion mechanism in its entirety will automatically be brought to rest.

2. The combination, with the slow-motion pulley and fast or driving pulley, of intermediate slow-motion-transmitting mechanism actuated by the slow-motion pulley and connected with the fast pulley substantially in the manner hereinbefore set forth, so that when the belt is shifted from the slow to the fast pulley the said mechanism will automatically be thrown out of engagement with said fast pulley.

3. The combination, with the fast and the slow motion pulleys, of intermediate slow-motion-transmitting mechanism, connected with the fast pulley by a pawl-and-ratchet connection, substantially as and for the purposes hereinbefore set forth.

4. The combination, substantially as hereinbefore set forth, of the fast and slow motion pulleys, provided respectively with ratchet and pinion, as described, the stationary internal gear, the shaft, the slow-motion cross-head fixed to said shaft and carrying two gear-wheels, meshing one with the slow-motion pulley-pinion and the other with the internal gear, the pawl-carrying cross-head, fixed also on said shaft, and the pawl.

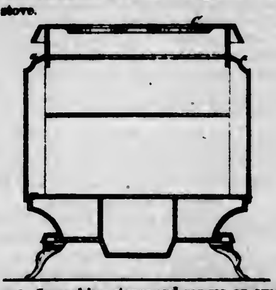
256,206. FOUNTAIN-PEN. PARKS P. PLOUNSBY, Bethesda, Md. Filed Apr. 11, 1881. (Model.)

Claim.—1. A fountain pen-holder having an ink-regulator consisting of a bar, E, spring *d*, pad *e*, and pin *d'*, attached to the feeder, all substantially as shown and described.

2. The combination, in a fountain pen-holder, of the ink-stop consisting of two plugs fitted air-tight, one near and the other in upper end of cylinder, both centrally bored, the one in upper end or top having a tube with internal and external projections, the two plugs inclosing between them an air-chamber with a feeder closed air-tight by the continued pressure of a spring, all substantially as shown and described.

256,207. FIRE-ESCAPE. GEORGE W. GIBBS, Salem, Ohio. Filed Feb. 18, 1882. (No model.)

Brief.—Loops are placed alternately on the sides of the rod, and may be braced by flanged rings placed therein.

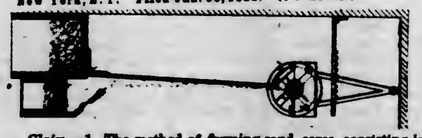


Claim.—1. A fire-escape ladder consisting of a metallic rod or wire having loops formed alternately on opposite sides thereof, as set forth.

2. The rod or wire B, having loops C, formed alternately on opposite sides, the upper sides of said loops being straight and their under sides curved, as set forth.

3. The combination, with the metallic rod or wire having loops C, of the flanged rings F, placed in said loops, as set forth.

256,208. STOVE. JAS. L. GORRILL, Cleveland, Ohio. Filed Jan. 19, 1882. (No model.)

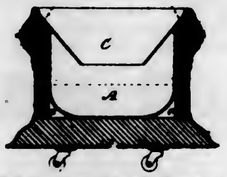


Brief.—The bottom of the oven is of greater width than the body of the stove.

Claim.—1. In cooking stoves and ranges, an oven having the bottom thereof extended beyond one or both sides of the stove, and provided with a door adapted to cover the said extension and the doorway of the oven, substantially as described, and for the purpose specified.

2. In cooking stoves and ranges, an oven having the bottom plate thereof extended beyond the doorway of said oven, thereby adding to the transverse length of the oven-bottom, substantially as set forth, and for the purpose specified.

256,209. MAKING CORES FOR CASTINGS. LEWIS G. GOLDSMITH, Port Chester, assignor to the J. L. Mott Iron Works, New York, N.Y. Filed Jan. 30, 1882. (No model.)



Claim.—1. The method of forming sand cores, consisting in causing the sand to fall from the proper height upon the core-bar to cause it to adhere thereto and pack, revolving such core-bar during the fall of the sand, and then removing the surplus sand by a knife or cutter, substantially as set forth.

2. The combination, with the revolving core-bar and stationary cutter, of the elevated sand-screen and the swinging deflector, substantially as set forth.

256,210. SPITTOON. RUDOLPH T. GOSSELIN, Boston, Mass., assignor to himself and Charles H. Case, same place. Filed Feb. 6, 1882. (No model.)

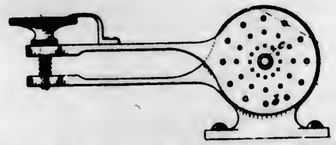
Claim.—1. A spittoon composed of sheet metal and having a double shell, with the space or spaces between the inner and outer thicknesses of metal filled or partially filled with wood, papier-maché, or other similar light solid material, substantially as and for the purpose set forth.

256,210.

2. The combination, with the body A, composed of a double shell of sheet metal, of a filling of wood, papier-maché, or other similar light solid material, so arranged or disposed as to form chambers or spaces as for containing sand or other heavy substance, whereby the stability of the spittoon is increased, substantially as described.

3. The sheet-metal cap B, having its sides made double, and provided with a filling of wood, papier-maché, or other similar light solid material, substantially as and for the purpose set forth.

256,211. BUTTON OR STUD. ALBERT G. ORNEGG, Providence, R. I.; (William B. Wightman, Administrator of said Ornegg, deceased.) Filed Aug. 11, 1881. (Model.)



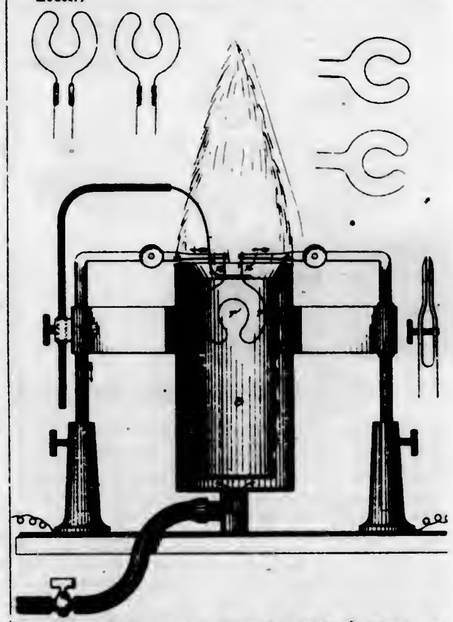
Claim.—1. The combination, in a button, of a head, A, a flat post provided with a bead longer in its cross-section than the body of the post, the back plate, *a'*, provided with a central orifice, *a*, and lugs *c c*, and pin-holes *d' d'*, contained partly in the lugs and partly in said back plate, a journal, *e*, flat spring, and outer plate, *e*, all arranged as shown, and operating as described.

2. In a button, the flat post *p*, consisting of a flat strip of metal bent upon itself in the middle of its length and provided with a journal-orifice, *d'*, near one end, swaged partly out of each side of said bent-up strip, and with the ends of said strip adjacent and exterior to said orifice bent outwardly in opposite directions to form a post-head longer in its cross-section than the body of the post.

256,212. DRAW-PLATE FOR PREPARING FIBROUS FILAMENTS FOR ELECTRICAL CARBONS. JOHN H. GUNDT, Brooklyn, N. Y. Filed Sept. 24, 1881. (No model.)

Brief.—Two perforated plates having suitable cutting-edges at the perforations are adjustable upon one another, so as to make the perforations coincide wholly or partially. The sizes of the holes through which the filaments are drawn are thus made adjustable. The adjusting-screw has a graduated head.

Claim.—1. A drawing plate or tool formed with two plates fitted closely against each other, and adjustable upon each other in such manner that the aperture or effective caliber of the draw-holes is reduced by the movement of one plate over the other, and provided with a means for so adjusting the plates and retaining them firmly at the desired adjustment, substantially as herein shown and described.



2. A draw plate or tool formed with two overlying plates, perforated with a coinciding set of draw-holes, and with means of moving or adjusting the plates over or upon each other, and of holding them firmly at each adjustment, so as to bring the holes out of coincidence more or less, and so retain them, substantially as and for the purpose set forth.

3. A draw-tool formed with two overlying plates fitted closely against each other, and each perforated with a coinciding series of draw-holes having a flaring or tapering form, arranged with their narrow ends meeting at the meeting faces of the plates, and with means for moving or adjusting the two plates upon each other, so as to bring the tapering holes out of coincidence more or less, substantially as herein shown and described.

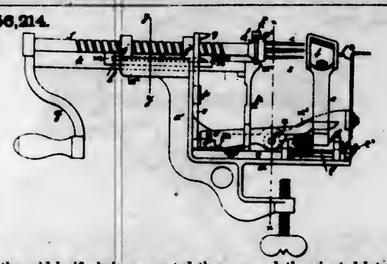
4. A draw-tool constructed with two plates fitted against and pivoted or jointed to each other, with an adjusting-screw connecting the two plates, whereby the turning of said screw moves the plates upon each other and causes the draw-holes to be partly obstructed or contracted by the movement of one plate over the holes of the other, and at the same time enables the plates to be held at each adjustment, substantially as and for the purpose herein set forth.

5. The combination, with a draw-tool formed with two oversliding plates, in which the draw-holes are contracted or obstructed by the movement of one plate on the other, of an adjusting-screw connecting with and serving to converge or diverge the plates, and a series of graduations on said screw with an index-point affixed to one of the plates, substantially as and for the purpose set forth.

256,213. FORMING AND TREATING ELECTRICAL CARBONS. JOHN H. GUNDT, Brooklyn, N. Y. Filed Sept. 7, 1881. (No model.)

Claim.—1. An apparatus for treating electrical carbons, consisting of a burner adapted to emit a hollow flame, and means for holding a carbon within the hollow or the gases of the flame, and means for passing an electric current through said carbon or rendering it incandescent in the gases of said flame, substantially as herein set forth.

2. An apparatus for treating electrical carbons, consisting of a burner of Argand or tubular form adapted to emit a hollow or tubular flame, with a space or receptacle within the tubular burner freely open at the top to admit and inclose the carbon loop and permit observation of the same while under treatment, with electric-circuit connections and clamping devices external to said burner to hold the carbon within said receptacle and to include the same in an electric circuit, substantially as herein shown and described.



3. An apparatus for treating electrical carbons or carbon loops, consisting of a burner adapted to emit a hollow carbonaceous flame, in combination with adjustable forceps mutually insulated and adapted to respectively seize each end of the carbon and hold it in the hollow or gases of the flame, and means for including said forceps and the carbon held thereby in an electrical circuit, substantially as herein set forth.

256,214. APPLE PARER, CORER, AND SLICER. C. RAYMOND REINHARD, Reading, Pa., assignor to the Penn Hardware Company, same place. Filed Jan. 4, 1882. (Model.)

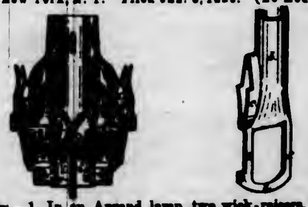
Claim.—1. In an apple-parer, the combination of the fork-shaft *f*, the crank *g*, the track-bar *h*, provided with a track, *l*, the paring-knife slide *i*, and engaging-bolt *o*, for the purpose of effecting engagement between the said bolt *o* and shaft *f*, substantially as set forth.

2. The combination of the fork-shaft *f*, the track-bar *h*, with its downward projection h^2, the spring-actuated paring-knife slide

256,214.

i, the said knife being mounted thereon, and the pivoted latch *u*, for giving to the paring-knife a following pressure on the apple, and thus more completely paring the rear part of the apple, substantially as set forth.

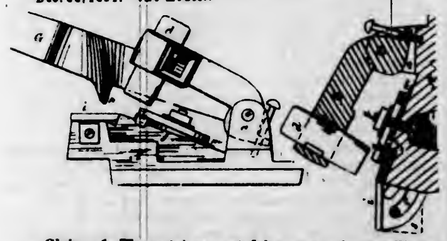
3. The combination of the fork-shaft *f*, the fork with its beveled head *h*, the track-bar *h*, provided with a track, *l*, the bolt *o*, and the sliding core-expeller *a²*, for the purpose of clearing the apple-core from the fork, substantially as set forth.



256,215. SEWING-MACHINE HOOK. CHARLES H. HIRE, St. Louis, Mo., assignor to Judson H. Bemis, Boston, Mass., and Stephen A. Bemis, St. Louis, Mo. Filed Nov. 21, 1881. (Model.)

Claim.—1. The herein-described sewing-machine hook, having the curved prongs *a' a²*, projection *a³*, and the flat *a* or rounded shank *a⁴*, substantially as described.

2. As a new manufacture, the blank A, having the shank *a*, the prongs *a'* and *a²*, and the swell or projection *a³*, substantially as described.

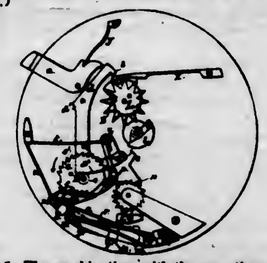


256,216. ARGAND BURNER FOR LAMPS. THOMAS HIPWELL, New Brunswick, N. J., assignor to the Manhattan Brass Company, New York, N. Y. Filed Jan. 3, 1882. (No model.)

Claim.—1. In an Argand lamp, two wick-raisers, between which the wick passes in a folded condition, in combination with the air-tube of an Argand lamp, the metal of which is pressed together at the lower part and provided with an opening in the metal adjacent to the wick-raisers, so that the folds of the wick will be in contact at the wick-raisers, substantially as set forth.

2. In an Argand lamp, the combination, with the wick-raisers that act upon each side of the wick in a folded condition, of an air-tube above the wick-tube, the lower end of which is closed, and a rib or piece of metal extending from the air-tube across beneath the wick-raisers, for the purposes set forth.

256,217. SAW-SET. HIRAM E. HITCHCOCK, Ionia, Mich. Filed Dec. 26, 1881. (No model.)



Claim.—1. The rest *i*, connected by means of a curvilinear slot, *r*, and bolt *o* to the stock A, in combination with the fixed inclined portion *f* of the bed A, substantially as described.

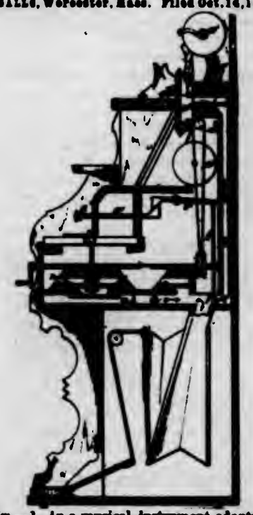
2. The steel disk of uneven thickness, in combination with the inclined surfaces *f* and *i* of the bed A, as and for the purpose specified.

3. The reversible die *d*, in combination with the inclined surfaces *f* and *i* of the bed A, and disk *n*, as and for the purpose specified.

4. The lever G, provided with an elongated hole for the fulcrum-pin, and having the clamping-lip *u*, in combination with the inclined surface *i*, as shown and described.

256,218. REPEATING-MOVEMENT FOR WATCHES. WILLIAMS E. HUGUENIN, Locle, Switzerland. Filed Aug. 27, 1881. (No model.)

Claim.—1. The combination, with the repeating mechanism, of the sliding bolt *b*, within the ring *w*, and guided by said ring and by the pins *d' d'*, and provided with a finger-piece projecting through a slot in the ring *w*, and with a notch to receive the end of a lever, substantially as and for the purposes set forth.



2. In a repeating-watch, the toothed lever *d*, pinion *c*, spring-barrel B, and disk *c*, in combination with the hour-snail L and hammer for striking the hour, substantially as and for the purpose specified.

3. The toothed lever *d*, hour-snail L, pinion *c*, spring-barrel B, disk *c*, and pin *f*, in combination with the quarters-piece *p*, notched lever *g*, and quarters-snail *l*, substantially as and for the purposes specified.

4. In a repeating-watch, the combination of the toothed lever *d*, hour-snail L, spring-barrel, and pinion *c*, substantially as and for the purposes specified.

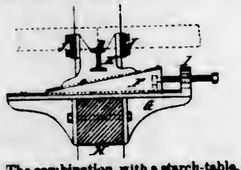
5. In a repeating-watch, in combination with the star-wheel E and quarters-snail *l*, the surprise, made as a plate, *s*, upon a sleeve surrounding the cannon of the quarters-snail, and with a finger extending from said sleeve for acting upon the star-wheel of the hour-snail, and with a pin upon the snail entering a slot in *s*, substantially as specified.

256,219. MECHANICAL MUSICAL INSTRUMENT. GUSTAVUS W. ISBALLS, Worcester, Mass. Filed Oct. 14, 1881. (No model.)

Claim.—1. In a musical instrument adapted to be operated at will either by a key-board or a music-sheet, a pair of brackets

attached to the back of the instrument, on the front face of the upper part thereof, in combination with a music-sheet and its winding-rolls supported by said brackets.

2. In a musical instrument adapted to be operated at will either by a key-board or a music-sheet, a pair of brackets attached to the back of the instrument, on the front face of the upper part thereof, in combination with a music-sheet and its winding-rolls supported by said brackets, a reed-board governed by said music-sheet, and a vertical passage leading from the bellows to the said reed-board, said passage being arranged against the back wall of the casing, substantially as set forth.



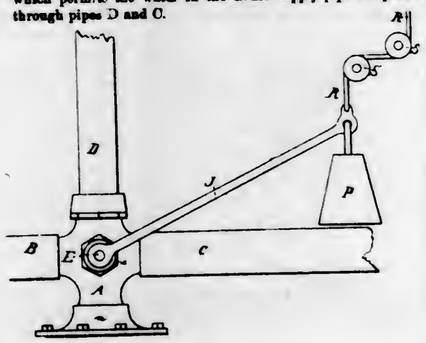
3. In a musical instrument adapted to be operated at will either by a key-board or a music-sheet, the vertical music-sheet, in combination with the casing and means for supporting said music outside of said casing, but in proximity to the back wall thereof, substantially as set forth.

4. In combination with a music-sheet and the casing and operative parts of a duplex instrument, means for supporting said sheet outside of the casing, the said means being attached to the back wall thereof.

256,220. METHOD OF TREATING MINERAL OILS, &c. ROBERT LAVEN, Royston Granton, County of Mid-Lothian, Scotland. Filed Jan. 5, 1882. (No specimens.)

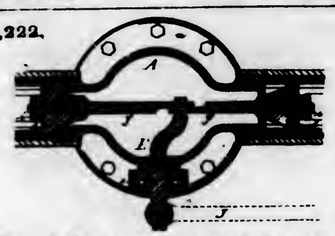
Claim.—The employment, in conjunction with mineral oil or oils used for illuminating purposes, mineral naphtha or naphthas and soap or saponaceous matter or matters in a dry or anhydrous state in order to obtain compounds in a semi-solid or solid state or condition, substantially as and for the purposes herein described.

256,221. STARCH-TABLE. THOMAS A. JUBB and WILLIAM T. JUBB, Buffalo, N. Y. Filed Jan. 20, 1881. (No model.)



Claim.—1. The combination, with a starch-table, of wedges F, resting on supports or ways G and engaging under plates or shoes E, and guides whereby the parts resting on the wedges are held against lateral displacement, but permitted to move vertically, substantially as set forth.

2. The combination, with a starch-table, of wedges F, resting on supports or ways G and engaging under plates or shoes E, guides whereby the parts resting on the wedges are held against lateral displacement, but permitted to move vertically, and screws whereby the wedges are adjusted, substantially as set forth.



3. The combination, with one or more starch-tables, of cross-sills B, provided with shoes E, wedges F, horizontal ways G, secured to the beams H, and vertical guides J, between which the shoes E slide, substantially as set forth.

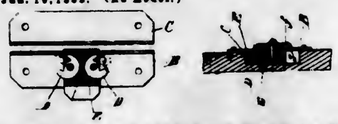
256,222. STOP AND WASTE COCK. JOHN KELLY, Chicago, Ill., assignor of two-thirds to Thomas Kelly and James Kelly, same place. Filed Jan. 9, 1882. (No model.)

Brief.—The object of the device is to relieve the pipes of a building of water when desired. The weight is held up by a cord, in which position water flows through to the house supply-pipes. When the weight is released valve F closes and valve G opens, which permits the water in the house supply-pipes to pass out through pipes D and C.

256,222.

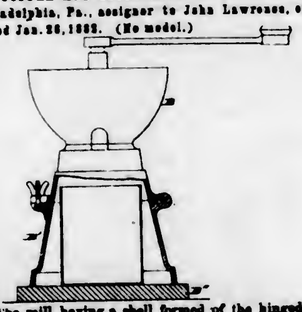
Claim.—1. The stop-cock herein described, consisting of casing A, that forms a connection between the pipes B, C, and D, in combination with crank E, reciprocating the conical elastic valves F and G, all being constructed and arranged substantially as set forth.

2. The combination, with the casing A, having base *a*, screw-necks for coupling pipes B, C, and D, and stuffing-box *e*, of crank E, valve-rods *f* and *g*, and elastic conical valves F and G, the whole being constructed and arranged substantially as described and shown.



3. The combination, with the casing A, valves F and G, and crank E, of lever J, weight P, and cord R, the whole being arranged to operate substantially as shown and specified.

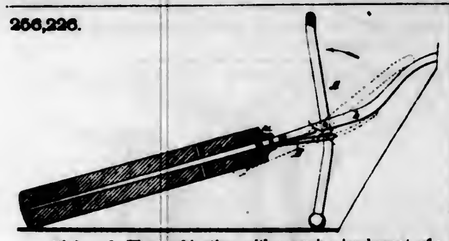
256,223. LEAD AND CRAYON HOLDER. GUSTAV KÜSTERMANN, Green Bay, Wis. Filed Nov. 23, 1881. (No model.)



Claim.—A lead or crayon holder composed of the tubular handle A, having jaws *b* and stops *c*, all formed of a single piece of metal, said stops being formed by punching out a portion of each side of the handle, as described, in combination with the tube B, having conical collar *d* and cap *e*, the whole of which being constructed and arranged substantially as set forth.

256,224. BOX-FASTENER. WILLIAM LANG, Brooklyn, N. Y. Filed Jan. 19, 1882. (No model.)

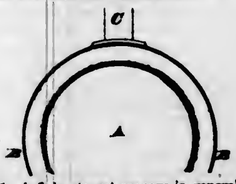
Claim.—The combination of the slotted flanged plate B, attached to the body A, the recessed flanged plate C, attached to the lid, the interior slide-plate, E, the segmental locking-bolts D, pivoted thereto, and the actuating slide-plate *f*, which is connected to the interior slide-plate, whereby the upward or downward movement of the actuating-plate opens or closes the lock without the use of a key, substantially as described.



256,225. COFFEE AND SPICE MILL. J. FRANKLIN LAWRENSON, Philadelphia, Pa., assignor to John Lawrence, same place. Filed Jan. 26, 1882. (No model.)

Claim.—The mill having a shell formed of the hinged top part, B, and hollow base B', with the closing bottom B'', and a removable cup which is loosely fitted in said base B' and rested on said bottom B'', substantially as and for the purpose set forth.

256,226. GUARD FOR CARVING-FORKS. JOHN B. H. LUCAS, Glastenbury, Conn., assignor to the Williams Brothers Manufacturing Company, same place. Filed Nov. 26, 1881. (Model.)



256,226.

Claim.—1. The combination, with a carving implement, of a pivoted piece, A, having pin *i*, and a spring, B, arranged on the lower side of the shank, and having a terminal lip or shoulder, substantially as set forth.

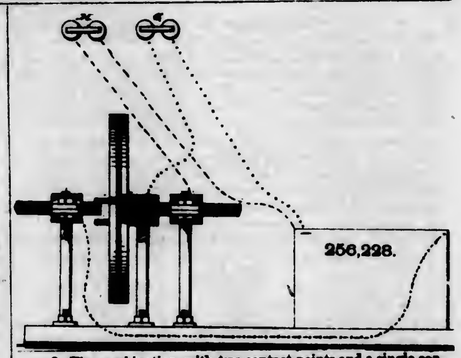
2. The combination of the shank, the piece A, pivoted thereto, spring B, and ferrule *p*, arranged to confine the spring to the shank, substantially as set forth.

256,227. FLYING TARGET. GEORGE LIGOWSKY, Cincinnati, Ohio, assignor to the Ligowsky Clay Pigeon Company, same place. Filed Feb. 21, 1882. (No model.)

Claim.—1. A flying target concave in general form, as at A, but having the edge or rim turned in at B, to insure a rapid and stable axial rotation when thrown in the inverted position herein described, whereby a gradual descent of said target is caused by the imprisonment of air within its concavity, substantially as set forth.

2. A flying target composed of a fragile material that will readily shatter or break when struck with shot, said target being concave in general contour, but having its edge or rim turned in at B, to insure a rapid and stable axial rotation when thrown in the inverted position herein described, whereby a gradual descent of the target is caused by the imprisonment of air within its concavity, substantially as set forth.

3. A flying target concave in general form, as at A, but having the edge or rim turned in at B, to insure a rapid and stable axial rotation when thrown in the inverted position herein described, said rim being provided with a peripheral projection, C, for the purpose stated.



4. A flying target consisting of a concave body, A, united to the inturned rim B by an intermediate member, D, which latter is curved reversely with reference to said rim, for the purpose herein described.

5. A flying target consisting of the body A D, having an inturned rim, B, which latter is provided with a projecting lug or tongue, C, for the purpose described.

256,228. ELECTRICAL GOVERNOR. HARVEY LISTON, Allegheny, Pa. Filed Oct. 1, 1881. (No model.)

Brief.—A disk having two insulated contact-points is revolved at a determined rate by a standard-motor. These contact-points are both connected with one pole of the battery by separate circuit-wires, each of which circuits contains a magnet. In line with the shaft of said disk, but disconnected therefrom, is a shaft of the motor to be regulated. Projecting radially from said second shaft and revolved thereby is an arm electrically connected with the opposite pole of the battery. The said arm extends between the two points on the face of the disk, and as long as the motor to be regulated, which revolves the arm, rotates synchronously with the standard-motor which drives the disk the said arm is in contact with neither of the two points on the disk; but when the regulated motor gains or looses in speed it comes in contact with one point or the other and closes the circuit to decrease or increase the supply of motive force.

Claim.—1. The combination, with two contact-points, of a single contact-point located between them, the said points and point being revolved respectively by independent mechanism and by the motor governed, and devices in circuit with said points and point and adapted to regulate the amount of motive force supplied to the motor, substantially as set forth.

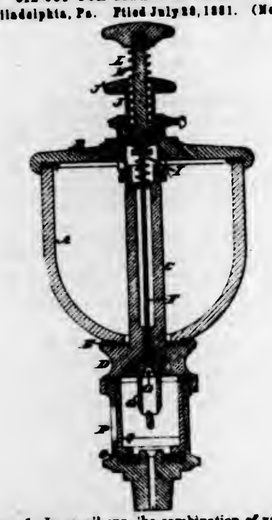
2. The combination, with two contact-points and a single contact-point which is located between them, the said points and point being revolved respectively by the independent mechanism and by the motor governed, of magnets in circuit with the points and point, and devices operated by the said magnets to regulate the amount of motive force supplied to the motor, substantially as set forth.

3. The combination, with two insulated disks rotated by independent mechanism and provided each with a contact-point, and a rod or contact-point rotated by the motor governed, of magnets in circuit with the points and point, and devices operated by the said magnets to regulate the amount of motive force supplied to the motor, substantially as set forth.

4. The combination, with two insulated disks rotated by independent mechanism and provided each with a contact-point, of a contact-point rotated by the motor governed, and adapted when the speed thereof fluctuates to engage with one of said points, according as the fluctuation in speed is due to an accelerated or retarded condition of the motor, and thus close a circuit embracing a magnet, and devices adapted to be operated by said magnet to regulate the motive force supplied to the motor, substantially as set forth.

5. The combination, with two insulated disks rotated by independent mechanism and provided each with a contact-point, the point of the inner disk, which projects through the outer disk, being insulated from it, of a point rotated by the motor governed and located between the points of the said disks, of magnets located in circuits closed by the engagement of said point with the points between which it is located, and devices actuated by said magnets to regulate the amount of motive force supplied to the motor, substantially as set forth.

6. The combination, with, two contact-points, and a contact-point adapted when the speed of the motor fluctuates to engage with one of said points and close a circuit embracing a magnet, of weights released by the magnets and adapted to regulate the amount of motive force supplied to the motor, and devices to restore the said weights to their normal positions, substantially as set forth.



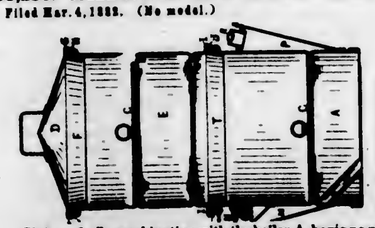
7. The combination, with magnets located in circuits closed by a contact-point oscillated by fluctuations in the speed of the motor governed, of a pair of weights normally elevated and adapted to be released when the magnets are energized, a device isolated from but adapted to be moved by either of said weights acting alone to regulate the amount of motive force supplied to the motor, and devices adapted to restore the weights to their normal positions, substantially as set forth.

8. The combination, with magnets located in circuits closed by a contact-point oscillated by fluctuations in the speed of the motor governed, of levers, weights supported by said levers when the same are not attracted by the magnets, and adapted when released by the closing of a circuit to regulate the amount of motive force supplied to the motor, and devices arranged to restore the weights to their normal positions when the circuits are broken, substantially as set forth.

9. The combination, with magnets located in circuits closed by a contact-point oscillated by fluctuations in the speed of the motor, of levers attracted by said magnets, disks supported in position by said levers, weights normally elevated, and adapted when falling to rotate said disks in opposite directions, devices arranged to engage said disks the instant they cease to be supported by the levers, with a central disk adapted to vary the amount of motive force supplied to the motor, and devices adapted to restore the weighted disks to the positions occupied by them before falling, substantially as set forth.

10. In an electrical governor, the combination, with a central disk provided with a rack engaging with valve mechanism and having ratchets on its opposite faces, of disks located on each side of the central disk, weights secured to and adapted to turn the said disks in opposite directions, a pair of levers actuated by magnets, lever systems mounted in said disks and adapted to be engaged by said levers and to operate pawls which engage with the ratchets on the central disk, and devices to connect the said disks with other disks revolving in opposite directions at the moment they have been sufficiently turned by their weights, and to release them from said revolving disks as soon as they have been elevated to the positions occupied by them before falling, substantially as set forth.

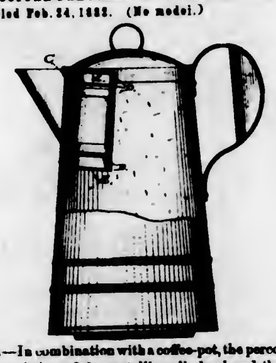
256,229. OIL-CUP FOR STEAM-ENGINES. JOHN E. LOWRAS, Philadelphia, Pa. Filed July 20, 1881. (No model.)



Claim.—1. In an oil-cup, the combination of valve G, rod F, spring I, and screw-plug J, the latter being provided with a locking device, T, set thereupon, said plug causing plunger K to impinge below upon the top of the valve-rod F, whereby the flow of oil can be regulated and set, substantially as and for the purposes described.

2. In an oil-cup, the combination of valve G, loose rod F, spring I, the latter resting upon a bearing, plunger K, and spring L, resting upon a base or support, J, whereby a sudden blow upon said plunger will momentarily increase the flow of oil beyond the regular flow, substantially as and for the purposes described.

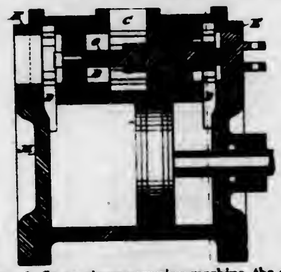
3. In an oil-cup, the combination of screw-plug J, lock-nut T, forming a regulating device with the stem and valve, and situated above the cap of the oil-cup, with the transparent or open chamber I', situated below the oil-cup, whereby the feed can be observed in the lower chamber and instantly regulated or altered from above without taking any of the devices apart, substantially as and for the purposes described.



256,230. STEAM-COOKER. ALONZO M. MACE, Needham, Mass. Filed Mar. 4, 1882. (No model.)

Claim.—1. In combination with the boiler A, having a packed steam-tight cover, D, the weighted automatic valve K, arranged within the chamber L, and the hinged alarm or whistle N, inclosed within the steam-escape tube M, substantially as described, as and for the purposes set forth.

2. In combination with the boiler A, having a cover, D, and provided with a steam-escape tube, M, the alarm or whistle N, arranged within the steam-exit passage, substantially as described, as and for the purposes set forth.



256,231. COFFEE-PERCOLATOR. JOHN C. MACKEY, New York, N. Y. Filed Feb. 24, 1882. (No model.)

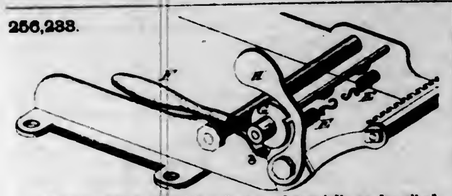
Claim.—In combination with a coffee-pot, the percolator herein described, consisting of the metallic cylinder *b* and the removable cups D, the latter being each composed of a strainer, *d*, held between an inner ring and an outer ring, *a*, the percolator being adapted to be suspended wholly above the mid-height of the pot, substantially as set forth.

256,232. AIR-COMPRESSOR. HANS S. HANSING, Jr., Brooklyn, N. Y. Filed Dec. 21, 1881. (No model.)

Brief.—The valve-chest has open ends, by which air is directly admitted to the compressing-cylinder through ports D D. The linings E E project, serving as guides for the piston-valve G. The loose piston H is actuated by the compressed air in the cylinder A, and moves to the right or to the left when the pressure from A exceeds that from the pipe C, leading to the compressed-air receiver.

Claim.—1. In an air-compressing machine, the combination of the piston-valve G, composed of three pistons, the center piston being self-acting and free to move on its stem, with the circular valve-chest B open at both ends, such open ends acting as inlet-ports for the air to be compressed, substantially as described.

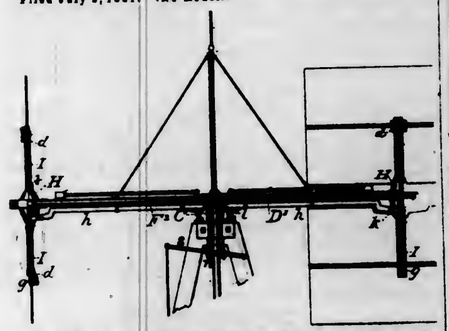
2. In an air-compressing machine, the combination of the piston-valve G, composed of two or more pistons, a circular valve-chest, B, open at both ends, the projecting linings E E, and the air-compressing cylinder A, connected with the valve-chest G by the ports D D, all substantially as shown and described, and operating in the manner and for the purposes herein set forth.



3. The linings E E of the circular open-ended valve-chest B, projecting beyond the face of the valve-chest and serving to give a suitable bearing to the valve G, substantially as described.

256,233. MACHINERY FOR SEWING THE MOUTHS OF BAGS. WILLIAM H. MARTIN, Brooklyn, N. Y. Filed Oct. 31, 1881. (No model.)

Brief.—Invention consists in the frame having a rock-shaft with hooks along its length and operated by a handle and catch for raising the bag-mouth previously placed on said hooks, and in spring-hooks at each end of frame for distending the bag-mouth lengthwise. Suitable sewing mechanism serves to unite the edge by being fed along on the bars of the frame.



Claim.—1. In a frame for holding the mouths of bags intended to be sewed by machinery, the combination of a rod, D, provided with spurs *f*, for catching the bag, the handle F, for tightening the same, and the cam and lock G H, for holding the same fixed in position, substantially as and for the purposes described.

256,233.

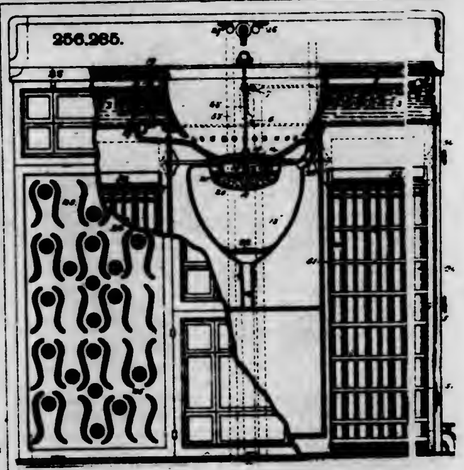
2. In combination with a frame, substantially as described, for holding the mouths of bags to be sewed by machinery, the spring-hooks E, substantially as and for the purposes described, for distending and closing the mouths of the bags.

256,234. WIND-ENGINE. FRANK MCCLINTOCK, West Union, Iowa, assignor of one-half to William McClintock, same place. Filed July 9, 1881. (No model.)

Claim.—1. In a horizontal wind-engine, the combination, with sails attached to vertical sail-shafts which revolve with one-half the velocity of the engine, of a frame consisting of a central box or hub and horizontal arms with boxes on their outer extremities having bearings in which the sail-shafts revolve, the boxes being joined by diagonal tie rods or tubes, and with the arms securely trussed by means of diagonal rods extending to the upper end of a vertical tube rising from the center, in which the vane-shaft revolves, substantially as shown and described.

2. A horizontal wind-engine with sails hinged in sections to horizontal cross-pieces on vertical sail-shafts which revolve in boxes attached to horizontal arms, said sail-shafts being geared so as to make one-half of a revolution for each revolution of the engine, in combination with trip-levers *d*, links *f*, slide-rods *g*, sliding collars *i*, levers A, sliding collars *l* and *n*, guide-rods *m*, and a centrifugal governor, substantially as and for the purpose specified.

3. In a horizontal wind-engine, the combination, with sails attached to vertical shafts which revolve at the rate of one-half a revolution for each revolution of the engine in boxes attached to horizontal arms, of tubing D', D², K', K', K², and K', covered boxes H, and hollow sail-shafts I, for the purpose of protecting the working parts of the engine from the weather, substantially as specified.



4. In a horizontal wind-engine, the combination, with sails attached to vertical shafts which are geared to make one-half of a revolution for each revolution of the engine, of sails attached or hinged to sail-shafts in sections, half of the area of the sail above and half below the plane of said horizontal arms, and the sections arranged to turn on their horizontal axes in alternately opposite directions, substantially as and for the purpose specified.

256,235. WASH-BOWL. L. HAMILTON MCCORMICK, Chicago, Ill. Filed Dec. 8, 1881. (No model.)

Brief.—The arrangement of the wash-bowl and water-tank is such that the height of the water in the tank governs the height of the water in the bowl, and thus prevents overflow. The waste water accumulated in the chamber 13, as the outlet from the bowl is larger than the outlet from the chamber 13.

Claim.—1. A wash-bowl having in its sides, near its bottom, an annular chamber provided with an inward opening which is inclined toward the bottom of the bowl, into which the water for filling the bowl is introduced, substantially as described.

2. The combination of a bowl, as 1, a supply-pipe, as 6, a tank, as 3, adapted to hold a supply of water for immediate use, so positioned that the height of the water in the tank governs the height to which it will rise in the bowl to prevent overflow, and

communicating with the bowl by a large pipe, as 4, and an automatically-operated cock, as 7, by which the flow of water into the tank is stopped when a certain height is reached, substantially as described.

3. The combination of the tank adapted to contain a supply of water for immediate use, and so located that the height of the water in the tank governs the height to which it will rise in the bowl and prevent overflow, the pipe of large size connecting the tank with the bowl, the entrance to which is controlled by a valve or plug, and the bowl having its walls provided with the annular chamber with its opening inclined toward the bottom of the bowl, all substantially as described.

4. The combination of the bowl, the tank situated in close proximity thereto and adapted to hold a small supply of water, as described, and the connecting-pipe, as 4, having its receiving end projecting above the bottom of the tank, to prevent the drawing out of sediment and to form a seat for the valve 5, substantially as described.

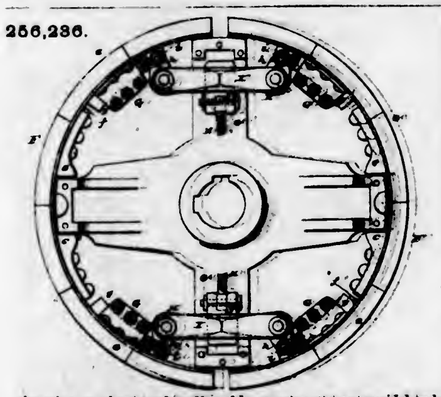
5. The combination, with the waste-pipe, as 12, provided with the enlargement or chamber 13 just below the bowl, of the bowl provided with an outlet-opening larger than the waste-pipe, whereby the water will pass so rapidly from the bowl as to accumulate in the said chamber, substantially as described.

6. The combination of the bowl, the waste-pipe having the chamber for the accumulation of the water, and the water-seal located between the bowl and chamber, substantially as described.

7. The combination of the bowl having the outlet-opening in its bottom, a valve, as 14, a stem, as 16, provided with a nut or head, as 18, and a bar, as 17, through which the valve-stem extends and by which its removal is prevented, all substantially as described.

8. The combination of the bowl having in its sides the annular chamber with the inward opening inclined toward the bottom of the bowl, and having the larger outlet for waste water in its bottom, the tank adapted to contain a supply of water for immediate use, located in close proximity thereto, and communicating with said chamber by the large pipe, as 4, and the waste-pipe provided with the chamber 13, for the accumulation of the outflowing water, all substantially as described.

9. The combination of the stand, the bowl, the tank arranged beneath the slab or top of the stand, and the steam-pipes located within the casing of the stand, beneath the tank, substantially as described.



10. The combination of the stand, the bowl, the tank located beneath the slab or top of the stand, the steam-pipes arranged within the casing of the stand, beneath the tank, and the register 53, for controlling the heating of the water in the tank, substantially as described.

11. The combination of the stand, the tank, the steam-pipes located within the stand, and the registers 53 and 51, substantially as described.

256,236. EXPANDING AND CONTRACTING DEVICE FOR FRICTION-CLUTCHES. DANIEL H. MERRITT, Marquette, Mich. Filed Feb. 20, 1882. (No model.)

Claim.—1. The combination, with the friction-rim and clutch-band adapted to engage therewith, of the hinged or pivoted bars *g g*,

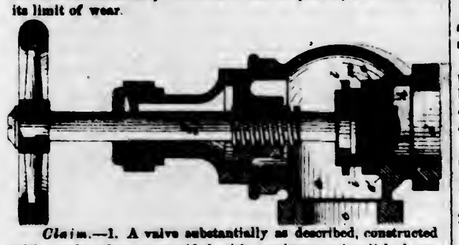
256,236.

clamping mechanism for adjustably securing them to said band, pivoted bell-cranks *H H*, having long and short arm, sliding block J, and bars I I and toggle K, for connecting said block J with the sliding sleeve L, substantially as and for the purpose specified.

2. The combination, with the friction-rim and clutch-band adapted to engage therewith, and formed in semicircular sections, of the hinged or pivoted bars *g*, clamping mechanism for adjustably securing them to the band, pivoted bell-crank bars I I, sliding blocks J J, and toggles K K, for connecting said blocks with the sliding sleeve L, substantially as and for the purpose specified.

3. The combination, with the clutch-band, of the hinged or pivoted bars *g* and clamping-plates G G, bell-cranks H H, having short arms *h h*, pivotally connected to said bars *g*, sliding block J, having a slot or opening for the ends of the long arms *h' h'*, grooved bars I I, for the reception of the sliding block, and to which the bell-cranks are pivotally connected, and a toggle for connecting said sliding block with operating mechanism, substantially as and for the purpose specified.

4. The combination, with a clutch-band and a lever for operating it, of the intermediate connecting mechanism consisting of hinged or pivoted and adjustable bars *g*, pivoted bell-cranks H H, grooved bars I I, sliding and slotted blocks J J, sliding sleeve L, and connecting rods or toggles, substantially as and for the purpose specified.



5. The combination, with a clutch-band, sliding sleeve L, and intermediate connecting mechanism, and a lever, *m*, for operating said sleeve, of the hand wheel or shaft having the crank-pin *n*, the bracket *p*, and connection or rod *o*, intermediate of and connecting the crank-pin *n* with lever *m*, substantially as and for the purpose specified.

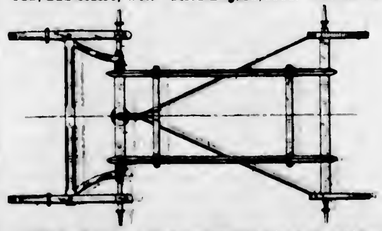
6. The combination, with a clutch-band, sliding sleeve, and intermediate connecting mechanism, and a lever for operating said sleeve, of the hand wheel or shaft having the crank-pin *n*, the bracket *p*, and adjustable connection or rod *m'*, substantially as and for the purpose specified.

7. The combination, with a clutch-band, of hinged bars *g*, adjustably connected thereto, sliding sleeve, and means, substantially as described, for connecting said bars *g* with said sleeve, the pivoted lever *m*, for operating said sleeve, adjustable connection or rod *m'*, hand wheel and shaft having a crank-pin, *n*, and the bracket *p*, substantially as and for the purpose specified.

256,237. VALVE. MATTHEW HICKENBOTHOM, Brooklyn, N. Y. Filed Nov. 23, 1881. (No model.)

Brief.—The primary valve-disk A is exposed around its sides, and is adapted to fit into a deep cavity, *c*. The seat *m* is intended to receive the secondary valve-rim *l* when the primary valve reaches its limit of wear.

Claim.—1. A valve substantially as described, constructed with a valve-plunger provided with a primary valve-disk, A, exposed around its sides, and having a definite depth and range of wear, in combination with a valve-seat having a deep depressed cavity or socket to receive and envelop the said disk, and with a secondary seat around the edge of said socket to meet with a secondary valve-rim on the holder of said disk when the latter reaches the limit of its wear in the primary seat, substantially as herein shown and described.



2. The combination, in a valve of substantially the described kind, of a valve-seat formed with a deep depressed seat or socket, *c*, forming a primary valve-seat and a raised secondary annular seat, *m*, around the edge of said socket, with a valve-plunger provided with a deep exposed disk, *h*, to enter said socket and a secondary valve-rim, *l*, to meet with the raised and isolated seat *m* when the primary disk reaches the limit of its wear in the primary seat or socket, substantially as and for the purpose set forth.

3. The combination, in a valve of substantially the described kind, with a flexible or wearable disk having a definite depth and range of wear, and with a corresponding deep seat or socket therefor, of a disk holder or follower, to which said disk is attached, adapted to enter said socket as wear takes place, with the secondary valve-rim *l* upon said follower, and a corresponding lip or seat, *m*, on said socket, adapted to meet together and form a tight joint when the primary disk reaches the limit of its wear, substantially as herein shown and described.

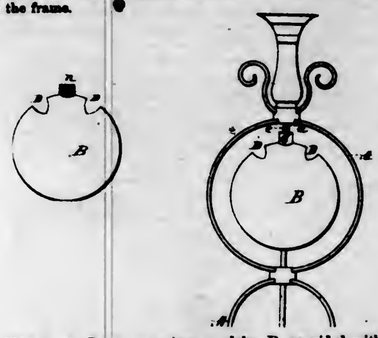
4. A valve of substantially the described kind, constructed with a flexible non-metallic wearable disk of straight cylindrical form with its lower corner or seating base rounded and with a seat or socket of corresponding form, substantially as and for the purpose set forth.

5. The combination, in a valve of substantially the described kind, of a flexible or non-metallic valve-disk of cylindrical form having a rounded base with a corresponding seat or socket, with a disk holder or follower having a cylindrical form corresponding to the straight portion of said disk and socket and of a length equal to the straight portion of the disk and socket, or nearly so, substantially as and for the purpose set forth.

256,238. RUNNING-GEAR FOR VEHICLES. HENRY G. HOUSE, Eau Claire, Wis. Filed Aug. 19, 1881. (No model.)

Claim.—In a running-gear for vehicles, the combination of the front axle, the thills rigidly attached thereto, the longitudinal rearwardly-extending springs attached to the thills and terminating over the front axle, the transverse spring connected with the rear ends of the longitudinal springs, the rear axle having bowed springs, and the vehicle-body resting and turning upon the front springs and suspended from the rear springs, as and for the purpose set forth.

256,239. SELF-LEVELING BERTH. LORENZO D. HOWELL, Providence, R. I. Filed July 26, 1881. (No model.)

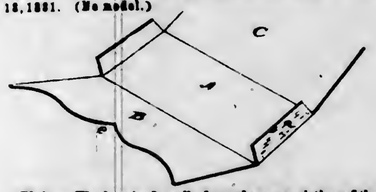


Claim.—1. In combination with a self-leveling berth for vessels, the curved T-shaped strips G and grooved journals E, substantially as shown and described.

2. In a self-leveling berth for vessels, the combination of the toothed counter-weight K with the pinion *k'* and shaft *k*, said shaft being adapted to receive a removable wrench, and arranged to be operated by the occupant of the berth, substantially as shown and described.

3. In a self-leveling berth for vessels, the combination of the swinging frame B, the ends C thereof having inwardly-projecting grooved journals E, with the sliding bearing D' and stationary bearing D, substantially as shown and described.

256,240. AQUARIUM. CHARLES N. OSGOOD, New York, N. Y., assignor to the E. P. Gleason Manufacturing Company, same place. Filed Dec. 19, 1881. (No model.)



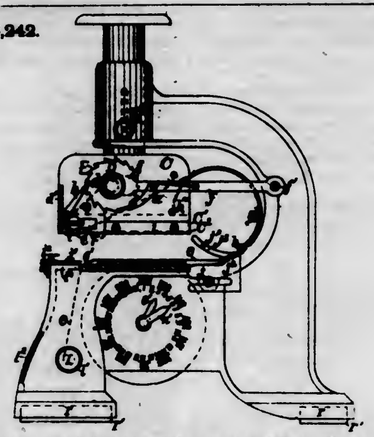
Brief.—A globe B, provided with oval openings D, for aerating the water therein, has a nipple *a*, adapted to engage with a screw-thread in the thimble C, by the eye *e* of which it is suspended from the hook *a* in the frame. A flower-pot, E, may rest upon the frame.

Claim.—1. In an aquarium, a globe, B, provided with a threaded nipple, and with small openings D, in combination with a thimble, C, substantially as set forth.

2. In an aquarium, the combination, with a stand, A, provided with a hook, *a*, of the globe B, having the thimble C and eye *e*, and the oval openings D, substantially as and for the purposes set forth.

256,241. ENVELOPE. ELIOTT H. PERRICK, Hudson, Mass., assignor of one-half to Cyrus D. Munson, same place. Filed Oct. 18, 1881. (No model.)

Claim.—The herein-described envelope, consisting of the middle portion, A, having the short end flaps, *a a*, which are folded inward and provided with adhesive material on their outer faces, an inner flap, B, having the cut-away portion *c*, and folded down upon the middle portion, A, so as to cover nearly the entire face of the same, and secured to the end flaps, and an outer flap, C, folded down upon the inner flap and extending flush with the edges of the inner portion, A, the said construction producing an article having three unbroken plies of uniform thickness, except where the side flaps and cut-away portion *c* are located, and affording a smooth, unbroken body of uniform thickness, upon either side of which a clear and regular impression can be made by a printing-press, as set forth.



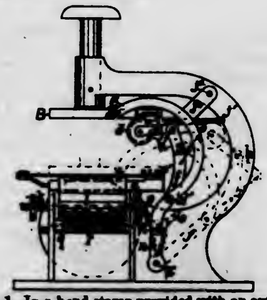
256,242. HAND-STAMP. WILLIAM H. POOLE, Chicago, Ill. Filed Feb. 24, 1881. (No model.)

Claim.—1. In a hand-stamp, a base provided with a platen, removable die, and a fixed arm carrying a vertically-reciprocating plunger provided with a removable die, platen, and automatically-turning drum for the purpose of winding the inking-ribbon thereon, all arranged to operate substantially as and for the purpose specified.

2. A hand-stamp the base of which is provided with a platen, removable die, and drum carrying an inking-ribbon, and a fixed arm carrying a vertically-reciprocating plunger provided with a removable die, platen, and automatically-turning drum upon which the inking-ribbon is wound, all arranged to operate substantially as and for the purpose specified.

3. In a hand-stamp, a base provided with a platen, removable die, series of dating-wheels, and drum carrying an inking-ribbon, and a fixed arm provided with a vertically-reciprocating plunger having a platen, removable die, and an automatically-turning drum upon which the inking-ribbon is wound, and which is actuated by means of a lever attached to said drum and pivoted to the fixed arm, and provided with a pawl, all arranged to operate substantially as and for the purpose specified.

4. In a hand-stamp, a base provided with a platen, removable die, and drum carrying an inking-ribbon, and a fixed arm carrying a plunger provided with a die, platen, and automatically-turning drum to wind the inking-ribbon, in combination with a spring *g*, all constructed to operate substantially as and for the purpose specified.



5. In a hand-stamp provided with drums on which an inking-ribbon is worked from one to the other of said drums, an inking-ribbon provided with a white or blank end, constructed and arranged to operate substantially as and for the purpose specified.

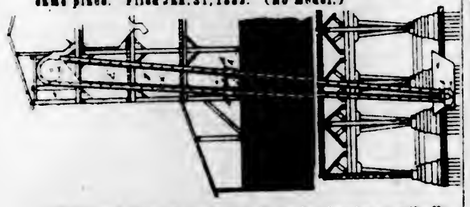
6. In a hand-stamp provided with a reciprocating plunger, a drum, D, provided with a ratchet-wheel, E, and longitudinally-slotted lever *f*, attached to and pivoted at *f'*, and provided with a pawl, *e*, and spring *e*, all combined and arranged to turn the drum D, substantially as and for the purpose specified.

7. The clamp *f'*, provided with a fixed hook, *f''*, in combination with the notched plate *f'*, united by a bar, *f*, so as to form an adjustable ticket-gage for a hand-stamp, all constructed and arranged to operate substantially as herein shown and described.

256,243. HAND-STAMP. WILLIAM H. POOLE, Chicago, Ill. Filed Aug. 18, 1881. (No model.)

Claim.—1. In a hand-stamp provided with an automatically-adjustable inking-ribbon, plunger, and roller inking apparatus, the combination of the ribbon, the plunger, and base, oscillating levers *f*, attached to the base behind and below the inking-ribbon, and mechanism, as described, to actuate said levers and ribbon, said levers carrying at their free ends an automatically-adjustable inking-roller, substantially as specified.

2. In a hand-stamp provided with an automatically-adjustable inking-ribbon, plunger, printing-surfaces both upon its bed and plunger, and inking-plate, the combination of the oscillating levers *f*, attached to the base behind and below the drums *k*, and provided with an automatically-adjustable inking-roller and mechanism, substantially as described, whereby said levers, roller, and drums are actuated, substantially as specified.



3. In a hand-stamp provided with drums *k*, one on each side of its base, printing-surfaces on both its base and plunger, and inking-plate *f'*, the combination of the levers *f*, pivoted to the base and carrying at their free ends an automatically-adjustable inking-roller, with the base and plunger, pawls *e*, and mechanism, substantially as described, connecting the plunger and levers *f*, constructed to operate substantially as specified.

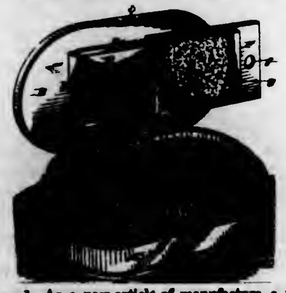
4. In a hand-stamp provided with printing-surfaces both upon

its bed and plunger, the combination of the base *c* and plunger B, ribbon *l*, and drums *k* on each side of the base, provided with ratchet-wheels *t*, inking-plate *f*, with the levers *f*, carrying the automatically-adjustable roller *j*, pawls *o*, and bars *e*, substantially as specified.

5. In a head-stamp provided with printing-surfaces upon its bed and plunger, the ribbon *l*, drums *k* on each side of its base, provided with ratchet-wheels *t*, in combination with the levers *f*, bars *h*, pivoted at *h'*, and carrying roller *j*, spring *h²*, bars *e*, pawl *o*, spring *n*, and base *c* and plunger B, constructed to operate substantially as specified.

256,244. GRAIN-ELEVATOR. ELIAS ROBERTS, Chicago, Ill., assignor of one-half to Edward Baumann and William H. Lotz, same place. Filed Jan. 31, 1882. (No model.)

Claim.—1. The elevator-legs in grain-elevators, vertically composed of sections *i* and *j*, and connected by sleeves *k*, in which the leg-sections will slide to accommodate themselves to the shrinkage and settling of the building, all substantially as and in the manner described and shown.



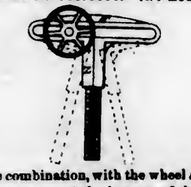
2. In a grain-elevator, and in combination therewith, of the elevator-legs composed of the upper sections, *i*, and the lower sections, *j*, both connected by a box or sleeve, *k*, that is made rigid with sections *j* and will form a guide for section *i*, all substantially as and for the purpose described and shown.

256,245. SPRING-BACK FOR BOOKS. FRIEDRICH SCHUBERT, Zurich, Switzerland. Filed Jan. 16, 1882. (No model.)

Claim.—A spring-back for books, consisting of a resilient inner part, *b*, exterior longitudinal strips, *a a*, and a covering, *d*, stitched intermediately between the strips to the inner part, substantially as set forth.

256,246. COMBINED TOBACCO AND MATCH BOX. SAMUEL E. SCOTT, Sandy Hill, N. Y. Filed Oct. 22, 1881. (No model.)

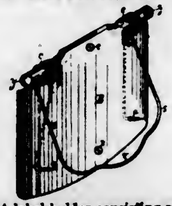
Claim.—1. As a new article of manufacture, a tobacco-box provided with a match safe or compartment rigidly secured to the under side of the lid or cover thereof, the said match-compartment being provided with a cover having suitable material removably secured thereto for striking the match.



2. The combination, with a box provided with a suitable hinged lid, of a match-compartment rigidly secured to the inside of the said lid, a sliding cover adapted to close the said match-compartment, and suitable material removably secured to the top of the said sliding cover for igniting the matches, substantially as set forth.

3. The combination, with a box provided with a hinged cover or lid, the said box and cover being constructed substantially as described, of a match-compartment rigidly secured to the under concave side of the cover, a sliding cover adapted to close the match-compartment and provided with suitable flanges for holding sand-paper for igniting the matches, substantially as set forth.

4. The combination, with the box A and cover B, of the compartment E, having sides *a*, ends *b* and *b'*, and bottom *c*, and the sliding cover F, provided with the turned edges *d*, depending lug *e*, raised projection *f*, flanges *g*, and removable sand-paper *h*, all of the said parts being constructed substantially as described.



5. In a combined tobacco and match box, the combination, with a tobacco-box provided with a suitable hinged lid, of a match-compartment rigidly secured to the inside of the said lid and provided with a sliding cover adapted to be presented upward when the hinged lid is thrown open, the said sliding cover being provided with suitable means for striking the match.

256,247. PARLOR-DOOR HANGER. SAMUEL SHEEFFLER, Jr. Joliet, Ill. Filed Nov. 28, 1881. (No model.)

Claim.—The combination, with the wheel *s*, having two treads, and a central axle to support the hanger, of the hanger consisting of the slotted upper end, *w'*, and split shank *x* and nut *n*, to support the door B, in the manner and for the purpose set forth.

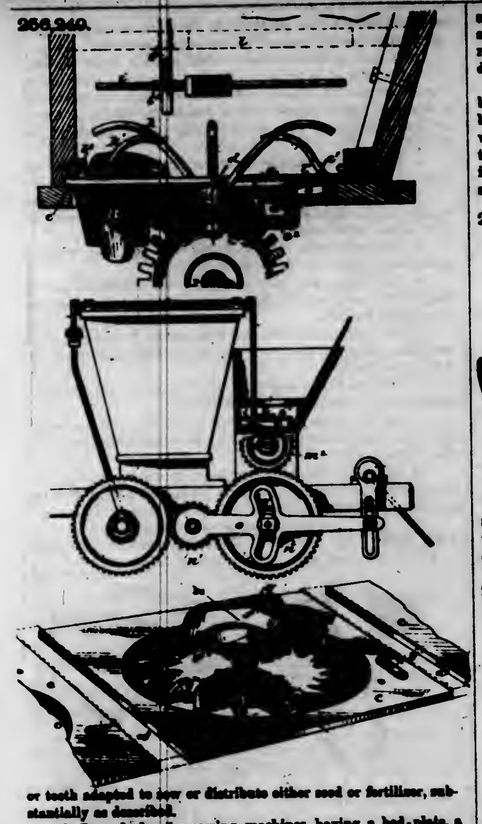
256,248. CAR-LABEL HOLDER. GEORGE J. SLAYTER, Grand Junction, Mich. Filed Dec. 29, 1881. (No model.)

Claim.—1. A label-holder consisting of a plate provided with arms for supporting a clamp, a clamp coiling around each of said arms, forming springs, and extended vertically therefrom and passed through the plate, terminating in spurs adapted to receive the label on the front face of said plate, where it is held by the clamp-arms, all substantially as described, for the purpose set forth.

2. The combination, substantially as set forth, of the plate with its arms and rear grooves and holes for the spurs, and the clamp having the handle, the bellows, and the extended ends with the spurs, all adapted for the purposes set forth.

256,249. FERTILIZER-DISTRIBUTER AND SEEDER. JACOB W. SPANGLER, York, Pa. Filed Dec. 14, 1880. (Model.)

Claim.—1. The combination of the rotating toothed feed-wheel *a*, provided with an axial gudgeon, *b'*, a bed-plate, *c*, provided with a bearing to receive said gudgeon, and a connecting-bolt, *d*, washers *d' d²* thereon, and a nut, *d³*, substantially as described.



2. The combination, with a bed-plate having a discharge-orifice and a horizontally-rotating toothed feed-wheel to advance the substance to be distributed to said orifice, of the cap *f'*, arranged over said wheel above the orifice, and having the plow or point *f²* carved as shown and edged tangentially to the feed-wheel, substantially as and for the purpose described.

3. In a feeder having a bed-plate and means therein for distributing fertiliser or seed, a cap to cover the discharge-orifice, hung in said opening as upon an axis, and provided with a rearwardly-extended tongue projecting downwardly through an opening in said plate and engaged by a spring, substantially as and for the purpose described.

4. In a sowing-machine feeder, a bed-plate having a cavity or trough to receive a feed-wheel, and provided with a rib or flange, in combination with said feed-wheel, having a groove in its under face to receive said rib or flange to prevent the escape of the material to be sown, substantially as described.

5. A force-feed wheel for sowing-machines, provided with alternating series of closed or covered cups or teeth, and open cups

256,249.

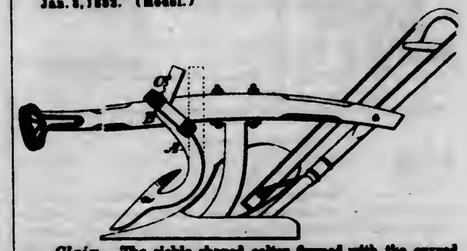
or teeth adapted to sow or distribute either seed or fertilizer, substantially as described.

6. In a feeder for sowing-machines, having a bed-plate, a toothed or cupped feed-wheel, and a cap, *f*, over the discharge-orifice, a covering-plate, *m*, arranged, as shown, over a number of such teeth or cups of the feed-wheel, so as to expose less than all of such teeth or cups at any one time to receive the material to be distributed, whereby clogging and burdening of such teeth and wheel are prevented, substantially as described.

7. In a feeder for sowing-machines, having a cap, *f*, over the discharge-orifice, the combination of a toothed or cupped feed-wheel, a covering-plate, *m*, to cover two or more of its teeth or cups, as shown, and a bed-plate to receive said wheel and plate, and having an open bottom beneath the covering-plate, substantially as described.

8. In a feeder for sowing-machines, having a bed-plate, a toothed or cupped feed-wheel, and a cap, *f'*, over the discharge-orifice, a covering-plate, *m*, arranged over a number of the teeth or cups of the feed-wheel, as shown, so as to expose less than all of such teeth or cups at any one time to receive the material to be distributed, as described, and provided with a flange or lip, *m'*, overhanging the teeth or cups at their inner ends, to make a close joint with the wheel, substantially as and for the purpose described.

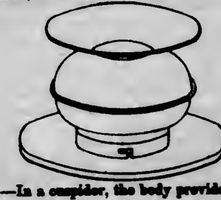
9. The within-described feeder, composed of a bed-plate having a discharge-throat, a force-feed wheel having oblique teeth lying in the same horizontal plane therewith in said bed-plate, a yielding thrust-cap overlying the discharge-throat and secured to the bed-plate, and a spur-wheel or clearer the teeth whereof are adapted to project into the teeth of the feed-wheel, substantially as described.



10. In a feeder for sowing-machines, the combination of a rotatable feed-wheel and stirrers carried thereby with stationary, intersecting, or crossing stirrers overhanging that portion of the feed-wheel by which the material is fed, substantially as described.

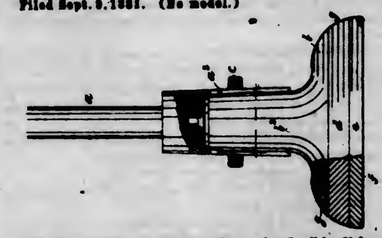
11. The spur-wheel or clearer provided with teeth or spurs of diamond shape in cross-section, and adapted to mesh with the teeth of the feed-wheel, substantially as and for the purpose described.

12. A feed-wheel having oblique teeth, the whole arranged and adapted to be rotated in a horizontal plane, combined with a spur-wheel the teeth or spurs whereof project between the teeth of said feed-wheel to clear said teeth, the said spur-wheel deriving rotary motion from said feed-wheel by its rotation, substantially as described.



13. A feed-wheel having teeth projecting obliquely from its body in the plane of the body, the whole arranged and adapted to be rotated in a horizontal plane, combined with a clearer or spur-wheel arranged in a plane intersecting at a substantially right angle to the plane of rotation of the feed-wheel, the teeth of the two wheels intermeshing and the clearer deriving motion from the feed-wheel, substantially as and for the purpose described.

256,250. PLOW-COLTER. MORRIS A. SPINK, Grown Point, Ind., assignor of one-half to Jacob A. Weis, same place. Filed Jan. 3, 1882. (Model.)



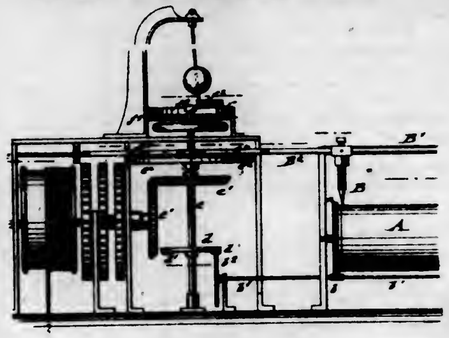
Claim.—The sickle-shaped colter formed with the curved standard A, the cutting-blade *a*, having its upper end curved to the landside, and the notched shank C, substantially as shown and described.

256,251. CUSPIDOR. GEORGE C. STERLING, New York, N. Y. Filed Jan. 28, 1882. (No model.)

Claim.—In a cuspidor, the body provided with a flange, and a base-plate, also provided with a flange adapted to fit into or surround the flange of the body, the one flange having connecting pins or projections and the other angular slots, in combination, substantially as and for the purpose set forth.

256,252. LEATHER-BUFFING MACHINE. JOHN E. STEVENS, Lynn, assignor to Freeman Winslow, Trustee, Salem, Mass. Filed Sept. 9, 1881. (No model.)

Claim.—1. In a buffing-machine, the flexible disk and connected flexible shank, combined with the washers or felt, substantially as described.



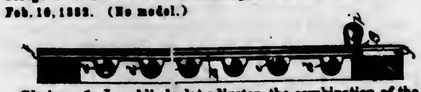
2. The spindle *a*, combined with and carrying the flexible disk, having the connected flexible shank, substantially as described.

3. The spindle provided with a split socket and the ring, combined with the disk *b* and its flexible shank *b'*, inserted in the said socket, substantially as described.

4. The pouch composed of the circular piece of material *f* and the india-rubber annulus stitched thereto, substantially as described.

5. The india-rubber disk and its flexible shank *b'* and the felt washers, combined with the abrasive pouch composed of the abrasive cloth and connected india-rubber annulus *g*, substantially as described.

256,253. CHEMICAL TELEGRAPH. WILHELM C. TAUCHE, New York, N. Y. Filed Aug. 26, 1881. (No model.)

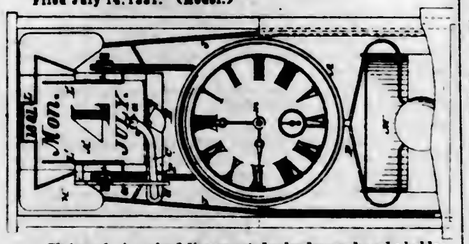


Claim.—1. The combination of a rapid reciprocatory stylus, a rotary cylinder, mechanism for imparting an intermittent motion to the cylinder between the strokes of the stylus, a motor, an intermediate vertical driving-shaft between the motor and cylinder, and a conical pendulum connected to the upper end of said vertical shaft, substantially as described.

2. The combination of a rotary cylinder, a rapid reciprocatory stylus, and means for raising the stylus out of contact with the cylinder at each end of its stroke, substantially as described.

3. The combination of a rotary cylinder, a rapid reciprocatory stylus, mechanism whereby the cylinder is rotated step by step between the strokes of the stylus, and means for raising the stylus out of contact with the cylinder at each end of its stroke, substantially as described.

4. The combination of the rotary cylinder A, gear *a*, shaft *b'*, pinion *b*, gear *b²*, disk *d*, with teeth *d'*, vertical shaft *e*, with balance-wheel and regulator, connecting-rod B², stylus B, and guide therefor, substantially as described.



256,254. BLIND-ADJUSTER. ORVIL C. VELIE, Corning, N. Y., assignor of one-half to John H. Hungerford, same place. Filed Feb. 10, 1882. (No model.)

Claim.—1. In a blind-slat adjuster, the combination of the slats having grooved tenons at one end and a vertically-movable bar having a series of lugs or teeth adapted to engage said grooved tenons, whereby the slats may be simultaneously operated by the movement of said bar, substantially in the manner herein shown and described.

2. The combination of the blind-frame having mortises B and a recess, *f*, and slot A, the slats D, having tenons C, provided with groove *d* at one end, and a vertically-movable bar, E, having lugs or teeth *e*, adapted to engage said grooved tenons, and a projecting stud, *g*, provided with a knob, *f*, the several parts constructed and arranged relatively to each other substantially in the manner as and for the purpose herein shown and described.

256,255. CALENDAR-CLOCK. CARL VOTT, Philadelphia, Pa. Filed July 14, 1881. (Model.)

Claim.—1. A pack of disconnected calendar-cards and a holder therefor, in combination with a time-piece or motor, mechanism operated by said piece for removing the cards, and a chute whereby when the cards are removed from a holder they drop therefrom and are directed to and deposited by the chute in a separated receptacle, substantially as and for the purpose set forth.

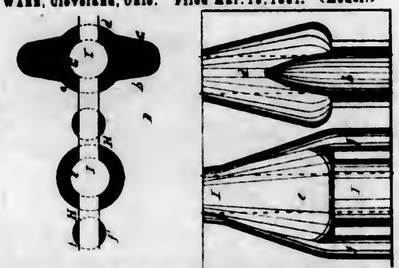
2. A pack of disconnected calendar-cards, a holder therefor, and a time-piece or motor, in combination with a rotary and sliding finger provided with a downwardly-extending hook, *c*, substantially as described, whereby each card is grasped by the finger, drawn out from holder, and then caused to drop clear of the finger and the holder.

3. The card-holder, in combination with the finger C and deflector F, substantially as and for the purpose set forth.

4. The card-holder and the rotary reciprocating finger, the toggle, and gearing of the motor, combined and operating substantially as and for the purpose set forth.

5. The card-holder, in combination with the rotary wing E, substantially as and for the purpose set forth.

6. The cards, with openings *a*, and the covering-pieces *b*, adapted for operation with the finger C, substantially as and for the purpose set forth.



7. The card-holder provided with guides K, and the cards with channels *a*, combined and operating substantially as and for the purpose set forth.

8. The card-holder provided with the guard L and spring L', substantially as and for the purpose set forth.

9. The time-piece or motor, the card-holder, and operating-finger, in combination with the chute M, substantially as and for the purpose set forth.

10. In a calendar-clock provided with a delivery-chute for the purpose set forth, the pendulum having its arm of the form of a frame, as stated.

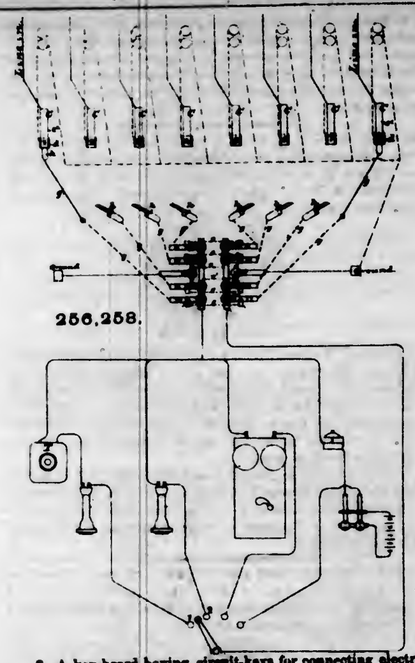
256,256. DIE FOR MAKING TURN-BUCKLES. WILLIAM WARD, Cleveland, Ohio. Filed Mar. 15, 1881. (Model.)

Claim.—1. In mechanism for making turn-buckles, the dies G G, having a cavity for the head of the article, with a recess on two sides for the reception of the bars or links, constructed and arranged to operate conjointly for welding the head and bars together by the action of the dies, substantially as set forth.

2. The pair of dies H H, provided with a cavity for the head of the article, with a concave on each side of the cavity and extending therefrom to receive the bars B B, constructed and arranged, as shown, to co-operate conjointly in welding and forging the head and bars of turn-buckles together, substantially as described.

3. In dies for forging turn-buckles, the pair of dies G G, formed to receive the head and bars of the article, arranged to operate jointly with the dies H H, shaped with a cavity for the head, concaves for the bars at the sides for welding the head and bars together and swaging the same at one continuous operation, substantially as herein set forth.

256,257. CHILL FOR CHILLING METAL. JASPER P. WARNER, Dowagiac, Mich. Filed July 6, 1881. (No model.)



Claim.—A metallic cylinder-chill having a longitudinal opening and tapering end and a green-sand filling for forming and chilling holes in castings, substantially as shown and described, for the purpose set forth.

256,258. TELEPHONE-EXCHANGE SYSTEM. THOMAS A. WATSON, Everett, assignor to the American Bell Telephone Company, Boston, Mass. Filed Apr. 26, 1880. (No model.)

Brief.—A key-board is provided, by which the central-office instruments or generators may be connected either directly in subscribers' circuits or in a ground-branch.

Claim.—1. The combination, with a switch-board, of an independent key-board with spring-keys for manipulating circuits, and devices for temporarily connecting lines centering in said switch-board with the key-board, substantially as described.

256,258.

2. A key-board having circuit-keys for connecting electrical conductors in circuit with each other through their bridges or back contacts, and ground-keys connected with the anvils of said circuit-keys for grounding the same, substantially as described.

3. In an electric key-board, the combination of circuit-keys with their bridges or back contacts electrically connected in pairs, and ground-keys connected with the anvils of the circuit-keys for grounding the same, substantially as described.

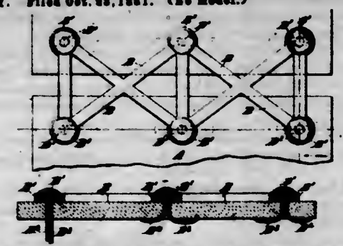
4. The combination, with two or more pairs of circuit-keys, of a pair of ground-keys connected with the anvils of each pair of circuit-keys for grounding said anvils separately or together, substantially as described.

5. The combination, with circuit-keys for connecting electrical conductors or circuits with each other through their bridges or back contacts, of a local-instrument circuit connected with the anvils of said circuit-keys, substantially as described.

6. The combination of circuit-keys for connecting electrical conductors or circuits with each other through their bridges or back contacts, of a local-instrument circuit connected with the anvils of said circuit-keys, and ground-keys connected with said anvils for grounding the same, substantially as described.

7. The combination, with line-circuits emanating from a central office, of a series of spring-keys and a telephone circuit or branch connected with the anvils of the circuit-keys, and thus adapted to be brought into connection with the several lines by means of said keys, substantially as described.

8. A pair of circuit-keys having their back contacts connected with each other, combined with means for temporarily connecting said keys with line-circuits, substantially as described.

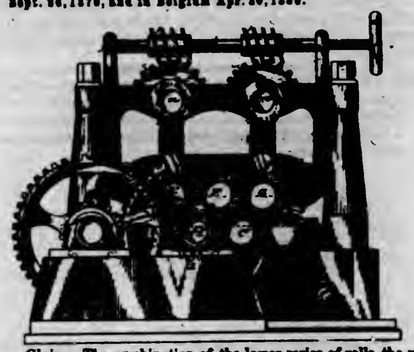


9. A pair of circuit-keys having their back contacts connected with each other, in combination with keys normally grounded having their anvils connected with those of the first-named keys, substantially as described.

10. The combination, with circuit-keys, of a local circuit provided with branches and connected with the anvils of said keys, and a switch for closing the local circuit through the required branch, substantially as described.

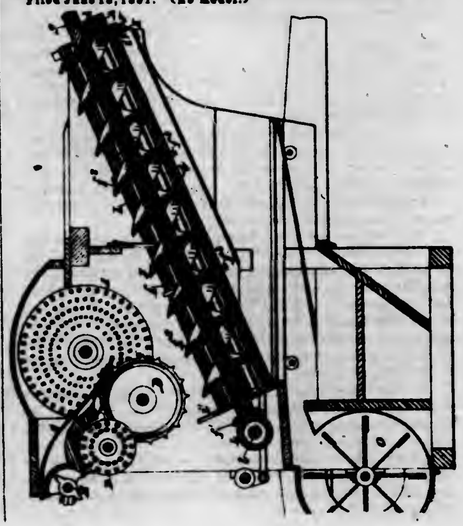
11. The combination of ground and circuit keys, local circuit provided with branches and connected with the anvils of said keys, and a switch for connecting in the required branch, substantially as described.

12. The combination, with a series of line-circuits emanating from a central office and a key-board, of a magneto-generator and battery located in separate branches, a switch, and electrical connections, substantially as described, whereby either of said sources of electricity can be connected temporarily with any of said lines through the key-board, as set forth.



256,259. BELT-FASTENER. ARTHUR W. WEBB, Brooklyn, N. Y. Filed Oct. 28, 1881. (No model.)

Claim.—1. The open-work frame B and split pins D, combined and adapted to serve as herein specified.



2. The combination of two abutting lengths of belting, open-work metallic frame having re-enforced holes, and removable split pins inserted through the frame and through the belt and secured by clinching, as specified.

256,260. MACHINE FOR BENDING AND STRAIGHTENING METAL. AUGUST WILKE, Brunswick, Germany. Filed Dec. 28, 1881. (No model.) Patented in Austria Dec. 16, 1876, in Germany July 14, 1877, in England July 26, 1877, in France Sept. 26, 1876, and in Belgium Apr. 20, 1880.

Claim.—The combination of the lower series of rolls, the upper series of rolls, the frame carrying such rolls and working in guides, as described, and the counter-shafts N N', having the eccentrics and operated by the shaft and worm, as described.

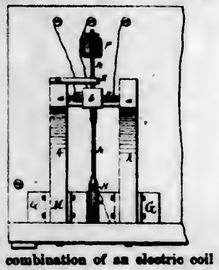
256,261. CORN-SHELLER. JOHN Q. ADAMS, Marseilles, Ill. Filed June 13, 1881. (No model.)

Claim.—1. In a corn-sheller, a separating mechanism composed of the screw-conveyer and a concave receptacle for the latter of skeleton construction, arranged to receive the delivery from the shelling mechanism, substantially as described.

2. In a corn-sheller, the shelling mechanism, in combination with the skeleton trough I and screw-conveyer F, arranged underneath the shelling mechanism and extending upward and rearward in an inclined position to the rear end of the machine, substantially as described.

3. The shelling mechanism, in combination with the screw-conveyer, skeleton receptacle, and corn-shoe, substantially as described.

4. The straight runners A, in combination with the bevel-runners B, rag-irons C, screw-conveyer F, and skeleton receptacle I, substantially as described.



5. The screw-conveyer F, provided with projections f^3, arranged at distant intervals on the rear face of the blade, in combination with the skeleton receptacle, substantially as and for the purpose set forth.

6. The skeleton receptacle, in combination with the screw-conveyer provided with a straight section, H, at its upper end, and the shaft-supporting arm G, substantially as and for the purpose set forth.

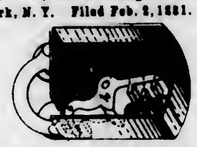
7. The shelling mechanism, in combination with the screw-conveyer F, skeleton receptacle I, pinions f^4 and L, and rag-chain M, running from the main shaft to the counter-shaft l, substantially as described.

8. The conveyer-receptacle composed of the straight rods i, provided with hooks i^2 at one end, in combination with the fastening-plates J and K and the supporting-plate i^3, substantially as described.

256,262. ELECTRICAL RELAY. CLEMENT ADER, Paris, France. Filed Sept. 24, 1881. (No model.) Patented in France May 20, 1881, in England July 7, 1881, in Belgium July 8, 1881, in Italy Aug. 1, 1881, in Spain Oct. 7, 1881, and in Austria-Hungary Oct. 20, 1881.

Claim.—1. The combination of an electric coil having no core, delicately mounted and free to move in a direction at right angles, or substantially so, to its axis, with a magnetic pole arranged within attractive range of said coil and to one side of its path of motion, substantially as set forth.

2. The combination of an electric coil having no core, delicately mounted and free to move in a direction at substantially right angles to its axis, with two unlike magnetic poles arranged opposite to each other within attractive range of the coil and one on each side of its path of motion, whereby the coil when attracted to them will move between them, substantially as set forth.



3. The combination of a delicately-mounted electric coil having no core and free to move in a direction substantially at right angles to its axis with two unlike magnetic poles arranged within attractive range of the coil, both on the same side of its path of motion, and the two on opposite sides of its normal or intermediate position, substantially as set forth.

4. The combination of a delicately-mounted electric coil having no core and free to move in a direction at substantially right angles to its axis with four magnetic poles arranged in two pairs, with like poles diagonally opposite to each other and unlike poles directly opposite to each other, the two unlike poles of each pair arranged on opposite sides of the path of movement of the coil, and the two pairs arranged one on each side of the normal or intermediate position of the coil and within attractive range thereof, substantially as set forth.

5. The combination, to form a relay, of a pendulously-hung stem or lever, an electric coil mounted upon one arm thereof, an adjustable counterpoise mounted on the opposite arm thereof, a contact-point borne by said stem or lever, a fixed contact-stop against which said point may impinge upon the movement of the coil from its normal position of rest, and one or more fixed magnetic poles arranged within attractive range of the coil, substantially as set forth.

6. The combination of a series of magnets, A A, arranged side by side, their pole-extensions G G, the blocks a a, mounted on the magnets, the pendulous stems h h, arranged one in each of the spaces between the magnets and hung from the blocks a a, the contact-pins T T, the contact-stops E E, and the coils H H, substantially as set forth.

256,263. LOCK. HARVEY C. ALDRICH, Norwich, Conn., assignor, by direct and mesne assignments, of eleven-twelfths to William H. Babcock, same place, George M. Aldrich and Richard V. D. Wood, both of Orangetown, and Henry C. Townsend, New York, N. Y. Filed Feb. 2, 1881. (Model.)

Claim.—1. The combination, substantially as described, of a tumbler provided with one or more lugs or projections and a key suitably slotted, recessed, perforated, or notched, and adapted to act upon or propel the tumbler in substantially the manner described, whereby the lugs or projections upon the latter, when said tumbler is propelled by the key, may be caused to pass into the notches or perforations in said key.

2. In locks, a single pivoted tumbler provided, first, with two or more projections adapted to pass into notches in its operating-key; second, with an arm or projection, with which said key engages; and, third, with a catch or locking-projection for engaging with a hasp or shackle.

256,264. WATER-GAGE AND ALARM. THOMAS AMPELETT, Kiev, Russia. Filed Nov. 2, 1881. (No model.) Patented in Germany May 27, 1880, in France Aug. 3, 1880, in Belgium Aug. 4, 1880, and in Austria Sept. 27, 1880.

Claim.—In water-gages, the combination, with a float, of a steam-tight case or cylinder fast upon and communicating with the boiler, a spindle, D, with hand E, a dial, J, a rod extending from the float and connected to the spindle D, two collars, E, mounted on this rod, ball-crank levers F, valves v, and whistles w, all for the purpose and substantially as described.

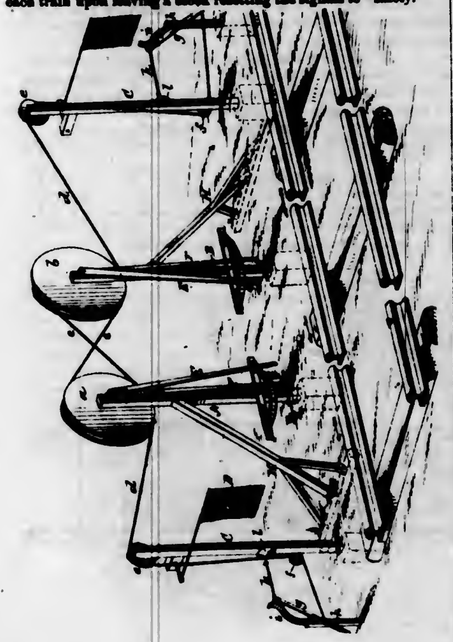
256,265. DEVICE FOR WAKING PERSONS FROM SLEEP. SAMUEL S. APPLEGATE, Camden, N. J. Filed Dec. 14, 1881. (No model.)

Claim.—1. As a means of waking persons from sleep, the combination of the light frame A, of the character described, a cord for suspending the same over the bed, and a device for retaining and for automatically releasing said cord, all substantially as specified.

2. The combination of the suspension-cord and a device for retaining and automatically releasing the same with a frame, A, having pendent cords d, as set forth.

3. The combination of the suspension-cord and a device for retaining and for automatically releasing the same with a frame having pendent cords d, with blocks e, as specified.

4. The combination of the suspension-cord B and the frame A with the retaining-cord n, as set forth.



5. The combination of the frame A, the suspension-cord B, and a device for retaining and releasing the latter with a stop whereby the descent of the frame on the release of the cord is limited, as specified.

6. The combination of the bars b with the central bar, a, of the frame, said bar a being made in parts x x', hinged together, the parts x' carrying the bars and the part x having a turn-buckle, m, as set forth.

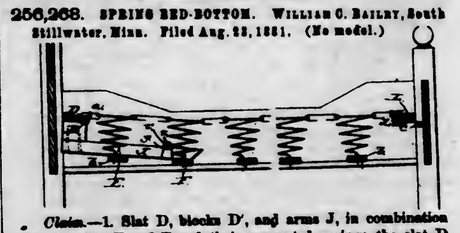
7. The combination of the frame A and the suspending-cord B, having a notched plate, h, with the winding-spindle i of the alarm mechanism of a clock, said spindle being flattened for the reception of the notched plate, as set forth.

256,266. RAILWAY SIGNALING APPARATUS. WILLIAM H. BACHTEL, Canton, Ohio, assignor of one-fourth to Hiram Serba, same place. Filed Dec. 9, 1881. (No model.)

Brief.—Vertical swinging spring-held levers carry pulleys on their pivots, around which pulleys pass reversely-wound cords, which operate the signal-flags. When set to "danger," alarm-levers are brought into position to be actuated by a following train in case it enters the "block" before a preceding one has left it, each train upon leaving a block resetting the signals to "safety."

Claim.—1. In a railway signaling apparatus, the flags D and cords or wires d, in combination with the levers B F and springs G, substantially as and for the purpose specified.

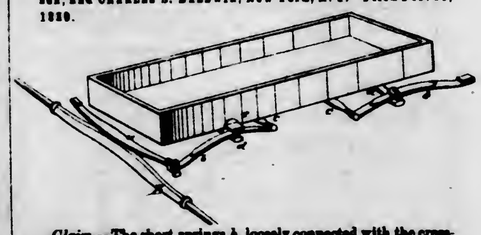
2. In a railway signaling apparatus, the signal-flags D and cords or wires d e, in combination with pulleys a b and levers E F, constructed and arranged to operate substantially as and for the purpose described.



3. In a railway signaling apparatus, the combination, with the signal-flags D, wires or cords d, and levers E F, of the levers g, provided with a suitable alarm-sounding device, substantially as and for the purpose set forth.

256,267. COVERING FOR DEMIJOHNS. FREDERICK A. BAHR and DANIEL BAHR, Brooklyn, N. Y. Filed Mar. 8, 1882. (No model.)

Claim.—The combination, with a demijohn, of a bottom of wood or other equivalent material, radiating inclined channels extending from the edge of the wooden bottom in an upwardly-inclined direction, a series of strips extending through these radiating channels and up on the sides of the demijohn, and braiding-strips interlaced with the upright strips, substantially as and for the purpose shown and described.

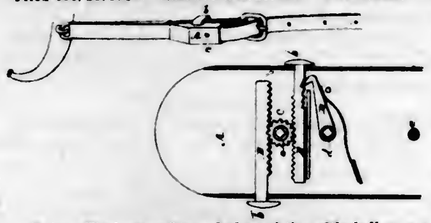


256,268. SPRING BED-BOTTOM. WILLIAM C. BAILEY, South Stillwater, Minn. Filed Aug. 23, 1881. (No model.)

Claim.—1. Slat D, blocks D', and arms J, in combination with the slats E and F and their supported springs, the slat D being on a level with tops of such springs, as set forth.

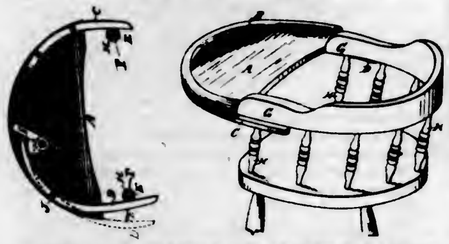
2. The bed-frame A and its screws c, in combination with the detachable double open hook-links d and the end slat, L, of the spring-frame, all constructed and arranged as set forth.

256,269. VEHICLE-SPRING. JOHN H. BALDWIN, Port Jefferson, and CHARLES S. BALDWIN, New York, N. Y. Filed Feb. 18, 1880.



Claim.—The short springs b, loosely connected with the cross-springs and rigidly attached to the body-bars c d, as and for the purpose specified.

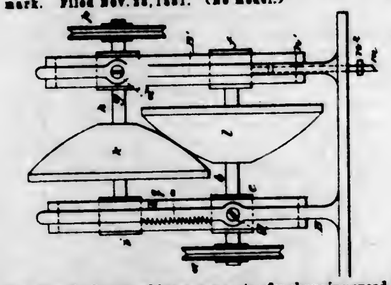
256,270. FLOAT-BALL FOR STEAM-TRAPS, &c. PETER BARKER, Ansonia, Conn. Filed Feb. 9, 1882. (No model.)



Claim.—A float-ball composed of an internal hollow foundation and an external seamless metallic shell or coating, substantially as set forth.

256,271. TRACE-LOCK. JAMES A. BASSETT, Windsor, Cal. Filed Oct. 28, 1880. Renewed Dec. 29, 1881. (No model.)

Claim.—The improved trace-lock consisting of the hollow case A, with its ratcheted bars B B, clasps *b b*, ratchet C, and spring-pawl D, with their spindles *c d*, said case being provided with the screw *e*, substantially as and for the purpose herein set forth.

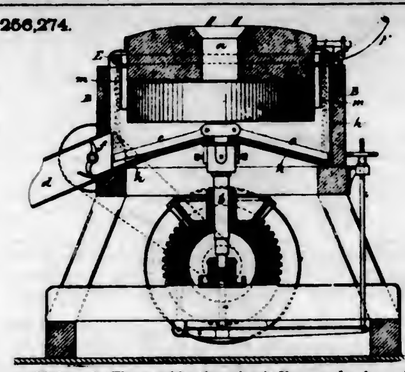


256,272. TRAY FOR CHILDREN'S CHAIRS. REUBEN L. BUNT, Gardner, Mass. Filed Mar. 14, 1881. (No model.)

Claim.—1. In combination with a chair having seat S, arms G, and spindles H, a removable tray or shelf having two horizontally-projecting bars, one fixed and one pivoted to said tray on a vertical axis, and both adapted to engage with the chair by means of pins and sockets, as described, and to be held in engagement by a locking device, substantially as and for the purpose set forth.

2. The combination, with a child's chair, of the tray A, bars C D, pins E, arms G, spindles H, having sockets F, and locking-piece I, substantially as set forth.

256,273. MACHINE FOR CHANGING SPEED. JOHAN JACOB BENOMARD and CARL EMIL HÜTTENMEIER, Copenhagen, Denmark. Filed Nov. 25, 1881. (No model.)



Claim.—1. In a machine or apparatus for changing speed, the combination of two cone-shaped disks having swelled or curvilinear frustums, mounted upon axles provided respectively with one pivoted and one sliding box, substantially in the manner and for the purpose herein shown and set forth.

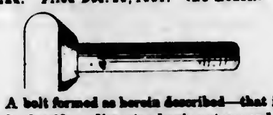
2. The machine or apparatus for changing speed herein shown and described, composed of the base A, having slotted standards B B', pivoted journal-boxes *e h*, sliding journal-boxes *f i*, rod *m*, having stop-buttons *n'* and *n²*, spring *o*, and axles *b g*, provided respectively with the cone-disks *l k* and pulleys *a p*, the whole constructed and combined to operate substantially as and for the purpose herein shown and specified.

256,274. DEVICE FOR MIXING PULVERISED SUBSTANCES WITH LIQUIDS. CHARLES F. BISSER, Camden, N. J. Filed Dec. 5, 1881. (No model.)

256,274.

Claim.—1. The combination of grinding mechanism with a pipe or pipes, whereby liquid may be brought into intimate contact and mixed with the material after the latter is ground, substantially as set forth.

2. The combination of the millstones and the casing B with the annular pipe E, having perforations through which jets of liquid are discharged downward between the stones and casing, substantially as specified.



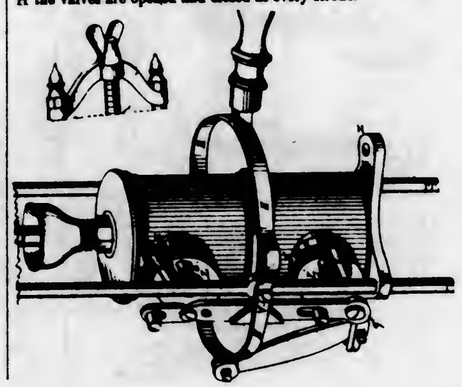
3. The combination of the millstones and their casing with the liquid-supplying pipe and the scraping and mixing arms *c*, as set forth.

4. The combination of the millstones, the liquid-supplying pipe, and the casing having a lining, A, as set forth.

5. The combination of the millstones, the casing, the liquid-supplying pipe E, and the hood *i*, as set forth.

6. The combination of the millstones, the casing, and the pipe E with the guard *m*, as specified.

256,275. BOLT FOR CHILLED PLOWS. THELUS M. BISSELL, South Bend, Ind. Filed Dec. 20, 1881. (No model.)

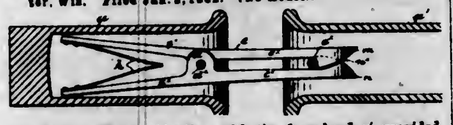


Claim.—1. A bolt formed as herein described—that is to say, with a round shaft of uniform diameter, having at one end a screw-thread and at the other a shouldered oblong conical head, all substantially as set forth.

2. The combination, with a chilled mold-board provided with oval apertures, of a bolt constructed with a shaft of uniform diameter, having a screw-thread at one end and a shouldered oblong conical head at the other, all as herein described and shown.

256,276. AIR-PUMP. NAPOLEON B. BLACKMER, Portage, Wis. Filed July 15, 1881. (Model.)

Brief.—By moving the handle H up and down air is alternately admitted and expelled from each end of the cylinder, air being admitted behind the piston through valves *i* as it is receding and expelled through exhausts *e*. By means of a lug, P, on lever H the valves are opened and closed at every stroke.



Claim.—1. The combination, with the piston and its rod, of the cross-head, guide-rods, lever, and link, substantially as and for the purposes herein specified.

2. The combination, with the flexible packing-ring, of the piston, rod, plate, sleeve, screw, cross-head, and nut, as set forth, substantially as and for the purposes specified.

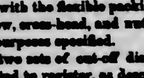
3. In an air-pump, two sets of cut-off disks, each set being provided with holes adapted to register, as described, in combination with an operating-lever and a connecting-rod, whereby the sets are alternately worked, as set forth.

256,277. CAR-COUPLING. FERDINAND J. BLANKE, Whitewater, Wis. Filed Jan. 5, 1882. (No model.)

Claim.—The combination, with the draw-head *a'*, provided with the coupling-pin *d'*, of the draw-head *a*, arms *c' c'*, centrally pivoted together by the coupling-pin *c*, and provided with the half arrow-heads *m m*, the former having a projection, *m'*, and the latter a recess, *n'*, and the springs A, secured to the inner faces of the rear ends of the arms *c'*, and having their front ends bearing against each other, substantially as described, and for the purpose set forth.

256,278. MACHINE FOR SEWING BUTTONS TO FABRICS. ALBERT BERCHARDT, Weehawken, N. J. Filed Dec. 3, 1881. (Model.)

Brief.—A clamp adapted to hold a button by its edge and to be carried by the bed-plate or other laterally-moving part of a sewing-machine presses the button directly upon the fabric to which it is to be sewed, thus holding it in alignment with the needle.



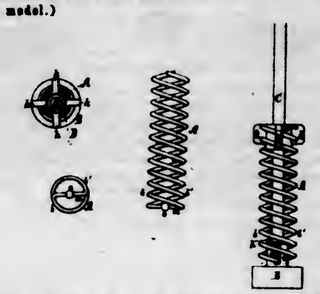
Claim.—1. The button-holder B, provided with means for holding a button by its edge, so that it may be lowered upon the fabric, in combination with means, substantially as described, for pressing the button directly upon the surface of the fabric to which it is to be sewed, as set forth.

2. The button-holder B, provided upon its under surface with a fixed bearing for a portion of the edge of the button, and with a movable jaw bearing with elastic pressure upon the edge of the button and serving to hold the button in place, in combination with means for pressing the button directly upon the surface of the fabric to which it is to be sewed, substantially as described.

3. The slotted plate A, in combination with the hinged plate C and the button-holder B, adapted to carry a button, substantially as and for the purpose set forth.

256,279. CUTTER-BAR FOR HARVESTERS. NIC. BOHNS, Jr., Hanbstadt, Ind. Filed Sept. 1, 1881. (No model.)

Claim.—As an improvement in cutter-bars for harvesters, the combination of the grooved or recessed bar A, having studs G G on both sides of the central longitudinal recess, B, the sliding bar C, having step D, threaded projection E, and studs H, the nut F, and the removable knives or cutters I, having notches K K L, and recesses J, formed in one side between the notches K K, as herein described, for the purpose shown and specified.



256,280. COUPLING. FELIX BROWN, New York, N. Y. Filed Dec. 21, 1881. (No model.)

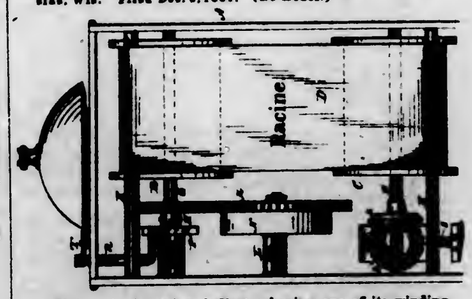
Claim.—1. The combination, in a coupling, of a recessed body with the clamps B, located within the same, and the devices for tightening up the clamps, consisting each of a wedge having at one end a screw-threaded bolt adapted to receive the tightening-nut, substantially as described.

2. The combination, in a coupling, of the recessed body A with the clamps B, each having a portion of one of its sides resting against a shoulder within the said body, and the devices for tightening up the clamps, each consisting of a wedge applied against one side of the clamps and having at one end a screw-threaded bolt, whereon the tightening-nut is fitted, substantially as described.

256,281. SPRING-CONNECTION FOR INDICATOR-PISTONS. GILMAN W. BROWN, West Newbury, assignor to Crosby Steam Gage and Valve Company, Boston, Mass. Filed Oct. 8, 1881. (No model.)

Claim.—1. The wire spring as composed of the median straight portion, *a*, and the two spirals *b b'*, extended therefrom and arranged with each other substantially as represented.

2. The nut D, as having in each of its wings holes, as described, and the spring-coils extended into and through such holes, and where within such surrounded entirely by the metal or material of the wing, all being substantially as represented.



3. The piston-head B, provided with the tubular and slotted shank *c*, in combination with the piston-rod screwed into the said shank, and with the spring A, as composed of the median portion, *a*, and the two spirals *b b'*, arranged therewith and with each other substantially as set forth, the said median portion, *a*, being arranged within and across the said shank, and all being substantially as described.

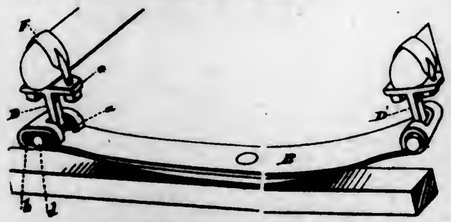
4. The spring constructed of the median portion and two spirals and provided with the ball, all being substantially as represented.

5. The combination of the spring made and provided with the ball, substantially as described, with the piston head and rod connected and socketed to receive the ball, essentially as set forth.

6. The piston-head provided with the adjustable stop or socket-ed screw *d*, in combination with the piston-rod C, socketed at its lower end, as described, and with the spring A, provided with the ball *c*, and composed of the median part, *a*, and the two spirals *b b'*, arranged as set forth.

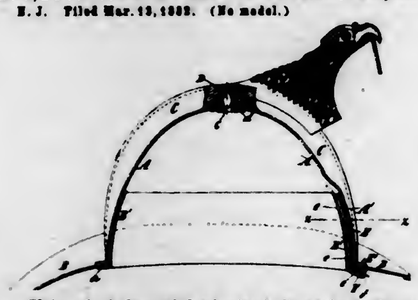
256,282. STATION-INDICATOR. JONATHAN S. BROWN, Racine, Wis. Filed Dec. 8, 1881. (No model.)

Claim.—1. A station-indicator having one of its winding-drums, C, secured to a shaft, *g*, provided with a bevel-wheel, *h*, meshing with a bevel-wheel, *h'*, on a shaft, *l*, having a cam, *m*, with peripheral projections *p* and concaves *n*, in combination with a drum, E, geared to a toothed wheel, K, carrying a spring, I, whereby the latter drum is turned in a direction to wind the strip D from the lower to the upper drum, substantially as specified.



2. In a station-indicator, the combination, with the drum B on the shaft G, having the pinion H and trip-wheel I', the barrel-wheel K, having spring J, and the drum C on shaft g, having bevel-wheel h, shaft l, having cam m, with projections p, concaves n, and bevel-wheel K', and the spring-stop e, of the rollers E E and strip D, and the pest T, arm a, angle-lever b, bell-hammer c, spring e, and bell V, substantially as specified.

256,283. ANALGAMATOR. WILLIAM TRAVIS BROWNE, Stockton, Cal. Filed Aug. 30, 1881. (No model.)



Claim.—The inner pan or distributor, C, with its central feed-pipe, D, and having the scraper E, in combination with the outer mercury-containing pan, A, within which it is pivoted, so as to be rotated with its bottom immersed in the mercury, said outer pan having its bottom formed with a series of depressions, substantially as and for the purpose herein described.

256,284. VEHICLE-SPRING. GEORGE O. BUCKLAND, Tulare, Cal. Filed Jan. 23, 1882. (No model.)

Claim.—In a vehicle, the spring B, having its end slotted and formed into an elongated journal-socket, b, in combination with the shackle D, having a cross-bar, d, working in the socket b, and having a slight play therein, said shackle having a cross-head, e, adapting it to be secured to the body or frame of the vehicle, substantially as and for the purpose herein described.

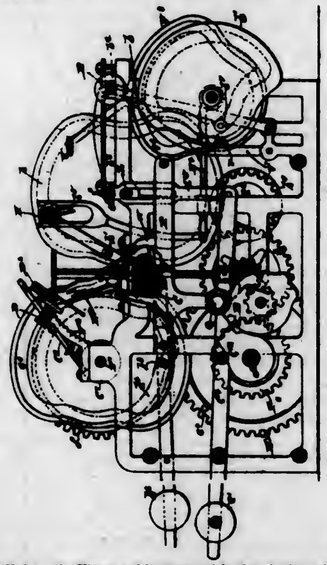
256,285. FIREMAN'S HAT. IRVING GAINES, Jersey City, N. J. Filed Mar. 13, 1882. (No model.)

Claim.—1. A fireman's hat having in its comb a cavity provided with one or more lateral openings leading through the side or face of the comb, and an opening or duct leading from said cavity to the interior of the skull, substantially as and for the purpose specified.

2. The combination, with the skull and comb of a fireman's hat, of a metallic air conductor or casing inclosed in the comb, and provided with lateral openings leading through the sides or face of the comb, and also provided with an opening or air-duct leading to the interior of the skull, substantially as and for the purpose specified.

3. The combination, with the comb C, provided with openings in its back and front, of the conductor or casing D, having the lateral openings b on both sides, and the tube C, extending into the skull, substantially as and for the purpose specified.

4. A fireman's hat having in the front, between the skull and lining, a passage or passages extending downward and thence forward under the brim, substantially as and for the purpose specified.



5. The combination, with the skull A, provided in its front with the recess or depression A', of the corrugated plate E and its flange E' and the cap-plate F, all substantially as and for the purpose specified.

256,286. PROCESS OF PRODUCING METALLIC PANELS WITH ARTISTIC DESIGNS. HENRY R. GASSER, New York, N. Y., assignor, by mesne assignments, to himself and Christian Hanfeld, Jr., same place. Filed May 24, 1880. (Specimens.)

Claim.—The method herein described of producing metallic panels with artistic designs, and which consists of the following successive steps: first obtaining the desired design on a metal sheet by means of photography and photo-engraving, then coating the engraved metal sheet with a colored varnish, japan, or other suitable enamel, then drying the enamel by suitable means, then removing the surplus of the enamel when thoroughly dry by grinding or other means until the relief-surface of the metal is laid bare and substantially made even with the surface of the enamel, and finally electroplating the metal sheet to form the background of the design, all as described, and for the purpose set forth.

256,287. MACHINE FOR MAKING FISH-NETS. JEAN CHARBINE, Lyons, France, assignor, by direct and mesne assignments, to Pierre J. Boris, Boston, Frank O. Kincaid, Somerville, and Osceola A. Whitmore, Malden, Mass. Filed Sept. 26, 1881. (No model.) Patented in France Oct. 26, 1880.

Brief.—The devices comprised in this machine are adapted to form nets or seins of the description known as the "diagonal mesh," automatically tying the threads or cords into knots known as the "fisherman's" or "double-bowline" knot, by which a net similar to that made by hand is produced. Mechanism is provided for forming the warp-threads into loops, and by a novel contrivance, termed a "brochour," having a peculiar operation, the weft-threads are carried, first, around the loops of the warp-threads, forming the first part of the knot, and next back through the spread loop of the warp-threads, completing the knot and drawing it tight over mold-bars, the size of which determines the size of the mesh.

Claim.—1. The combination, with the devices for forming the warp-threads into loops, of the brochours carrying the weft-threads, mechanism for causing said brochours first to form a half-hitch of the weft-threads around said loops and then for passing the weft-threads through the loops to complete the knot, devices for tightening the knots, and devices for shifting the thread-holder so as to move the warp-threads laterally, in order to form the diagonal mesh, substantially as described.

2. The brochour-frame, the brochour carrying a reel, and mechanism for causing said brochour to turn upon two centers upon the brochour-frame to engage the weft-thread with the warp-thread in the manner described, in combination with devices for manipulating and looping the warp-threads, whereby the brochour in turning upon one center will pass the weft-thread around a loop in the warp-thread, so as to form a half-hitch thereround, and in turning around the remaining center will pass the weft-thread through the loop formed in the warp-thread to form the second hitch and complete the knot, substantially as described.

3. The combination of the oscillatory brochour-frame carrying a series of pinions having heads upon their spindles and a rack-bar for actuating the said pinions with the brochour carrying a reel and adapted to engage and turn with the heads of the pinion-spindles, substantially in the manner and for the purpose specified.

4. The combination of the oscillatory brochour-frame provided with the fingers having hooks, the brochours supported by said frame and carrying reels for the weft-threads, the swinging thread-holder for the warp-threads, adjusted to be brought into position above the fingers of the brochour-frame, the thread-holder adapted to bring the warp-thread down to form a loop, and mechanism for imparting the movements specified to the thread-holder and thread-leader, substantially as and for the purpose described.

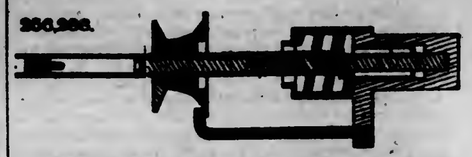
5. The oscillatory brochour-frame provided with a series of fingers having hooks, the rotary pinions d^2, having heads D^2 upon their spindles, and the brochours D, each carrying a reel and formed with two grooves capable of receiving the heads of the pinion-spindles, combined with mechanism for imparting the necessary oscillatory movement to the pinions d^2, substantially as described.

6. The combination of the mold-bars M M' with the swinging thread-leader, the thread-holder H, constructed and adjusted to engage the warp-thread and to coact with the thread-leader in forming the warp-thread into a loop above the mold-bars, the oscillatory brochour-frame d, the brochour D, carrying a reel for the weft-thread and movable on two centers, and a part revolution upon a second center, in the manner described, so as to carry the warp-thread through said loop, and mechanism for imparting the necessary movements to said devices, substantially as described.

7. The combination of the oscillatory brochour-frame, the brochours D, carrying reels for the weft-threads, the pinions having heads upon their axles for turning the brochours, the slidable rack-bar located to engage said pinions, and the star-wheels adjusted to act at different periods upon the rack-bar in order to reciprocate the same, and mechanism for imparting the necessary movements to the slidable rack-bars and star-wheels, substantially as described.

8. The combination, with the oscillatory brochour-frame d, of the brochours D, carrying reels for the warp-threads, the pinions d^2, carrying the brochours upon their spindles, the slidable rack-bar engaging said pinions, the segmental racks engaging said wheels upon the brochour-frame, the star-wheels, mechanism for intermittently actuating the star-wheels, and mechanism for operating the brochour-frame, whereby the segmental racks oscillate the brochour-frame, substantially as described.

9. The combination, with the swinging bar H', carrying the thread-holder H, of the thread-holder H, provided with devices for engaging the warp-threads, and mechanism timed for sliding the thread-holder upon its supporting-bar, substantially as described, and for the purpose set forth.



10. The combination, with the supporting-bar H', carrying the thread-holder H, of the vertically-movable bar I and devices timed to raise said vertically-movable bar in position to tilt the thread-holder so as to spread the loop, substantially as described.

256,288. SPINDLE AND DEVICE FOR LUBRICATING THE SAME. CHARLES E. CHAPMAN, Shirley, Mass., assignor to the Sawyer Spindle Company, of Massachusetts. Filed Mar. 13, 1881. (No model.)

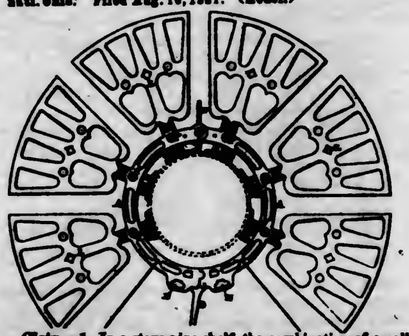
Brief.—The invention is an improvement on Letters Patent No. 233,474, and is designed to lubricate the spindle by direct pressure on the oil. The flange on the lower end of the spindle, acting as a piston within the oil-reservoir, forces the lubricant up through the groove in the standard to the bearing-surfaces of the spindle when the latter returns to its normal position after being raised in the act of doffing the bobbin. Means are also provided for preventing the oil in the reservoir from working upward on the walls thereof and escaping over the top.

256,289.

Claim.—1. The combination, substantially as set forth, of a grooved standard, an oil-reservoir surrounding the base of the standard, and composed of a contracted annular portion and enlarged portions above and below the same, a bearing on said standard for the spindle, a spindle supported on said bearing movable longitudinally with relation to said standard, and provided at its lower end with a flange fitting closely in the contracted portion of the oil-reservoir, an air-space in the spindle above the standard, and a stop to limit the upward movement of the spindle on the standard.

2. The combination, with the rotary spindle, of the oil-reservoir surrounding the base of said spindle, and provided with a spiral inwardly-projecting flange separated from the spindle, and adapted to prevent the oil from working upwardly on the walls of the reservoir, as set forth.

256,289. BEDSTEAD-LOCK. CHARLES H. CLARK, Rochester, N. Y. Filed Mar. 13, 1882. (No model.)



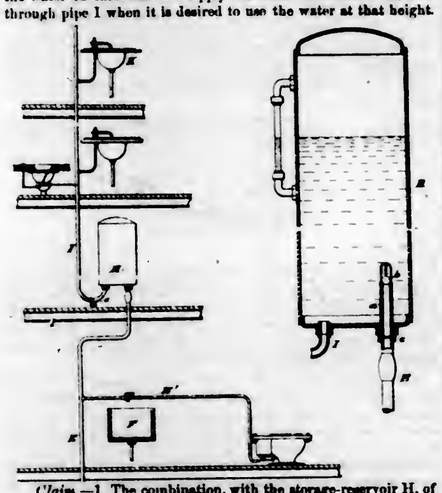
Claim.—1. In combination with the side rail and post of a bedstead, the plates F and G, each being provided with a longitudinal inclined locking-lip and channel parallel with said locking-lip, substantially as shown, the locking-lip of either plate being adapted to rest within the channel of the other when the two said plates are locked together, as described.

2. In combination with the side rail and post of a bedstead, the plates F and G, each being provided with a longitudinal inclined locking-lip and channel parallel with said locking-lip, substantially as shown, the locking-lip of either plate being adapted to rest within the channel of the other when the two said plates are locked together, means being provided to prevent said plates from sliding by each other and binding by friction on account of the tapering or wedge-shaped parts of the plates.

3. In combination with a post and side rail of a bedstead, the locking-plates F and G, substantially as shown and described, secured to the respective surfaces of the post and side rail—that is to say, secured to said post and side rail without being let into the timber of the same, substantially as set forth and shown.

4. In combination with the side rail and post of a bedstead, the plates F and G, each being provided with a locking-lip and channel, substantially as shown, the plate F being provided with the shoulder or guide-line g, substantially as and for the purpose set forth.

256,290. STOVE-PIPE SHELF. HERBERT CLAYTON, Cincinnati, Ohio. Filed Aug. 10, 1881. (Model.)

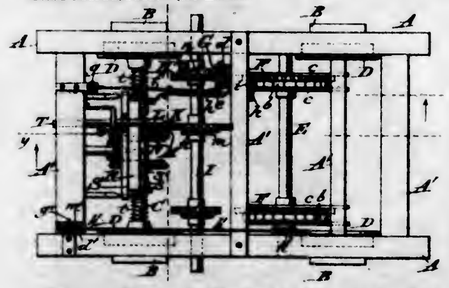


Claim.—1. In a stove-pipe shelf, the combination of a collar formed in two parts and fastened together substantially as shown, and provided with openings B for the attachment of the leaves directly to the collar, with adjustable clamps which hold the collar in position upon the stove-pipe and form supports for other leaves, substantially as described.

2. The combination of the two sections of the collar A, fastened together at one of their ends by means of the screw or bolt B, with a hook which has an eye formed upon its upper end, and which is secured to the collar by means of the bolt B, substantially as set forth.

3. The combination of the two sections A, the clamps G, having the grooves *b* made in their under sides, the nuts *a*, and the clamping-bolts F, the sections A being provided with the flanges I, to catch in the notches in the tops of the clamps, substantially as set forth

256,291. AUTOMATIC STORAGE PRESSURE RESERVOIR. RICHARD R. COGGIN, Brooklyn, N. Y., assignor of one-half to John A. Scallay, same place. Filed Dec. 24, 1881. (No model.)



Brief.—Water rising in pipe E raises check *c* and compresses the air in tank H, so that there will be sufficient pressure above the water in said tank to supply the water to basins J K, &c., through pipe I when it is desired to use the water at that height.

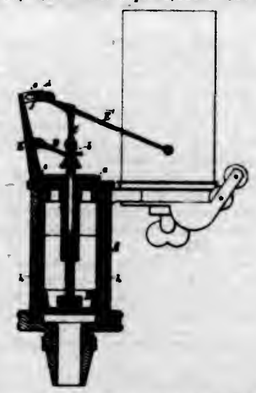
Claim.—1. The combination, with the storage-reservoir H, of the main service-pipe E, arranged to admit water at its bottom, the check-valve *b*, arranged to control the inlet, as shown, and the auxiliary service-pipe I, arranged to supply water from the reservoir to cocks beyond, all arranged substantially as herein set forth.

2. The combination, with the reservoir, of the spud *a*, secured in its bottom and arranged to project upward into the same, the caged check-valve *b*, arranged to close the inner end of the spud, the tip *c*, and the auxiliary service-pipe I, all constructed and arranged substantially as and for the purposes set forth.

256,292. CAR-PROPELLER. JACOB H. COLE, Danville, Pa. Filed Feb. 23, 1882. (No model.)

Claim.—1. In a car-propeller, the combination, with the shaft E, having spur-wheels F, provided with ratchets *b* and springs *c*, and shaft I, having loose spur-wheels H and K, provided with spring-pawls *m*, and fixed ratchets *n*, of one or more spur-wheels, G, journaled upon an eccentric shaft or shafts supported in suitable brackets, a pawl, *i*, adapted to engage with the ratchet *b*, and a lever, *g*, and rods *f* and *h*, connecting with said pawl and with a crank, *d'*, on the eccentric-shaft *c*, substantially as shown and described.

2. In a car-propeller, the combination of the frame A and A', the shaft E, having spur-wheels F, provided with ratchets *b* and springs *c c*, the spur-gears G, journaled upon eccentric-shafts *c*, having crank-arms *d'*, the shaft I, having loose spur-gears H K, provided with spring-pawls *m m*, and fixed ratchet-wheels *n n*, keyed to said shaft, the axle C, having spring-clutches *e e*, gears L, M, N, and N', the gears L and N' being provided with clutch-jaws *e' e'*, the intermediate gear, P, connecting the gears N N', the sliding bar R, having arms Q Q, lever T, having pins *d'*, adapted to retract the pawl U from its engagement with the ratchet M, and the lever *g* and rods *f h*, for retracting the pawl *i* and raising the cog G out of gear, all substantially as shown and described.

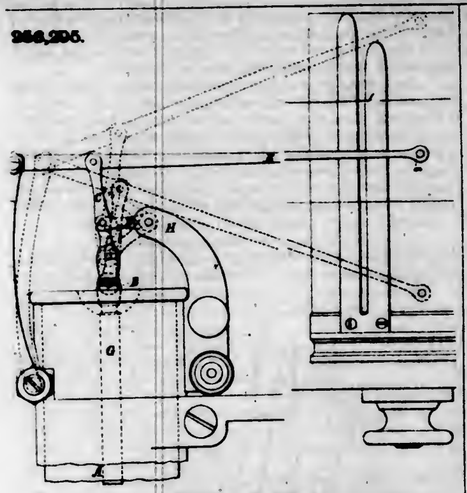


3. In a car-propeller, the combination, with the wheel F, having springs *c c* and pulley *h'*, of the standard B', having dial *n'*, the pulley *d'*, journaled in said standard, and having a shaft provided with an index, *g'*, and the band *h'*, connecting the pulleys *d'* and *h'*, whereby the expanded force of the springs is indicated upon the dial, substantially as described.

256,293. COUPLING-PIN FOR CONNECTING-RODS, &c. WILLIAM H. OSBURN, Dunkirk, N. Y., assignor of one-half to Henry K. Dow, same place. Filed Mar. 2, 1882. (No model.)

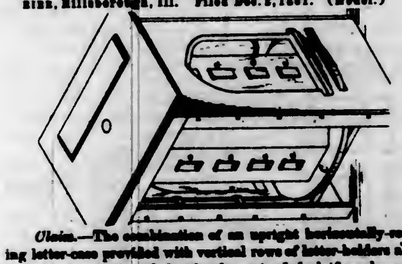
Claim.—The combination, with the parts A and B, of a slotted sleeve, E, and a tapering bolt, I, whereby the parts A and B are connected, substantially as set forth.

256,294. STEAM-ENGINE RECORDER. GEORGE H. CROSBY, Somerville, Mass. Filed Sept. 12, 1881. (No model.)



Claim.—1. The indicator-cylinder provided with the annular chamber *h*, arranged therein, and to open at its lower part into the bore of the cylinder, all being substantially and for the purpose as specified.

2. The post E and its projection *f*, slotted as described, arranged and combined as set forth, with the marker-lever E', connected with the piston by the lever C, having its shorter arm jointed to the said post by a link, D, all being substantially as specified and represented.

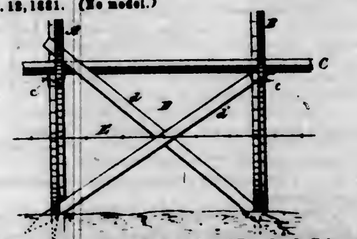


256,295. STEAM-ENGINE RECORDER. GEORGE H. CROSBY, Somerville, Mass. Filed Jan. 6, 1882. (No model.)

Claim.—In combination with the post H and the marker-lever E and its piston-rod and cylinder-sleeve, connecting-links C and F, arranged as described, the link D as jointed to the post H and to the link C, and with such post arranged under the lever E, all being substantially and to operate as set forth.

256,295.

256,296. REVOLVING LETTER-CASE. AUGUSTUS S. CURRIER, Hillsborough, Ill. Filed Dec. 8, 1881. (Model.)



Claim.—The combination of an upright horizontally-revolving letter-case provided with vertical rows of letter-holders alphabetically arranged, and the circular extended platform-base, with a glass-faced inclosing-case open only inside of the office and provided with an aperture through which protrudes a portion of said platform, substantially as described.

256,297. INSTRUMENT FOR ATTACHING BUTTONS. JAMES W. DAVIS, Detroit, Mich., assignor to the Belle Patent Button Fastener Company, same place. Filed Jan. 26, 1882. (No model.)

Claim.—In an instrument for attaching buttons, the combination, with the jaws A B, the clinching-plate E, and the spring C, of the plate D, provided with lips *b b*, bent at an angle to the jaw to form a firm and flat base for supporting the button, substantially as set forth.

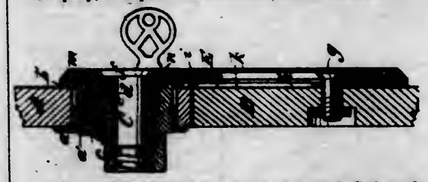
256,298. FENCE. HORATIO P. DAVIES, Fairfield, Tex. Filed Dec. 13, 1881. (No model.)

Claim.—1. In a fence, the bars A and B and pale C, in combination with the bars *d d'*, substantially as shown and described.

2. In a fence, the bars D, having their lower ends driven into the ground at the base of the bars A and B, the upper end of the bar *d* being placed in the crotch of the bars A in front of the pale C, and the bar *d'* crossing in front of the bar *d* and sprung behind both the bars B, substantially as and for the purposes set forth.

256,299. PROCESS OF REFRIGERATING AND PRESERVING MEAT AND OTHER ARTICLES. EDWARD H. DICKERSON, Jr., New York, N. Y. Filed Mar. 2, 1882. (No specimens.)

Brief.—The gas to be used may be prepared as described in Letters Patents No. 241,977, dated May 17, 1881, and No. 243,546, dated June 7, 1881, granted to C. F., A. W., and A. L. Lawton, and may be cooled as described in Letters Patent No. 256,261, dated April 6, 1882, granted to J. J. Coleman.



Claim.—1. The process of preserving putrescible bodies which consists in subjecting them to carbonic-oxide or similar decay-preventing gas artificially reduced to a low temperature, substantially as described.

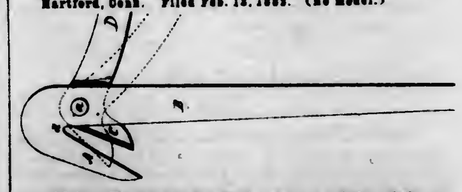
2. The process of preserving putrescible bodies which consists in subjecting them to mechanically-produced currents of carbonic-oxide or similar decay-preventing gas, substantially as described.

3. The process of preserving putrescible bodies which consists in subjecting them to mechanically-produced currents of carbonic-oxide or similar decay-preventing gas artificially reduced to a low temperature, substantially as described.

4. The process of preserving putrescible bodies which consists in subjecting them to carbonic-oxide or similar decay-preventing gas at a greater pressure than the external barometric pressure, said gas being artificially reduced to a low temperature, substantially as described.

256,300. TRUNK-LOCK. THOMAS DONAHUE and GEORGE H. WATHERBURY, Terryville, Conn., assignors to the Eagle Lock Company, same place. Filed Jan. 6, 1882. (Model.)

Claim.—1. The combination of locking-bolt C, formed with a screw and an outer flange, *f*, cylindrical case *e*, provided with an internal screw and locking-pins and sliding loop E, having a slot, *l*, and recessed face, substantially as shown and described, for operation as specified.



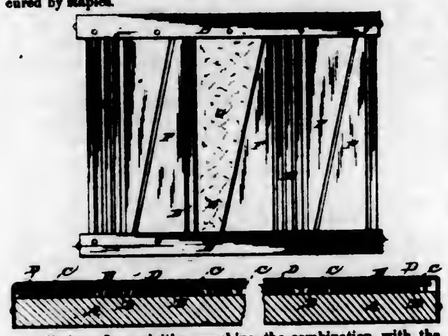
2. In trunk-locks, the cylindrical lock-case *b*, provided with flange *b'*, screw-collar *a*, and key *a'*, combined for connection to the trunk-cover, substantially as shown and described.

3. In a trunk-lock, the combination, with the locking-bolt C and the sliding loop E, provided with the slot *l* in its upper end, of the ring *a*, provided with the filling-piece *m*, and fitted loosely upon the bolt, substantially as herein shown and described, whereby it is adapted to accommodate itself to the loop and to fill out said loop above the bolt, as set forth.

4. In a trunk-lock, the combination, with the locking-bolt C, provided with the recesses *c c'*, cut away at one side, of the spring-pressed stop-pin *d*, engaging with the notches of the said bolt, substantially as and for the purpose set forth.

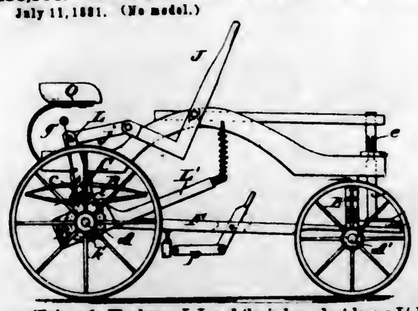
5. In a trunk-lock, the combination of loop E, having slot *k* and pin *i*, with bolt *g* and slotted plate *h*, substantially as shown and described.

256,301. BALE-BAND CUTTER. THOMAS C. DOOLITTLE, New Hartford, Conn. Filed Feb. 13, 1882. (No model.)



Claim.—The herein-described cutters, consisting of the one handle, B, provided with a hook-shape blade, A, for insertion beneath the band, combined with the second handle, D, provided with a blade, C, corresponding with the blade A, the two pivoted together at a point above the cutting-edge of both blades, the heel *d* of the blade A forming a bearing against which one edge of the

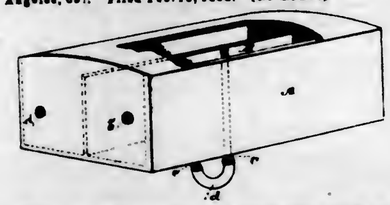
band rests, and whereby the cutting of the blades commences at their point ends and cuts from the opposite edge of the band toward the heel of the blades, substantially as described.



256,302. PLAITING-MACHINE. SAMUEL I. ECHOLS, Memphis, Tenn. Filed Jan. 30, 1882. (Model.)

Brief.—The strips and plates are held in place by wires secured by staples.

Claim.—In a plaiting-machine, the combination, with the sides A, of the transverse ribs and triangular plates connected to said sides by means of wires C, secured by staples D, and the sheet-metal binding E, substantially as and for the purpose herein set forth.

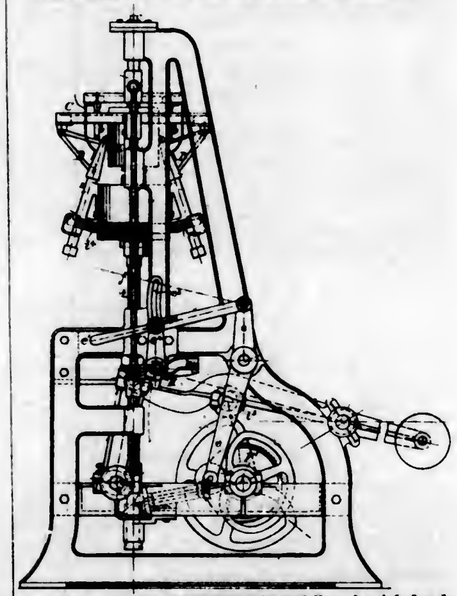


256,303. VELOCIPEDE. ELIAS EDWARDS, Romeo, Mich. Filed July 11, 1881. (No model.)

Claim.—1. The levers L L and the independent levers L' L', journaled upon the hubs, and the ratchet-wheels *h h*, secured upon the hubs, in combination with the angle-levers J J, links *j j*, and the cross-bar A, whereby the levers may be operated by the hands and feet of the rider, substantially as specified.

2. The annular ring G, formed with the cam-slots *g*, in combination with the sliding rods *b*, substantially as and for the purposes set forth.

256,304. HYDROCARBON-BURNER. EVAN A. EDWARDS, Los Angeles, Cal. Filed Feb. 18, 1882. (No model.)



Claim.—1. A liquid-hydrocarbon burner consisting of the box or casing A, provided with a vertical longitudinal diaphragm, B, open above and dividing said box into separate compartments *a b*, connected above over the top of the diaphragm, and having separate entrance-apertures and a common exit or exits, substantially as herein described.

2. A liquid-hydrocarbon burner consisting of a box or casing, A, provided with a vertical longitudinal diaphragm, B, open above, dividing said box into separate compartments *a b*, connected above over the top of the diaphragm, and having separate entrance-apertures *a' b'*, and a common exit-pipe, C, opening from within the box near the top, and extending down under the box and turned upward, as shown, substantially as herein described.

3. A liquid-hydrocarbon burner consisting of a box or casing, A, provided with a vertical longitudinal diaphragm, B, open above, dividing said box into separate compartments *a b*, connected above over the top of the diaphragm, and having separate entrance-apertures *a' b'*, in combination with a common exit pipe or nipple, C, opening from within the box near the top and extending downward, and provided with a return-bend, *d*, the end of which extends upward under the box, and is closed with a plug, *e*, having a small opening, *e*, as shown, substantially as herein described.

256,305. HAT-STRETCHING MACHINE. RUDOLF BICKENBACH, Yonkers, N. Y. Filed Jan. 30, 1882. (No model.)

Claim.—1. The combination, substantially as hereinbefore described, of a series of automatically reciprocated or vibrating brim-stretching fingers and fulcrum and finger plates, either of which is movable toward the other while the fingers are in motion, for varying the position of the working-faces of the fingers, as set forth.

2. The series of automatically reciprocated or vibrating brim-stretching fingers provided with variable fulcra, substantially as described.

3. The series of automatically reciprocated or vibrating brim-stretching fingers provided with automatically-variable fulcra, substantially as described.

4. The combination, substantially as hereinbefore described, of the reciprocating or vibrating brim-stretching fingers, the movable fulcrum-plate, the cam, levers, and links for automatically varying the position of the fulcrum-plate while the fingers are in motion, as set forth.

5. The combination, substantially as hereinbefore described, of the reciprocating or vibrating brim-stretching fingers and the movable fulcrum-plate with the cam for moving said plate, and adjustable connections between said cam and plate for varying the position of said plate, and thereby varying the positions of the working-faces of the finger, as set forth.

6. The combination, in a brim-stretching former, of ribs and a rotative supporting-shell, substantially as described.

7. The combination, with brim-stretching ribs, of a vertically-adjustable rotative shell, substantially as described.

8. In a brim-stretching former, axially-rotative ribs, substantially as described.

9. The combination, substantially as hereinbefore described, of the axially-rotating former-ribs and the mechanism by which said ribs are rotated.

10. The combination, with a series of rotating stretching-ribs and their rotating mechanism, of a stop-motion whereby the rotation of said ribs is controlled, substantially as described.

11. The combination, with the rotating ribs, of compressing-springs, substantially as described, for forcing the hat-body into good contact with said ribs.

12. The combination, with the rotating ribs, of the movable compressing-springs, substantially as described, whereby a hat-body is not only held in good contact with the ribs but forced downward thereon.

13. In a brim-stretching machine, the combination, substantially as hereinbefore described, of reciprocating or vibrating stretching-fingers and ribs co-operating therewith as stretching devices, and mechanism for automatically varying the working positions of the surfaces of the stretching devices during the stretching operation, as set forth.

14. The combination, substantially as hereinbefore described, of automatically reciprocated or vibrated brim-stretching fingers and a former co-operating therewith, which is automatically placed into and out of working relations with the fingers, as set forth.

15. The combination, substantially as hereinbefore described, of the reciprocating or vibrating brim-stretching fingers and a former which is automatically lifted into working relations with said fingers, then gradually lifted during the stretching operation, and then lowered from said fingers, as set forth.

16. The combination, substantially as hereinbefore described, of the reciprocating or vibrating brim-stretching fingers, the former, said fingers and former being automatically placed into and out of working relations, and a stop-motion for maintaining them in a separated condition, as set forth.

17. The combination, substantially as hereinbefore described, of the reciprocating or vibrating brim-stretching fingers, the former automatically lifted to and lowered from said fingers, and a stop-motion, which causes said former to rest at its lowest position, as set forth.

18. The combination, substantially as hereinbefore described, of reciprocating or vibrating brim-stretching fingers, a former, and means for rotating a hat-body on the former during the stretching operation, substantially as described.

19. The combination, substantially as hereinbefore described, of the reciprocating or vibrating brim-stretching fingers and a former having rotating ribs.

20. The combination, with the stretching-fingers and a former having a shell free to rotate, of a rotative stripper-weight, substantially as described.

21. The combination, with the former, its spindle, and levers, of the two-part cam-shaft and the differential gearing, substantially as described.

256,306. PARQUET-FLOOR. ROBERT W. HUTCHER, New York, N. Y. Filed Dec. 9, 1881. (No model.)

Brief.—A panel composed of sections of wood or stone united by exterior metallic bands and internal intervening metal strips.

Claim.—As a new article of manufacture, a tile or panel for parquet-flooring, composed of sections of wood or stone which are united with each other by internal lateral connecting devices and by exterior metallic bands, substantially as set forth.

256,307. INSTRUMENT FOR SETTING BUTTONS. FRANK H. FARNSWORTH, Detroit, Mich., assignor to the Bolle Patent Button Fastener Company, same place. Filed Jan. 26, 1882. (No model.)

Claim.—In an instrument for attaching buttons, and in combination with the jaws and spring F, the finished spring G, arranged and adapted to serve as and for the purposes specified.

256,308. UMBRELLA OR PARASOL SUPPORT. JOSEPH FORSTER, Vienna, Austria-Hungary. Filed Jan. 3, 1882. (No model.) Patented in Austria July 30, 1879, and Apr. 15, 1880, in Hungary July 30, 1879, and Apr. 12, 1880, in England June 11, 1880, in France Aug. 25, 1880, in Belgium Oct. 18, 1880, in Italy Oct. 16, 1880, and in Germany May 18, 1881.

Brief.—The umbrella-support is formed of four rods pivoted to each other at the ends, the top ends of the upper rods being pivoted to the middle of the umbrella-top frame, the lower ends of the lower rods being pivoted to each other at the handle end of the umbrella-support.

Claim.—1. An umbrella or parasol constructed, substantially as herein shown and described, with a support formed of a series of rods pivoted to each other and constituting a frame which forms two parallel rods when the umbrella is closed and an irregular quadrangle or lozenge when the umbrella is opened, whereby the head and hat of the person carrying the umbrella or parasol can be placed within the quadrangle, so as to be directly under the middle of the umbrella-top, as set forth.

2. The combination, with an umbrella-top, of a support formed of two rods provided with hinges between their ends, these rods being pivoted to each other at the lower or handle ends and at their upper ends at the middle of the umbrella-top frame, substantially as herein shown and described, and for the purpose set forth.

3. The combination, with the umbrella-top A', of the rods A, B, C, and D, forming the folding support for the umbrella-frame, of which rods C D are pivoted to each other at the middle of the umbrella-top frame, the upper end of the rod A being pivoted to the lower end of the rod C, the upper end of the rod B to the lower end of the rod D, and the lower ends of the rods A and B pivoted to each other, substantially as herein shown and described, and for the purpose set forth.

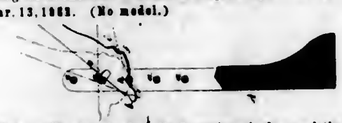
4. The combination, with the umbrella-top A', of the rods A, B, C, and D, pivoted to each other in the manner described, and of the brace-bars E, pivoted to one of the upper rods, C or D, and to a sleeve, *c*, sliding in the other upper rod, C or D, substantially as herein shown and described, and for the purpose set forth.

5. The combination, with the umbrella-top A', of the rods A, B, C, and D, pivoted to each other in the manner described, of the pivoted brace-bars E, the sliding sleeve *c*, and a locking device attached to this sleeve, substantially as herein shown and described, and for the purpose set forth.

6. The combination, with the umbrella-top A', of the rods A, B, C, and D, pivoted to each other in the manner described, of the brace-bars E, the sliding sleeve *c*, to which one end of the bars E is pivoted, the stud or catch *h'*, projecting from that upper rod, C or D, on which the sleeve *c* slides, and the latch *f* on the sleeve *c*, substantially as hereinbefore and described, and for the purpose set forth.

7. The combination, with the umbrella-top A', of the rods A, B, C, and D, pivoted to each other as described, the umbrella-point *c'*, and the brace-bars E, and devices for locking these brace-bars, substantially as herein shown and described, and for the purpose set forth.

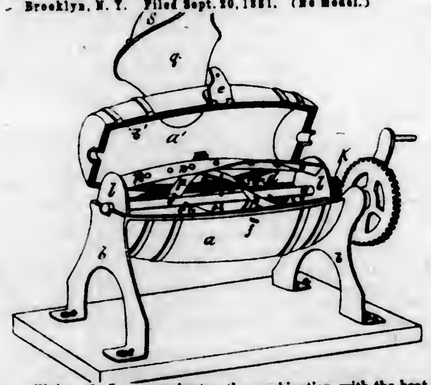
8. The combination, with the umbrella-top A', of the rods A, B, C, and D, pivoted to each other as described, umbrella-point *c'*, the plates *a* and *b*, the brace-bars E, and devices for locking these brace-bars, substantially as herein shown and described, and for the purpose set forth.



9. The combination, with the umbrella-top A', of the rods A, B, C, and D, pivoted to each other as described, the umbrella-point *c'*, the crown-plate *a*, to which the ribs *n* are pivoted, the cap *c'*, the brace-bars E, and of devices for locking these brace-bars, substantially as herein shown and described, and for the purpose set forth.

10. The combination, with the umbrella-top A', of the rods A, B, C, and D, pivoted to each other in the manner described, of the sleeves *l l*, adapted to slide on the lower rods, A and B, the

brace-rods *m*, pivoted to these sleeves and to the ribs *n*, and of devices for locking these sleeves *l l* in position, substantially as herein shown and described, and for the purpose set forth.



11. The combination, with the umbrella-top A', of the rods A, B, C, and D, pivoted to each other as described, the sleeves *l l*, provided with slots *o*, and adapted to slide on the lower rods, A and B, the brace-rods *m m*, pivoted to these sleeves *l l* and to the ribs *n*, and the locking-springs *k k* on the rods A and B, for locking the sleeves *l l* in position, substantially as herein shown and described, and for the purpose set forth.

256,309. CARRIAGE-JACK. WILLIAM A. FOSTER, Chester, assignor of one-half to S. H. Jennings, Deep River, Conn. Filed Mar. 13, 1881. (No model.)

Claim.—The herein-described carriage-jack, consisting of the base A, constructed with the vertical slot B and provided with bars *a* transversely across the said slot, combined with the lever C, one end fitted for a handle, the other as the lifting end, constructed with a notch, *e*, upon one side, the segment-shaped surface *f* and locking-shoulder *i* upon the opposite side, substantially as described

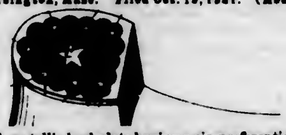
256,310. EGG BEATER AND MIXER. GEORGE B. FOWLER, Brooklyn, N. Y. Filed Sept. 20, 1881. (No model.)

Claim.—1. In an egg-beater, the combination, with the beating mechanism, of a vessel composed of two barrel-shaped sections hinged together, and having bearings for a central shaft formed in their meeting edges, substantially as set forth.

2. In an egg-beater, the combination, with a vessel consisting of two concavo-convex sections hinged together, of a shaft having its bearings in the ends of said vessel, and provided with disk-plates for supporting the beating-blades and with mechanism for driving said shaft, substantially as set forth.

3. The combination of the vessel *a*, rotary shaft *g*, disk-plates *l*, and beating or stirring blades *m*, attached to the periphery of said disk-plates, all arranged and operated in the manner set forth.

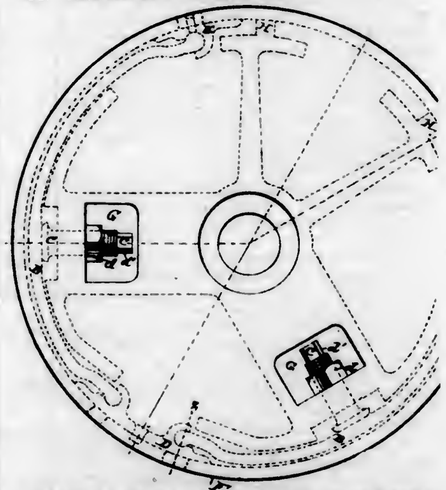
4. The combination, with the concavo-convex vessel *a* and driving-shaft *g*, having disk-plates *l* secured thereto, of the correspondingly-shaped twisted and perforated beating-blades *m*, substantially as and for the purpose set forth.



5. The combination, with an egg-beater having the beating mechanism arranged within the egg-holding vessel, of a driving-shaft provided with radial arms set at right angles thereto and to each other, and with twisted bars or blades secured to said arms in a spiral manner, substantially as herein shown and described.

6. In combination with the vessel *a*, the funnel-shaped receiver *q*, provided with a spout, *r*, and hinged cover *s*, substantially as set forth.

7. In an egg-beater, the stirring and beating device herein described, composed of perforated bars or blades secured to disk-plates arranged on the driving-shaft and shorter spiral bars arranged on arms projecting from said shaft and inclosed by the perforated bars, substantially as set forth.



8. An egg-beater consisting of a vessel hinged together in two equal sections, the upper section being provided with a strip of rubber or other equivalent material, whereby a close joint is formed when the said sections are shut together, substantially as set forth.

256,311. HEEL-PLATE FOR BOOTS AND SHOES. EDWARD C. GARDNER, Abington, Mass. Filed Oct. 19, 1881. (Model.)

Claim.—A metallic heel-plate having a circumferential flange with a smooth outer or wearing surface and a depressed middle part, provided with studs at a little distance from the flange and parallel therewith, the depressed portion being filled with leather or other suitable material, as set forth.

256,312. PISTON-HEAD. HUGH D. GARRETT, Philadelphia, Pa. Filed June 24, 1881. (No model.)

Claim.—1. A piston-head provided with levers and supports, substantially as described, whereby the weight of the piston, through said levers, bears directly against the upper circumference of the packing-rings to expand the same in the upper part of the cylinder.

2. A solid piston-head provided with levers and supports, substantially as described, whereby the weight of the piston, through said levers, bears directly against the upper circumference of the packing-rings to expand the same in the upper part of the cylinder.

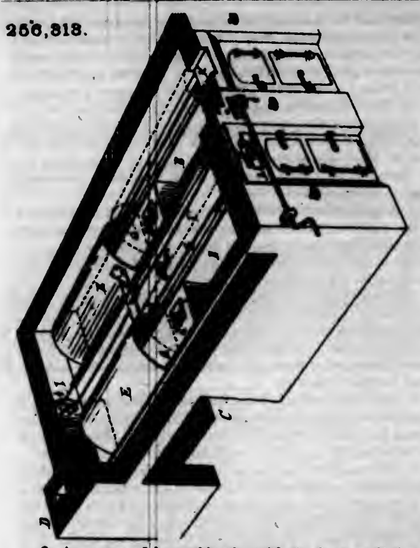
3. A piston-head provided with levers, supports, and centering device, substantially as described, whereby the piston is centered in the cylinder and the weight thereof utilized, through said levers, to bear directly against the upper circumference of the packing-rings to expand the same in the upper part of the cylinder.

4. A piston-head having a lever or levers fulcrumed in the lower portion of the piston and extending into the upper portion so as to rest against the packing at that point, with suitable bearings for the piston against the levers, whereby the weight of the piston is utilized to expand the packing, substantially as set forth.

5. In a solid piston-head, the combination of the levers B, bolts C, and openings G, substantially as and for the purpose specified.

6. The combination of levers B, bolts C, and blocks D E, substantially as described.

7. The combination of levers B, bolts C and their nuts *d*, and blocks D E, substantially as described.



8. The combination of levers B, bolts C, having the extension-heads *d'*, nuts *d*, and blocks D E, substantially as described.

256,313. ATTACHMENT TO BAKERS' OVENS. HENRY R. GORDON, Detroit, Mich. Filed Oct. 26, 1881. (No model.)

Claim.—1. A baker's oven the furnaces of which are provided with adjustable sliding arches E, substantially as and for the purposes set forth.

2. An oven, and in combination with the furnaces B thereof, provided with adjustable sliding arches E, the draft-openings K, and outlets *a*, substantially as and for the purposes specified.

256,313.

3. An oven, and in combination with the furnaces B thereof, the sliding arches E, adapted to be operated by the chain I, pulleys *b*, and crank-shaft J, substantially as described.

4. In a baker's oven, and in combination with the furnace B thereof, having a draft-opening, K, and outlet *a*, the arch E, provided with one open and one closed end, and adapted to be moved to cover or partly cover the furnace, substantially as described.

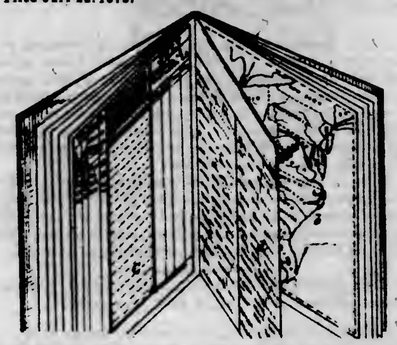
256,314. DETACHABLE CLASP-HOOK FOR SHIRT-COLLARS. SIDNEY S. GRANNIS, Red Wing, Minn. Filed Feb. 23, 1882. (No model.)

Claim.—The collar clasp-hook formed of a single piece, having the hook part *a*, the middle clasp part, *c*, and the back part, *e*, terminating in an eye or plate, *g*, for the purpose of securing and holding the collar to the shirt-band, substantially as herein set forth.

256,315. STARCH-SEPARATOR. GILBERT S. GRAVES, Buffalo, N. Y., and JACOB KNUDE, Peoria, Ill. Filed Nov. 4, 1881. (No model.)

Claim.—1. In a starch-separator, a sieve provided with transverse strips arranged underneath the water-pipes and adapted to receive the impact of the falling water, substantially as set forth.

2. In a starch-separator, a sieve composed of two or more sections of bolting-cloth and one or more intermediate troughs, in which the tailings of the first section are received and commingled, and from which the material is delivered on the head of the next following section, substantially as set forth.

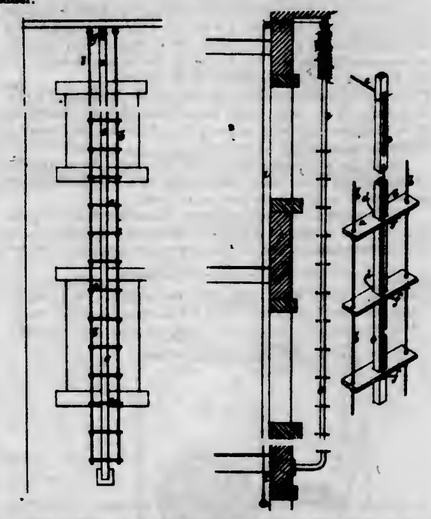


3. In a starch-separator, the combination, with the sieve composed of two or more sections of bolting-cloth and one or more intermediate troughs or gutters, C, of spray-pipes F, arranged over the troughs C, substantially as and for the purpose set forth.

4. In a starch-separator, a sieve provided with one or more transverse troughs, C, made angular in cross-section, substantially as set forth.

5. In a starch-separator, a sieve provided with one or more transverse strips or troughs, C, and two or more sections of bolting-cloth secured to the under side of the sieve-frame A and to the edges of the transverse strips, whereby a separate section of bolting-cloth can be removed without removing the remaining sections, substantially as set forth.

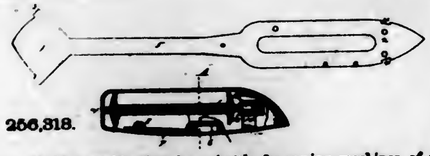
6. The combination, with the sieve-frame A and the trough or gutters C, secured to the under side thereof, of sections B of bolting-cloth, secured to the under side of the sieve-frame and the upper edges of the troughs C, substantially as set forth.



256,316. ALMANAC. GEORGE G. GREEN, Woodbury, N. J. Filed July 28, 1879.

Claim.—In an almanac in which are indicated the days of the month and week in columns on one side of a page, the rising and setting of the sun and moon on the other side, and blank memorandum-lines between them, one for each day, the days of the year arranged in continuous number, each coming on a line with its appropriate day of the month and week, as set forth.

256,317. FIRE-ESCAPE. JOHN HARRISON and MICHAEL FOLLIARD, Brooklyn, N. Y. Filed Feb. 21, 1882. (No model.)

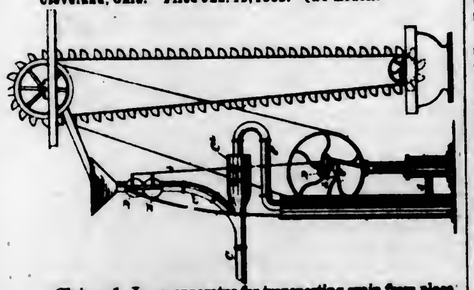


Brief.—The ladder is guided and held by a fixed rod, which passes through openings in the steps. The rungs or steps may be slid up under the cornice upon said rod by a suspending-cord, which may be severed upon any floor of the building to lower the ladder.

Claim.—The combination, as hereinbefore described, of the rod secured to the outside wall of a building, the steps or rounds fitted on and guided by said rod, the chains or ropes connecting said steps, and the cord or chain for controlling the position of the steps.

256,318. SEWING-MACHINE SHUTTLE. FRANK H. NATHAWAY and CHARLES A. LOCKE, Springfield, Mass. Filed Feb. 3, 1882. (No model.)

Claim.—1. An improved shuttle for sewing-machines, made of a blank punched in a single piece from sheet metal and bent into form and its ends secured together, substantially as described.

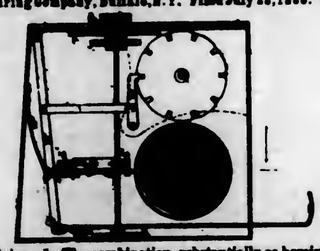


256,318.

2. The combination, in a shuttle for sewing-machines, of a tension-spring, as 7, provided with a thread-notch, 9, and pivoted at one end to swing outward, and adapted to be adjusted against the inside of the face-plate with more or less pressure, an adjusting-screw, 8, for adjusting the said spring, and a bobbin-holder and spring secured to the face-plate of the shuttle at the pointed end, and a distributing-bar, as 6, secured at both ends to the face-plate of the shuttle, substantially as described.

3. In an improved shuttle for sewing-machines, a bobbin-spring holder formed up from a thin sheet-metal blank in a single piece and secured to the face-plate, and provided with a cylinder adapted to contain a spring, and a plug to receive the end of the bobbin and hold the latter in place, substantially as described.

256,319. GRAIN-TRANSPORTING DEVICE. THOS. F. HOARE, Cleveland, Ohio. Filed Jan. 13, 1882. (No model.)



Claim.—1. In an apparatus for transporting grain from place to place, the combination, with a suitable conducting-pipe having an enlarged end, of a plug or driver, and devices for feeding grain to the conveyor-pipe and for forcing a blast of air through said pipe to move the grain, substantially as set forth.

2. In a grain-transporting device, the combination of a conveyor-pipe, an air-blast pump, and a grain-charging device, the latter being provided with valves B B' and rods *b b'*, for operating the latter, substantially as set forth.

3. In a grain-transporting device, the combination, with the conveying-pipe C and an air-blast device, of a plug or driver, H, substantially as and for the purpose set forth.

4. In a grain-transporting device, the combination of a grain-receiving bin or hopper, *a*, and the alternately-operating valves B B', substantially as and for the purpose set forth.

256,320. FARE REGISTER AND RECORDER. WILLIAM H. HOBBIE, New York, assignor to the Railway Register Manufacturing Company, Buffalo, N. Y. Filed July 28, 1880. (Model.)

Claim.—1. The combination, substantially as hereinbefore set forth, of the passenger-register, the actuating gearing and handle of said register, the notched wheel of said register, the detent-pawl to engage said wheel to lock it, and the trigger or push-bar, independent of the actuating-handle of the register, to release said detent to permit the register to be moved.

2. The combination, substantially as hereinbefore set forth, of the passenger-register, the actuating-handle of said register, the permanent register-roller carrying a recording-slip to be marked or punctured, the marking device moved by the actuating-handle of the passenger-register over said recording-slip simultaneously with the operation of the passenger-register, and the device acting upon said marker to cause it to mark or puncture the recording-slip to make a record of the indications of the passenger-register.

3. The combination, substantially as hereinbefore set forth, of the passenger-register, the permanent register-roller covered with its recording-slip extending lengthwise of the machine, the turning-shaft to actuate said passenger-register, and the marking device moved by said shaft along the roller to make an impression upon the recording-slip.

4. The combination, substantially as hereinbefore set forth, of a roller provided with a recording-slip, mechanism, substantially as described, operated by hand to impart a partial or step-by-step rotation to said roller, and a marker traveling lengthwise of said roller to make a mark upon said slip.

5. The combination, substantially as hereinbefore set forth, of the permanent register-roller, the shaft of said roller from which the roller may be readily removed, and bearings for said shaft, one of which is attached to a removable part of the inclosing-case, and capable of separation from said shaft to permit the roller to be removed endwise therefrom.

6. The combination, substantially as hereinbefore set forth, of the permanent register-roller, its shaft, and a locking-connection between the roller and shaft to secure the two together in operation while permitting of their ready separation when required.

7. The combination, substantially as hereinbefore set forth, of the permanent register-roller, the shaft of said roller having bearings at its opposite ends, the locking-connection between said roller and shaft, and the hinged door carrying one of the bearings of said shaft, whereby when said door is opened the bearing carried by it is swung away from the shaft and access afforded to the locking-connection, so that it may be disengaged and the roller removed from the machine.

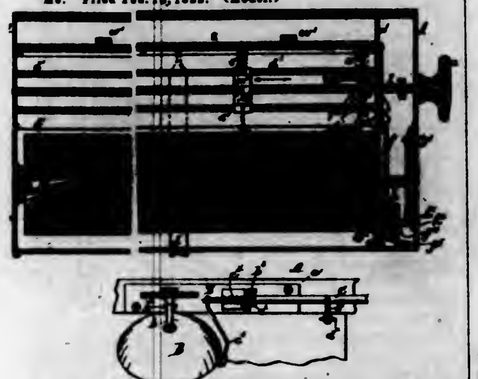
8. The combination, substantially as hereinbefore set forth, of the passenger-register, its actuating-handle, the detent mechanism to normally lock said register from operation, the trigger to operate the detent mechanism to release the register, and a registering device independent of the passenger-register to indicate the number of times said trigger is operated.

9. The combination, substantially as hereinbefore set forth, of the direction-indicator, its shaft, the actuating-handle of said shaft, and the marker actuated by said shaft to register the shifting or changing movements of said indicator.

10. The combination, substantially as hereinbefore set forth, of a passenger-register, a direction-indicator, and detent mechanism; substantially as described, for normally locking and simultaneously releasing said register and said indicator.

11. The combination, substantially as hereinbefore set forth, of a passenger-register, a direction-indicator, an alarm apparatus, and mechanism, substantially as described, for normally locking said register, indicator, and alarm apparatus, and for releasing them, whereby the indicator can only be shifted or changed and the alarm sounded when the register is free to be moved to make a count or tally.

12. The combination, substantially as hereinbefore set forth, with a passenger-register and mechanism, substantially as described, for indicating the resetting movements of said register, of a direction-indicator and mechanism, substantially as described, for indicating the shifting movements of said indicator.



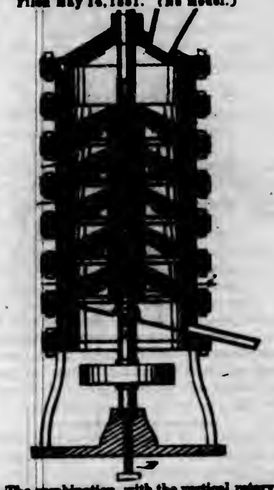
13. The combination, substantially as hereinbefore set forth, of a passenger-register, an actuating-handle therefor, mechanism, substantially as described, to record the resetting or changing movements of said register, a direction-indicator, the operating mechanism of said indicator, mechanism, substantially as described, to record the shifting movements of said indicator, and devices to normally lock said register and said indicator.

14. The combination, substantially as hereinbefore set forth, of a temporary passenger-register, a permanent register, an actuator to actuate said registers, mechanism, substantially as described, to normally lock said registers from being moved, and mechanism, substantially as described, to register the movements of said locking mechanism, which release the registers and enable them to be operated to change their indications.

15. The combination, substantially as hereinbefore set forth, of a temporary passenger-register, a permanent register, an actuator to actuate said registers, a direction-indicator and its actuating device, and mechanism, substantially as described, to normally lock said registers and indicator, so that when operated to release the registers said mechanism also releases the indicator to permit it to be shifted.

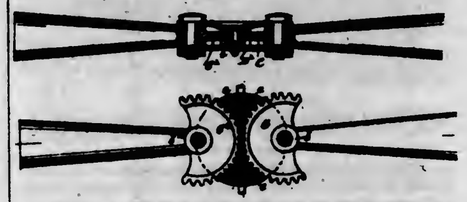
16. The combination, substantially as hereinbefore set forth, of the passenger-register, the permanent register, the actuating-handle of said registers, the direction-indicator and its actuating device, the alarm apparatus, and mechanism, substantially as described, which normally locks said registers, indicator, and alarm from operation, while when released it permits the registers to be moved, the indicator to be shifted, and the alarm to be sounded.

256,321. BURGLAR-ALARM. WILLIAM B. HOWELL, Albany, No. Filed Feb. 13, 1882. (Model.)



Claim.—1. In a burglar-alarm, the combination of the shaft C, its latches *c'*, stop-leg *c²*, clapper *c³*, with the gong B and spring *c⁴*, substantially as shown and described.

2. In a burglar-alarm, the combination of the shaft C, its latches *c'*, stop-leg *c²*, and clapper *c³* and spring *c⁴*, with the plate *b'*, arm *b*, and gong B, all arranged to operate substantially as shown and described.



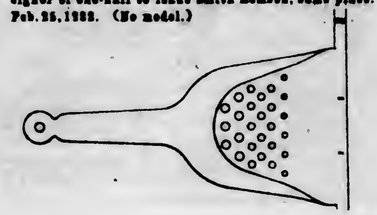
3. The combination of the latches *c²* and knuckles *c'* with the shaft C and its latches *c'*, and clapper *c³*, with the gong B, all arranged to operate substantially as shown and described.

256,322. MACHINERY FOR PULVERIZING ORE, &c. FREDERICK J. HOYT, New York, N. Y., and WILLIAM H. HOYT, Jersey City, N. J. Filed May 14, 1881. (No model.)

Claim.—The combination, with the vertical rotary spindle, of the grinding-disks B, secured thereon and formed with smooth beveled edges, and the shell having the smooth beveled inner faces, *i*, said grinding-disks successively increasing in diameter from the top to the bottom of the series, substantially as described.

256,323. CAR-LOCK. SAMUEL IRWIN, Lindsay, Ontario, Canada. Filed Jan. 6, 1882. (No model.)

Claim.—1. The toothed segments C C', having fulcrum-hubs of greater length than the width of their teeth, in combination with the fulcrum-pins, and the fulcrum-box cast in one piece with posts *c c*, and arranged, as described, with a bearing against the upper edge of the teeth of the segments and out of contact with the lower edge of the same, as and for the purpose described.



2. The gunwale-plate *f*, having lugs *c d'*, one of which is open-slotted, and provided with spring-slide *g*, as and for the purpose described.

256,324. CAR-LOCK. SAMUEL IRWIN, Lindsay, Ontario, Canada. Filed Jan. 6, 1882. (No model.)

Claim.—1. The toothed segments C C', having fulcrum-hubs of greater length than the width of these teeth, in combination with the fulcrum-pins, and the fulcrum-box cast in one piece with posts *c c*, and arranged, as described, with a bearing against the upper edge of the teeth of the segments and out of contact with the lower edge of the same, as and for the purpose described.

2. The gunwale-plate *f*, having lugs *c d'*, one of which is open-slotted, and provided with spring-slide *g*, as and for the purpose described.

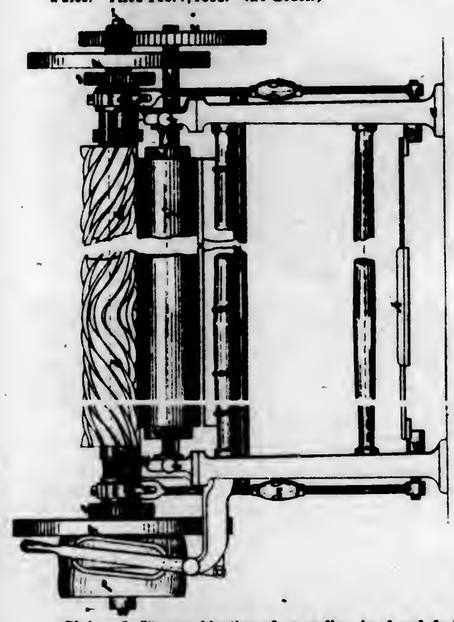
256,325. SHOVEL. JACOB A. JOHNSEY, Brooklyn, N. Y., assignor of one-half to Isaac Smith Romson, same place. Filed Feb. 25, 1882. (No model.)

256,328. COUNTER-BALANCE FOR EXTENSION-CHANDELIERS. WOLCOTT A. HULL, New York, N. Y., assignor of one-half to the Antonia Brass and Copper Company, same place. Filed Jan. 28, 1882. (No model.)

Claim.—1. A counterbalancing-weight consisting of cast-metal sections provided with cavities which, when the sections are put together, form a hole for surrounding a guide-rod, substantially as specified.

2. A counterbalancing-weight consisting of sections of cast metal provided with cavities which, when put together, form a hole for surrounding a guide-rod, of a shell inclosing said sections, substantially as specified.

3. The combination, with a counterbalancing-weight consisting of sections of cast metal provided with cavities which, when put together, form a hole for surrounding a guide-rod, of a shell inclosing said sections, substantially as specified.



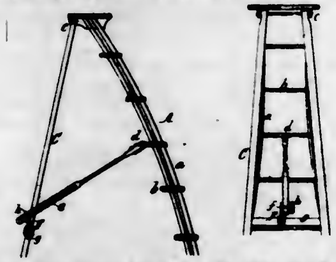
4. The combination, with a counterbalancing-weight consisting of sections of cast metal provided with cavities which, when put together, form a hole for surrounding a guide-rod, of a shell inclosing the same and formed of two parts, which are connected transversely to the meeting or opposite faces of the sections of the weight, substantially as specified.

5. The combination, with a counterbalancing-weight consisting of sections of cast metal provided with cavities which, when put together, form a hole for surrounding a guide-rod, of a shell inclosing the same and having its upper and lower edges turned inward to fit the guide-rod, substantially as specified.

Claim.—1. In combination with the edge of a shovel, a strip of india-rubber, B, projecting a short distance over the edge of the shovel, substantially in the manner and for the purpose described.

2. A shovel-blank provided with projecting strips m m at the sides at its end, substantially for the purpose specified.

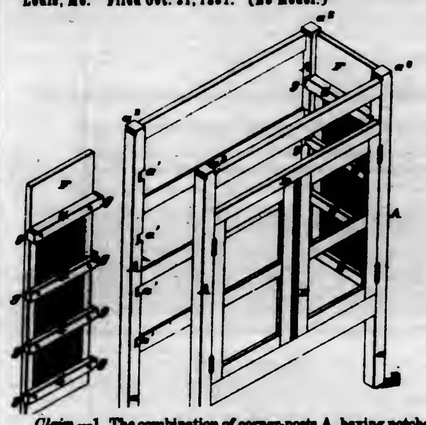
256,326. MACHINE FOR TREATING HIDES AND SKINS. JOHN MEREDITH JONES, Wrexham, County of Denbigh, North Wales. Filed Feb. 7, 1882. (No model.)



Claim.—1. The combination of an endless band and feed-rollers with a spiral-faced roller, movable arms m, carrying bearings for said spiral-faced roller, and a treadle or lever controlling the movement of said arms, all substantially as set forth.

2. The combination of an endless band and feed-rollers with a weighted lever, *t*, carrying a scraper.

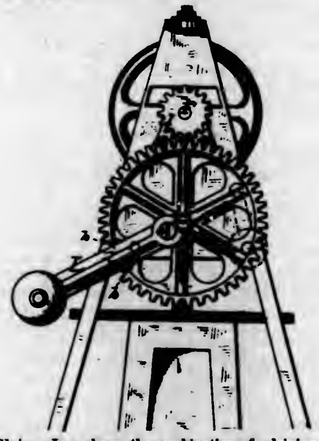
3. The combination of the endless revolving band of a skin or leather treating machine with a water-pipe provided with jets for lubricating the band.



256,327. STEP-LADDER. RUSSELL F. JONES, Forestville, N. Y., assignor of one-half to William E. Powers, same place. Filed Jan. 16, 1882. (No model.)

Brief.—A belt on the bracket, which is secured to the cross-piece of the hinged brace-legs, passes through a slot in the brace and is held in position by a thumb-nut thereon.

Claim.—In a step-ladder, the combination, with the body A and hinged standard C, of a brace connecting the body A and standard C, hinged at one end, and provided at its opposite end with a longitudinal slot, *e*, a bracket, F, provided with a horizontal bolt, *f*, upon which the slotted end of the hinged brace slides, and a thumb-nut, A, whereby the brace is secured in place, substantially as set forth.



256,328. SECTIONAL KITCHEN-SAFE. CHARLES KAHN, St. Louis, Mo. Filed Oct. 31, 1881. (No model.)

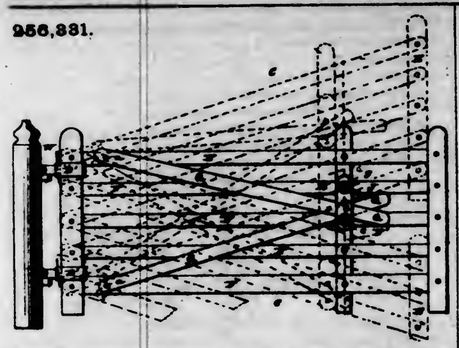
Claim.—1. The combination of corner-posts A, having notches *a'* on their inner sides, and end pieces, F, provided with strips G, having tenons *g* occupying said notches and securing the ends to the posts, as set forth.

2. The combination of posts A with tenons *a²* at their tops and top board, H, grooved for the reception of the tenons, substantially as set forth.

256,329. CHURN. ROBERT H. G. KENNAN, Chillicothe, Mo. Filed Sept. 19, 1881. (No model.)

Claim.—In a churn, the combination of a driving gear-wheel provided with a plurality of adjusting-holes and steady-lugs *b b*, and an adjustable crank-lever arranged between the steady-lugs and made fast to the said wheel by means of set-screws, substantially as described, and for the purpose set forth.

256,330. PROCESS OF TREATING CERTAIN DERIVATIVES OF COAL-TAR COLORS. EDWARD D. KENDALL, Brooklyn, N. Y. Filed Dec. 16, 1881. (No model.)

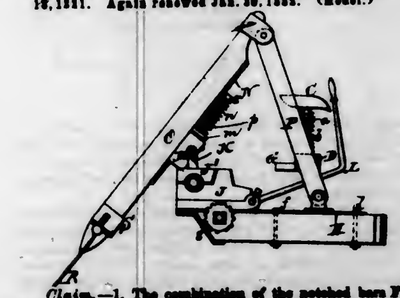


Claim.—1. The method or process of producing aniline or toluine from their corresponding nitro derivatives of coal-tar hydrocarbons by means of the voltaic current through the cathode in the presence of acidulated water, as hereinbefore set forth.

2. The method of producing a color-yielding product or oxidized compound of aniline or toluine, or a mixture of both, by subjecting aniline or toluine, or a combination of both, to the action of the voltaic current through the anode in the presence of acidulated water, as hereinbefore set forth.

256,331. SWINGING GATE. ISRAEL L. LANDIS, Lancaster, Pa. Filed Dec. 16, 1881. (Model.)

Claim.—1. The combination of the end battens and the intermediate batten pivoted to the gate-rails, the diagonal endwise

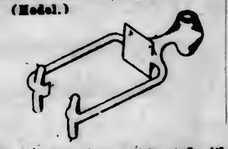


256,331.

movable braces, also pivoted to the gate-rails and crossed, the stud *b* and bolt *c*, between which said crossed portions of the braces play, the flexible clamp or grip H, and means, substantially as described, for binding the parts rigidly together.

2. In a vertically-adjustable gate having diagonal crossed braces guided by the stud *b* and bolt *c*, the combination of the pivotal through-bolt, the clamp or grip H, the bolt *g*, and a hand-crank, J, substantially as described.

256,332. COMBINED HAY TEDDER AND RAKE. ISRAEL L. LANDIS, Lancaster, Pa. Filed Apr. 26, 1880. Renewed Jan. 17, 1881. Again renewed Jan. 30, 1882. (Model.)

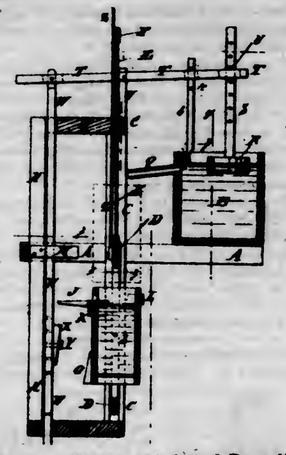


Claim.—1. The combination of the notched bars F F and cross-bar D with the seat C, rod *a*, and spring *b*, substantially as herein set forth.

2. The tedder-frame composed of the slotted plates H, having curved projections *c*, and connected by the plate L, in combination with the hinged beams J J' and the rod K', provided with the lever L, and forming the pins for the hinges, and having the beams secured thereto, substantially as herein set forth.

3. The combination of the fork-handle O, hollow pin *i*, the coiled tines E E, notched plate or casting S, bolt *c*, and nut *n*, substantially as and for the purposes herein set forth.

256,333. GATE-HINGE. ISRAEL L. LANDIS, Lancaster, Pa. Filed Feb. 21, 1882. (Model.)

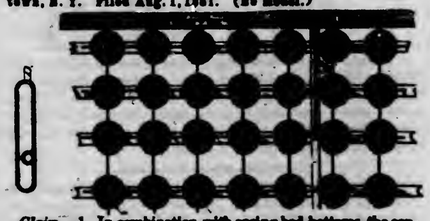


Claim.—A hinge having the wings constructed with a bevel bearing, and with arms having the ends bent inwardly, and provided with elongated bearings and slips, and adapted to be applied and secured to the gate or post by means of a wedge, substantially as and for the purposes specified.

256,334. WINDMILL-REGULATOR. JOHN LAMOTT and HUGH WHITE, Abingdon, Ill. Filed Nov. 21, 1881. (No model.)

Brief.—As the water is withdrawn from tank B the float E descends, operating the lever T, which raises the sliding bar W. The block X raises the latch J, allowing the bucket I, which is weighted at L, to discharge its contents, when the frame D and the empty bucket will be drawn upward by the weight H and the windmill will be thrown into gear and will force water into tank B.

256,334.



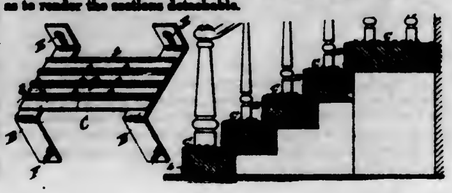
Claim.—1. The combination, with the tank B, provided with an overflow-spout, and the windmill trip-rod E, of the counterbalanced sliding frame D, the bucket I, the float R, and the connecting and tripping devices, substantially as and for the purpose set forth.

2. The combination, with the tank B, provided with the overflow-spout 2, and the windmill trip-rod E, of the counterbalanced sliding frame D, provided with the latch J, the bucket I, the float R, the bar S, the lever T, and the sliding bar W, provided with the block X, substantially as and for the purpose set forth.

3. The combination, with the tank B, provided with the overflow-pipe Q, and the windmill trip-rod E, of the counterbalanced sliding frame D, the pivoted bucket I, provided with the latch J, the arm M, the float R, the bar S, the lever T, and the sliding bar W, provided with the block X, substantially as and for the purpose set forth.

4. The combination, with the tank B, provided with the overflow-spout Q, the float R, and the lever T, of the valve *a*, the bar *b*, and pins *c*, substantially as and for the purpose set forth.

256,335. SPRING BED-BOTTOM. A. JESSE LANDON, Jamestown, N. Y. Filed Aug. 1, 1881. (No model.)



Claim.—1. In combination with spring bed-bottoms, the connecting-link having a loop near one end of suitable size to prevent the link from changing ends on the coil, substantially as shown and described, and for the purpose set forth.

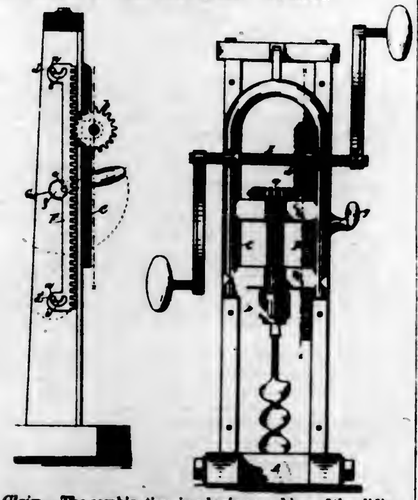
2. In combination with spring bed-bottoms having cross-bar and side rail, substantially as shown, the spring-brace B, having turns *j* and *n* at end, as shown and described, and for the purpose set forth.

256,336. STEP-COVER. WILLIAM E. LAWRENCE, New York, N. Y. Filed Nov. 2, 1881. (No model.)

Brief.—The sections consist of U-shaped slats secured together and to side straps. The ends of the straps are so connected as to render the sections detachable.

Claim.—1. A step-covering consisting of treads D and connecting devices, constructed substantially as described, for detachably uniting the treads, as specified.

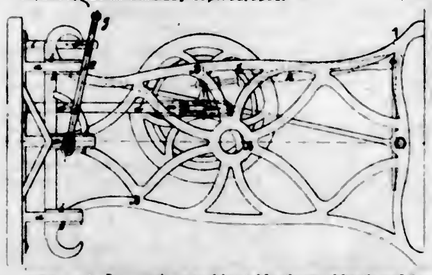
2. The combination, with the platform D of a step-cover, of straps extending upward from one edge and downward from the other, and devices whereby said straps may be detachably connected to those of the adjacent platforms, substantially as set forth.



3. A step-covering composed of platforms D and straps B B, riveted or bolted to the platforms; forming sections C, which sections are provided with devices for attaching them detachably together, substantially as set forth.

4. The combination, in a step-covering, of the platform D, metal straps B B, bent to the shape shown, and provided with slots E, and studs F, substantially as set forth.

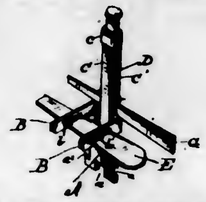
5. A step-cover tread consisting of a series of metal slats, each having edge flanges and connected substantially as set forth.



6. The within-described covering or tread, consisting of strips of metal having upright side flanges arranged side by side and connected together, substantially as set forth.

256,337. WOOD-BORING MACHINE. WILLIAM E. LAWRENCE, New York, N. Y. Filed Jan. 27, 1882. (No model.)

Claim.—The combination, in a boring-machine, of the sliding frame carrying the geared boring-bar and driving-shaft provided with a fixed pinion, *b*, and a rack-bar, F, having curved slots *i*, receiving pins *n*, projecting from the side piece, and a rocking cylinder, G, provided with a handle, and with a pin, *c*, fitting a socket in the rack-bar, substantially as set forth.



256,338. ADJUSTABLE TABLE AND DRIVING MECHANISM FOR SEWING-MACHINES. RUDOLPH LUY, Arnstadt, Germany. Filed Oct. 15, 1880. (No model.) Patented in Austria July 22, 1880, and in Germany Sept. 14, 1880.

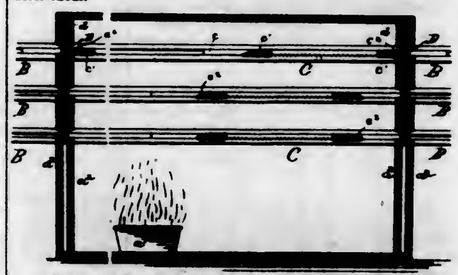
Claim.—1. In a sewing-machine table, the combination of the pivoted lever-frame comprising the lateral arms *c* and transverse bar *l*, carrying a locking device, with the vertically-adjustable table-top provided with guide-tongues *a* and a retaining-arm, *i*, for the lever-frame, and the sewing-machine frame having grooved ways or guides *h*, as and for the purpose set forth.

2. In a sewing-machine table, the combination of a vertically-adjustable table-top having a pendent arm, *d*, carrying the driving or hand pulley, and the sewing-machine frame provided with a guide-piece, *m*, for receiving said arm, and the treadle having an extensible pitman, *k*, as and for the purpose set forth.

256,339. TIRE-TIGHTENER. HEZEKIAH H. LINDLER, Pine Ridge, S. C. Filed Dec. 23, 1881. (No model.)

Claim.—In a tire-tightener and lifting-jack combined, the base A, having the parallel ears B B', provided with slots *b b'*, and wedge E, in combination with the standards C C', sliding bar D, and wedge G, constructed substantially as set forth.

256,340. CLOCK-CASE. JOHN R. LOMAS, West Haven, Conn. Filed Dec. 3, 1881. (No model.)



Claim.—1. A cover for clocks, consisting of the two parts B B', hinged to the clock-case, and so as to divide and swing therefrom in a plane at substantially right angles to the axis of the clock to expose the clock, or brought together to inclose the clock, substantially as described.

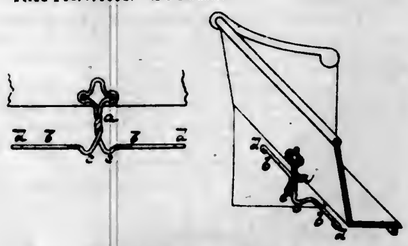
2. A cover for clocks, consisting of the two parts B B', hinged to the clock-case, and so as to divide and swing therefrom in a plane at substantially right angles to the axis of the clock to expose the clock, or brought together to inclose the clock, the said parts arranged to be turned beneath the clock to form a base or support for the clock, substantially as described.

256,341. APPARATUS FOR BLEACHING FRUIT. SETH W. LOWELL, Nunda, N. Y., and FRANK A HOOKER, Charlotte, Mich., assignors to the Steam Heat Evaporator Company, Charlotte, Mich. Filed Jan. 19, 1882. (No model.)

Brief—The fruit is placed upon trays having beveled ends adapted to elevate the sliding vertical doors by simply being pushed forward. The trays are caused to emerge by pushing other trays after them.

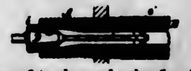
Claim.—1. In a fruit-bleacher, the combination of the doors D, arranged to slide vertically within the ends of the bleacher, with the frames C, the guide-bars of which project beyond the transverse bars *c'*, and have beveled ends *c²*, substantially as and for the purposes set forth.

2. A fruit-bleacher provided with ways B, the extremities of which project from the ends of the bleacher, with frames C, sliding on said ways, and with doors D, arranged to slide vertically within the ends of the bleacher, the frames C being provided with guides *c'*,



3. A fruit-bleacher provided with ways B, vertically-acting doors D, and frames C, consisting of the guides *c* and transverse bars *c'*, having their outer edges beveled at *c²*, said guides projecting beyond the bars *c'*, and provided with beveled ends *c³*, adapted to be inserted under the lugs *d²* and elevate the doors, the beveled edges *c³* adapted to assist the operation by pressing under the bottom edges of the doors, substantially as shown and described.

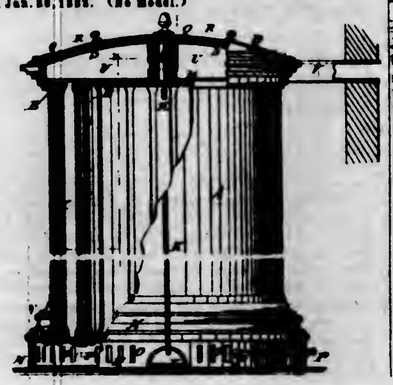
256,342. PIN-TICKET. ALBERTO T. LUNDQVIST, New York, N. Y. Filed Feb. 13, 1882. (No model.)



Claim.—The improved pin tag or ticket for marking goods herein shown and described, the same consisting of a marking-card, A, of suitable size and shape, a sheet-metal back plate, B, provided with suitable means for the attachment of the card and having the hinge-loops *a a*, and double-pronged hinged pin C, constructed and combined substantially as and for the purpose shown and set forth.

256,343. HAT-HOLDER. CHARLES C. LYON, Altoona, Pa. Filed Feb. 7, 1882. (No model.)

Claim.—The coat hook or support herein described, consisting of the vertical body portion *a*, designed to be secured to the back of the seat, the forward and outward curved concave branches *c*, forming an umbrella-holder, and the laterally-diverging horizontal ends *d*, forming hat-supports, substantially as specified.



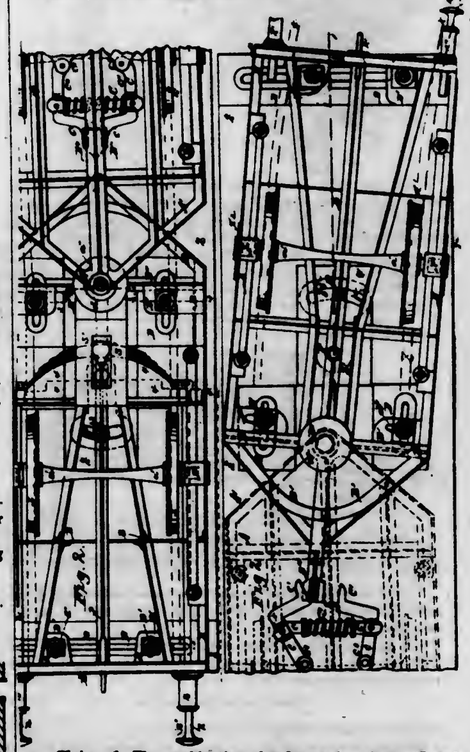
256,344. SAFETY PLUG AND VALVE FOR BOILER-FITTINGS. JOHN J. MACKNDER, Omaha, Nebr. Filed Aug. 5, 1881. (Model.)

Claim.—1. The safety plug and valve for steam-fittings, consisting of plug A, valve B, wire *d*, and cross-pin *c*, combined for operation substantially as shown and described.

2. The guide *b* and ring *c*, combined with valve B and plug A, substantially as and for the purposes set forth.

256,345. HEATER. JAMES H. MACKINTOSH, Paterson, N. J. Filed Jan. 30, 1882. (No model.)

Claim.—1. In a heater, the air-heating flues C, provided with the projections E on their inner surfaces projecting alternately from the opposite sides and extending beyond each other, substantially as and for the purpose set forth.



2. In a heater, the air-heating flues C, longitudinal slots H formed through them, and provided with the projections E on their inner surfaces and the projections E' on their external surfaces, substantially as and for the purpose set forth.

3. In a heater, the combination, with the heating-flues C, provided with the projections E' on their external surfaces, of the inclosing-case provided with the projections E' on its inner surface, substantially as and for the purpose set forth.

4. In a heater, the combination, with the case A, top and bottom plates, B, and air-heating flues C, of the pipe K, having stop-cock L, substantially as herein shown and described, whereby the air that collects in the upper part of the water-space can be readily drawn off, as set forth.

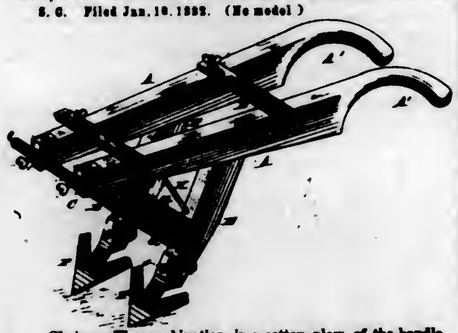
5. In a heater, the combination, with the top plate B and the perforated cover Q, having dampers S, of the hinged radial partitions U, and one or more pipes, V, substantially as herein shown and described, whereby a part or all of the heated air can be used for heating other rooms, as set forth.

256,346. RAILWAY-CAR. JOHN MACLACHLAN, New Orleans, La. Filed May 14, 1881. (No model.) Patented in England June 1, 1878, and Feb. 4, 1880.

Claim.—1. The combination of under carriage-frame, Z, and the three lower carrying-frames, with their oscillating connecting-joints arranged on their central longitudinal line, the resting springs *a a'* and levers C C', and the subsidiary slotted attachments and sliding bushes, all constructed and operating substantially as and for the purpose set forth.

2. The combination of carriage-frame Z with the oscillating under frames jointed at *b b*, between the central and outer axles, an oscillating joint, *b' b'*, and connecting-frame E to said under frames, and differential slotted cam traction-joints *b² b²*, all substantially as and for the purpose set forth.

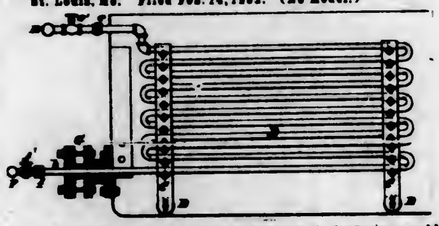
3. The combination of carrying-frames A B C and the under frames with the actuating-levers B' B'', and the joints or connec-



tions for allowing the axles and wheels to oscillate to suit the curves of a railway-track, substantially as set forth.

4. The combination of coupling-levers B' B'' B''' with the under carrying-frames, A B C, said parts being swiveled together to allow the wheels and axles to conform to the curvature of the line of railway over which the cars are passing.

256,347. COMPOSITION FOR USE IN SMELTING IRON AND OTHER ORES. WILLIAM G. HASTIN, Oswego, N. Y. Filed Jan. 21, 1882. (No specimens.)

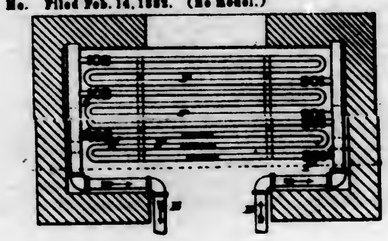


Claim.—A composition for use in the process of smelting metallic ores, consisting of the following ingredients in the proportions stated: caustic soda, one pound; limestone, two pounds; sodaash, three-fourths of a pound, and charcoal, one-fourth of a pound.

256,348. COTTON-PLOW. DANIEL R. HATHERN, Blackville, S. C. Filed Jan. 10, 1882. (No model.)

Claim.—The combination, in a cotton-plow, of the handle-beams A A', the standards E, the one-sided whiffletree D, adjustable on the beams, the slotted cross-bars B B, and the adjusting cross-bar and cutter G, substantially as shown and described.

256,349. REMOVABLE PIPE-SECTION FOR TANKS. CHAS. G. HAYES, Harvey, Ill., assignor of one-half to Leo Rassieur, St. Louis, Mo. Filed Feb. 14, 1882. (No model.)



Claim.—1. In combination with the tank A, the removable section B, supported on frames C on rollers D, substantially as set forth.

2. In combination with tank A and removable section B, the guide H, secured to the side of the tank, substantially as and for the purpose set forth.

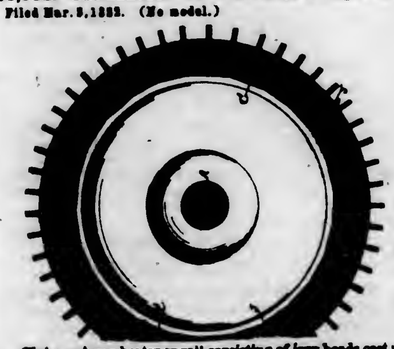
3. In combination with tank A and removable section B and stuffing-box G, the plug I, arranged to close the opening in the box, for the purpose set forth.

256,350. REFRIGERATING APPARATUS. CHAS. G. HAYES, Harvey, Ill., assignor of one-half to Leo Rassieur, St. Louis, Mo. Filed Feb. 14, 1882. (No model.)

Claim.—1. In combination with main pipes D and E, the connecting-sections F, arranged substantially as and for the purpose set forth.

2. In combination with main pipes D and E, the sections F, removably connected to the lengths *f* by couplings *f'*, which are provided with cocks *f''*, substantially as and for the purpose set forth.

256,351. RATCHET-MONKEY-WRENCH. WILLIAM F. MCGREGOR, Chicago, Ill., assignor to John C. MacGregor, same place. Filed Aug. 10, 1881. (No model.)

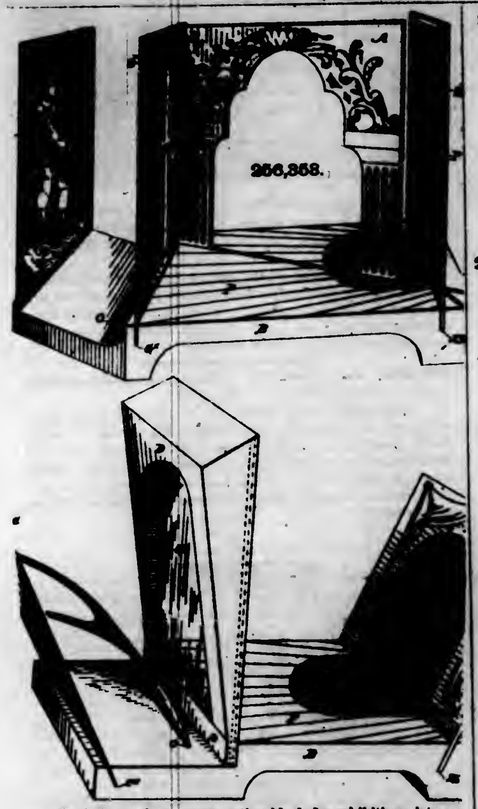


Claim.—1. In a ratchet monkey-wrench, the combination of the jaws A, the double-threaded screw *a*, with the thumb-wheel *a'*, the disks B B', and the plate or guide A', constructed and arranged as herein described and shown.

2. The disks B B', with notches in their outer circumferences, (the disk B having ridge B'', the disk B' having slot E,) the screw *a a'*, the jaws A, and the guide A', as described and shown, in combination with the frame C and pawl D, substantially as and for the purpose specified.

3. The frame C, hollow at its center, pawl D, thumb-wheel D', and spiral spring *d*, in combination with the disks B B', provided with notches, jaws A, with double-threaded screw *a*, and guide A', substantially as and for the purpose specified.

4. A ratchet monkey-wrench having jaws A, a plate or guide, A', disks B B', frame C, pawl D, with thumb-wheel D' and spiral spring *d*, double-threaded screw *a*, with thumb-wheel *a'*, all arranged and operating substantially as herein shown and described.



256,352. RAG-BEATER. GUYOT HILLER, Downingtown, Pa. Filed Mar. 3, 1882. (No model.)

Claim.—A rag-beater or roll consisting of iron heads cast with mortises or other depressions for the reception of the wood filling C, the wood filling constructed with tenons adapted to fit into said mortises, and the bolts for clamping the whole firmly together, substantially in the manner and for the purposes described.

256,353. METHOD OF AND DEVICE FOR EXHIBITING PICTURES. FRANCIS E. HILLS, Pittsburg, Pa., assignor of one-half to William McMahon, same place. Filed Jan. 19, 1882. (Model.)

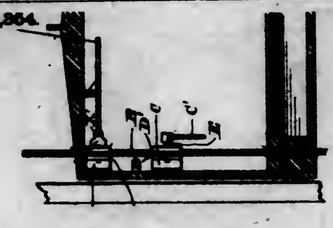
Claim.—1. The method of setting, arranging, or exhibiting pictures which consists essentially in placing the picture on a black ground behind, but away from, a glass having a transparent center and opaque margins, and placing still farther away from, but in front or obliquely in front of, this glass a screen having a blackened or cut-away center with luminous borders, or luminous figures between the borders of the screen and the glass, the picture, the glass, and the screen being arranged at such distances from and at such angles with each other, respectively, that when the light falls obliquely upon the picture and it is viewed from a direction at right angles with its plane the paper or card on which the picture is taken will become invisible, while images of the luminous objects upon the screen will be seen by reflection projected beyond or around the picture, substantially as herein shown and described.

2. A frame, box, or supporting-block for exhibiting pictures, containing a device or devices for holding a transparent glass with opaque margins or diaphragm between a picture on a black ground and a screen having a blackened or cut-away center, substantially as and for the purpose set forth.

3. A frame, box, or supporting-block for exhibiting pictures, containing a device or devices for holding a card-picture, a glass, and a screen in substantially the relative positions described, whereby to a person looking through the glass by the aid of a light falling obliquely upon the picture the black card will be apparently invisible and an image of the screen will be projected beyond or around the picture, as specified.

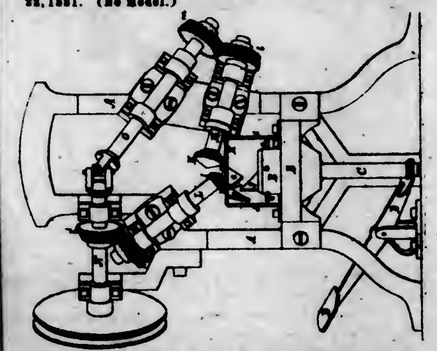
4. In combination with a device or devices for holding the card, glass, and screen in the relative positions herein described, a floor or ground, F, represented in reverse perspective, substantially as shown and described.

5. In combination with devices for holding the card and the glass in the relative positions described, the arch A, held in a stationary device, or hinged, substantially as and for the purpose herein set forth.



6. The block B, provided with means for holding the card, the glass, the screen, and the arch in their relative positions, substantially as and for the purpose described.

7. The block B, having means for holding the card, glass, and screen, and the slot O, for holding a blackened counter-screen behind the glass, substantially as and for the purpose described.



8. A frame, box, or case for holding pictures, containing a screen with a blackened or cut-away center, a glass with an opaque margin or diaphragm, and a device for holding a picture behind the glass, substantially as and for the purpose set forth.

256,354. SAFETY ATTACHMENT FOR ELEVATORS. CHAS. B. HOBEAR, Oakland, Cal. Filed Aug. 24, 1881. (No model.)

Claim.—In combination with an elevator tub or cage and the fixed arresting cable or rod B, the clamping-heads D D', vise-screw E, and operating-lever C', located within easy reach of the attendant, substantially as shown and described.

256,355. MACHINERY FOR BEVELING WATCH-GEAR. JOSEPH A. HORIS, St. Hyacinthe, Quebec, Canada. Filed Dec. 22, 1881. (No model.)

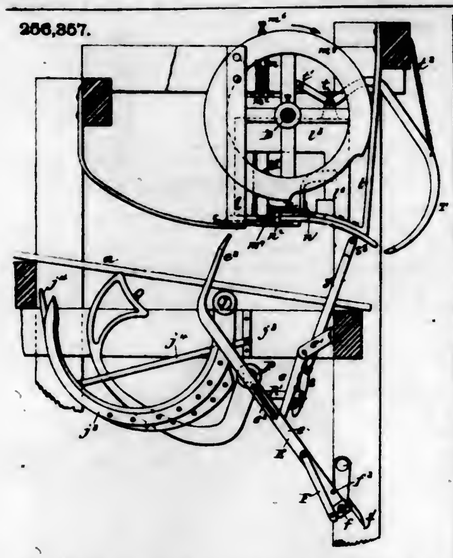
Claim.—The combination of the revolvable and reversed vertically-reciprocating carrying-head B, having the series of arms *a*, as set forth, with the stationary ring H, and cams *e*, *f*, and *g*, and with the cutters I and K, provided with mechanism for revolving them, all being substantially and to operate and for the purpose as specified.

256,356. CULTIVATOR-TOOTH. JOHN HORTON, Bloomingburg, Ohio. Filed Dec. 19, 1881. (Model.)

Claim.—The combination of the beam A, the pivoted tooth-holder B, the supports E, which project beyond the front edge of the beam, the angular lever G, which bears against the upper end of the tooth-holder spring O, and set-screw V, substantially as shown.

256,357. GRAIN-BINDER. GEORGE B. HORTON, Chicago, Ill., assignor of one-third to Thomas H. Arnold, Memphis, and said Horton and Arnold assignors of one-fourth to E. G. De Pass, Memphis, Tenn. Filed July 26, 1881. (Model.)

Claim.—1. In a grain-binder, a gathering and packing arm or arms constructed and arranged to yield bodily as the bundle is gathered and formed, substantially as described.



2. In a grain-binder, a yielding packer or packers, in combination with an adjustable tension device, whereby the size of the bundles may be regulated, substantially as described.

3. In a grain-binder, a packer or packers constructed and arranged to yield the bundle, in combination with a tripping mechanism, whereby the binder is thrown into operation by the yielding of the packers, substantially as described.

4. In a grain-binder, the yielding, gathering, and packing arms F F', in combination with the cranks to which they are attached at one end, and pivoted swinging links connected to the said arms between the cranks and the packing-ends, whereby a three-motion curvilinear movement is given to the said packing-ends, substantially as described.

5. The packer-arm, in combination with a pin or guide-bar to which the packer-arm is loosely connected at its inner end, the crank-arm to which the pin is pivoted, and the spring between the

256,357.

pin and packer, whereby the latter is permitted to yield lengthwise on the former, substantially as described.

6. The packer E, in combination with the pin e^3, connected to the crank d^3, spring e^7, connecting-rod F, rocking-lever f, and tripping-finger f', arranged to operate the trip-crank as the lever is rocked by the yielding of the packer, substantially as described.

7. The yielding packer, in combination with the connecting-rod F, rocking-lever f, provided with trip-finger f', trip-crank g', on the rock-shaft G, pitman g^2, spring-pin g^3, and spring-clutch H, substantially as described.

8. A compresser-arm supported upon a slotted lever beneath the grain-receiver, in combination with a crank concentric with and operated by the shaft of the discharging-arm, whereby the compresser is withdrawn simultaneously with the movement of the bundle-discharger, substantially as described.

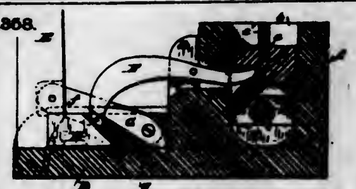
9. The compresser-arm, in combination with a vibrating lever, T, and a cam on the main shaft arranged to vibrate the lever when the shaft is revolved, substantially as and for the purpose set forth.

10. The yielding packer, in combination with the arms s' and the vibrating compresser-arm, substantially as described.

11. The tubular shaft m, carrying at its lower end one member of the knotting-hook, in combination with the shaft m^1, carrying the upper member of the tying-hook and provided with a pin, m^2, the cam m^3, the spring m^4, and the adjusting-screw m^5, substantially as described.

12. The tubular shaft m, carrying at its lower end one member of the knotting-hook, in combination with the shaft m^1, carrying the other member of said hook and provided with a pin, m^2, the cam m^3, the spring m^4, the adjusting-screw m^5, and the stripper, substantially as described.

13. The tubular shaft m, carrying at its lower end one member of the knotting-hook, in combination with the shaft m^1, carrying the other member of said hook, and provided with the pin m^2, the cam m^3, the spring m^4, the adjusting-screw m^5, the stripper n^1, and the cutter n^2, substantially as described.



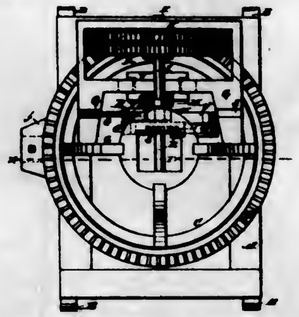
256,358. CAR-COUPLING. WILLIAM L. MOONEY, Wells' Tannery, and DANIEL GREEN, Bedford, Pa. Filed Mar. 10, 1882. (No model.)

Claim.—1. In car-couplings, the locking-piece O and finger A, operated by mechanism, substantially as described, to lock a coupling-bar, B, at the upper and lower sides of its head, substantially as specified.

2. In car-couplings, the pivoted trigger F, catch-piece G, pivoted to the finger-bar H, and operated by a link, f, and lever E, arranged for operation substantially as specified, and for the purpose set forth.

3. In car-couplings, the catch-piece G, held in locked position by a curved projection, g, and a recessed part, i, in combination with a pivoted trigger, F, having projection e, and operated by suitable connecting mechanism, substantially as specified.

256,358.



4. The combination of the weighted locking-piece C and finger-bar H with a pivoted trigger, F, having projection e, a pivoted catch-piece, G, the link f, and lever E, all arranged substantially as specified.

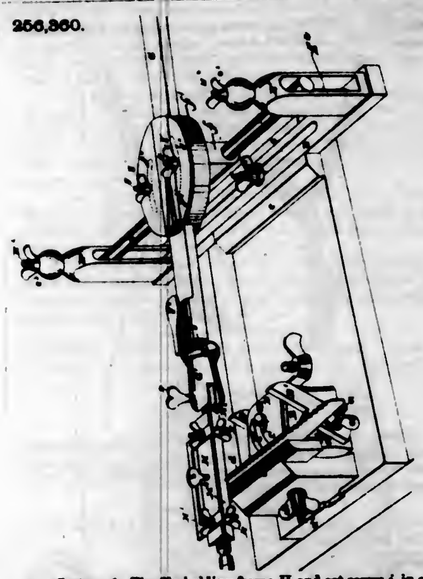
5. The combination of the bumper A, having projection D, cavities a A, and weighted locking-piece C, with the pivoted trigger F, catch-piece G, pivoted to the sliding bar H, having finger A, connecting-link f, and lever E, all constructed and arranged substantially as shown and herein set forth.

256,359. WEDGE-DRIVER. OTTO HEUSSENSTAMM, Guttenberg, N. J. Filed Dec. 15, 1881. (No model.)

Brief.—The hammer is caused to reciprocate through adjustable connecting-rods and cranks and a clutch carried by a collar loosely mounted on a shaft having a fixed cog-wheel, with which said clutch automatically engages, said shaft being rotated through a train of gear-wheels and a circular rack. An adjustable drill-rod guide can be secured to the lower end of the hammer-guides, when desired.

Claim.—1. In a wedge-driver, the combination, with a shaft rotated by means of a circular rack and a train of gear-wheels, of a cog-wheel mounted rigidly on this shaft, a collar mounted loosely on this shaft, and connected by connecting-rods and crank-bars with a vertically-reciprocating hammer, and of a clutch device for engaging the loose collar automatically with the cog-wheel on the shaft, substantially as herein shown and described, and for the purpose set forth.

2. In a wedge-driver, the combination, with the revolving shaft L, of the cog-wheel M, mounted thereon, the loose collar N, the hook Y, the vertically-reciprocating hammer V, and devices for connecting the collar N and the hammer V, substantially as herein shown and described, and for the purpose set forth.



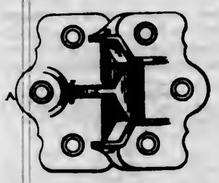
3. In a wedge-driver, the combination, with the revolving shaft L, of the fixed cog-wheel M, the loose collar N, the hook Y, the rod O, the connecting-bar Q, provided at one end with a loose collar, P, and at the other end with an apertured flange, R, the rod S, the crank-bar c, pivoted to the hammer V, and provided with a loose collar, T, substantially as herein shown and described, and for the purpose set forth.

4. In a wedge-driver, the combination, with a rotating shaft, of a fixed cog-wheel and a loose collar thereon, an adjustable connecting-bar for connecting the loose collar and the pivoted crank-bar of a reciprocating hammer, and a clutch device for automatically connecting the fixed cog-wheel and loose collar for the purpose of raising the hammer, substantially as herein shown and described.

5. The combination, with the hammer-guides W and the reciprocating hammer V, of the frame c, fitting on the lower ends of the hammer-guides and adapted to hold a drill, d, substantially as herein shown and described.

256,360. MACHINE FOR FILING SAWS. THOMAS HUNGARTEN, Newark, Ohio, assignor of one-half to William Albert Whipple, Alleghany, Pa. Filed June 13, 1881. (Model.)

256,360.



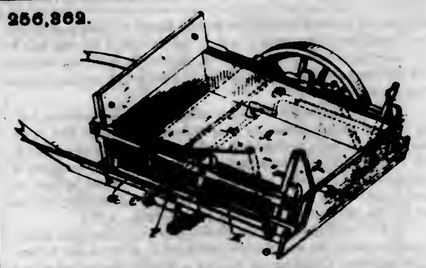
Claim.—1. The file-holding frame H and set-screw i, in combination with a slotted laterally-adjustable frame, H', having secured thereto the adjustable gage-plate H', substantially as shown and described.

2. The cross-rod F, block f, disk f', having curved slots f'', disk f''', and notched screws g g', fixed with relation to the disks, in combination with the file-holder bar G, substantially as and for the purpose set forth.

3. The combination, in a saw-filing machine, of the base A, cross-bar B, uprights E', thumb-piece e', screws E', block f, cross-rod F, and disks f' f''', for receiving the sliding bar G, substantially as shown and described.

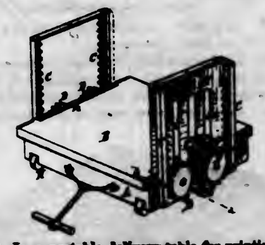
256,361. LOCK-RINGS. SIGMUNDUS HEBBELN, Sedalia, Mo., assignor of one-half to David H. Smith, same place. Filed Feb. 16, 1882. (Model.)

Claim.—1. A hinge composed of the two parts A B, the part A being provided with the two projections E and the part B with the flat pintle-eye, which passes in between the inner ends of the projections, substantially as shown.



2. A hinge composed of the two parts A B, the part A being provided with the two projections, which are placed in line with each other and have their ends separated but a slight distance, the part B being provided with the flat central pintle-eye, I, which has suitable inclines formed upon it, substantially as described.

3. A hinge composed of the two parts A B, the part A being provided with the two projections placed in line with each other, and the part B having a pintle-eye projecting outward from its center, which is grooved upon opposite sides, substantially as specified.



256,362. DUMPING-CART. ISAIAH R. NICHOLS, Newberry Township, York County, Pa. Filed July 7, 1881. (No model.)

Claim.—In a dump-cart, the body A, in combination with levers G, connected by rock-shaft H, and provided with hooks i i, pivoted latch-levers E, connected with levers G, and the tail-board swinging on a pivot and provided with extensions e e, over which the latch-levers catch, all arranged for operation substantially as described.

256,362.

256,363. DELIVERY-TABLE FOR PRINTING-MACHINES. THEODORE HOUSEL, Detroit, Mich. Filed Nov. 19, 1881. (No model.)

Claim.—1. In a portable delivery-table for printing-presses, the combination, with the frame or base A and the rigid vertical rack-bars C C of said frame, of the table B, adapted to slide between said rack-bars, the gear-wheels D, secured at opposite ends of the table and constructed to engage with the rack-bars, and the worm E, for operating said gear-wheels, substantially as and for the purpose specified.

2. The table B, having friction-collars b, adapted to traverse the outside of the rack-frame C, combined with said rack-frame, duplex gears, and an operating-worm, as set forth.

3. In a portable delivery-table for printing-presses, the table B, having friction-rolls b, arranged to traverse the outer surface of the rack-frame C, opposite the gears D, combined with said gears and rack, and with worm E, arranged between the gears, the parts b D E being in an approximately horizontal line, and adapted to prevent strain, as set forth.

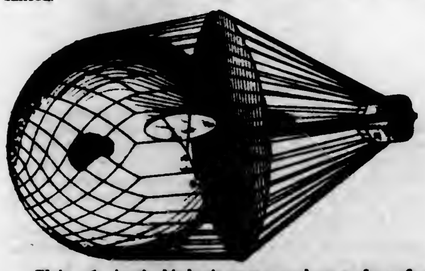
4. The combination, with the base A, table B, racks C, and gears D E, of the apron I, secured to the rack-bars and to the base and passing through openings in the table, substantially as described.

256,364. WHIFFLETREE-COUPLING. JAMES PENDERGAST, New Haven, Conn. Filed Jan. 16, 1882. (No model.)

Claim.—The herein-described coupling, consisting of the sleeve A to receive the whiffletree, constructed with ears upon the rear side, with a recess, h, between the said ears and forward of the pivot, combined with the head b, secured between said ears by the pintle f, and an elastic block, i, arranged in said recess to bear against the sleeve in one direction and the head in the opposite direction, substantially as described.

256,365. CENTRIFUGAL CREAMER. CARL PETERSEN and LARS C. NIELSEN, Roskilde, assignors to the Burmeister and Wain's Maskin and Skibsbyggeri, Copenhagen, Denmark. Filed Oct. 24, 1881. (No model.) Patented in England July 1, 1881.

Claim.—1. In a centrifugal machine of the described class, the annular plate c, located a short distance below the annular top plate or cover, g, of the centrifugal vessel or receiver a, and pro-



vided on its under side with the curved flange or collar *j*, whereby two ring-formed chambers, *i* and *f*, are formed in the top part of the centrifugal vessel or receiver *a*, concentric with one another and with said receiver, substantially as and for the purpose herein shown and specified.

2. The combination of the centrifugal vessel or receiver *a*, having the horizontal concentric ring-formed chambers *i* and *f*, arranged substantially as described, and stationary discharge-pipes *f'* and *f''*, adjustable in the direction of their length, and curved at their inner ends to form tapering mouth-pieces, which project respectively into the ring-formed chambers *i* and *f*, substantially as and for the purpose herein shown and set forth.

3. The combination of the discharge-pipe *f'*, having a screw-threaded section, *m*, and flanged bed-plate *h*, grooved nut *n*, having thumb-disk *t*, nut box or bearing *g*, having stop-screw *v*, and fixed bed-piece *l*, provided with parallel grooves for the reception of the adjustable plate *h*, substantially as and for the purpose herein shown and described.

256,866. AIR-SHIP. CARL W. PETERSEN, San Francisco, Cal. Filed Nov. 11, 1881. (No model.)

Brief.—The balloon-body A is made readable, so that its lifting capacity will be variable. A horizontal sail, C, is adjustably fixed below the balloon, so that it may be presented to the wind at any angle. Automatic valves regulate the quantity of gas in the balloon.

Claim.—1. An air-ship having a gas-vessel, means for rarefying said vessel, and a guiding-sail whereby the ship may beat or tack regularly in the air in vertical inclinations, substantially as described.

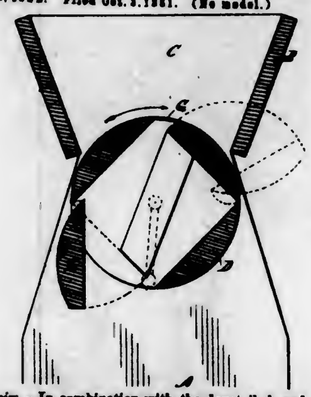
2. The combination of a readable balloon and a guiding-sail adjustable from a horizontal position to various inclinations, substantially as described.

3. The combination, with a balloon and its car, of a tank or tanks for containing volatile liquid and a retort for converting said liquid into gas, substantially as described.

4. An air-ship-lifting vessel having a vertical circular rudder pivotally connected to the frame of the sail, said rudder being provided with a brace and steering-lines extending from the ends of said brace to the car, substantially as described.

256,867. CHURN-DASHER. FRANCIS T. PISTER, Schulenburg, Tex. Filed Oct. 24, 1881. (No model.)

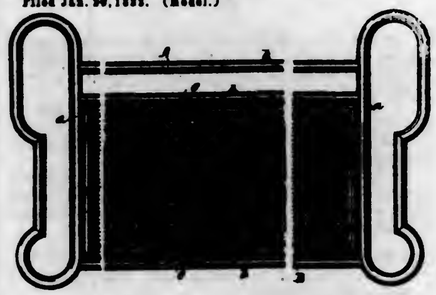
Claim.—1. In a churn-dasher, the combination of the rod A, the dasher B, pivoted upon the lower end of the rod and having both a vertical and a rotary movement, and the weighted arms D, which are applied to opposite sides of the dasher, substantially as shown.



2. A churn-dasher having both a vertical and a rotary motion, and having weighted arms applied directly to it, substantially as set forth.

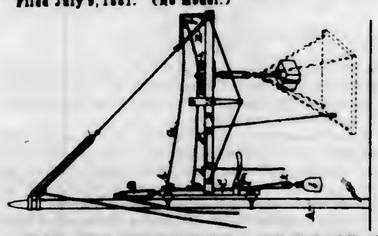
256,868. ROOFING COMPOSITION. GUSTAV H. PÖHERL, Union Hill, N. J. Filed Feb. 27, 1882. (Specimens.)

Claim.—1. A roofing composition made of a mixture of chalk, sulphur, asphalt, tar, and pitch, substantially in the manner herein described.



2. A compound roofing made of layers of paper alternating with layers of a mixture of chalk, sulphur, asphalt, tar, and pitch, substantially as set forth.

256,869. VEGETABLE-CUTTER. CONSTANTIN RAIBLE, Oskaloosa, Iowa. Filed Oct. 3, 1881. (No model.)



Claim.—In combination with the dovetail-shaped standards A and hopper C, the hollow rotating cylinder D, provided with knives G, and having automatically-acting hinged flaps E, all arranged and operating as described.

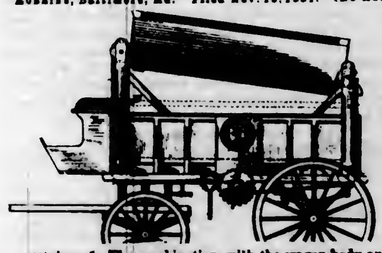
256,870. DASH-BOARD. EMIL BATTEY, New York, N. Y. Filed Jan. 20, 1882. (Model.)

Claim.—As an improved article of manufacture, a dash-board consisting of the outer frame, A, the inner frame, B, composed of slotted tubing *c*, and the wire-netting *d*, fitted in the slotted tubing of the said inner frame, substantially as herein shown and described.

256,871. DERRICK. ISRAEL S. REEVES, New Orleans, La. Filed July 9, 1881. (No model.)

Claim.—The crane or derrick composed of the following organizations: a standard, a vertical side with block and tackle, horizontal beam with block and tackle, a traveling car or carriage with block and tackle, and a friction-brake, substantially as described.

256,872. LEMON-SQUEEZER. ALFRED C. REE, Philadelphia, Pa. Filed Feb. 16, 1882. (No model.)



Claim.—1. In a lemon-squeezer, the frame A, provided with the aperture B and slots or recesses B', in combination with the cup C, having flange D and lugs F, and elastic ring G, substantially as and for the purpose specified.

2. In a lemon-squeezer, the frame A, provided with handle A', aperture B, and slots or recesses B', in combination with glass cup C, having flange D and lugs F, elastic band G, lever I, provided with handle I', and hollow surface J, covered with sheet metal K, not corrodible by citric acid, substantially as and for the purpose specified.

3. In a lemon-squeezer, the combination of cup C, having flange D at the top and lugs F at the bottom, with frame A, provided with aperture having slots B' and inclined faces or rims *f*, substantially as and for the purpose specified.

4. In a lemon-squeezer, a pressure-lever provided with an inverted cup or hollow part having a flat rim, in combination with a non-corrosive sheet-metal cover pressed into said hollow part and clamped around the rim, as shown.

256,873. WEIGHING AND DUMPING WAGON. HENRY R. ROBBINS, Baltimore, Md. Filed Nov. 15, 1881. (No model.)

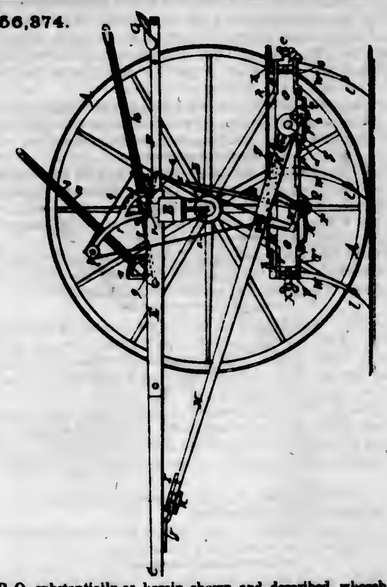
Claim.—1. The combination, with the wagon-body and a set of weighing devices, of an internal shell made adjustable, as described, so as to be thrown off or on the scales, and means for raising and inclining said shell for dumping the contents, as set forth.

2. The combination, with a wagon-body having standards at its corners, of an internal shell and a set of pulleys and ropes carried by said standards for raising the shell, as described.

3. The combination, with a wagon-body having standards at its four corners carrying pulleys, of a set of ropes passing over said pulleys, and a differential windlass having its larger drums connected with and arranged to wind up the front ropes, and its smaller drums connected with and arranged to wind up the rear ropes, substantially as described, and for the purpose of imparting an inclination to the shell contemporaneously with its elevation.

4. The combination, with a wagon-body having standards at its four corners with pulleys thereon, as described, of an adjustable shell fitting within the wagon-body and suspended upon cords passing over said pulleys, so as to be raised, and a set of weighing devices for weighing the shell in one of its positions and affording a solid bearing in the other, as described.

5. The combination, with a wagon-body having elevated corner standards and a set of weighing devices beneath the same, of a shell fitting in the wagon-body, a set of ropes attached to the shell, a set of pulleys arranged in the standards and carrying the ropes, and a set of slides carrying these pulleys and extending through the wagon-body and supported upon the weighing devices, as and for the purpose described.



256,874. CULTIVATOR. HENRY A. ROBERTSON, Hocking, Ohio. Filed Aug. 31, 1881. (Model.)

Brief.—The arms of the rock-shaft are set at any elevation by a lever. From them the lifting-chains pass to the drag-bars, and thence over pulleys to levers. The standards are swiveled to the beams, and have cranks and a connecting-bar to set the shovels uniformly to throw in any direction. An arched cross-bar connects the draft-bars and sustains the strain of the shovel-beams, which, by keepers and blocks, have a longitudinal play. An elbow-crank at the rear divides the strain with the arch and regulates the pitch of the beam. The draft-bars connect with the tongue by a ball-and-socket joint.

Claim.—1. The combination of the perforated and grooved bearing-plates T V, provided with forwardly-projecting ends, the standard W, the eyebolt X, and the ribbed recessed block Y, whereby the standard W may be readily adjusted, as specified.

2. In a cultivator, the combination, with the inclined draw-bars H and the plow-beams O, of the arched bar L, the hangers M, the slotted keepers N, and the clamping eyebolts and blocks

256,874.

P Q, substantially as herein shown and described, whereby the plow-beams are adjustably connected with the inclined draw-bars, as set forth.

3. In a cultivator, the combination, with the beams O and the plow-standards W, of the cranks *h* and the connecting-bars *k*, substantially as herein shown and described, whereby the plow-standards and plows of each beam will be held in corresponding positions and can be adjusted at the same time, as set forth.

4. In a cultivator, the combination, with the inclined bars H and the plow-beams O, of the bearing-plates *m*, the cranks *p*, the keepers *s*, and the clamping eyebolts and blocks *s t*, substantially as herein shown and described, whereby the plow-beams can be readily leveled, as set forth.

5. In a cultivator, the combination, with the axle B, the tongue C, and the inclined draw-bars H, of the bearing-brackets *u*, having arms 1, the rod *v*, having arms *w w* 6, the levers 2 2, the connecting-rod 7 and lever 8, and the cords *x*, substantially as herein shown and described, whereby the inclined draw-bars and their plow-beams and plows can be raised together or separately, as set forth.

256,875. DYE-STUFF OR COLORING-MATTER. CARL RUMPFF, Aprath, near Elberfeld, Prussia, Germany. Filed Jan. 9, 1882. (No specimens.)

Claim.—As a new product, the dye-stuff or coloring-matter which results from the reaction of diazoazo-toluol-monosulphonic acid with the sodium salt of the alpha-monosulphonic acid of beta-naphthol, substantially as described.

256,876. MANUFACTURE OF DYE-STUFF OR COLORING-MATTER. CARL RUMPFF, Aprath, near Elberfeld, Prussia, Germany. Filed Jan. 9, 1882. (No specimens.)

Claim.—As a new product, the dye-stuff or coloring-matter which results from the reaction of diazo-alpha-naphthaline-monosulphonic acid with the solution of sodium salt of the alpha-monosulphonic acid of beta-naphthol, substantially as described.

256,877. MANUFACTURE OF DYE-STUFF OR COLORING-MATTER. CARL RUMPFF, Aprath, near Elberfeld, Prussia, Germany. Filed Jan. 9, 1882. (No specimens.)

Claim.—As a new product, the dye-stuff or coloring-matter which results from the reaction of diazo-beta-naphthaline-monosulphonic acid with the sodium salt of the alpha-monosulphonic acid of beta-naphthol, substantially as described.

256,878. MANUFACTURE OF DYE-STUFF OR COLORING-MATTER. CARL RUMPFF, Aprath, near Elberfeld, Prussia, Germany. Filed Jan. 9, 1882. (No specimens.)

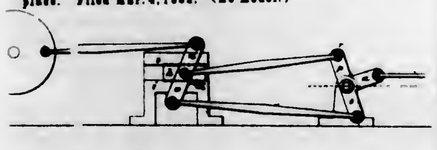
Claim.—As a new product, the dye-stuff or coloring-matter which results from the reaction of diazoazo-xylol-monosulphonic acid with the sodium salt of the alpha-monosulphonic acid of beta-naphthol, substantially as described.

256,379. MANUFACTURE OF DYE-STUFF OR COLORING-MATTER. CARL RUMPFF, Aprath, near Elberfeld, Prussia, Germany. Filed Jan. 18, 1882. (No specimens.) Patented in England Mar. 31, 1881, in France Mar. 31, 1881, in Belgium Apr. 15, 1881, and in Germany Oct. 11, 1881.

Claim.—As a new product, the yellow dye-stuff which results from the reaction of the nitro-alpha-monosulphonic acid with carbonate of potash or its equivalent, substantially as described.

256,380. MANUFACTURE OF DYE-STUFF OR COLORING-MATTER. CARL RUMPFF, Aprath, near Elberfeld, Prussia, Germany. Filed Jan. 18, 1882. (No specimens.) Patented in England Mar. 31, 1881, in France Mar. 31, 1881, in Belgium Apr. 15, 1881, and in Germany Oct. 11, 1881.

Claim.—As a new product, the new scarlet dye-stuff which results from the reaction of diazoso-benzole with alpha-monosulphonic acid of beta-naphthol, substantially as described.



256,381. MANUFACTURE OF A NEW COLOR-PRODUCING ACID. CARL RUMPFF, Aprath, near Elberfeld, Prussia, Germany. Filed Apr. 8, 1881. (Specimens.) Patented in England Mar. 31, 1881, in France Mar. 31, 1881, in Belgium Apr. 15, 1881, and in Germany Oct. 11, 1881.

Claim.—1. The mode described of producing the alpha-monosulphonic acid of beta-naphthol, which consists in treating beta-naphthol with commercial sulphuric acid of the strength and at the temperature and in the proportions substantially as herein set forth.

2. As a new product, the alpha-monosulphonic acid of beta-naphthol, substantially as described.

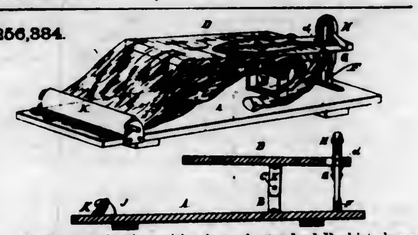
3. As a new product, the soda salt of alpha-monosulphonic acid of beta-naphthol, substantially as described.

256,382. MECHANICAL MOVEMENT. ARTHUR E. RUST, Pine Meadow, Conn., assignor of one-half to Selon R. Rust, same place. Filed Mar. 4, 1882. (No model.)

Claim.—1. The herein-described mechanical movement, consisting of a rock-shaft to which a vibratory movement is imparted from a reciprocating power, a crank arranged for full revolution, a slide between said crank and rock-shaft carrying an arm hung thereto, so as to vibrate in a plane parallel with the plane in which the crank swings, with a connecting-rod from the said crank to one end of said arm, and a connecting-rod from the opposite end of said arm to an arm extending from said rock-shaft, and a connecting-rod from an arm extending in the opposite direction from said rock-shaft to the center of motion of the arm to which the crank connecting rod is attached, substantially as described.

2. The herein-described method for converting reciprocating into rotary motion, consisting of a rock-shaft to which a reciprocating movement imparts oscillation less than half of a full revolution, with a shaft having a crank thereon arranged for full revolution, and intermediate mechanism, substantially such as described, whereby the rotation or oscillation of the rock-shaft in one direction imparts a full revolution to the crank and on its return imparts a second revolution to the crank, substantially as described.

256,383. CONCRETE PAVEMENT. JOHN J. SCHILLINGER, New York, N. Y. Filed Mar. 1, 1882. (No specimens.)



Claim.—1. A concrete pavement for roadways, laid in sections and provided with grooves extending transversely across the roadway from curb to curb, substantially as shown and described.

2. A concrete pavement for roadways, laid in sections on a convex bed or foundation and extending from curb to curb, substantially as set forth.

256,384. BOSOM-STRETCHER. RUDOLF SCHMIDT, Cincinnati, Ohio. Filed Dec. 1, 1881. (Model.)

Claim.—1. A bosom-stretcher board, D, hinged to a standard and adapted to be rocked thereon, in combination with a clamp for gripping the skirt of the garment and a device for depressing the head of the board and elevating the foot thereof, as set forth.

256,384.

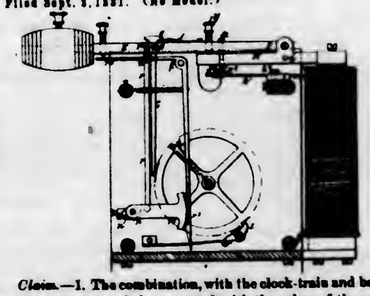
2. The combination, with a base, A, standard B, skirt-clamping device K, board or rest D, having arm E, hinged to the standard, and a tipping device adapted to depress the head and elevate the foot of the board or rest, as set forth.

3. The combination, with base A, provided with standard B and skirt-gripping and board-tipping devices, of the tipping or rocking board or rest D, having the arm E, hinged to the standard B, substantially as set forth.

4. In combination with the rocking board or rest D E, standard B, base A, and a rest-depressing device, the removable jaw or clamp K and open-notched bearings J J', substantially as set forth.

5. In combination with the rocking board or rest D E, standard B, and base A and skirt-clamp, the rest-depressing cam-lever H, fulcrumed in hinged post G, that occupies a notch, *d*, in the said rest and is removable therefrom, substantially as set forth.

256,385. SNATH-FASTENER. AUGUST SCHULTZE, Galveston, Tex. Filed Feb. 13, 1882. (Model.)



Claim.—1. In a device for attaching scythe-blades to handles, the plate A, having bracket B and studs D D, in combination with a hinged adjustable plate, F, having means for attaching the blade thereto, substantially as set forth.

2. The combination of the plate A, the hinged plate F, having slots H I J and hooked bolts K M, and mechanism for adjusting the two plates in relation to each other, substantially as set forth.

3. The combination of the plate A, having teeth T, bracket-S, connected by cross-piece U and set-screw V with the hinged plate F, having slots H I J, hooked bolts K M, and hinged segmental rack Q, provided upon its inner side with teeth or recesses W, all arranged and operating substantially as and for the purpose set forth.

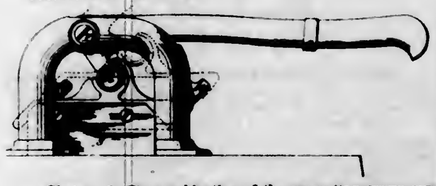
256,386. ELECTRIC CLOCK. JAKOB SCHWEIZER, Soleure, Switzerland, assignor to Cornelius Roosevelt, New York, N. Y. Filed Sept. 3, 1881. (No model.)

Claim.—1. The combination, with the clock-train and balance-wheel and a ratchet-disk connected with the arbor of the minute-hand in said train through an elastic bar or spring, of a weight heavy enough to operate the said train, a device for conveying

power, such as a lever connected with said weight, an impulse-pawl between said device and the ratchet-disk, and an electro-magnet, said parts being constructed and arranged as described, so that the said weight, serving as the motive power of the clock, descends gradually, and in its descent operates the clock-train through the said impulse-pawl and ratchet-disk, and at the end of its fall is instantaneously raised by the said electro-magnet independent of said clock-train, substantially as set forth.

2. The combination, with an electro-magnet and a weighted lever provided with an impulse-pawl, of an arbor, a ratchet-disk mounted loosely on said arbor and adapted to be advanced by said pawl, an elastic bar or spring having sufficient stiffness after a slight yielding to resist the pressure of the weight, and revolving with the ratchet-disk and arbor, to convey gradually to the said arbor the power of the descending weight applied to the ratchet-disk through the pawl, and electric contacts for closing a circuit through the electro-magnet as said lever descends and for breaking the circuit when it is raised, so that said weight serves as the motive power for revolving the arbor, and the said elastic bar or spring acts simply to maintain the power during the instant required to restore the weighted lever, substantially as described.

3. In an electric clock, the combination, with the weighted lever, pawl and ratchet, electro-magnet, armature, and contacts for automatically closing the circuit through the electro-magnet as the lever descends, of means, as indicated, for regulating or varying the point in the descent of said lever at which the circuit is closed, and thus regulating or varying the play of the armature and the effective stroke of the said pawl, substantially as described.

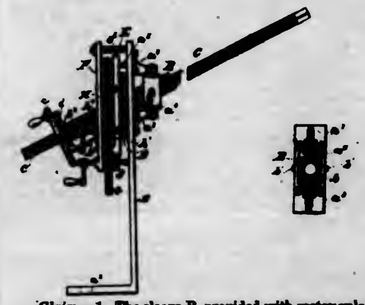


4. The combination, with a weighted lever, an electro-magnet, its armature, and contacts for automatically closing and breaking the circuit through the electro-magnet as the weight alternately descends and is raised, of an auxiliary circuit-breaker arranged, as described, for automatically breaking the circuit when the armature is no longer drawn to the electro-magnet on closing the circuit through the latter, substantially as described.

5. The combination of a shaft, contact-spring, disk mounted on said shaft for making contact with the spring, insulated disk provided with pins or projections for breaking the contact, and an additional spring for holding said contact-spring away from the disk until it is itself withdrawn, substantially as described.

6. The combination of a commutator for making and breaking an electric circuit, means, such as an unbalanced arm, for shifting said commutator when released, a trip-pawl for retaining said arm in place, a vibratory lever operating a ratchet through an impulse-pawl, an electro-magnet in the circuit of commutator, and devices connected with said lever for alternately tripping the said trip-pawl to allow the commutator to be shifted by the aforesaid unbalanced arm, and for restoring the commutator, substantially as described.

7. An electric clock comprising a clock-train with balance-wheel, an elastic bar or spring, a ratchet-disk, a click, an impulse-pawl, a weighted lever, an electro-magnet, and a commutator, constructed, combined, and arranged substantially as described, so that said weighted lever is raised by said electro-magnet independently of the clock-train and operates in its ascent the commutator to break the circuit of the electro-magnet, and then gradually descends by gravity, operating the clock by means of the impulse-pawl and ratchet through the elastic bar or spring, and at the end of its fall operates the commutator to restore the circuit through the electro-magnet, said elastic bar or spring being sufficiently elastic and yielding to keep the clock going while the weighted lever is lifted and of sufficient stiffness to resist the pressure of the weight and cause the weight to descend gradually as the said spring with the arbor of the clock-train is revolved, as set forth.



256,387. TOBACCO-CUTTER. WORTHINGTON SCRANTON, New Haven, Conn., assignor to Sargent & Co., same place. Filed Jan. 21, 1882. (No model.)

Claim.—1. The combination of the supporting-frame constructed with parallel inclined guides, and a cutter-stock carrying the knife, and arranged to move up and down in a diagonal path on said inclined guides, with a lever hung in the frame above, the said lever provided with an arm extending downward and working loosely in a seat provided for it in the cutter-holder, whereby the said cutter is permitted to move in a diagonal path, while the arm of the lever moves in the arc of a circle, substantially as described.

2. The inverted-U-shaped frame, divided longitudinally and constructed with parallel inclined guides, combined with the cutter arranged to move in a diagonal path on said inclined guides within said frame, and the lever, also hung within said frame, and constructed with an arm extending into a seat in the cutter-stock and working loosely therein, the said two parts of the frame secured together to hold the cutter and lever in place, substantially as described.

256,388. DEVICE FOR SUSPENDING PERSONS IN MID-AIR WITHOUT VISIBLE SUPPORT. ERNST H. J. SEEMAN, Berlin, Germany. Filed Jan. 26, 1882. (No model.)

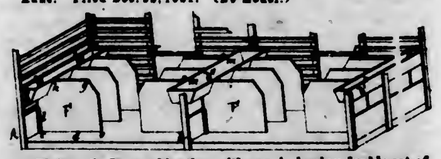
Claim.—1. The sleeve B, provided with rectangular shoulders *b* upon its forward portion and a ratchet-wheel, b^3, upon its rear portion, and journaled within the pivotal frame a^4, substantially as shown and described.

2. The standards a a, bars a^7 a^7, and brackets a^5 a^5, in combination with the pivotal frame a^4 and sleeve B, all arranged to operate substantially as shown and described.

3. The pole C, provided with a wheel, *c*, and pawl c^1, which is controlled by the ratchet b^3, and adapted to rotate the pole within the sleeve, substantially as shown and described.

4. The pole C, sleeve B, pivoted frame a^7, and brackets a^5, in combination with the plates D and E, all arranged and operating substantially as shown and described.

5. The plate D, having formed in it a horizontal slot, *d*, vertical guide-slots d^7, recesses d^8, and provided with a rack, d^9, adapted to be raised up or down by the gear H and its pinion h, substantially as shown and described.



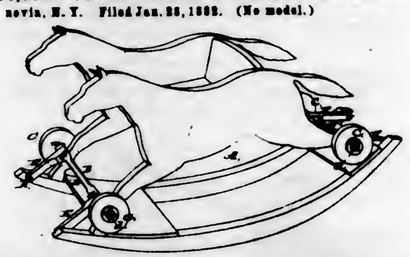
6. The plate E, having formed in it a vertical slot, *e*, guide-slots e^7 e^7, and a rack, e^8, upon its lower edge, which is engaged by the actuating mechanism consisting of the gear G, and pinions g g^1, all arranged to operate substantially as shown and described.

7. The combination of the plates D E and their actuating mechanism herein before set forth with the standards a a and pole C, all arranged and operating substantially as shown and described.

8. The combination of the pole C with the plate E, said plate being adapted to impart to the pole a vertical movement, substantially as shown and described.

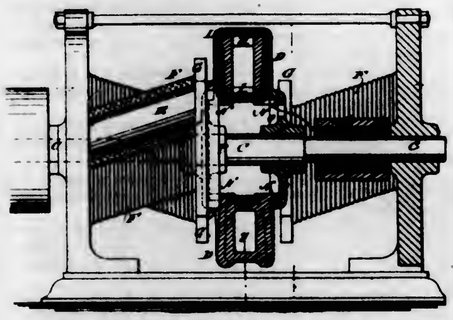
9. The combination of the pole C with the plate D, said plate being adapted to impart to the pole a lateral movement, substantially as shown and described.

256,389. STOCK-CAR. JACOB H. SHELLABARGER, Topeka, Kans. Filed Dec. 23, 1881. (No model.)



Claim.—1. In combination with car A, having double set of doors S, arranged opposite each other, the adjustable longitudinally-arranged stall-partitions F, and troughs b' b'', secured at each end and center of the car, thereby forming aisles across the car from door to door, through which the cattle enter the stalls, as shown and described.

2. The stalls or removable partitions F, bound on their edges with metal, and formed with notches *b b* and provided with pins *d e*, in combination with cross-piece *b*, stationary cleats *a'*, and cleats *e*, as and for the purpose specified.



3. In combination with car A, having double set of doors S and provided with stationary cleats *a'*, the cross-piece *r*, removable and interchangeable stall-partitions F, troughs *b' b''*, and cross-bar *p*, all arranged for operation substantially as shown and described.

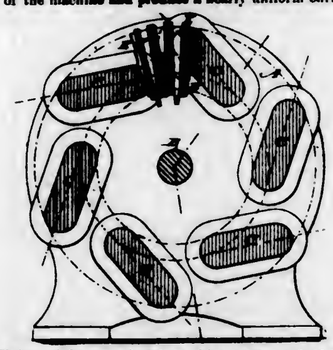
256,390. ROCKING-HORSE. CORNELIUS SHEPARDSON, Canovia, N. Y. Filed Jan. 28, 1882. (No model.)

Claim.—The combination, with a side-frame rocker, of the swinging adjustable axles B, extending entirely across the frame, carrying a wheel, C, at each end, and having the arms E E at right angles to said axle pivoted to the ends of the rockers and braced in contact with the rocker-faces by the intermediate portion, D, of the axle, substantially as specified.

256,391. DYNAMO-ELECTRIC MACHINE. HENRY B. SHERIDAN, Cleveland, Ohio. Filed July 19, 1881. (No model.)

Claim.—1. In a dynamo-electric machine, the armature-core D, constructed, substantially as herein shown and described, of a hollow iron ring nearly rectangular in its cross-section and with sides converging or inclined inward from the convex side toward the concave side, as set forth.

2. In a dynamo-electric machine, the armature-core D, constructed, substantially as herein shown and described, of a hollow iron ring having corresponding openings, H I, in its convex and concave sides and projections forming channels of uniform width upon its inclined or converging sides, as set forth.



3. In a dynamo-electric machine, the armature-core D, constructed, substantially as herein shown and described, of a hollow iron ring having upon its sides projections J K of different thicknesses, alternating with each other and projecting beyond the concave side of the core, the projections J being made V-shaped or with sides converging to an edge, and the projections K being made with slightly inclined or converging sides and V-shaped ends, whereby channels or grooves of uniform width are formed to receive the helix-coils, as set forth.

4. In a dynamo-electric machine, the combination, with the armature-core D, having lugs N, and the armature-shaft C, of the hubs P, having flanges O, substantially as herein shown and described, whereby the said armature will be firmly connected with the said shaft, as set forth.

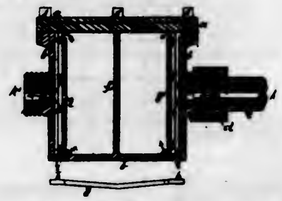
5. In a dynamo-electric machine, the combination, with the armature and the armature-shaft C, of the stationary magnet-cores E and the bobbins F, substantially as herein shown and described, the said cores being placed spirally around the armature-shaft and at an inclination with the said armature-shaft, and the said helices being wound with their coils parallel with the magnetic field of force, as set forth.

256,392. DYNAMO-ELECTRIC MACHINE. HENRY B. SHERIDAN, Cleveland, Ohio. Filed Aug. 22, 1881. (No model.)

Brief.—The construction is clearly indicated in the drawing and claim. The purpose is to avoid wide breaks in the inductive action of the machine and produce a nearly uniform current.

Claim.—A dynamo-electric machine constructed substantially as herein shown and described, with its magnets C made oblong in cross-section and arranged around the armature-shaft B, with the side of each magnet in the series nearly overlapping the edge of the adjacent magnet, substantially as herein specified.

256,393. SPECTACLE-HOLDER. JOSEPH A. SHORB, Salem, Ohio. Filed Aug. 15, 1881. (No model.)



Claim.—1. As an improved article of manufacture, a spectacle-holder made substantially as herein shown and described, and consisting of a clip, E, to which is pivoted a strip, D, carrying the spectacles C', as set forth.

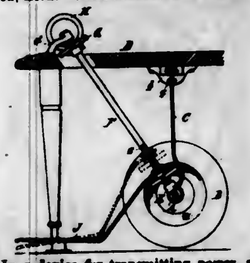
2. The combination, with the shade G, of the clip E, the strip D, and the spectacles C', substantially as herein shown and described, and for the purpose set forth.

3. The combination, with the clip E, of the strip D, the strip A, the spectacles C', and the binding-springs L and M, substantially as herein shown and described, and for the purpose set forth.

256,394. BELL-STOP. L. HYDE SLADE, Bridgeport, Conn. Filed Nov. 10, 1881. (No model.)

Brief.—Water entering the pipe *e* strikes against plate *g* and escapes around its edges, which are so narrowed as to prevent eels or other fish from passing. Plates *f f* project from the sides of the case and prevent the deposit of sediment.

Claim.—1. The combination of the case *h*, having the internal grooves, *i i*, hubs *c c*, threaded to receive the service-pipes *h h'*, and the center plate, *f*, all cast in one piece, substantially as set forth.



2. The case *h*, combined with the stop-plates *g g*, set therein opposite, transverse, and close to the orifice of the service-pipes *h h'*, substantially as and for the purpose set forth.

3. The angular stop-plates *g g*, provided with the ears *h h*, combined with the case *h*, as described and set forth.

4. The combination of the case *h*, provided with hubs *c c* for connection with the service-pipes, and the angular plates *g g*, set transversely to the orifice of said hubs with the re-entrant sides of said plates presented to said orifices, as set forth.

5. The combination of the case *h*, having the grooves *i i*, and the inlet *k* and outlet *k'*, with the angular plates *g g*, central diaphragm, *f*, and cover *a*, secured by the screws *j j*, all arranged substantially as described and shown.

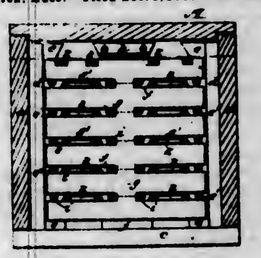
256,395. DEVICE FOR TRANSMITTING MOTION. ENNIS L. SMITH, Jackson, Mich. Filed Jan. 26, 1882. (No model.)

Claim.—1. In a device for transmitting power, a revolving friction-wheel combined with a power-disk having a bearing-face upon which said wheel traverses radially to transmit different rates of speed, and central recess in which said wheel is forced to break the connection, as specified.

2. In a device for transmitting power, a revolving wheel combined with a power-disk having bearing-surface for said wheel, and a central recess in which the wheel is forced to break connections, and with means, substantially as described, for breaking the speed of said wheel when disconnected, as specified.

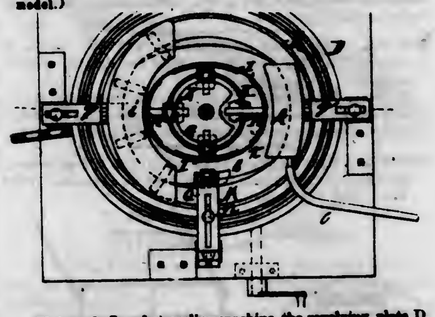
3. The combination of the power-disk B, having a bearing-surface and central recess, with the friction-wheel I and the treadle J, substantially as set forth.

4. The combination of the power-disk B, having bearing-surface and central recess, and the hanger C with the reciprocating friction-wheel I and the treadle J, as set forth, and for the purpose specified.



5. The combination, with the main shaft A, of the disk B, hanger C, step E, shaft F, friction-wheels G I, and treadle J, the parts being constructed, arranged, and operating substantially as and for the purposes set forth.

256,396. CALENDAR-INKSTAND. JAMES G. SMITH, Cleveland, Ohio. Filed June 11, 1881. (No model.)



Claim.—In a calendar-inkstand, the combination, with the inkstand having the base-bearing *d*, carrying the names of the months, of the cover-band K, sprung upon said bearing and having an opening for disclosing a single month at a time, as set forth.

256,397. UNDERGROUND-TELEGRAPH LINE. WARREN D'E. SMITH, Boston, Mass. Filed Dec. 5, 1881. (No model.)

Claim.—The clamping-plate *g*, provided with slots *g'*, in combination with the box A and slotted wire-holders *e f*, substantially as shown and described.

256,398. HAT-CURLING MACHINE. WILLIAM T. SMITH and CHARLES E. HALL, Bloomfield, N. J. Filed Dec. 5, 1881. (No model.)

Claim.—1. In a hat-curling machine, the revolving plate D, having in its face the grooves I, substantially as described, and carrying a curling mechanism, in combination with means for revolving said plate, substantially as and for the purposes specified.

2. The plate D, substantially as above described, in combination with central mechanism for holding a hat, substantially as set forth.

3. The combination of plate D, substantially as set forth, the mechanism for holding hats, and the crank *f* and screw-wheel connection for turning said plate, substantially as set forth.

4. The plate D, substantially as set forth, fixed on the hollow shaft C, the band-wheel F, and shaft F, carrying the bevel-gear G, in combination with pinion K, rods H, and head-sections I, substantially as and for the purpose specified.

5. The bevel-gears G and K, the adjustable screw-rods H, and sections I, in combination with mechanism for revolving said gears, substantially as and for the purpose set forth.

6. The combination of the plate D, curling mechanism M, arranged to and operating on the face of the plate, with the device for attaching it, and the stops *p*, substantially as named.

7. The curling mechanism M, embracing the strip N, having the tongue O, the strip O', strip Q, carrying the shaft R, and foot S, in combination with plate D, substantially as and for the purpose specified.

8. The foot S, with the shaft R, hung to the pin *b*, and the lever *c*, substantially as and for the purpose named.

9. The combination of the plate D and foot S, substantially as set forth, and rollers *e*, for the purpose specified.

10. The combination of the plate D, curling mechanism M, all substantially as set forth, and weight *i*, substantially as and for the purpose named.

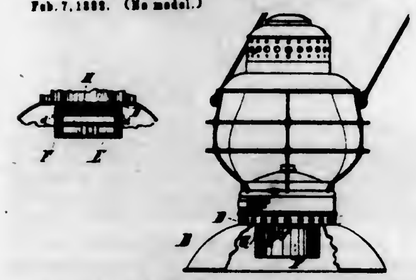
11. The combination of plate D, curling mechanism M, and weight *i*, all substantially as described, and iron *h*, for the purpose set forth.

12. The combination of the plate D and curling mechanism M, substantially as described, and devices for holding a hat, substantially as specified.

256,399. PADLOCK. GEORGE D. SPILMAN, Lancaster, Ohio. Filed July 26, 1881. (Model.)

Claim.—In a padlock, the combination, with the casing C, provided with the stationary jaw O, having stud P, the pivot G, the tumblers H, and springs I, of the jaw A, provided with the recess B in the under side of its outer end, and the recesses D E on its inner end, and the spring F, wound around the said pivot, substantially as and for the purpose set forth.

256,400. PRODUCTION OF NAPHTHYL-SULPHATE SODA SALT. JAMES H. STEBBINS, Jr., New York, N. Y. Filed Jan. 27, 1882. (Specimens.)

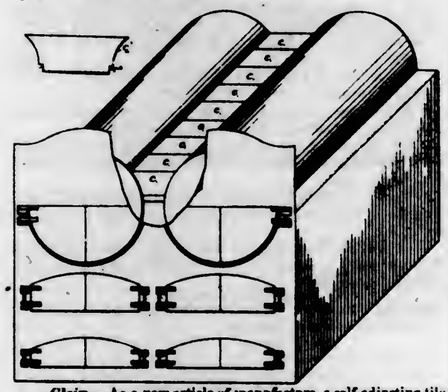


Brief.—The acid of this salt is produced by the reaction of commercial sulphuric acid upon beta-naphthol at moderate temperatures.

Claim.—The soda salt of naphthyl-sulphate produced by treating beta-naphthol with sulphuric acid and separated from other matters by the action of hot alcohol, substantially in the manner herein set forth.

256,401. DYE-STUFF OR COLORING-MATTER. JAMES H. STEBBINS, Jr., New York, N. Y. Filed Feb. 6, 1882. (Specimens.)

Claim.—The dye-stuff or coloring-matter produced by the action of diazoazo-benzole-monosulpho-acid upon the soda salt of naphthyl-sulphate, substantially in the manner herein set forth.

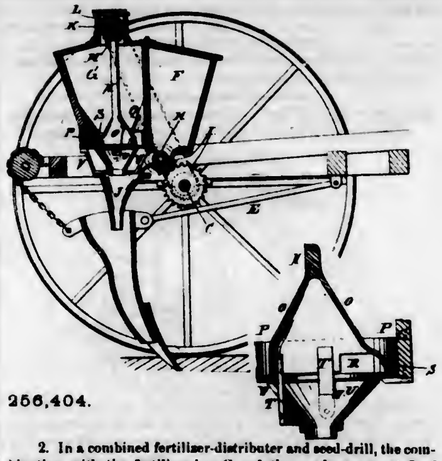


256,402. RAILWAY-LANTERN. WILLIAM O. STEPHENSON, Cincinnati, Ohio, assignor to H. H. Buck, St. Louis, Mo. Filed Feb. 7, 1882. (No model.)

Claim.—1. A railway lamp or lantern whose foot or base contains a holder or receptacle, D, a cap, F, and a spring catch or fastening, G, substantially as set forth.

2. The torpedo-holding attachment for railway-lanterns, consisting of receptacle D, cap F, fastening G, and anti-rattling spring H, substantially as set forth.

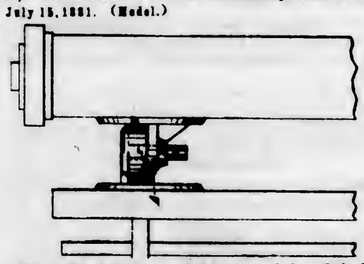
256,403. TILE FOR STEAM-BOILERS. JOHN C. STEVENS, Pittsburg, Pa. Filed Jan. 18, 1882. (No model.)



Claim.—As a new article of manufacture, a self-adjusting tile for steam-boilers, having the concave sides *c' c'* and cut-out *c² c²* substantially as described and shown.

256,404. COMBINED FERTILIZER-DISTRIBUTER AND SEED-DRILL. CHARLES R. STRAHORN, Centreville, Md. Filed Jan. 26, 1882. (No model.)

Brief.—A hollow feeding-cone having a scoop-like mouth is rotated in a depressed bottom or cup in the hopper. To this cone by suitable straps is attached an inverted truncated cone for guiding the material being fed to the drill-boots.



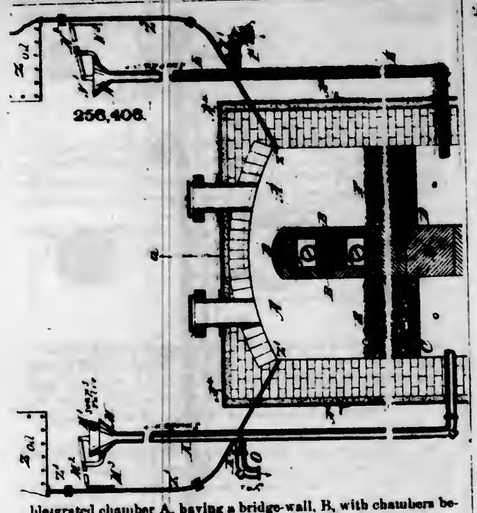
Claim.—1. In a combined fertilizer-distributer and seed-drill, the fertilizer-feed constructed substantially as herein shown and described, and consisting of the rotating hollow cone O, having side opening, R, and scoop-projection S, the stationary cup or recess P, having a central opening in its bottom, the connecting-bars T, and the inverted hollow truncated cone U, as set forth.

256,404.

2. In a combined fertilizer-distributer and seed-drill, the combination, with the fertilizer-box G and the conductor-spout J, of the shaft K, the gear-wheels L M, the shaft N, the hollow cone O, having side opening, R, and scoop-projection S, the cap or recess P, having center opening, the connecting-bars T, and the inverted hollow truncated cone U, substantially as herein shown and described, whereby the fertilizer is discharged with a positive force, as set forth.

256,405. HINGE. ALVAN SWEETLAND, Syracuse, N. Y. Filed July 15, 1881. (Model.)

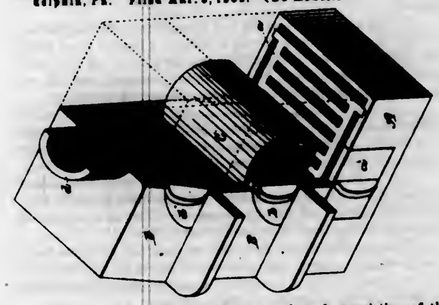
Claim.—The improved gate-hinge, consisting of the bracket B, having the socket *b*, provided on the side farthest from the attaching-plate with a rigid journal, the roller *c*, mounted on said journal and provided with a peripheral flange on the side adjacent to the bracket B, the bracket A, having a solid plate, *e*, covering the socket *b*, and provided with the rigid downward-projecting pintle *a* and the concentric double-inclined rim *r*, the latter riding on the roller *c* and engaging with its inner edge the flange of said roller, all constructed substantially in the manner described and shown.



256,406. APPARATUS FOR MAKING CARBURETED-HYDROGEN GAS. WILLIAM H. TAYLOR, New York, N. Y., assignor to ENOS BARNES, same place. Filed Dec. 17, 1881. (No model.)

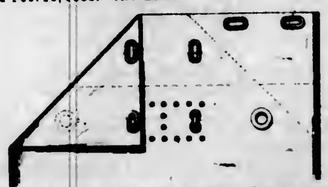
Claim.—1. In a gas-generating apparatus, the combination of a double-grated chamber adapted for holding two masses of coal separated by a bridge-wall, with a smoke-stack or flue connected to a chamber under each grate and provided with dampers at their outer ends, whereby the products of combustion may be conducted from both grates alternately, as hereinbefore set forth.

2. In a gas-generating apparatus, the combination of a double-grated chamber having a bridge-wall between the grates and two smoke-flues, one connected to the space under each grate, and provided with a damper or valve at their outer ends, with the branches O and P, for conducting the gas from the grates alternately, as hereinbefore set forth.



3. In a gas-generating apparatus, the combination of the double-grated chamber A, bridge-wall B, smoke-flues K and L, dampers M' and N', branches O and P, and inlet-pipes Z' and Z², whereby the operation of producing the carbureted gas may be conducted alternately, as hereinbefore set forth.

4. In a gas-generating apparatus, the combination of the double-grated chamber A, having a bridge-wall, B, with chambers below the grates, in combination with the steam, air, and smoke pipes for each grate, as hereinbefore set forth.

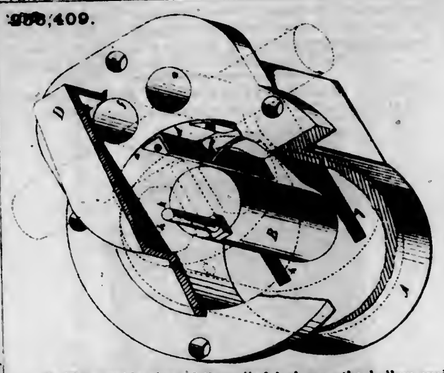


256,406.

256,407. KILN FOR ENAMEL WORK. AMELIA THEIL, Philadelphia, Pa. Filed Mar. 8, 1882. (No model.)

Claim.—A portable kiln for enamel work, consisting of the base A, having grate *a* and door *a'*, the muffle-chamber B, provided with muffle C, having door *b*, and the roof-section D, having the fuel-feeding door *d'*, constructed and operating substantially as and for the purpose set forth.

256,408. MAIL-BAG. ELISHA P. TURNER, Alliance, Ohio. Filed Feb. 23, 1882. (No model.)



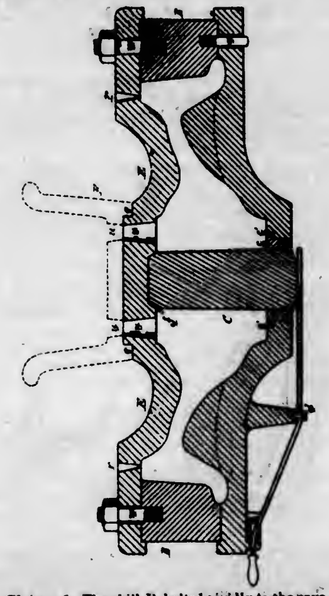
Claim.—A mail-bag the sides of which are of the same length, one side being provided with four horizontal and with two vertical slots, and with two staples which are secured to its outer face and located respectively below the said slots, the other side of the bag being provided with the same number of horizontal and vertical slots, substantially as set forth.

256,409. ROTARY WATER-METER. EDWARD C. TERRY, Hartford, Conn. Filed Oct. 24, 1881. (Model.)

Claim.—1. In a water-meter, the combination of a cylindrical case having an enlargement at one side with an oval float having both a longitudinal and rotary movement within said case, substantially as described, and for the purpose specified.

256,409.

2. The combination of the cylindrical case, the hollow oval float, the post B, and the cut-off *d*, substantially as described, and for the purpose specified.



3. The combination of the cylindrical case having the enlargement *a*, the float C, post B, cut-off *d*, and guide *m*, substantially as described, and for the purpose specified.

4. The combination of the case A, oval float C, slotted cross-piece *b*, shaft *k*, and post B, substantially as described, and for the purpose specified.

5. The combination of the case A, oval and hollow float C, post B, and outlet and inlet channels *g h*, located with reference to the end of the float substantially as described, and for the purpose specified.

6. In a water-meter, the passages *e f*, with the transverse inlet and outlet channels at both ends thereof leading to and from the interior of the case, substantially as described, and for the purpose specified.

256,410. MOLD FOR CASTING CAR-WHEELS. JAS. THIERRY, Detroit, Mich. Filed Jan. 11, 1882. (No model.)

Claim.—1. The chill B, bolted rigidly to the cope E, and provided with steady-pins *a*, to enter holes in the lower section, in combination with said cope and lower section, the flanged collar *c*, the core C, and the basin F, the cope being provided with a flange to fit into the basin, and with a tapering recess to receive the upper beveled end of the core, substantially as set forth.

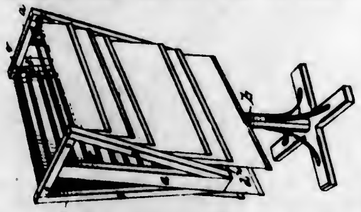
2. The cope E, provided with a projecting portion, O, to en-

ter a recess in the basin F, in combination with said basin, both the cope and the basin being provided with conical coincident openings, having their smallest openings at the adjoining faces of the cope and basin, substantially as and for the purpose specified.

256,411. PARLOR HEATING-STOVE. GEORGE O. THOMAS, Philadelphia, Pa. Filed Feb. 13, 1882. (No model.)

Claim.—1. The combination of the combustion-chamber F and the heating-chamber M in the rear of the same with a magazine and a partition, J, separating the said chambers, both magazine and partition being exposed at the front to the products of combustion and at the rear to the air to be heated, as set forth.

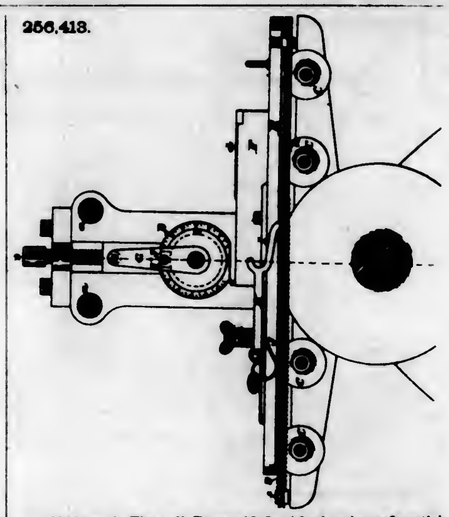
2. The combination of the combustion-chamber F, the hot-air chamber M, the partition J, and magazine G, separating the two chambers, and the ascending and descending flues a' a^4 in the rear of said chamber M, as set forth.



3. The combination of the combustion-chamber F, the hot-air chamber M, the partition J, and magazine G, separating the two chambers, the ascending and descending flues a' a^4 in the chamber M, and the connecting-flues a^2 a^3 in the hollow base of the stove, as set forth.

4. The combination of the combustion-chamber F and the heating-chamber M in the rear of the same with the magazine G and partition J, separating the said chambers, said magazine projecting partly into the combustion-chamber and partly into the heating-chamber, as set forth.

5. The combination of the stove having the heating-chamber M and rear and base flues, as described, with the partition *g* and door *i*, forming an oven, A, in the said chamber M, as set forth.



6. The combination of the stove having the heating-chamber M and rear and base flues, as described, with the door *i* and the partition *g*, having a damper, *k*, as set forth.

256,412. WINDOW-SHADE EXHIBITOR. FRANCIS H. TINKHAM, Springfield, Mass. Filed Feb. 7, 1882. (No model.)

Claim.—The within-described window-shade exhibitor, consisting of the frame *a*, having two outwardly-inclined shade-supporting posts, *x x*, upon opposite sides thereof, the tie-rods *v v*, the horizontal bar *u*, and the stand *b*, to which said frame is pivotally attached, combined and operating substantially as set forth.

256,413. PLATE-PRINTING PRESS. JAMES TREGURTHA, Boston, assignor to William C. Domain, Jr., Medford, Mass. Filed Nov. 16, 1881. (No model.)

Claim.—1. The roll D, provided with the circumferential groove *i* and flange or lip *i'*, in combination with the arm G, provided with the lug *k* and stud *l* and loosely mounted upon the shaft of the roll D, and the bolt *j* and nut *j'*, all constructed, arranged, and adapted to operate substantially as and for the purposes described.

2. The combination of the roll D, provided with the groove *i*, the arm G, provided with the lug *k* and stud *l*, the bolt *j* and nut *j'*, the plank E, the bar I, adjustably secured to said bed, the hook-arm H, and the spring J, all constructed, arranged, and adapted to operate substantially as and for the purposes described.

256,414. COMPOUND FOR DESTROYING CARPET BUGS AND WORMS. JACOB S. VANDENBURGH, Canandaigua, N.Y. Filed Sept. 10, 1881. (No specimens.)

Brief.—To make the tobacco extract, one and a half pound of tobacco is boiled in six quarts of water, and one quart of alcohol is then added. Of this six ounces are added to one ounce of the potash mixture and one ounce of turpentine.

Claim.—The herein-described composition of matter to be used to destroy carpet bugs and worms, consisting of extract of tobacco, potassium oxide, muriate of ammonia, salts of tartar, and turpentine, in the proportions stated.

256,415. TILE OF GLASS, PORCELAIN, &c., FOR DECORATING WALLS. ELIAS VERBEN, New York, N. Y. Filed Dec. 19, 1881. (No model.)

Claim.—1. A tile having various configurations on its surface formed in one piece, with depressions corresponding to the figures represented, and adapted to receive a corresponding design of metal, as herein before set forth.

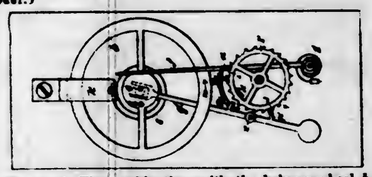
2. A panel consisting of a tile formed with depressions corresponding to the figures to be represented, and filled with a design of metal, whereby the forms of the figures appear through the metal, representing inlaid work, as herein before set forth.

256,416. PLIERS FOR ATTACHING BUTTONS. WILLIAM H. WARD, Topeka, Kans. Filed Jan. 21, 1882. (No model.)

Claim.—1. A pair of pliers having suitable means for holding a button in the upper jaw and a die in the lower jaw, having a groove surrounding a raised portion for bending the prongs of a button-clasp inward, substantially as shown and described.

2. The combination, with the recessed upper jaw of the pliers

256,416.



A, of the die *c'*, secured to the lower jaw, having a circular groove or recess, *d*, surrounding a raised portion, *e*, and provided with small radial grooves *e'*, extending to the bottom of the recess *d* and up the outer side thereof, substantially as shown and described.

256,417. BUTTON. WILLIAM H. WARD, Topeka, Kans. Filed Feb. 18, 1882. (No model.)

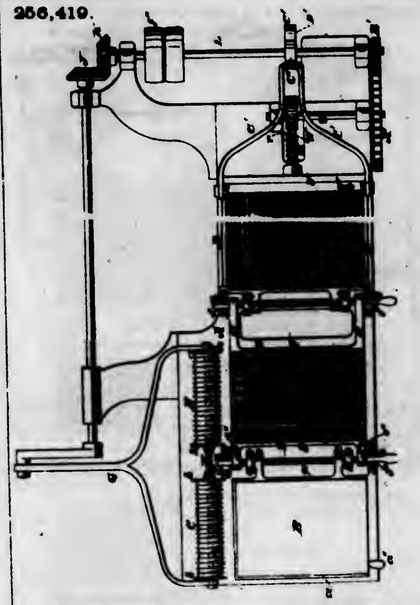
Claim.—The combination, in a button, of a rotary eyelet secured within the back of the button, so as to form a shank, a fastening having its cylindrical end secured within the eyelet, and a face having a depression fitting within the spread ends of the fastening and eyelet, substantially as shown and described.

256,418. ESCAPEMENT FOR CLOCKS AND WATCHES. EDUARD WERSCH, Vienna, Austria-Hungary, assignor of one-half to John James Hanhart, same place. Filed Dec. 12, 1881. (No model.)

Claim.—1. The combination, with the balance-wheel *b* and the escapement-wheel *r*, of the pivoted lever *f*, provided with a projection, *a*, and means for pressing it toward the escapement-wheel, the pin *i*, the pivoted rod *g*, provided with teeth *p p'*, and an arm, *n*, substantially as herein shown and described, and for the purpose set forth.

2. The combination, with the balance-wheel *b*, having an eccentric pin, *i*, and with the escapement-wheel *r*, of the eccentric *s* on the shaft of the balance-wheel, the pivoted rod *g*, provided with a fork and with teeth *p p'*, and an arm, *n*, and of the pivoted lever *f*, provided with a projection, *a*, substantially as herein shown and described, and for the purpose set forth.

256,419. PROCESS OF AND APPARATUS FOR MAKING PILLS. JAMES A. WHITNEY, Dobbs Ferry, N. Y. Filed June 23, 1880. Renewed June 8, 1881. Again renewed Feb. 24, 1882. (No model.)



Claim.—1. The herein-described method of making strips of mass for the manufacture of pills by forming the sheet of mass with parallel divisions extending through more than one-half of the thickness of the sheet, then inverting the sheet, and completing the separation of the strips by coincident divisions on the opposite side of said sheet, substantially as and for the purposes herein set forth.

2. The herein-described method of preventing the adhesion of the cylindrical strips of mass to the mechanism whereby they are formed by providing the sheet of mass with parallel divisions extending through more than one-half the thickness thereof, then inverting the partially-divided sheet into the grooves of a plate, D, the sharp edges between the grooves of which extend through only substantially one-half of the thickness of the sheet, and then separating the strips by parallel divisions coincident with those on the opposite or under side of the sheet, substantially as and for the purposes herein set forth.

3. The method herein described of insuring the separation of the cylindrical strips of mass by first forming the sheet of mass with parallel divisions extending through more than one-half of the thickness of the sheet, then filling to a greater or less degree the said divisions with powdered chalk, resin, or similar material, then inverting the said sheet and completing the formation of the strips by coincident divisions on the opposite side of the sheet, substantially as and for the purposes herein set forth.

4. The combination, in a pill machine, of the following elements, namely: a substantially plain-faced plate, B, for receiving

256,419.

a sheet or quantity of mass, a mechanical device for forming parallel divisions in the mass to a depth greater than one-half of the thickness of said mass, a plate, D, having grooves of a contour substantially correspondent with the divided surface of the mass to be operated upon, and a mechanical device for dividing the opposite surface of the mass coincident with the divisions first made therein, the whole provided for joint use and operation, substantially as and for the purposes herein set forth.

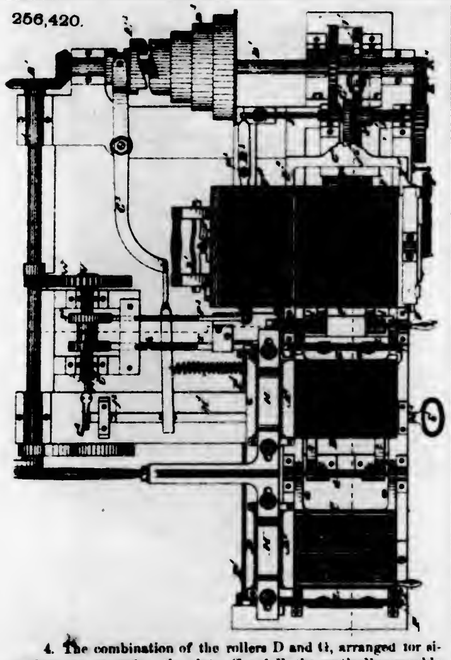
5. The combination, in a machine for making pills, of a grooved plate, N, a coincidentally-grooved plate, E, and mechanism, substantially as described, for imparting a simultaneous downward and reciprocating movement to the plate E', with reference to the plate N, substantially as and for the purposes herein set forth.

6. The combination of the substantially plain-faced plate B, grooved plate D, and grooved rollers C and E, substantially as and for the purposes herein set forth.

7. The grooved plate D, constructed and arranged to be tilted or turned in opposite directions, in combination with the plates B and N, and mechanism, substantially as described, for forming divisions in the mass on the plate B, for completing the division of the mass into cylindrical strips on the plate D, and for dividing and shaping the strips into pills on the plate N, substantially as and for the purposes herein set forth.

8. The combination of the inclined planes R, the slides S, the reciprocating plate E', and mechanism, substantially as described, for giving a longitudinal movement to the slides S, substantially as and for the purposes herein set forth.

9. The combination of the frame T, the grooved plate E', and grooved plate N, substantially as and for the purposes herein set forth.



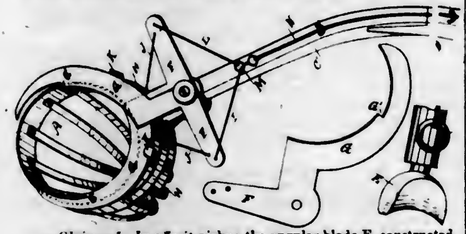
256,420. MACHINE FOR MANUFACTURING PILLS, &c. JAS. A. WHITNEY, Dobbs Ferry, N. Y. Filed Sept. 16, 1881. (No model.)

Claim.—1. The combination, with the grooved roller D, of the plate C, constructed with shallow grooves or depressions in its upper surface to prevent casual lateral displacement of the mass during the operation of the grooved roller thereon, substantially as herein set forth.

2. The combination, with the grooved roller D and plate C, of means, substantially as described, for graduating the descent of the roller upon the plate during the operation of grooving and corrugating the mass thereon, substantially as herein set forth.

3. The combination, with the roller D and plate C, of vertically-movable rails L and means, substantially as described, for raising and lowering said rails to graduate the distance between the said roller and plate, substantially as and for the purpose herein set forth

256,420.



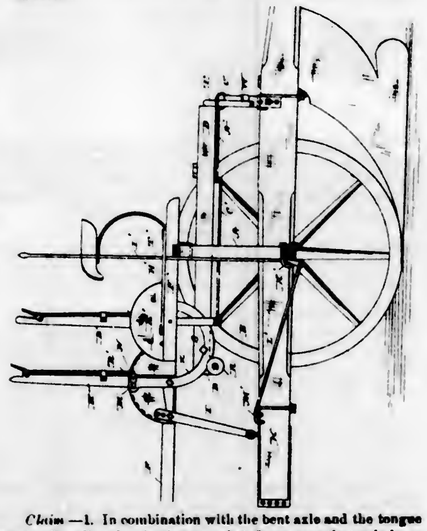
4. The combination of the rollers D and G, arranged for simultaneous operation, the plates C and E, the vertically-movable rails L, arranged to receive the weight of the rollers, and means, substantially as described, for graduating the vertical movement of the rails to graduate the distances of the said rollers from the said plates, substantially as herein set forth.

5. The combination, with the rollers D G and the plates C E, of mechanism, substantially as described, for automatically stopping the movement of said rollers at intervals to permit the manipulation of the plates, substantially as and for the purpose herein set forth.

6. The combination, with the plates F F², inclined planes F' F'', and cam G', of mechanism, substantially as described, for stopping the motion of the cam to permit continued motion of the plate F² after the same has descended to the plate F, substantially as herein set forth.

256,421. FRUIT-PICKER. JAMES R. WILLIAMSON and JOSEPH A. WILLIAMSON, Brunswick, Ga. Filed Oct. 10, 1881. (Model.)

Claim.—1. In a fruit-picker, the angular blade F, constructed substantially as herein shown and described, with a curved cutting-edge, G, having an offset or shoulder, G', as set forth.



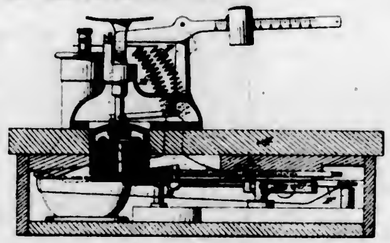
2. In a fruit-picker, the combination, with the basket A and the handle D, of the angular blades F, having curved cutting-edges and pivoted to the said handle, and the springs H, having one end secured to the basket and the other connected to the blades by cords J, substantially as shown and described, whereby the said blades will be held open, as set forth.

3. In a fruit-picker, the combination, with the basket A, the handle D, and the angular blades F, pivoted to the said handle, of the springs H, having one end secured to the basket and their free ends connected to the blades by cords J, the cords L, and the cord M, substantially as and for the purpose set forth.

4. In a fruit-picker, the combination, with the handle D and the basket A, provided with the clips K and the springs H, of the angular pivoted blades F, the cords J, connecting the said springs and blades together, and the cords L N, substantially as and for the purpose set forth.

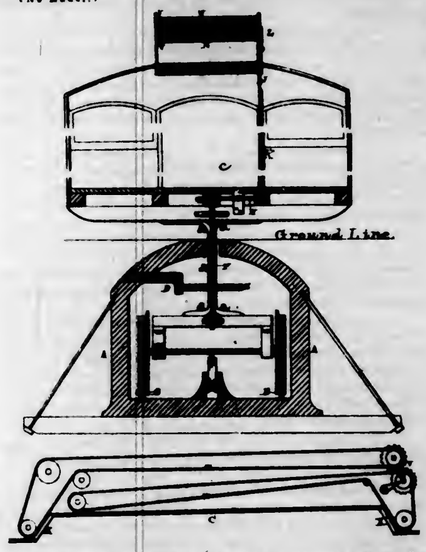
5. In a fruit-picker, the combination, with the handle D, of the removable knee-piece E, substantially as and for the purpose set forth.

256,422. SULKY-PLOW. MYRON G. WOOD, Church's Corners, and WALTER C. PRATT, Hudson, Mich. Filed Mar. 9, 1882. (Model.)



Claim.—1. In combination with the bent axle and the tongue or pole of a sulky-plow having a ratcheted segment, the angle-lever fulcrumed to the segment and loosely connected to the forward part of the plow-beam, the curved lever fulcrumed to said segment and provided with a slotted head adapted to play upon a bolt upon the angle-lever, and the pivoted frame D, provided with a friction-roller and pin between which the curved lever plays, substantially as and for the purpose specified.

2. In combination with the frame D, pivoted to the bent axle, and the segment T at the rear thereof, the plow-beam provided with the yoke U V Y, the bell-crank, connecting-rods, and the lever D' for operating the plow to wing the same, substantially as and for the purposes set forth.



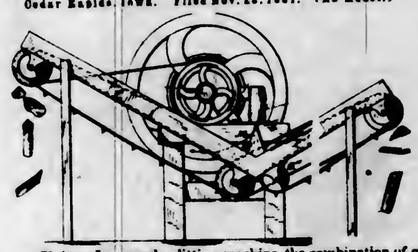
3. In combination with the bent axle and plow-beam, the angle-lever I', fulcrumed to the axle, the connecting-rods L' N', and the beam-clamp M', whereby the width of the furrow may be regulated, substantially as specified.

256,423. WEIGHING-SCALES. WALTER W. WRIGHT, Cairo, Ill. Filed Oct. 21, 1881. (Model.)

Claim.—As an improvement in weighing-scales, an electric alarm which is set in operation by means of a circuit-closer that is adapted to be operated by the arm of the scale-beam which receives the article to be weighed, and a wedge adapted to be moved longitudinally, so as to vary the position of said circuit-closer with relation to the said arm, substantially as and for the purpose specified.

256,424. ADVERTISING DEVICE FOR STREET-CARS. RICHARD F. BRINKWELL, San Francisco, Cal. Filed Jan. 30, 1882. (No model.)

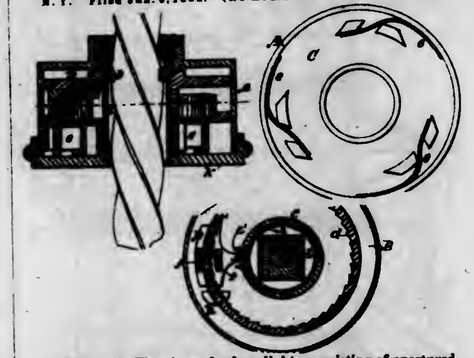
Claim.—1. The combination, with a street-car, of an advertising device consisting of a rack, D, placed in the road-bed, a vertical shaft, F, provided with a toothed wheel, E, to engage with the rack, and having an operating-cam, G, secured to its upper end, with a mechanism for operating one or more endless belts, substantially as shown.



2. The combination of the pivoted lever H, an operating mechanism for moving the lever, and a connecting cord, wire, or chain, J, a loose pulley, L, provided with dogs P, a ratchet, R, a roller, N, spar-wheels V, and belts W, substantially as described.

3. The combination of a car having an opening, X, through each end, with the belts W, arranged as shown, and mechanism for operating the belts, whereby the names of the streets and the advertisements will be alternately exposed to view at both ends of the car at the same time, substantially as set forth.

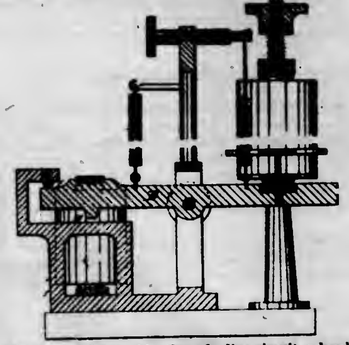
4. The combination, in a street-car, of belts W, a mechanism for operating them, an alarm mechanism to attract the attention of the passengers, a connecting rod, cord, or wire, J, a pivoted lever, H, a grooved cam, G, for operating the lever, a vertical shaft, F, and a toothed wheel, E, and rack D, substantially as specified.



5. The combination of an operating mechanism for advertising in a street-car, consisting of a pivoted lever, H, a connecting wire, cord, or rope, J, the loose pulley L, placed upon the end of the roller N, adapted to operate the belts W, a weight, Q, secured to the pulley L, the dogs P, the ratchet O, the projections R, and an alarm mechanism adapted to call the attention of the passengers to movement of the belts in front of the openings X, substantially as shown and described.

256,425. WOOD-SPLITTING MACHINE. ROBERT G. BROCK, Cedar Rapids, Iowa. Filed Nov. 28, 1881. (No model.)

Claim.—In a wood-splitting machine, the combination of carrier F, partition M, and carrier F', substantially as and for the purpose set forth.



256,426. CLAMP FOR EXTENSION GAS-FIXTURES. JOHN F. BROWN, Brooklyn, assignor to Oxley & Giddings, New York, N. Y. Filed Jan. 3, 1882. (No model.)

Claim.—1. The clamp for drop-lights, consisting of apertured disk B, provided with slotted hub e and stud A, disk C, having flange d, spring-arms e, and dog D, provided with lugs f g, substantially as shown and described, combined with case A, for operation as specified.

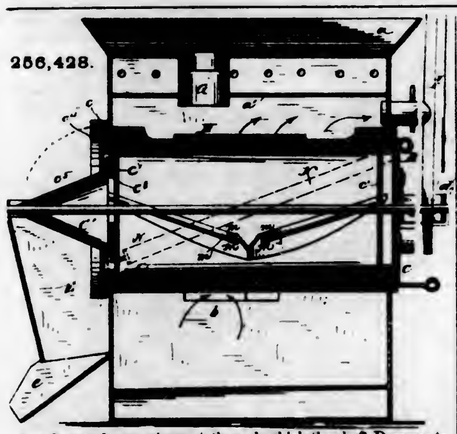
2. In clamps for drop-lights, the loose clamping-dog D, in combination with the revolving disk B and friction-disk C, substantially as shown and described.

256,427. RELAY AND SOUNDER. CHARLES S. RUSSELL, New York, N. Y. Filed Jan. 18, 1882. (No model.)

Claim.—1. The combination of a line-circuit, a local circuit, an electro-magnet having independent coils wound in the same direction, one coil being in the line and the other in the local circuit, an adjustable spring assisting said magnet, an armature-lever, and a retracting-magnet in local circuit, substantially as described.

2. The combination of an overlying and underlying magnet having two sets of independent coils wound in the same direction, an armature-lever, a local circuit, a controllable resistant in said local circuit modifying the power of the local battery continuously energizing one set of coils in said magnets, a retracting-spring of fixed tension, a retracting-magnet, and an adjusting-spring acting in the line of attraction, for operation substantially as described.

256,428. COFFEE AND PEANUT ROASTER. CHARLES L. COLE, Bucknell, Ill., assignor of one-half to James R. Kay, same place. Filed Sept. 12, 1881. (Model.)



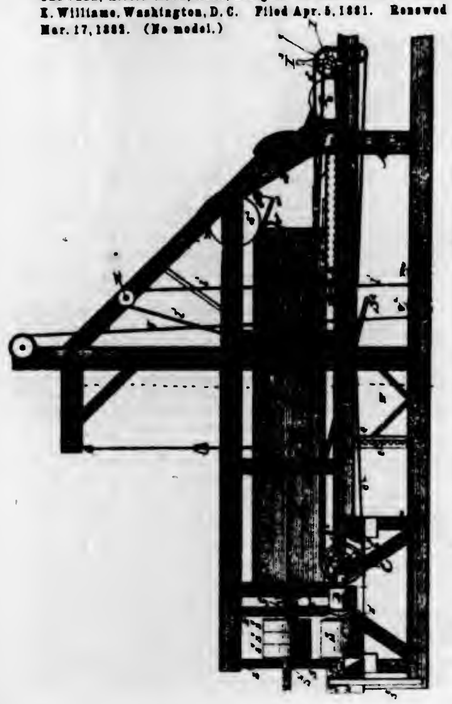
Claim.—1. In a coffee-roasting cylinder, the double-inclined plane M, one or more, set at right angles to the inside periphery, and having the bent edges m m', substantially as described.

2. In a roasting-cylinder, the combination of the double-inclined plane M, having edges m m', with the single inclines N, extending from end to end of the cylinder, substantially as described.

3. The cylinder C, having at one end the cone C', in which is opening c' and annular door c', and at the other the doors c'', having valved openings, substantially as described.

4. In combination with furnace B, having the strap d at one end and the hopper E at the other, the cylinder C, larger at one end than at the other, and provided with annular door and in-

256,428.



ternal central cross-pieces, *c'*, through which the shaft D passes to its bearings in parts *d* and E, all substantially as set forth.

5. The exhibitor K, having water-chamber k^2 and its connecting-pipes, steam-pipe *p*, door *k*, and glazed openings *k'*, combined with fine L, passage-way *b*, damper *i'*, and furnace B, substantially as described.

6. In combination with exhibitor K, the hot-water chamber k^2, having pit k^3, and which not only forms its entire bottom, but extends up and around its lower sides, and is provided with pipe k^4 and steam-escape pipe *p*, all substantially as described.

7. The cylinder C, slightly larger at one end than at the other, and having an annular discharge-door, *c'*, at the larger end, in combination with cone C', fixed in said larger end, substantially as set forth.

256,429. COMBINED COTTON GIN AND PRESS. PEARL K. CROWELL, Little Rock, Ark., assignor of one-fourth to Elisa K. Williams, Washington, D. C. Filed Apr. 5, 1881. Renewed Mar. 17, 1882. (No model.)

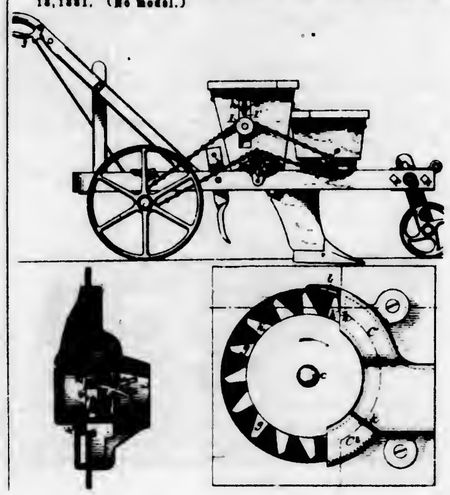
Claim.—1. In a combined cotton gin and press, the packer F, connected with a reciprocating rack-frame, and composed of vertical and horizontal bars secured to a base-plate, substantially as described.

2. The combination, with the packer F, of the rack-frame G, provided with two internal sets of teeth, a pinion arranged to be raised or lowered within the rack-frame to engage the teeth of either set, and devices for raising and lowering the said pinion, whereby the rack-frame and the packer can be moved back and forth by the rotation of the pinion in one direction, substantially as described.

3. The combination, with the movable packer F, arranged within the lint-box, of the trap-door *e'*, arranged to be raised by the forward movement of the packer, and the weighted arm *e²*, arranged to be raised by the spring *e³* during the backward movement of the packer, substantially as described.

4. In a combined cotton gin and press, the bale-holder K, consisting of vertical bars *k*, forming one section thereof, and the triangular-shaped plates L, secured to a plate, L', and constituting the remaining section of the same, said sections being connected by eyebolts, substantially as described.

5. The combination, with the packer F, provided with a series of vertical bars, of the vertically-movable bale-holder K, provided with vertical bars, and triangular-shaped plates arranged to admit of the passage of the vertical bars of the packer between them in the manner set forth, said bale-holder being adapted to be raised by pressure of the lint wedged under its triangular-shaped plates by the packer, substantially as described.



6. The tie-holder T, comprising vertical sheaths for the ties and pinions, and rack-bars for raising the same, substantially as described.

7. The combination, with the vertical sheaths *t* for the ties, of the crank-wheel *t'*, the pinion t^2 upon the shaft of the crank-wheel, the pinion t^3, connected with the crank-wheel by a connecting-rod, and the rack-bars t^4, with which the pinions engage, whereby by operating the crank-wheel the tie-holder can be raised into the bale-box, substantially as set forth.

8. The combination, with the head-block Q, of the follower-blocks O O', the latter provided with pins passing through slots P, the screw acting upon the block O, the fast and loose pulleys *s'*, and mechanism for driving the fast pulley in different directions, substantially as described.

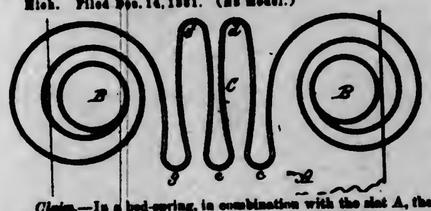
9. The combination, with the gin-saws, the rotary brush, and a flue leading from the brush to the condenser, of a movable packer arranged to travel back and forth in the lint-chamber below the condenser, a vertically-moving bale-holder arranged in front of the packer, the head-block arranged to be lowered at one side of the bale, the follower and screw of the press, and the vertically-moving tie-holder, substantially as described.

256,430. FERTILIZER-DISTRIBUTER AND PLANTER. ARTHUR B. FARQUHAR, JOHN A. JONES, and HENRY W. EISENHART, York, Pa., assignors to said Farquhar and Jones. Filed July 18, 1881. (No model.)

Claim.—1. The combination, with the fertilizer hopper or box and the horizontal rotating feed-wheel provided with teeth formed with cutting-edges, of a scraper secured within the box above the feed-wheel, and provided with a cutting-edge arranged with respect to and adapted to co-operate with the teeth of the feed-wheel successively passing beneath it, substantially as hereinbefore set forth.

2. The obliquely-toothed horizontal feed-wheel and the box or hopper in which the same is mounted, in combination with a scraper provided with a cutting-edge arranged with respect to and adapted to co-operate with the teeth of the feed-wheel, substantially as hereinbefore set forth.

3. The combination of the hopper provided with a bottom having a feed-wheel-receiving recess, as described, the horizontal rotating toothed feed-wheel mounted in said recess, and the scraper formed with a cutting-edge to co-operate with the teeth of the feed-wheel, substantially as and for the purposes hereinbefore set forth.



4. The scraper formed with a cutting-edge to co-operate with the feed-wheel teeth, and arranged, substantially as herein described, so as to cover the discharge-opening and part of the feed-wheel, in combination with the hopper or box and the horizontal rotating toothed feed-wheel, substantially as set forth.

5. In combination with the hopper and the horizontal rotating toothed feed-wheel, the scraper formed and arranged to cover the discharge-opening and part of the feed-wheel, and provided with two cutting-edges, one in front and one in rear (relatively to the direction of rotation of the feed-wheel) of the discharge-orifice, adapted to co-operate with the teeth of the feed-wheel, substantially as hereinbefore set forth.

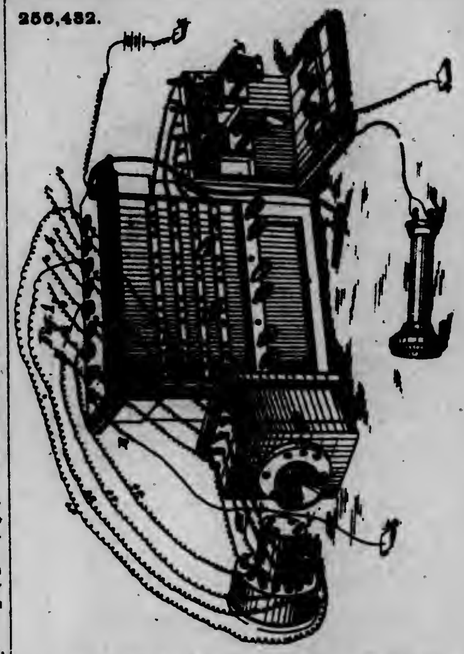
6. The combination of the fertilizer and seed hoppers, the feed-shaft, the pinions or chain-wheels, the chain, and the adjustable tightening pulley or wheel, under the arrangement and for operation as hereinbefore set forth.

7. The teeth-covering wheel formed with teeth inclined both laterally and in the plane of revolution of the wheel, substantially as and for the purposes hereinbefore described, and illustrated in Figs. 9 and 10 of the accompanying drawings.

256,431. BED-SPRING. HENRY FOSBURGH, Howard City, Mich. Filed Dec. 14, 1881. (No model.)

Claim.—In a bed-spring, in combination with the slat A, the twin springs B B, having formed between them the wire plate C, consisting of the central tongue, *e*, and supporting-wires *c d* and *f g*, said springs being further provided with clamping-arms *b b* upon their lower ends, adapted to embrace the slat and secure the springs thereto, substantially as shown and described.

256,432. TELEPHONE-EXCHANGE SYSTEM. LEWIS T. GANSFIELD, Brooklyn, N. Y., assignor of one-half to the Holmes Burglar Alarm Telegraph Company, of New York. Filed Apr. 21, 1880. (No model.)



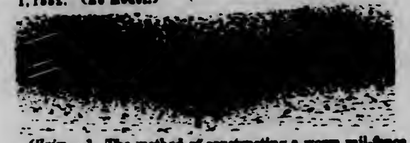
Brief.—The subscribers' lines are connected in pairs through the switch-board and multiple transmitter and receiver, so that each line has some other line as its ground-connection. When a pair of lines is separated the unemployed line takes a local ground. Branch lines from the switch-board lead to the listening operator's apparatus.

Claim.—1. The combination, in a telephone-exchange system, of a plurality of service-lines with multiple receiving and transmitting instruments at the central station, each line being connected through the instrument with another line of the system, whereby each line normally or in a state of rest is grounded through each other line.

2. The combination, in a telephone-exchange system of a plurality of service-lines arranged in groups, so that in their normal condition or a state of rest each has as its ground the ground of some one of the other lines, a switch-board, and a local ground at the central station, arranged substantially as set forth, whereby any line cut off from its normal ground may take the local ground of the central station.

3. The combination, in a telephone-exchange apparatus, of a switch-board, a multiple receiver, and a plurality of service-lines leading through the switch-board to each receiver.

256,432.



4. The combination, in a telephone-exchange apparatus, of a switch-board, a multiple transmitter, and a plurality of service-lines leading from each transmitter to the switch-board, and thence to the customers.

5. The combination, in a telephone-exchange system, of two service-lines and a single coil in each of the instruments (the receiver and the transmitter) of the central station, each line being connected through such coils with the other line, whereby each line normally or in a state of rest is grounded through the other line.

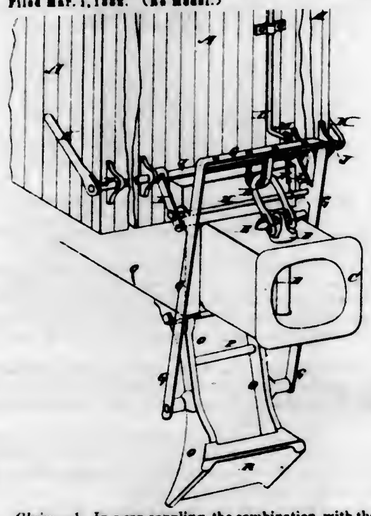
6. In combination with the key-board of the listening-off apparatus, a series of automatic drops arranged and connected to be operated at the time of placing the customers in communication, substantially as described.

7. In combination with the union-strips of the switch-board of a central telephone-station, a series of automatic drops arranged to be operated by the same current with which the switchman signals the customers, substantially as set forth.

256,433. FENCE. GIDEON A. HOBB, Newark, N. Y. Filed Mar. 1, 1882. (No model.)

Claim.—1. The method of constructing a worm rail-fence by securing one end of a piece of wire or cable to the top rail of a panel near the point of intersection of said rail and the top rail of the adjacent panel, then carrying said wire or cable down under the end of one of the lower rails of said panels, bringing it upward and attaching it to the top rail of said adjacent panel while lying in an inclined position, substantially as shown, and finally raising the free end of said inclined rail to its place upon the fence, so that it will act as a lever in straining said wire or cable, substantially as set forth.

2. A worm rail-fence of common construction, having the two ends of a piece of wire or cable secured to the respective top rails of adjacent panels near the point of intersection of said rails, said wire or cable extending under the ends of the rails of said panels, as shown, the rails of the fence contained within the circuit of the wire being held firmly together by the same.



256,434. HARVESTING-MACHINE. ASA NYER, Springfield, Ohio, assignor to William H. Whiteley, same place. Filed Mar. 22, 1880. (Model.)

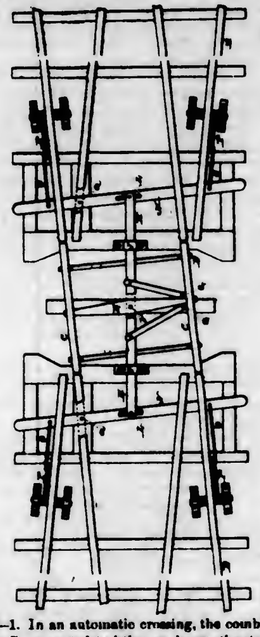
Claim.—1. The combination of the rotating gear-wheel, the oscillating gear-wheel working on a ball-and-socket joint, the vibrating arm and connections, and the suspension-rod, said rod being sustained at one end by a support placed above and connected to the frame of machine and connected at the opposite end to the vibrating arm, substantially as and for the purpose described.

2. A gear which rotates with the main axle and in mesh therewith, an oscillating gear upon a ball-and-socket joint, and an arm for driving the knife fastened rigidly to said oscillating gear, combined with a support for said arm adapted to prevent rotation of said oscillating gear, but to permit free reciprocation of said arm.

256,435. CAR-COUPLING. LEANDER KIRK, Georgetown, Ohio. Filed Mar. 1, 1882. (No model.)

Claim.—1. In a car-coupling, the combination, with the coupling-pin D and the rod J, working in bearings attached to the end of the car, and provided with the arms I and handles K, of the stirrup G, pivoted to the said arms, the clevis F, and pin E, substantially as and for the purpose set forth.

2. In a car-coupling, the combination, with the coupling-pin D, the rod J, provided with the arms I and handles K, and the hinged bars O, carrying the inclined apron R, of the stirrup G, pivoted to the said arms and bars, the clevis F, and the pin E, substantially as and for the purpose set forth.



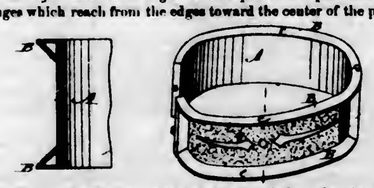
3. In a car-coupling, the combination, with the stirrup G and the coupling-pin D, having a diamond-shaped hole in its upper end, of the clevis F, having diamond-shaped holes in the ends of its arms, and the diamond-shaped clevis-pin E, having rounded parts or journals, substantially as herein shown and described, whereby the clevis-pin is made self-locking, as set forth.

256,436. METHOD OF TREATING FIBROUS MATERIALS FOR PAPER-STOCK, &c. JOSEPH O. ELINGER, Vienna, Austria-Hungary, assignor to the Society for the Manufacture of Wood Pulp, at Grallingen. Filed Feb. 24, 1882. (No specimens.)

Claim.—The process of freeing fibrous materials of any kind from its incrustating and other foreign substances by boiling them with a watery solution of ammonia in a closed vessel with or without pressure, substantially as herein described.

256,437. AUTOMATIC RAILROAD-CROSSING. DAVID LEE, Jr., Birmingham, assignor of one-half to C. A. SMITH, Fort Deposit, Ala. Filed Feb. 14, 1882. (No model.)

Brief.—The movable rails are vibrated upon their central pivot by tread-levers secured to vibrating levers, which give an endwise movement to a sliding rod to which is secured radial rods extending from a point on one of the movable rails opposite the pivot, the diverging ends of said rods being secured to the sliding rod.



Claim.—1. In an automatic crossing, the combination of the crossing-rails C, connected together as shown, the stops G, the connecting-rods I, pivoted thereto, the bar E, the endwise-moving connecting-rod, the slotted pivoted levers, and the pivoted levers I', which extend above the track, substantially as set forth.

2. The combination of the pivoted slotted levers N, the levers P, which extend above the tops of the tracks in pairs, so as to be struck by the wheels of the advancing car, connecting-rod H for uniting the two levers together, suitable devices for connecting the crossing-rail to rod H, and the crossing-rails, the parts being arranged and combined to operate substantially as specified.

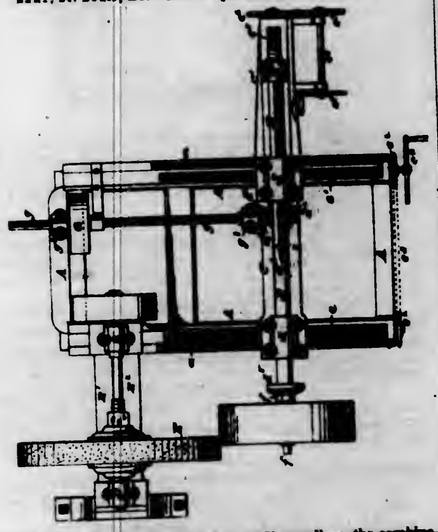
256,438. BRACELET. WILLIAM LISK, Newark, assignor to himself and Addison Conkling, Elizabeth, N. J. Filed Feb. 8, 1882. (No model.)

Brief.—The outer edges of the plates are provided with flanges which reach from the edges toward the center of the plates.

Claim.—1. The bracelet made substantially as herein shown and described, formed of the main plates A A and the hollow reenforcing flanges or ribs B B, secured upon the outer surface of the plates at their edges, as set forth.

2. The flanges B B, formed of the straight portion a, and the diagonal or inclined portion c, and adapted to be secured upon the outside and at the edges of the plates A, substantially as and for the purposes set forth.

3. The method of forming the ribs or flanges B B, which consists in stamping or otherwise bending a plate of metal into double acute angles and then cutting the bent plate longitudinally in the center, substantially as described.



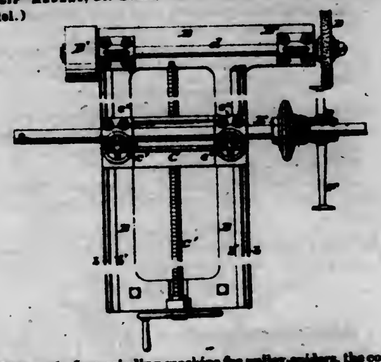
256,439. DESTRUCTIBLE SHUTTER-FASTENING. FRANK O. MATTHIESSEN, Irvington, N. Y. Filed Mar. 16, 1882. (No model.)

Brief.—Some part of the fastener which retains an automatically-closing shutter in an open position is of fusible alloy and melts off and allows the shutter to close and protect the window-frame in case of fire.

Claim.—In combination with self-closing shutters for windows or other openings, destructible fastenings for holding such shutters open, composed in whole or in part of a fusible compound which melts at a temperature below that at which wood ignites, and thereby breaks the fastenings and releases the shutters to the action of the springs or other mechanism by which they are made to shut over the window or other opening which they are designed to shield, substantially as set forth.

256,440. MACHINE FOR GRINDING PULLEYS. PHILIP MEHART, St. Louis, Mo. Filed Sept. 5, 1881. (No model.)

Claim.—1. In a machine for grinding pulleys, the combination of a pulley-carrying arbor having its end to which the pulley is attached overhanging the main frame, a grinding-wheel arranged to one side of the main frame, with its axis on a line parallel with the axis of the pulley-carrying arbor, and means for feeding the pulley across the face of the grinding-wheel, substantially as described.



2. In a machine for grinding pulleys, the arbor-carriage C, provided with an overhanging or extension part, C', in combination with the carrying-arbor D, box D', and feed-screw c^4, substantially as herein described, and for the purpose set forth.

3. In a machine for grinding pulleys, the combination of a pulley-carrying arbor having its pulley-carrying head overhanging the main frame, a grinding-wheel arranged to one side of said frame with its axis on a line parallel with the axis of the pulley-carrying arbor, an arbor-carriage, C, and duplicate operating-screws c c, arranged at the sides of the main frame, and connected together so as to operate in unison, for the purpose set forth.

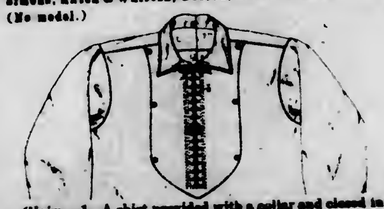
4. A machine for grinding pulleys, consisting of a bed or sheers, A, arbor D, feed-screws $c c'$, and grinding-wheel E, in combination with the traveling shaft g, driving-pulley G, gears d^3 d^4, box D', and feed-screw c^4, all arranged substantially as described, and for the purpose set forth.

5. A machine for grinding pulleys, consisting of a bed or sheers, A, grinding-wheel E, carriage C, feed-screws $c c'$, chain-wheels c^5, chain c^7, hand-wheel c^6, arbor D, box D', feed-screw c^4, gears c^8 c^9, counter-shaft c^{10}, hand-wheel c^6, gears d^3 d^4, traveling shaft g, and driving-pulley G, all arranged substantially as herein described, and for the purpose set forth.

256,441. MACHINE FOR GRINDING PULLEY-SPIDERS. PHILIP MEHART, St. Louis, Mo. Filed Sept. 5, 1881. (No model.)

Claim.—1. In a grinding-machine for pulley-spiders, the combination of a spider-carrying arbor having its carrying-head overhanging the side of the main bed or sheers and supported in suitable bearings, so that it can be moved endwise and rotated by hand, with a grinding-wheel the axis of which is in a parallel line with the axis of the carrying-arbor, substantially as described.

2. In a grinding-machine for pulley-spiders, the combination of an adjustable carriage, having beveled legs a, the bed or sheers B, having corresponding guides or lips, b, and hand-screws $d d'$, the ends of which have bearing against the bed B, substantially as described, and for the purpose set forth.



3. In a grinding-machine for pulley-spiders, the combination of a spider-carrying arbor having its carrying-head overhanging the side of the main bed or frame and supported in suitable bearings, so that it can be rotated and moved endwise by hand, and a bed or frame having a side extension, B', supporting an emery-wheel at its outer end, the axis of which is in a parallel line with the axis of the carrying-arbor, substantially as described.

256,442. SHOE OR GLOVE FASTENER. SIMEON HEBBLE, Sedalia, Mo. Filed Nov. 14, 1881. (Model.)

Claim.—In a glove and shoe fastener, the combination of the hook, having a stop formed on one end, and the staple, by means of which the hook is secured in place, the hook having an endwise sliding movement through the staple, substantially as described.

256,443. SHIRT. ALBERT R. PERKINS, Newton, assignor to Simons, Hatch & Whittan, Boston, Mass. Filed Feb. 27, 1882. (No model.)

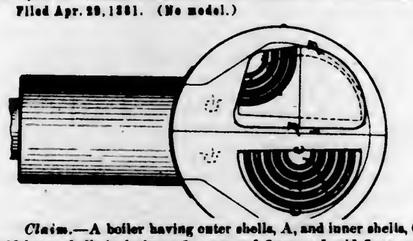
Claim.—1. A shirt provided with a collar and closed in front and open down the back and through the back of the collar, and having to the lips of the openings buttons and button-holes or other proper separable fastenings, all being substantially as described.

2. A shirt provided with a collar and closed in front, and there provided with a lacing and lacing-holes, as described, and also open in the back of the collar, and from thence down in the back of the body, and having the lips of the cloth at such openings provided with buttons and button-holes or other proper separable fastenings, all being substantially as set forth.

3. A shirt having a collar and a breast-shield and a lacing and lacing-holes in the latter, and also constructed with an opening down through the collar at its rear, and one in continuation down into the back of the shirt-body, such body and collar having buttons and button-holes for closing their said openings, all being substantially as described and represented.

6

10,000. PLATE-PRINTING PRESS. THOMAS S. BATES, Bos-

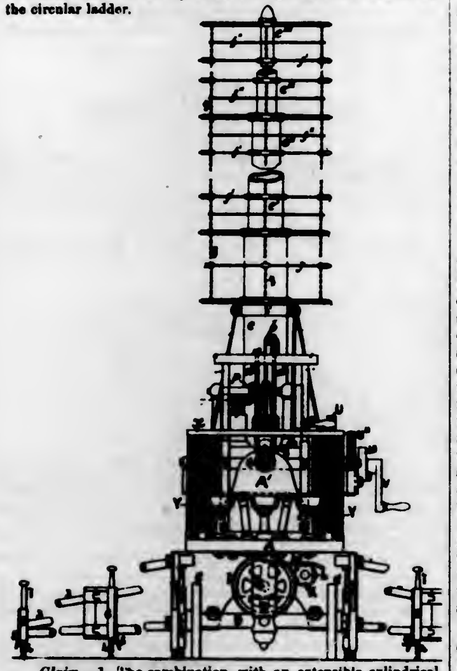


256,444. SALICYLATE OF CHINOLINE. WILHELM PICKHARDT, New York, and HERMANN HERRMANN, Brooklyn, assignors to said Pickhardt and Adolf Kuttroff, New York, N. Y. Filed Feb. 24, 1882. (Specimens.)

Claim.—As a new article of manufacture, the salicylate of chinoline herein described, and having the characteristics above set forth.

256,445. BENZOATE OF CHINOLINE. WILHELM PICKHARDT, New York, and HERMANN HERRMANN, Brooklyn, assignors to said Pickhardt and Adolf Kuttroff, New York, N. Y. Filed Feb. 24, 1882. (Specimens.)

Claim.—As a new article of manufacture, the benzoate of chinoline herein described, and having the characteristics above set forth.

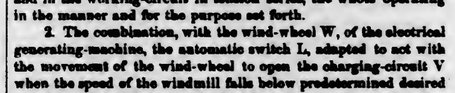


256,446. STEAM-BOILER. DAVID RENSHAW, Cohasset, Mass. Filed Apr. 29, 1881. (No model.)

Claim.—A boiler having outer shells, A, and inner shells, C, said inner shells inclosing a furnace and flues, and said flues containing within them bent water-tubes *d*, emerging from and entering a central water-body, *e*, substantially as described.

256,447. FIRE-ESCAPE LADDER. LORENZO D. B. SHAW, Revere, Mass. Filed Aug. 29, 1881. (No model.)

Brief.—Coiled springs in the front and rear of the frame, and connected by ropes to the frame and ladder, steady and counterbalance the ladder when elevated and at an inclination. A hose is connected to the top of the telescopic tubes which carry up the circular ladder.



Claim.—1. The combination, with an extensible cylindrical ladder, of a hose adapted to be elevated and lowered simultaneously with said ladder, substantially as set forth.

2. The combination, with a tilting table, S, of a series of springs, Y, attached to the frame A, and operating in connection with a chain, *d*, substantially as and for the purpose set forth.

3. The combination, with the tilting frame F, of springs P, connected to a bar, N, at the rear of the apparatus, and operating in connection with a chain, Q, attached to the lower portion of frame F, as and for the purpose specified.

256,448. DIE-STOCK. ALFRED J. STEVEN, Elkhart, Ind., assignor of one-half to Fredrick L. Collins, same place. Filed June 28, 1881. (Model.)

Claim.—In a die-stock, the frame A, open at one end, and having pivoted in this open end a lever, H, which has the cam J and stop L formed upon its inner end, in combination with the screw-threaded handle and dies, substantially as shown.

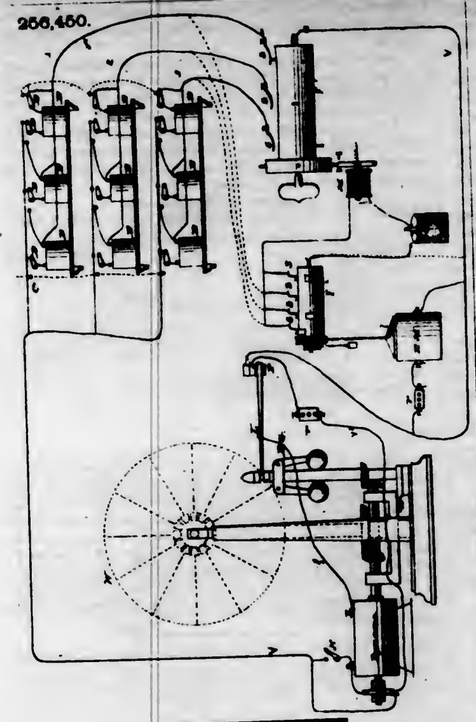
256,449. FOLDING CABINET-BEDSTEAD. FREDERICK STEINBRENNER, Buffalo, N. Y., assignor to Wilhelmina Steinbrenner, same place. Filed Dec. 22, 1881. (No model.)

Claim.—1. The combination, with the case or frame A and the bed-frame B, pivoted thereto, of a spring, D, an adjustable cross-piece, E, to which the spring is secured, and means, substantially as described, whereby the spring is connected with the bed-frame, substantially as set forth.

2. The combination, with the case or frame A and the bed-frame B, pivoted thereto, of a spring, D, a cross-piece, E, supporting the spring, and having teeth m at its ends, and serrated plates N, secured to the frame A, whereby the cross-piece E can be adjusted, substantially as set forth.

3. The combination, with the frame A, provided with a head-board, A', and pivoted bed-frame B, of a spring, D, cross-pieces E, F, and P, and guide-bars O, whereby the spring and the cross-piece attached thereto are maintained in their proper position, substantially as set forth.

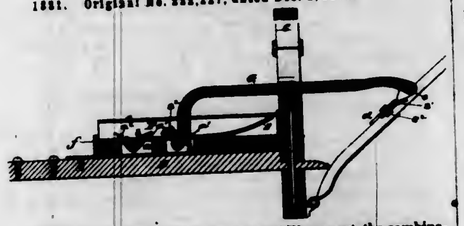
4. The combination, with the frame A, provided with a head-board, A', and pivoted bed-frame B, of the spring D, provided with cross-piece F, adjustable cross-piece E, cross-piece P, and slotted guide-bars O, substantially as set forth.



256,450. DEVICE FOR CHARGING AND DISCHARGING SECONDARY BATTERIES. CHARLES E. BUELL, New Haven, Conn. Filed Nov. 4, 1881. (No model.)

Claim.—1. The combination of the following elements, namely: an electrical generating-machine, a developing-circuit, a charging-circuit, two series of secondary batteries, and a working or discharging circuit with devices, substantially as described, for placing said machine charged into the charging-circuit, with one or more of said secondary batteries, and for withdrawing said machine from said charging-circuit, and leaving the charging-circuit open, with circuit-controlling devices, substantially as described, made operative by the action of said machine to switch the charging-circuit from one of said series of secondary batteries and connect said charging-circuit with another of said series of secondary batteries after a predetermined flow of current from said generating-machine has taken place, with means, substantially as described, for placing the secondary batteries alternately in the charging-circuit, as described, and in the working-circuit in tension series, the whole operating in the manner and for the purpose set forth.

2. The combination, with the wind-wheel W, of the electrical generating-machine, the automatic switch L, adapted to act with the movement of the wind-wheel to open the charging-circuit V when the speed of the windmill falls below predetermined desired velocity, and switch devices for changing the charging-circuit after a given action of the machine has taken place.

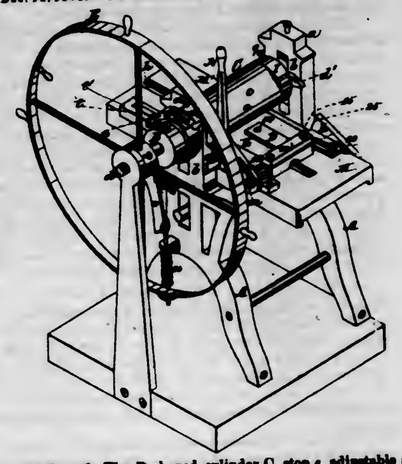


3. The combination, with an electrical generating-machine, of the wind-wheel W, the pump Z', the pipe n, the reservoir or tank, the siphon n', and the water-wheel O', the automatic switch devices, as described, with suitable circuits, and means, as shown, for charging secondary batteries, the whole operating in the manner and for the purpose set forth.

256,450.

REISSUES.

10,079. SHAFT-PROP FOR BUGGIES. JAMES T. BAKER, Fairfield, assignor to Martin Conrad, Chicago, Ill. Filed Dec. 3, 1881. Original No. 232,227, dated Dec. 2, 1879.



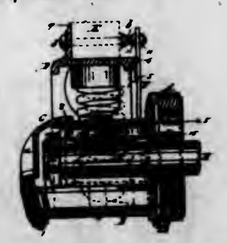
Claim.—1. In a wagon tongue or thill support, the combination, with the tongue or thills and relatively stationary gear, of a part, F, provided with a shoulder, a', a part, G, adapted to engage said shoulder, and a movable part, b, arranged to carry the part G over the shoulder a' by an upward and downward movement of the tongue or thills, substantially as described.

2. In a wagon tongue or thill support, the combination, with the vertically-movable thills or tongue and relatively stationary gear of the wagon, of a part, F, provided with a shoulder, a', and a movable piece, b, arranged to bridge said shoulder, a part, G, adapted to engage said shoulders and also to ride said bridging-piece, whereby the locking parts may be automatically engaged and disengaged by a vertical movement of the tongue, substantially as described.

3. In a tongue or thill support, the combination, with the vertically-movable thills and relatively fixed gear, of the box F, having the slot c', flanges c, and recess a, provided with tumblers b of the bar G, pivoted to the thills or tongue, and its end i, adapted to engage in the recess a and provided with the projecting arm f', substantially as described.

4. The combination, with the thills or pole and gear of the box F, having slots c', flanges c, recesses a, tumblers b, and spring S, of the bar G, pivoted to the thills and provided with arms f', substantially as described, and for the purposes specified.

10,080. PLATE-PRINTING PRESS. THOMAS S. BATES, Boston, Mass. Filed June 10, 1881. Original No. 145,616, dated Dec. 16, 1873. Reissue No. 5,379, dated May 18, 1874.



Claim.—1. The D-shaped cylinder C, stop *e*, adjustable stop *p*, and projections *t* and *d'*, in combination with the heel 25 of an adjustable wedge, L, table M M', and lever N, the spring-pawl *q r* and spring-rod and cord *s c*, substantially as and for the purpose set forth.

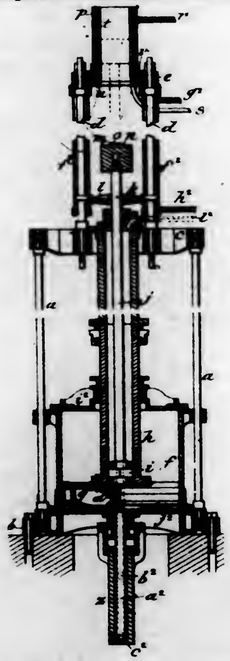
2. The D-shaped cylinder and projection *d'*, in combination with the inclined surface 10 of the adjustable wedge L and fly-wheel E, or a series of spokes or arms, as and for the purpose described.

3. In a plate-printing press, the D-shaped cylinder C, provided with a collar, 1, having a projection, *d'*, and made adjustable in order to vary its relative position to the edge *e* of the flattened portion c of the cylinder, in combination with and adapted to be brought into contact with a projection on the table M M' for the purpose of moving the latter under the cylinder C, substantially as and for the purpose set forth.

10,081. CAR-AXLE BOX. SUMNER A. BURNS, Springfield, Mass. Filed Oct. 18, 1881. Original No. 230,018, dated Mar. 23, 1881. Patented in England Aug. 12, 1880, in Belgium Aug. 31, 1880, and in France Sept. 22, 1880.

Claim.—1. The combination of the axle, having no brass-retaining collar of greater diameter than its bearing-surface, with the box adapted to contain the axle and its bearings, provided with a single lug, as 3, projecting down inside, and a movable brass provided with a single stud, as 2, projecting upward in a position to bear against said lug, substantially as and for the purpose set forth.

2. The combination, in an axle-box for cars, of the box adapted to contain the axle, the housing for the same at the inner end of the box, a step on each side of the box to support the car-spring, and two braces extending in different directions from each step, one to the box and the other to the housing, and made solid therewith, substantially as described.



3. In a car-axle box, the combination of the spring F, with retaining-nuts, as 11, the pedestal provided with lugs, as 6, to prevent side vibration of the spring, the lug, as 5, as a bearing for said spring, and the box with its housing for containing the axle, substantially as described.

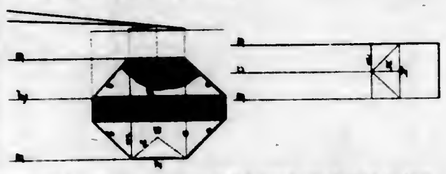
4. In a car-axle box, the reversible brass provided with a single stud, as 2, to operate in connection with a single lug, as 3, projecting down from the axle-box above and formed with elongated ends, substantially as and for the purpose set forth.

5. In an improved car-axle box, the combination of the removable brass, adapted to be moved longitudinally in the box between the journal and the upper side of the box, the box adapted to contain the axle-journal, and whose bearing for the brass on the inner surface of the upper side of the box is made on a horizontal plane extending to the outer end, the journal provided with a circumferential groove near its outer end, and a retaining-key adapted to be held in place by retaining ribs or shoulders on the interior of the box, and to engage in said groove in the journal, and extending upward in front of the brass, whereby the said brass may be easily withdrawn from its position between the journal and the upper side of the box by a horizontal movement without a vertical movement of the box, and is also prevented from any accidental horizontal movement outward, and consequent displacement, by the upwardly-projecting key, substantially as described.

6. The combination, in an improved car-axle box, of the box adapted to contain the axle-journal and its bearings, and a curved or partially-cylindrical cap fitted to the end of the box, and provided with a recess perforated at its bottom to receive the bolt which secures the lower end of the cap to the box, so that the head of said bolt, when in place, shall be within the line of the outer end of the box, to avoid collision of the bolt-head with other bodies and facilitate the attachment of the nut thereto, substantially as described.

10,082. PROCESS OF AND MACHINE FOR CASTING STEEL INGOTS. GEORGE W. BILLINGS, Cleveland, Ohio. Filed Mar. 2, 1882. Original No. 252,176, dated Feb. 7, 1882.

Claim.—1. The process of forming solid cast-steel ingots by pouring the molten steel into a mold, then gradually lowering the ingot until it has acquired the length desired, then reversing the movement of the ingot upward and compressing the ingot lengthwise, substantially as set forth.

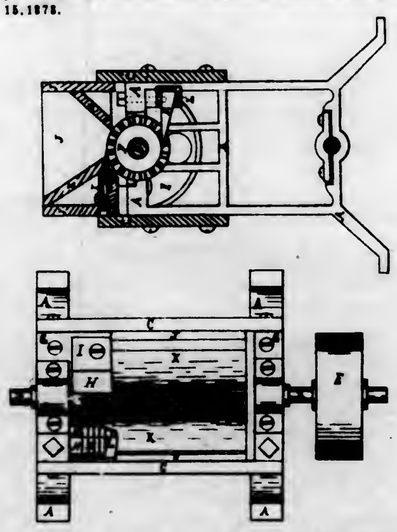


2. In a machine for casting and welding solid steel ingots, the combination of the mold *p*, cylinder A, reciprocating piston-rod *j*, having block *n* and dovetail key *o* thereon, with means, such as described, for lowering the piston-rod and the ingot thereon, substantially as set forth.

3. In a machine for casting and welding solid steel ingots, the combination of the mold *p*, steam-cylinder *f*, its piston *g*, cylinder A, piston-rod *j*, having block *n* and dovetail key *o* thereon, and the movable compression-plate *w*, substantially as and for the purposes described.

4. The steam-cylinder *f* and its piston *g*, the water-cylinder *h* and its piston-rod *j*, in combination with an ingot-mold bottom, a separate bottomless ingot-mold, and an adjustable compression-plate, substantially as and for the purpose set forth.

5. The ingot-mold *p*, in combination with a bottom, *m*, having the dovetail key *o* thereon, which reciprocates within the mold, receives upon its top the molten steel, and supports the ingot while being formed, substantially as set forth.



10,083. MANUFACTURE OF PAPER BAGS. MARK L. DERRIN, Cleveland, Ohio, assignor to the Union Paper Bag Machine Company, Philadelphia, Pa. Filed Nov. 29, 1881. Original No. 227,350, dated May 11, 1880.

Claim.—1. The herein-described process or method of forming paper bags by making in a sheet of paper or blank the folds B and C, then pasting together the two sides A' A², forming a bellows-sided body or tube of the bag, then spreading open one end of said body or tube, then forming the inwardly-projecting triangular folds H H, side laps, G G, and laps I J, which latter are secured in place by pasting or otherwise, substantially as described.

2. A bag consisting of a bellows-sided tube having a satchel-bottom and inward triangular folds, which form part of its two sides when distended.

10,084. OATMEAL-MACHINE. WILLIAM EBERHARD and ROBERT TURNER, Akron, Ohio, assignors to Susan Hower, same place. Filed Oct. 17, 1881. Original No. 248,870, dated Oct. 18, 1878.

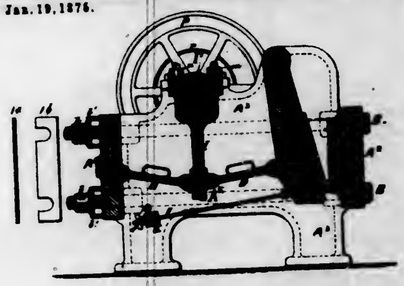
Claim.—1. In a grain-cutting machine, a roller formed with cells which are open at the feeding side of the roller and hold the kernels supported on the bottom of the cells in an endwise position and projecting above the feeding side of the roller, in combination with a knife at the feeding side which cuts off the projecting portions of said kernels, substantially as set forth.

2. The combination of the roller D F, having circular rows of holes in its face and ring-grooves through the said holes, the clearers M knife H, and hopper J K, substantially as described.

3. The combination of the grooved bar L, the clearers M, and the separating-blocks N with the roller D F, formed with its holes and ring-grooves, substantially as described.

4. The combination of the roller D F, formed with its holes and ring-grooves, and the knife H and its supporting and clamping bars G I with each other and with the frame A B C and the hopper J K, substantially as described.

10,085. ORE-CRUSHING MACHINE. STEPHEN E. KNOX, Plainfield, N. J. Filed Dec. 12, 1881. Original No. 186,309, dated Jan. 19, 1876.



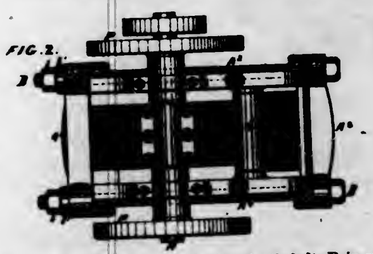


FIG. 2.

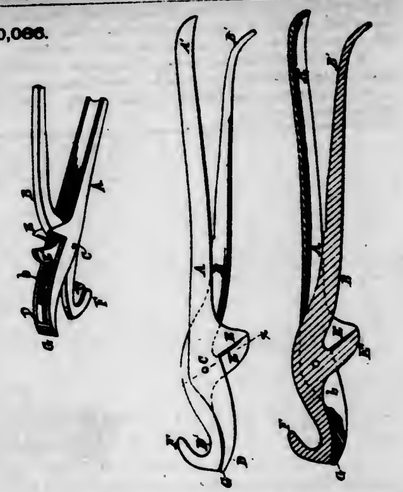
Claim.—1. The hollow washers *b'* on the tie-bolts B, in combination with the nuts *b* and stout framing A' A², and with the parts C D D I H, as specified.

2. The breaking cups *m*, in combination with the crank H, link I, toggles D D, and crushing-jaw C, as specified.

3. The combination, with the stationary and moving crushing-jaws, the toggle mechanism, the frame, and the tie-bolts, of hollow breakable pieces having less strength than the other parts of the machine, so as to give way under unusual strain and prevent injury to the other parts, substantially as set forth.

4. The exchangeable toggles D D, having rolling-surfaces, and the supporting projections *d d*, in combination with the crushing-jaws C and link I, as specified.



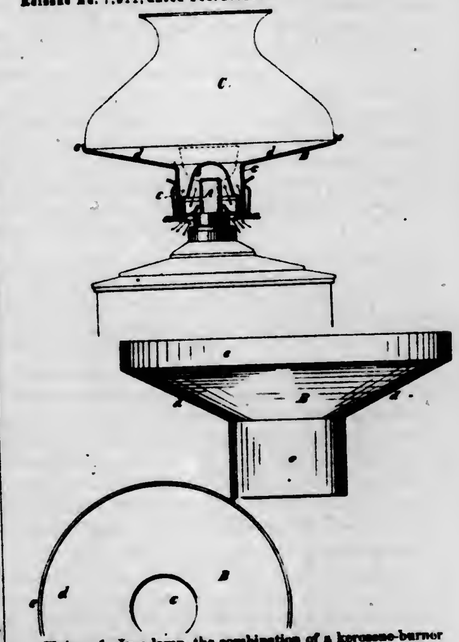
5. In a crushing-machine, the combination, with the jaws, of toggles D D, having rolling ends, and supports for the toggles, substantially as specified.

6. In a crushing-machine, the combination, with the crushing-jaw, actuating-shaft, and intervening mechanism for moving the jaw, of a fly-wheel on the shaft and a frictional connection between the fly-wheel and shaft, for the purposes and substantially as specified.

7. In a crushing-machine, the combination, with the stationary and moving jaws, supporting-frames, toggle-bars, and actuating mechanism, of tie-bolts running in the line of the strain and connecting the stationary jaw to the abutment of the toggle, substantially as set forth.

8. The combination of the sectional framing A' A² and longitudinal tie-bolts B with the ore-crushing jaw C, toggles D, and link I, the tie-bolts being arranged parallel to and directly in the line of the strain, substantially as specified.

10,086. KITCHEN IMPLEMENT. JOHN W. ROSS, Santa Clara, Cal. Filed Mar. 6, 1882. Original No. 241,622, dated May 24, 1881.



Claim.—1. A kitchen implement in two parts, pivoted together, each of the parts carrying one of the members of a set of grasping-jaws, inclined backwardly toward the handles, whereby a vessel containing hot substances may be handled and emptied with the implement without exposing the hand to the rising heat or steam, substantially as described.

2. A kitchen implement in two parts, A B, pivoted together at C, and provided with the set of grasping-jaws composed of the bifurcated member E E on the part A and the single member E' on the part B, and inclined backwardly toward the handles A' B', substantially as and for the purposes described.

3. A kitchen implement in two parts, pivoted together and provided with the hook F, the lid-lifter G, and the two sets of jaws D D' and E E', constructed, arranged, and inclined substantially as and for the purposes described.

10,087. SHADE-HOLDER FOR LAMPS. CARL VOTTI, Philadelphia, Pa., assignor to B. B. Schneider, New York, N. Y. Filed Mar. 11, 1882. Original No. 122,873, dated Oct. 3, 1876; Reissue No. 7,511, dated Feb. 13, 1877.

Claim.—1. In a lamp, the combination of a kerosene-burner with a transparent shade-holder and a shade, the shade-holder being adapted to rest upon the burner in the place adapted for the ordinary chimney, the shade resting on said shade-holder, and being formed so as to converge from its base toward its top, and the shade and shade-holder together constituting the draft-inducing device for the burner, substantially as set forth.

2. The shade-holder B, constructed of material that will admit of the passage of light, and provided with a downwardly-ex-

tending socket, c, and dish-shaped flange d, with rim e, in combination with a shade, C, converging from base to top, and the kerosene-burner A of a lamp, as and for the purpose set forth.

2. The combination, in a lamp, of the burner A, having perforated flange a and cone b, the shade-holder B and socket c, and a shade converging from base to top, substantially as and for the purpose herein set forth.

4. The combination of the shade C, shade-holder B, constructed of transparent material, and provided with a downwardly-extending socket, c, and dish-shaped flange d with the cone b, having a flange, e, provided with apertures for the admission of air to the outside and inside of the cone, the whole arranged to operate without a chimney, substantially as specified.

1880 ELIOTYPE PRINTING CO BOSTON

DECISIONS

OF THE

COMMISSIONER OF PATENTS

AND OF

UNITED STATES COURTS IN PATENT CASES.

COMMISSIONER'S DECISIONS.

EX PARTE PALMER.

Decided November 30, 1861.

1. DESIGNS—PREVIOUS MECHANICAL PATENTS SHOWING.
A previous mechanical patent is of itself no bar to the grant of a patent to the patentee therein for a design shown in such patent.

2. SAME—SAME.
Former decisions commented on and disapproved.

DESIGN FOR LAMPS.

Application filed November 4, 1879.

MARBLE, *Commissioner:*

This application comes before me upon a question of law, submitted by the Examiner of Designs, as follows:

Can an application for a design patent be properly rejected upon a mechanical patent to the same party showing the same design.

It appears that this question has been already considered by three different Commissioners; but the applicants in this case and in another in which the same point has arisen urge that in view of a recent decision of Mr. Justice Blatchford in *Collender* v. *Griffith* (18 O. G., 241) the former practice of the Office is improper and should be discontinued.

The decision by Commissioner Fisher in *Ex parte Stuart & Bridge* (C. D., 1870, 15) was made under the act of 1861, which contained a different provision in reference to prior knowledge and use from the act of 1870, and hence has no weight in the present case.

The decision in *Ex parte Kohler* (C. D., 1873, 84) was based upon the ground that if a design patent should be granted any subsequent assignee of the mechanical patent could not use the form in which the inventor originally embodied his invention, and that he must consequently be considered to have "dedicated it to at least any person who now does or may hereafter own the mechanical patent." To bar the grant of a patent upon the ground of abandonment, such abandonment must be to the public, and not simply to the assigns of the inventor, and hence it seems that the position taken by the Commissioner in this case is not tenable.

In *Ex parte Towne & Taylor*, (19, Com. Mss. Dec., 6,) which also presented the same question, the Commissioner allowed a design patent upon the ground that the parties in the patent and application were not the same, the design being shown in a previous mechanical patent to Taylor, but being in fact the joint invention of Taylor and Towne. He, however, approved the decision in Kohler's case, though basing his approval upon the ground that the previous mechanical patent was a publication.

As the statute requires, in order to defeat the grant of a patent, that a publication shall be made before the invention or production of the subject-matter thereof, it does not appear how the previous mechanical patent can have such effect. If the design was invented by the patentee at all it must have been invented before the filing of the application for the mechanical patent in which it is shown, and hence a publication, to be a bar, must have been made before the invention of the mechanism embodying the design.

The point which arises here is not exactly the same as that in *Collender* v. *Griffith*, above referred to, the design patent in that case having been first granted, and the question at issue was whether it was a bar to a subsequent mechanical patent, but the principles laid down by court are equally applicable to the present case. The court says:

The claim of the design patent is to shape. The claim of the reissued mechanical patent is a claim to a mechanical combination. The shape of the structure may be the same as the shape in the design patent, but the subject-matter of the two claims is not the same. The shape covered by the claim of the design patent may be attained without following the mechanical combination claimed in the reissued mechanical patent.

There seems to be no doubt that the court by this language meant to declare the subjects-matter of design and mechanical patents to be entirely different. Nothing else could have been intended, for in the one case ornament is the basis and in the other mechanical function. It therefore follows that whichever kind of patent is first obtained by an inventor it will not be a bar to the grant to him of a patent of the other kind.

It has long been held by the Office that where the applicant is the same a previous design patent is no bar to the grant of a mechanical patent, (*Ex parte Bartholomew*, C. D., 1871, 296, and *Collender*, C. D., 1872, 217,) and I am also of the opinion that of itself a previous mechanical patent is no bar to the grant of a patent to the patentee therein for a design shown in such patent.

The view herein taken accords with that of the court in *Burton* v. *Greenville*, (18 O. G., 411,) where this precise question arose, but which they did not think it necessary to decide. They say:

A question is made by the defendants whether an inventor is not to be presumed to abandon his design when he exhibits it in the drawings of a mechanical patent. I do not see why this consequence should follow until the design has been in use for two years.

DECISIONS OF THE U. S. COURTS.

Supreme Court of the United States.

ROOT v. LAKE SHORE AND MICHIGAN SOUTHERN RAILWAY COMPANY.

Decided March 13, 1882.

1. BILL IN EQUITY FOR NAKED ACCOUNT OF PROFITS DISMISSED.

A bill in equity brought under law of 1870 after the expiration of the patent, and not asking therefore for an injunction or other equitable relief, but for a naked account of profits, and it not appearing from the allegations of the bill that there were any circumstances that would render an action at law for the recovery of damages an inadequate remedy for the wrongs complained of, was dismissed.

2. LAW OF 1870 (SECTIONS 55, 59, AND 61) DOES NOT ABOLISH DISTINCTION BETWEEN LAW AND EQUITY IN PATENT CASES.

The language of the act of July 8, 1870, (sections 55, 59, and 61,) similar in that respect to the provisions of the acts of 1819 and 1836, conferring jurisdiction in patent cases in equity as well as in law, was not meant to obliterate the distinction between these two jurisdictions or even to confuse the boundaries between them. Indeed, it is the well-settled doctrine of this Court that this distinction of jurisdiction between law and equity is constitutional to the extent to which the seventh amendment forbids any infringement of the trial by jury as fixed by the common law, and the doctrine applies in patent cases as well as others.

3. SECTION 55 GIVES DAMAGES IN EQUITY IN ADDITION TO ACCOUNT WHERE COURT HAS JURISDICTION.

The whole force of the change in the law contained in the fifty-fifth section of the said statute, whereby the complainant is entitled to recover, in addition to the profits to be accounted for by the defendant, the damages the complainant has sustained thereby, consists in conferring upon courts of equity, in the exercise of their jurisdiction in administering relief which they are accustomed and authorized to give, the power, not merely to give that compensation for the past which consists in the profits of the infringer, but to supplement it when necessary with the full amount of damage suffered by the complainant. In other words, the power to award damages and to multiply them is added as an incident to the right to an account.

4. SECTION 61 PROVIDES APPROPRIATE MODES IN EQUITY PLEADINGS FOR TRIAL OF QUESTIONS ARISING OUT OF THE RIGHT CONFERRED BY SECTION 55 TO RECOVER DAMAGES.

The plain and obvious purpose of the provision of the sixty-first section of the said statute that "the like defenses may be pleaded in any suit in equity for relief against any alleged infringement, and proofs of the same may be given upon like notice in the answer of the defendant and with the like effect," is to furnish appropriate modes in equity pleading for the trial of all issues both of fact and law relating both to the alleged infringement and the validity of the patent without the necessity of framing special issues out of chancery for trial by jury or sending the parties to a court of law for the trial of an action in that forum in order to determine their legal right.

5. BILL IN EQUITY UNDER LAW OF 1870.

A bill in equity therefore brought under the provisions of the law of 1870 must find support in the general doctrines of equity.

6. JURISDICTION IN EQUITY—REMEDY AT LAW EXCLUSIVE.

It is the fundamental characteristic and limit of the jurisdiction in equity that it cannot give relief when there is a plain and adequate and complete remedy at law, and hence it has no original, independent, and inherent power to afford redress for breaches of contract or torts by awarding damages, for to do that was the very office of proceedings at law.

7. ACCOUNT OF PROFITS NOT A GROUND OF EQUITABLE RELIEF UNLESS REMEDY AT LAW INSUFFICIENT.

Bill in equity seeking only an account of profits cannot, therefore, generally speaking, be maintained, "nor can the Court retain the bill under an impression that a court of chancery is better adapted for the adjustment of the account for rents, profits, and improvements. The rule of the Court is that when a suit for the recovery of the possession can be properly brought in a court of equity and a decree is given that court will direct an account as an incident in the cause; but when a party has a right to a possession which he can enforce at law, his right to the rents and profits is also a legal right, and must be enforced in the same jurisdiction. (*Hipp* v. *Babin*, 91 Howard, 271.)

8. APPLICATION OF FOREGOING RULE TO INFRINGEMENT OF PATENT—INFRINGER NOT A TRUSTEE *de son tort*.

A bill for the infringement of a patent is not saved from the application of this principle by the fact that the courts have adopted the rule in ascertaining the profits of the infringer that the infringer is to be treated as though he were a trustee for the patentee in respect to profits. The case is not within the principle according to which in certain circumstances a court of equity decrees a wrong-doer to be a trustee *de son tort*, and exerts its jurisdiction over him in that character. The principle only applies where the defendant has wrongfully intermeddled with property already impressed with a trust, and he will then be required as a trustee to account, for the reason that trust property may be followed wherever it can be traced, into whosesoever possession it comes, except that of a *bona fide* purchaser, without notice.

9. GROUNDS OF RELIEF OTHER THAN INJUNCTION—INADEQUACY OF REMEDY AT LAW—SPECIAL GROUNDS MUST BE ALLEGED AND PROVED.

Grounds of equitable relief may arise other than by way of injunction, as where the title of the complainant is equitable merely, or equitable interposition is necessary on account of the impediments which prevent a resort to remedies purely legal, and such an equity may arise out of and inhere in the nature of the account itself, springing from special and peculiar circumstances which disable the patentee from a recovery at law altogether, or render his remedy in a legal tribunal difficult, inadequate, and incomplete, and as such cases cannot be defined more exactly each must rest upon its own particular circumstances as furnishing a clear and satisfactory ground of exception from the general rule.

APPEAL from the Circuit Court of the United States for the Northern District of Illinois.

Mr. A. H. Walker for the appellant.
Mr. Geo. Payson for the appellee.

Mr. Justice MATTHEWS delivered the opinion of the Court.

The appellant filed his bill in the court below on December 9, 1878, as assignee of the letters patent originally granted to Henry Tanner for an improvement in railroad-car brakes, dated July 6, 1852, and which, on July 5, 1866, were renewed and extended for the additional term of seven years, which expired July 6, 1873. It is averred in the bill that by virtue of the assignments to him the complainant was invested with all rights of action for infringements of the patent which had occurred, and particularly those of which it was alleged the defendant had been guilty from August 6, 1869, to July 6, 1873, having, as is averred, during that period used upon its railroad-cars the patented brakes, but how many, the bill states, the complainant is ignorant and cannot set forth, but avers that the number so used was large, and that defendant had derived, received, and realized great gains and profits therefrom, but to what amount he is ignorant and cannot set forth. The prayer of the bill is that the defendant may be compelled to account for and pay to the complainant all the gains, profits, and savings which it derived, received, or realized from or by reason of the use of said brakes.

To this bill a general demurrer was filed, alleging, as grounds thereof, that the bill does not contain any matter of equity on which the court could grant any relief, and that the complainant is not entitled to the relief prayed for, because he had a plain, adequate, and complete remedy at law, and also because it appeared on the face of the bill that the causes of complaint were

barred by the statutes of limitation both of the United States and of the State of Illinois. This demurrer was sustained and the bill dismissed by the decree of the circuit court, now brought here for review by this appeal.

The propositions mainly relied upon by the appellee in support of the decree are, first, that after the expiration of a patent equity has no jurisdiction to entertain a bill merely for an account and the recovery of the profits of an infringer during its existence, the remedy being at law for damages; and, second, that even if in certain cases such a jurisdiction exists the present does not fall within it.

On the other hand, it is contended on the part of the appellant that in cases for the enforcement of the rights of patentees resort may be had, as matter of right, to a court of equity, as a distinct head of its jurisdiction, for the mere purpose of establishing an infringement and ascertaining and recovering the profits of the infringer upon the independent equity that he is for that purpose a trustee of his gains for the use of the true owner of the patent and liable to account as such. In support of this contention we are referred by counsel for the appellant to numerous decisions of the circuit courts, many of which, it is claimed, are directly upon the point, and to several cases in this Court, in which, it is alleged, the same doctrine is either virtually decided or assumed, which, it is further argued, though not supported by the modern decisions of the English chancery, is found in its earlier precedents. An examination of the practice and opinions of the circuit courts undoubtedly shows much diversity, incapable of reconciliation, and makes it necessary, as far as it can be done, by a deliberate judgment of this Court, to remove the question out of its present uncertainty by a settlement upon some basis of principle in harmony with our system of equity jurisprudence, developed and modified by legislation. To effect this satisfactorily and intelligently it will be necessary to review the course of legislation and judicial decision in this Court so far as it bears upon the question from the beginning.

Prior to the passage of the patent act of 1819 (3 Stat. L., 481) Congress had passed three laws, in execution of the power conferred by the Constitution itself, and in furtherance of the policy thereby indicated, to secure to inventors an exclusive right of property in their inventions. The first of them, the act of 1790, (1 Stat. L., 109,) gave as a remedy for its violation an action at law upon the case for damages and forfeited the infringing article. The next was the act of 1793, (1 Stat. L., 318,) which fixed the rule and measure of damages recoverable in an action at law upon the act at three times the price at which the patentee had usually sold or licensed to other persons the use of the invention. This was changed by the act of 1800 (2 Stat. L., 37) to three times the actual damage sustained by the patentee by reason of the infringement. By neither of these acts, however, was any jurisdiction conferred upon the courts of the United States in equity. To vest such jurisdiction by reason of the subject-matter as a case arising under the laws of the United States, to be exercised in controversies between parties, without regard to difference of citizenship, it was held by Mr. Justice Livingston in the case of *Livingston* v. *Van Ingen* (1 Paine, 45) required the express authority of an act of Congress, and the parties in that case not being citizens of New York the bill was dismissed. The controversy was thereupon renewed in the courts of that State, and, the chancellor having refused the injunction asked for, it was brought by appeal into the court for the correction of errors. (9 Johnson, 507.) It was there objected that the right in question rested upon statute alone, which prescribed remedies at law for its violation, which, it must be deemed, were intended to be exclusive. But the decision affirmed the jurisdiction. "The principle is," said Chief Justice Kent, page 587, "that statute privileges, no less than common law rights, when in actual possession and exercise, will not be permitted to be disturbed until the opponent has fairly tried them at law and overthrown their pretension." The same learned judge refers also to the practice of the federal courts in granting injunctions under the patent law, mentioning two instances—one, the case of *Moree* v. *Reid*, an injunction bill filed in 1796 to restrain the invasion of a copyright; the other, *Whitney* v. *Fort*, in which an injunction was granted to restrain the violation of the patent for the cotton-gin. Of course, in those cases the jurisdiction of the court depended on the citizenship of the parties. Congress then passed the act of February 15, 1819, which enacted

That the circuit courts of the United States shall have original cognizance, as well in equity as at law, of all actions, suits, controversies, and cases arising under any law of the United States granting or conferring to authors or inventors the exclusive right to their respective writings, inventions, and discoveries; and upon any bill in equity filed by any party aggrieved in any such cases shall have authority to grant injunctions according to the course and principles of courts of equity to prevent the violation of the rights of any authors or inventors secured to them by any law of the United States, on such terms and conditions as the said courts may deem fit and reasonable.

In the case of *Sullivan* v. *Redfield*, (1 Paine, 441,) which was decided in 1825, Mr. Justice Thompson, who in the Livingston case had sat as one of the judges of the State court, had occasion to consider the nature of the equity jurisdiction in patent suits. "The equity jurisdiction," he said, "exercised by the court over patents for inventions is merely in aid of the common law and in order to give more complete effect to the provisions of the statute under which the patent is granted;" and, in answer to the argument that the act of 1819 gave a peremptory right to an equitable remedy by virtue of the patent itself, he said:

This act does not enlarge or alter the powers of the court over the subject-matter of the bill or the cause of action. It only extends its jurisdiction to parties not before failing within it. Before this act it had been held that a citizen of one State could not obtain an injunction in the circuit court for a violation of a patent right against a citizen of the same State, as no act of Congress authorized such suit. This act removed that objection and gave the jurisdiction, although the parties were citizens of the same State; but in the exercise of the jurisdiction in all cases of granting injunctions to prevent the violation of patent rights the court is to proceed according to the course and principles of courts of equity in such cases, so that the questions presented in the present case are precisely where they would have been without this act.

The substance of the act of 1819 was incorporated into the seventeenth section of the patent act of July 4, 1836, (5 Stat. L., 117,) so far as it related to inventors, but remained in force after the passage of the latter act so far as it gave cognizance to the courts of the United States of cases of copyright. It was under that provision of the act of 1819 that the case of *Stevens* v. *Gladding* (17 Howard, 447) arose and was decided. That was a bill for an injunction to restrain the violation of a copyright, and prayed for the recovery of the penalties given by the seventh section of the act of February 3, 1831, and for general relief. Mr. Justice Curtis, delivering the opinion of the Court, said:

There is nothing in this act of 1819 which extends the equity powers of the courts to the adjudication of forfeitures, it being manifestly intended that the jurisdiction therein conferred should be the usual and known jurisdiction exercised by courts of equity for the protection of analogous rights. The prayer of this bill for the penalties must therefore be rejected. The remaining question is whether there ought to be a decree for an account of the profits. The complainant has not prayed for such an account, nor have the defendants stated one in their answer; but the bill does pray for general relief. The right to an account of profits is incident to the right to an injunction in copy and patent right cases, citing *Colburn* v. *Simms*, (2 Hare, 554; 3 Dan. Ch. Pr., 1797.) And this Court has held in *Watts* v. *Waddle* (6 Pet., 389) that where the bill states a case proper for an account, one may be ordered under the prayer for general relief.

The seventeenth section of the act of 1836 differs from the act of 1819 in one other particular only. It makes the jurisdiction in patent causes of the courts of the United States exclusive.

It was under the act of 1836 that the question arose for the first time in *Livingston* v. *Woodworth* (15 Howard, 546) as to the rule for computing the profits of an infringer upon a decree for such an account. The bill was for an injunction and account. The validity of the patent and the fact of infringement were both admitted by the defendant, who consented to a decree requiring him to account for and pay over the gains and profits made by him during the infringement, in accordance with the prayer of the bill. The decree confirmed the report of the master, who awarded, not actual gains and profits, but such as he estimated the defendant might have made by due diligence. It was argued in support of the decree that where the court has jurisdiction to give the principal relief sought it will make a complete decree and give compensation for the past injury, as in bills for specific performance and injunction bills for waste, and that it was a correct rule to hold the party accountable as an involuntary trustee for what the patentee might have realized by the same exercise of the right, as a court of equity sometimes forces the character of a trustee upon an intruder or wrong-doer, or one in possession under color of right, or who takes rents or profits belonging to another, or might have taken them, as in cases of mortgagees; but it was admitted that the case was of first impression. The decree upon this point was reversed. The Court said, page 559:

We are aware of no rule which converts a court of equity into an instrument for the punishment of simple torts. * * * If the appellees, the plaintiffs below, had sustained an injury to their legal rights the courts of law were open to them for redress, and in these courts they might, according to a practice which, however doubtful in point of essential right, is now too inveterate to be called in question, have claimed, not compensation merely, but vengeance, for such injury as they could show they have sustained; but before a tribunal which refuses to listen even to any, save those whose acts and motives are perfectly fair and liberal, they cannot be permitted to contravene the highest and most benignant principle of the being and constitution of that tribunal. There they will be allowed to claim that which, *ex æquo et bono*, is theirs, and nothing beyond this.

The account was therefore restricted to the actual gains and profits of the appellants during the time their machine was in operation.

This rule in relation to the profits recoverable in such suits was followed in *Dean* v. *Mason*, (20 Howard, 198,) which was a case of a bill for an injunction and account, in which a decree *pro confesso* had been taken. The final decree was entered, on the report of the master, for the estimated amount of profits which the defendant with reasonable diligence might have realized, not what in fact he did realize. This was held to be erroneous. The Court said:

The rule in such a case is the amount of profits received by the unlawful use of the machines, as this in general is the damage done to the owner of the patent. It takes away the motive of the infringer of patented rights by requiring him to pay the profits of his labor to the owner of the patent. Generally this is sufficient to protect the rights of the owner; but where the wrong has been done under aggravated circumstances the court has the power under the statute to punish it adequately by an increase of the damages.

The important case of *Seymour* v. *McCormick* (16 Howard, 480) was decided in 1853. That was an action at law. The court below instructed the jury that the actual damages to which the plaintiff was entitled for an infringement of a patent for an improvement in a machine might be determined by ascertaining the profits which in judgment of law he would have made, provided the defendants had not interfered with his rights, and that the same rule applied whether the patent covered an entire machine or merely an improvement on a machine. This instruction this Court held to be erroneous, and reversed the judgment on that account. Mr. Justice Grier, in delivering the opinion of the Court, referred to the rule of damages prescribed by the acts of Congress previously in force, stating that "experience had shown the very great injustice of a horizontal rule equally affecting all cases without regard to their peculiar merits," and that it was to obviate this that the patent act of 1836 confined the jury to the assessment of actual damages, leaving it to the discretion of the Court to inflict punitive damages to the extent of trebling the verdict. He then pointed out that "it must be apparent to the most superficial observer of the immense variety of patents issued every day that there cannot, in the nature of things, be any one rule of damages which will equally apply to all cases. The mode of ascertaining actual damages must necessarily depend on the peculiar nature of the monopoly granted;" that a man who invents or discovers a new composition of matter or an entire new machine may find his profit to consist in a close monopoly, the patentee being himself able to supply the whole demand at his own price, in which cases "the profit of the infringer may be the only criterion of the actual damage of the patentee;" that "one who invents some improvement in the machinery of a mill could not claim that the profits of the whole mill should be the measure of damages for the use of his improvement, and where the profit of the patentee consisted neither in the exclusive use of the thing invented or discovered, nor in the monopoly of making it for others to use, it is evident that this rule could not apply. The case of Stimpson's patent for a turn-out in a railroad may be cited as an example. It was the interest of the patentee that all railroads should use his invention, provided they paid him the price of his license. He could not make his profit by selling it as a complete and separate machine. An infringer of such a patent could not be liable to damages to the amount of the profits of his railroad, nor could the actual damages of the patentee be measured by any known ratio of the profits of the road. * * * It is only where, from the peculiar circumstances of the case, no other rule can be found that the defendant's profits become the criterion of the plaintiff's loss. Actual damages must be actually proved, and cannot be assumed as a legal inference from any facts which amount not to actual proof of the fact." Accordingly, it was held in *New York* v. *Ransom*, (23 Howard, 487,) where the rule in *Seymour* v. *McCormick*, *supra*, was expressly approved, that in an action at law, if the plaintiff rested his case after proof of infringement merely, he was entitled only to nominal damages. It was also

applied in *Jones* v. *Morehead*, (1 Wall., 155,) which was a bill in equity for an injunction and an account, where a decree for a large sum as profits had been rendered against the defendant upon an entire machine, in respect to which it appeared as matter of fact that the defendants had not infringed the patent sued on, but had admitted to the contrary in the answer. The Court construed this admission by applying it to the smallest number of patented articles and to the use of any part of the patent found to be valid, and, reversing the decree, ordered one to be entered for a "nominal sum of one dollar for profits."

In the case of the *Rubber Company* v. *Goodyear*, (9 Wall., 788,) which was a bill for an injunction and account, a decree for a large sum was rendered in favor of the complainants, which was affirmed on appeal. "The rule," said Mr. Justice Swayne, delivering the opinion of the Court, "is founded in reason and justice. It compensates one party and punishes the other. It makes the wrong-doer liable for actual, not possible, gains. The controlling consideration is that he shall not profit by his wrong. A more favorable rule would offer a premium to dishonesty and invite to aggression. The jurisdiction of equity is adequate to give the proper remedy, whatever phase the case may assume, and the severity of the decree may be increased or mitigated according to the complexion of the conduct of the offender."

The case of *Mowry* v. *Whitney* (14 Wall., 620) was also a bill in equity for an injunction and account. A decree was rendered in favor of the complainant for all the profits on the manufactured article, instead of upon the patented process of manufacture, with interest added. On appeal this Court reversed the decree on that point, saying:

The question to be determined in this case is, what advantage did the defendant derive from using the complainant's invention over what he had in using other processes then open to the public and adequate to enable him to obtain an equally beneficial result? The fruits of that advantage are his profits. * * * That advantage is the measure of profits.

On the question of interest Mr. Justice Strong, speaking for the Court, said:

We add only that, in our opinion, the defendant should not have been charged with interest before the final decree. The profits which are recoverable against an infringer of a patent are in fact a compensation for the injury the patentee has sustained from the invasion of his right. Though called profits, they are really damages, and unliquidated until the decree is made. Interest is not generally allowable upon unliquidated damages. We will not say that in no possible case can interest be allowed. It is enough that the case in hand does not justify such an allowance.

In the case of *Packet Company* v. *Sickles*, (19 Wall., 611,) which was an action at law, the rule established in *Seymour* v. *McCormick*, *supra*, was reiterated, as "the established criterion of damages in cases to which it was applicable." "In cases where there is no established patent or license fee in the case, or even an approximation to it, general evidence must necessarily be resorted to," as was said by the Court in the case of *Suffolk Company* v. *Hayden*, (3 Wall., 315.) "And what evidence," said Mr. Justice Nelson, in that case page 320, "could be more appropriate and pertinent than that of the utility and advantage of the invention over the old modes or devices that had been used for working out similar results? With a knowledge of these benefits to the persons who have used the invention and the extent of the use by the infringer a jury will be in possession of material and controlling facts, that may enable them, in the exercise of a sound judgment, to ascertain the damages, or in other words, the loss to the patentee or owner by the piracy, instead of the purchase of the use, of the invention." He added that "a recovery does not vest the infringer with the right to continue the use, as the consequence of it may be an injunction restraining the defendant from the further use of it."

In *Packet Company* v. *Sickles*, *supra*, Mr. Justice Miller said:

The rule in suits in equity of ascertaining by a reference to a master the profits which the defendant has made by the use of the plaintiff's invention stands on a different principle. It is that of converting the infringer into a trustee for the patentee as regards the profits thus made; and the adjustment of these profits is subject to all the equitable considerations which are necessary to do complete justice between the parties, many of which would be inappropriate in a trial by jury. With these corrective powers in the hands of the chancellor, the rule of assuming profits as the groundwork for estimating the compensation due from the infringer to the patentee has produced results calculated to suggest distrust of its universal application even in courts of equity.

The doctrine of this case was reiterated in *Burdell* v. *Denig*, (92 U. S., 716,) where Mr. Justice Miller, again delivering the opinion of the Court, said:

Profits are not the primary or true criterion of damages for infringement in an action at law. That rule applies universally and mainly to cases in equity, and is based on the idea that the infringer shall be converted into a trustee as to those profits for the owner of the patent which he infringes, a principle which it is very difficult to apply in a trial before a jury, but quite appropriate on a reference to a master, who can examine defendant's books and papers, and examine him on oath, as well as all his clerks and employés. On the other hand, we have repeatedly held that sales of licenses of machines, or of a royalty established, constitute the primary and true criterion of damages in the action at law. No doubt, in the absence of satisfactory evidence of either class in the forms to which it is most appropriate, the other may be resorted to as one of the elements on which the damages or the compensation may be ascertained.

The case of *Littlefield* v. *Perry* (21 Wall., 205) was one where the patentee, by force of an agreement, held the legal title to the patent in trust for the complainant, in violation of which he was making use of his legal rights. It was held upon a bill filed for an injunction and account that it was a case under the patent laws, and the defendant was required to account for the profits he had made according to the rule in *Mowry* v. *Whitney*, *supra*. The Chief Justice said, (page 230:)

Profits actually realized are usually, in a case like this, the measure of unliquidated damages. Circumstances may, however, arise which would justify the addition of interest in order to give complete indemnity for losses sustained by willful infringements.

On July 8, 1870, Congress passed the act to revise, consolidate, and amend the statutes relating to patents and copyrights, (16 Stat. L., 198.) The fifty-ninth section renewed the provision previously in force that damages for infringement might be recovered by action on the case, and that whenever in any such action a verdict shall be rendered for the plaintiff the court may enter judgment therein for any sum above the amount found by the verdict as the actual damages sustained, according to the circumstances of the case, not exceeding three times the amount of the verdict. The fifty-fifth section is as follows:

That all actions, suits, controversies, and cases arising under the patent laws of the United States shall be originally cognizable as well in equity as at law by the circuit courts of the United States, or any district court having the power and jurisdiction of a circuit court, or by the Supreme Court of the District of Columbia, or of any territory; and the court shall have power upon bill in equity filed by any party aggrieved to grant injunctions according to the course and principles of courts of equity, to prevent the violation of any right secured by patent on such terms as the court may deem reasonable; and upon a decree being rendered in any such case for an infringement the complainant shall be entitled to recover, in addition to the profits to be accounted for by the defendant, the damages the complainant has sustained thereby, and the court shall assess the same or cause the same to be assessed under its direction, and the court shall have the same powers to increase the same, in its discretion, that are given by this act to increase the damages found by verdicts in actions upon the case; but all actions shall be brought during the term for which the letters patent shall be granted or extended, or within six years after the expiration thereof.

These provisions are substantially carried into the Revised Statutes, section 59 of the act of 1870 being section 4919 of the latter, and section 55 corresponding to section 4921 Revised Statutes, except as to the provision in respect to the limitation upon the right to sue, which is not found in the Revised Statutes. But the rights of the parties in the present suit arose while the act of 1870 was in force and are determinable under it.

In the case of *Birdsall* v. *Coolidge* (93 U. S., 64) it is declared, in reference to the effect of the act of 1870, that "gains and profits are still the proper measure of damages in equity suits, except in cases where the injury sustained by the infringement is plainly greater than the aggregate of what was made by the respondent," in which event the provision is that the complainant "shall be entitled to recover, in addition to the profits to be accounted for by the respondent, the damages he has sustained thereby." Mr. Justice Clifford in the opinion in this case quotes a passage, slightly altered, from Curtis on Patents, (section 341 a, 4th edition, page 461,) which, taken by itself, might seem to imply that prior to the act of 1870 the owner of a patent had the election to resort to a court of equity for the recovery of profits or a court of law for damages, irrespective of any other relief of an equitable character; but the language of the passage is to be restrained to mean merely that the option existed to sue at law for past infringement or seek equitable relief by way of prevention, the damages or profits following, as either jurisdiction is resorted to, each according to its kind. For, if this be not so, it follows that since the passage of the act of 1870 an owner of a patent may recover in a suit in equity profits and damages in all cases according to the rule above stated without seeking any other relief whatever, the effect of which would be to give two remedies, one in equity, the other at law, merely for the recovery of damages for an injury to a legal right, an anomaly not to be found in any other branch of our jurisprudence. And manifestly, upon such a construction, the action at law would soon become obsolete as completely as if it had been abolished by legislation. The whole force of the change in the statute consists in conferring upon courts of equity in the exercise of their jurisdiction in administering the relief which they are accustomed and authorised to give, and which is appropriate to their forms of procedure, the power not merely to give that measure of compensation for the past, which consists in the profits of the infringer, but to supplement it when necessary with the full amount of damage suffered by the complainant, and which, if he had sued for that alone, he would have recovered in another forum with power to increase the amount of the actual damages, as in courts of law. But as the account of profits previously was the incident of the suit and not its object, so now the power to award damages and to multiply them is added as an incident to the right to an account. But the difference between the state of the law before and after the act of 1870 finds its best illustration in a comparison between two cases, both of which were decided at the October term, 1877—*Elizabeth* v. *Pavement Company*, (97 U. S., 126,) and *Marsh* v. *Seymour*, (Ibid., 348.) In the former the bill was filed before the passage of the act, but prayed, besides an injunction, for both damages and profits. It was held that the court below had rightly decided that a decree for profits alone could be rendered, inasmuch as the jurisdiction of courts of equity to decree damages as distinct from profits was first conferred by the statute. Mr. Justice Bradley, delivering the opinion of the Court, remarking that the general question of the profits recoverable in equity by a patentee was surrounded with many difficulties, which the courts had not yet succeeded in overcoming, said:

> But one thing may be affirmed with reasonable confidence that if an infringer of a patent has realised no profit from the use of an invention, he cannot be called upon to respond for profits. The patentee in such case is left to his remedy for damages. It is also clear that a patentee is entitled to recover the profits that have been actually realised from the use of the invention, although from other causes the general business of the defendant in which the invention is employed may not have resulted in profits, as when it is shown that the use of his invention produced a definite saving in the process of manufacture. (*Mowry* v. *Whitney*, 14 Wall., 620; *Cawood Patent*, 94 U. S., 695.) On the contrary, though the defendant's general business be ever so profitable, if the use of the invention has not contributed to the profits, none can be recovered. The same result would seem to follow where it is impossible to show the profitable effect of using the invention upon the business results of the party infringing. It may be added that where no profits are shown to have accrued a court of equity cannot give a decree for profits by way of damages or as a punishment for the infringement. (*Livingston* v. *Woodworth*, 15 Howard, 559.) But when the entire profit of a business or undertaking results from the use of the invention the patentee will be entitled to recover the entire profits, if he elects that remedy; and in such a case the defendant will not be allowed to diminish the show of profits by putting in unconscionable claims for personal services or other inequitable deductions. (*Rubber Company* v. *Goodyear*, 9 Wall., 788.)

"And these general propositions," he added, "will hardly admit of dispute."

Accordingly in that case the bill was dismissed as to the city of Elizabeth, which had infringed, because it appeared that it had made no profit from the use of the patented improvement, while a decree was rendered against the contractor who had laid the pavement which was the subject of the patent because he was shown to have made profits from the infringement. The municipal corporation, of course, remained liable to respond in damages in an action at law for any loss which the plaintiff could have established by proof.

The cases of *Marsh* v. *Seymour*, *supra*, arose under the act of 1870, and were bills for injunction and account. Decrees were rendered in favor of the complainant and a reference ordered to a master to state an account of profits. In both cases the respondents showing that they had made no profits by reason of the use of the invention, the complainant waived his claim for a recovery on that account, and decrees were rendered for damages on the basis of a license-fee for the infringing machines which had been sold and nominal damages for those manufactured but not sold. These decrees were affirmed, the Court saying, Mr. Justice Clifford delivering its opinion, that "damages of a compensatory character may be allowed to a complainant in an equity suit where it appears that the business of the infringer was so improvidently conducted that it did not yield any substantial profits, as in the case before the Court."

In the case of *Parks* v. *Booth*, (102 U. S., 96,) which was a suit in equity for an injunction, an account of profits and damages, under the act of 1870, a decree was rendered in favor of the complainant and for profits and damages as found by a master. Under the head of damages there was included items for expenses of conducting the suit, being counsel fees, compensation for the complainant's time, and interest on the profits. The decree was modified on appeal by striking out all these allowances, except that for the complainant's time lost in attending to the suit. Interest on profits was disallowed on the authority of *Sibley* v. *Moots*, (20

Howard, 386,) on the ground that profits in such a case are to be regarded in the light of unliquidated damages. No injunction was decreed, as the term of the patent had expired. It does not appear from the report of the case when the suit was begun, but a reference to the original record shows that the bill was filed in April, 1871, before the expiration of the term of the patent.

The case of *Hendrie* v. *Sayles* (98 U. S., 546) was a bill in equity for an account of profits, filed after the expiration of the patent—the same patent on which the present suit is founded. It was decided upon a single point raised on demurrer to the bill, the question of jurisdiction not being noticed either by counsel or Court. A decree for the complainant was affirmed on appeal. This appears to be the only case of the kind until the present that found its way into this Court.

The case of *Eureka Company* v. *Bailey Company* (11 Wall., 488) is no exception to this remark, although in respect to it the observation has been made that the injunction prayed for in that case was incidental to the account, and not vice versa. That, however, is a misconception, for, unless upon the ground of a difference of citizenship, the Court would not have had jurisdiction to entertain the bill in that case if it had not prayed for an injunction. For the mere purpose of enforcing the contract for the royalty it was not a case arising under the patent laws so as to give jurisdiction to the courts of the United States. It was because the defendant was guilty of an infringement of the complainant's patent that he was suable in equity in these courts, and to restrain that an injunction was asked until he should pay what he had promised. The object of the suit doubtless was to collect the royalty, but it was sought by means of and therefore as an incident to the jurisdiction of the court, invoked for the purpose of enjoining the continuance of what until the royalty was acknowledged and paid, was found to be an infringement. All the acts of Congress relating to patents prior to that of 1870 contained provisions specifying the special defenses which might be made in an action at law for an infringement under the plea of the general issue, notice thereof having been previously given. The sixty-first section of the act of 1870 enumerates the several special matters thus authorized to be proved, and adds, for the first time in the history of this legislation, the clause that "the like defenses may be pleaded in any suit in equity for relief against an alleged infringement, and proofs of the same may be given upon like notice in the answer of the defendant and with the like effect." The plain and obvious purpose of this provision is to furnish appropriate modes in equity pleading for the trial of all issues both of fact and law relating both to the alleged infringement and the validity of the patent without the necessity of framing special issues out of chancery for trial by jury or sending the parties to a court of law for the trial of an action in that forum, in order to determine their legal right. It proceeds upon the idea that the court of equity, having acquired jurisdiction for the purpose of administering the equitable relief sought by the bill, may determine directly and for itself in the same proceeding all questions incidental to the exercise of its jurisdiction, notwithstanding they may be questions affecting legal rights and legal titles. Although this was the first statutory authority for the practice, it was rather a recognition of what had already been established than its introduction, for the practice had in fact originated long before, and was based upon well-known principles of equity jurisprudence. Whatever question may have existed in reference to it previously was settled in the courts of the United States by the decision in *Goodyear* v. *Day*, (2 Wall., Jr., C. C. Rep., 283,) a case argued by Webster and Choate, and decided by Mr. Justice Grier in 1852. That learned judge on that occasion said:

> It is true that in England the chancellor will generally not grant a final and perpetual injunction in patent cases when the answer denies the validity of the patent without sending the parties to law to have that question decided; but even there the rule is not absolute or universal. It is a practice founded more on convenience than necessity. It always rests on the sound discretion of the court. A trial at law is ordered by a chancellor to inform his conscience, not because either party may demand it as a right or that a court of equity is incompetent to judge of questions of fact or of legal titles.

See, also, *Orr* v. *Merrill*, (1 Wood. & Minot, 376.)

The distinction in the nature of the two proceedings of an action at law and a suit in equity is plainly pointed out in this section of the statute, the former as being an action for an infringement, the latter as a suit for relief against an alleged infringement. And while upon the words used in the fifty-fifth section of the act it may be that the jurisdiction in equity which is thereby conferred is not exhausted by the power to grant injunctions according to the course and principles of courts of equity to prevent the violation of any right secured by patent, yet the statute immediately says that it is upon a decree being rendered in any such case for an infringement—as though that was the only one—that the complainant shall be entitled to recover, in addition to the profits to be accounted for by the defendant, the damages the complainant has sustained thereby. It is impossible, we think, to maintain the claim that the language of this act, similar in that respect to the previous acts of 1819 and 1836, conferring jurisdiction in patent cases in equity as well as at law, was meant to obliterate the distinctions between these two jurisdictions, or even to confuse the boundaries between them, as it is alleged was done by the decision in the case of *Nevins* v. *Johnson*, (3 Blatchf., 80,) and, perhaps, in other subsequent circuit court decisions. Indeed, it is the settled doctrine of this Court that this distinction of jurisdiction between law and equity is constitutional to the extent to which the seventh amendment forbids any infringement of the right of trial by jury as fixed by the common law, and the doctrine applies in patent cases as well as others. This Court said in *Parsons* v. *Bedford*, (3 Peters, 446,) speaking of the meaning intended by the framers of that amendment, that "by common law they meant what the Constitution denominated in the third article, law, not merely suits which the common law recognized among its old and settled proceedings, but suits in which legal rights were to be ascertained and determined in contradistinction to those where equitable rights alone were recognized and equitable remedies administered." The rule was repeated in *Fenn* v. *Holme* (21 Howard, 484) in this language:

> In every instance in which this Court has expounded the phrases, proceedings at the common law and proceedings in equity with reference to the exercise of the judicial powers of the courts of the United States they will be found to have interpreted the former as signifying the application of the definitions and principles and rules of the common law to rights and obligations essentially legal, and the latter as meaning the administration with reference to equitable as contradistinguished from legal rights of the equity law as defined and enforced by the court of chancery in England.

It becomes necessary, therefore, to consider what support there is in the general doctrines of equity for the contention of the appellant.

It is the fundamental characteristic and limit of the jurisdiction in equity that it cannot give relief when there is a plain and adequate and complete remedy at law, and hence it had no original, independent, and inherent power to afford redress for breaches of contract or torts by awarding damages, for to do that was the very office of proceedings at law. When, however, relief was sought which equity alone could give, as by way of injunction to prevent a continuance of the wrong in order to avoid multiplicity of suits and to do complete justice, the court assumed jurisdiction to award compensation for the past injury, not, however, by assessing damages, which was the peculiar office of a jury, but requiring an account of profits, on the ground that if any had been made it was equitable to require the wrong-doer to refund them, as it would be inequitable that he should make a profit out of his own wrong. As was said by Vice-Chancellor Wigram in *Colburn* v. *Simms*, (2 Hare, 543,) "the court does not by an account accurately measure the damage sustained by the proprietor of an expensive work from the invasion of his copyright by the publication of a cheaper book," but, "as the nearest approximation which it can make to justice, takes from the wrong-doer all the profits he has made by his piracy and gives them to the party who has been wronged." Whether a bill for an account of profits against a wrong-doer would lie independently of other equitable grounds for the intervention of the court is a question, as was said by Lord Chancellor Brougham in *Parrott* v. *Palmer*, (3 Mylne & Keen, 640,) "which has been oftentimes agitated, and has, perhaps, never received a clear and a general decision—that is to say, a distinct judgment on the general proposition with its limitations." He concluded that "from the whole it may be collected that although as to timber there exists considerable discrepancy, yet the sound rule is to make the account the incident, and not the principal, where there is a remedy at law; but that mines are to be otherwise considered, and that as to them the party may have an account even in cases where no injunction would lie."

The supposed exception in cases of mines seems to rest upon a *dictum* of Lord Hardwicke in *Jesus College* v. *Bloom*, (3 Atkyn, 262,) that "it was a sort of trade;" but the reference is to the case of *Bishop of Winchester* v. *Knight*, (1 P. Wms. 406,) where the bill prayed for an account of ore dug by the ancestor of the defendant, in respect to which the argument was that, being a personal tort, it died with the person. The decision was that the plaintiff was not entitled; but on this point the Lord Chancellor said:

> It would be a reproach to equity to say where a man has taken my property—as my ore or timber—and disposed of it in his lifetime, and dies, that in thiscase I would be without remedy. It is true as to the trespass of breaking up meadow or ancient pasture ground; it dies with the person; but as to the property of the ore or timber, it would be clear even at law, if it came to the executor's hand, that trover would lie for it, and if it has been disposed of in the testator's life-time the executor, if assets are left, ought to answer it.

It is plain from these observations that the assumed ground of the equity jurisdiction was the absence of any remedy at law. (*Powell* v. *Aiken*, 4 Kay & Johns., 343.) It is now clearly established in the English chancery "that a bill will not lie for an account of timber felled any more than for any other money demand, except when the account is asked as an incident to an injunction, and that when the plaintiff has no right to an injunction he has no right to an account, and his remedy is at law alone." (Per Sir Wm. M. James, L. J., in *Higginbotham* v. *Hawkins*, L. R., 7 Ch. Apps., 679.)

The same rule is applied by the modern decisions in cases of mines where, as incident to the relief sought by a bill, an accounnt is asked of profits against trespassers. It appears that as to the mode of assessing compensation in such suits to an owner of coal which has been improperly worked by the owner of an adjoining mine, a different principle is applicable when the coal is taken inadvertently, or under a *bona fide* belief of title and when it is taken fraudulently, with knowledge of the wrong. In cases of the latter description at law the strict rule of damages laid down in *Martin* v. *Porter*, (5 M. & W., 351,) was to charge the value of the coal without allowing any of the expenses of getting it; but in those of the former description a milder rule was applied in *Morgan* v. *Powell*, (3 Q. B., 278,) and *Wood* v. *Morewood*, (3 Q. B., 440,) which was to give to the plaintiff the fair value of the coals, as if the coal-field had been purchased from him by the defendant. This distinction was adopted and the latter rule applied in equity by Vice-Chancellor Malins in *Hilton* v. *Woods* (L. R., 4 Eq., 432,) and by Lord Chancellor Hatherley in *Jegon* v. *Vivian*, (L. R., 6 Ch. App., 742,) the latter remarking that "this court never allows a man to make profit by a wrong." This rule was adopted in *Stockbridge Iron Co.* v. *Cone Iron Works*, (102 Mass., 86.)

The same rule applies in England in patent and copyright cases. The Vice-Chancellor Page Wood in *Smith* v. *The London and Southwestern Railway Co.* (Kay's Rep., 415) said:

> The true ground of relief in these cases is laid down in *Bailey* v. *Taylor*, (1 Russ. & M., 75,) where Sir J. Leach, M. R., says: "The court has no jurisdiction to give to a plaintiff a remedy for an alleged piracy unless he can make out that he is entitled to the equitable interposition of this court by injunction; and in such case the court will also give him an account, that his remedy here may be complete. If this court do not interfere by injunction, then his remedy, as in the case of any other injury to his property, must be at law." Unless that primary right to an injunction exists, this court has no jurisdiction with reference to a mere question of damages.

The Vice-Chancellor further observed that, as had often been stated by Lord Eldon, as the object of the court in interfering by injunction was the prevention of a multiplicity of suits, which might be rendered necessary by continued infringements of the patent, he was at a loss to see how the jurisdiction could attach or the relief by injunction be arrived at after the expiration of the patent, unless a case were made out of a numerous series of past infringements, from which the parties were still deriving advantage. He then referred to *Crossley* v. *Beverly* (Webs. Pat. Cas., 119) as a case where there was a specific ground for that relief—that the defendants had been manufacturing the patented articles secretly and fraudulently for the purpose of pouring into the market the articles so manufactured directly the patent should have expired. In that case the bill was filed before the expiration of the patent, and the right to sue having been thus acquired, the court extended it to restrain using the articles so manufactured after the patent had expired. "Such a case," continues the Vice-Chancellor, "of a fraudulent attempt to evade the patent might occur as would enable the court to restrain the use of articles made in infringement of the patent and kept back until it expired, even after its expiration, and the plaintiff having thus obtained a right to the injunction, the right to an account would follow."

In the case of *Price's Pat. Candle Co.* v. *Bauwen's Co.* (4 Kay & Johnson, 727) the bill was dismissed because the patent, having expired *pendente lite*, the relief by injunction could not be granted at the hearing; but in *Davenport* v. *Rylands* (L. R., 1 Eq. Cas., 302) the same judge retained the bill under similar circumstances for the purposes of an inquiry as to damages, because the act of 21 and 22 Vict., c. 27, commonly called "Cairn's act," passed after the former decision, had altered the rule. That statute declared that in all cases in which the court has jurisdiction to entertain an application for an injunction against a breach of any covenant, contract, or agreement, or against the commission or continuance of any wrongful act, or for the specific performance of any covenant, contract, or agreement, the same court may award damages to the party injured either in addition to or in substitution for such injunction or specific performance, and such damages may be assessed in such manner as the court shall direct, a provision which no doubt suggested the like extension of the jurisdiction of the court in patent cases contained in our patent act of 1870. But even after the passage of "Cairn's act" it was decided by Vice-Chancellor Sir Wm. M. James in *Betts* v. *Gallais* (L. R., 10 Eq. Cas. 392) that the court would not entertain a bill for the mere purposes of giving relief in damages for the infringement of a patent when the bill had been filed so immediately before the expiration of the patent as to render it impossible to have obtained an interlocutory injunction. He characterized it as "a mere device to transfer a plain jurisdiction to award damages from the court to which that jurisdiction properly belongs to this court."

Mr. Kerr in his treatise on injunctions, 41, summarizes the result of many decisions, which he cites under this statutes, as follows:

> The statute did not transfer to the court the general jurisdiction of common law by way of damages or extend its jurisdiction to cases where previously to the statute it had no jurisdiction or could not consistently with its rules and principles have interfered. The statute merely empowered the court to give damages in cases involving elements or ingredients of an equitable character. If the case as presented to the court was an equitable one, so that the subject-matter of the application is properly cognizable in equity, the court had jurisdiction under the statute to entertain the question of damages. If, on the other hand, the plaintiff had no equitable right at the time of bringing the action, so that the matter has been improperly brought into equity, the statute had no application. Damages may be awarded under the statute if it appear that at the time of bringing the action there was an equitable case, although the case for an injunction fails, or although an injunction is not competent from circumstances which have occurred since the filing of the bill.

It will be observed that the British statute does not touch the question of the account of profits by an infringer, leaving that as it stood before the passage of the act. The unavoidable inference is that damages can only be given under the act in cases in which an account might be decreed, and that the patentee must, as it was expressly decided by the House of Lords in *De Vitre* v. *Betts*, (L. R., 6 H. L., 321,) in all cases when he has a decree elect whether he will have an account of profits or an inquiry as to damages, and cannot have both. Under the act of Congress of 1870 he may recover damages in addition to the profits to be accounted for by the defendant; but as the recovery is limited by the act to the actual damages, it is manifest that the recovery of damages and profits is not intended to be double, but that when necessary the damages are to supplement that loss of the complainant which the profits found to have been received are insufficient to compensate, subject to the power of the court as to their increase, as in case of verdicts. This firm and indisputable doctrine of the English chancery has been recognized and declared by this Court in *Hipp* v. *Babin* (91 Howard, 271) to be part of the system of equity jurisprudence administered by the courts of the United States, founded, not only upon the legislative declaration in the judiciary act of 1789, "that suits in equity shall not be sustained in either of the courts of the United States in any case where plain, adequate, and complete remedy may be had at law," but also upon the intrinsic distinctions between the different jurisdictions of law and equity. In delivering the opinion of the Court in that case, Mr. Justice Curtis remarked that "the practice of the courts of the United States corresponds with that of the chancery of Great Britain, except where it has been changed by rule or is modified by local circumstances or local convenience," and cited the instances in which "this Court has denied relief in cases in equity where the remedy at law has been plain, adequate, and complete, though the question was not raised by the defendants in their pleadings nor suggested by the counsel in their arguments." He then adds:

> And the result of the argument is that whenever a court of law is competent to take cognizance of a right and has power to proceed to a judgment, which affords a plain, adequate, and complete remedy without the aid of a court of equity, the plaintiff must proceed at law, because the defendant has a constitutional right to a trial by jury.

It was contended in that case that notwithstanding this general principle the bill ought to be maintained, because the complainants being minors were authorized to call upon the defendants, who had intruded into possession of their lands, for an account as guardians, and that the court of chancery was better fitted to take an account for rents, profits, and improvements, and might decide the question of title as incidental to the account. In reply to these points Mr. Justice Curtis remarked that "there are precedents in which the right of an infant to treat a person who enters upon his estate with notice of his title as guardian or bailiff and to exact an account in equity for the profits for the whole period of his occupancy is recognized;" "but," he added, "in those cases the title must, if disputed, be established at law, or other grounds of jurisdiction must be shown."

Nor can the court retain the bill under an impression that a court of chancery is better adapted for the adjustment of the account for rents, profits, and improvements. The rule of the court is that when a suit for the recovery of the possession can be properly brought in a court of equity and a decree is given, that court will direct an account as an incident in the cause; but when a party has a right to a possession which he can enforce at law, his right to the rents and profits is also a legal right, and must be enforced in the same jurisdiction. The instances where bills for an account of rents and profits have been maintained are those in which special grounds have been stated to show that courts of law could not give a plain, adequate, and complete remedy. No instances exist where a person who had been successful at law has been allowed to file a bill for an account of rents and profits during the tortious possession held against him, or in which the complexity of the account has afforded a motive for the interposition of a court of chancery to decide the title and to adjust the account. (*Hipp* v. *Babin*.)

These principles were announced in a case for the recovery of the possession of real estate held adversely; but they are of general application, and embrace as well the case of torts to personalty and infringements of patent and copy rights.

The distinct ground upon which the opposite view is presented to us in argument is that the infringer of a patent right is by construction of law a trustee of the profits derived from his wrong for the patentee, and that

a court of equity in the exercise of its acknowledged jurisdiction over trusts and trustees will require him to account as trustee without reference to any other relief; and in support of this contention we are referred to passages in the judgments of this court in the cases of *Packet Company* v. *Sickles*, (19 Wall., 611;) *Burdell* v. *Denig*, (92 U. S., 720,) and *Birdsall* v. *Cooledge*, (93 U. S., 68,) all of which have been already cited in this opinion

But the inference sought to be drawn from the expressions referred to is not warranted. It is true that it is declared in those cases that in suits in equity for relief against infringements of patents the patentee succeeding in establishing his right is entitled to an account of the profits realized by the infringer, and that the rule for ascertaining the amount of such profits is that of treating the infringer as though he were a trustee for the patentee in respect to profits; but it is no where said that the patentee's right to an account is based upon the idea that there is a fiduciary relation created between him and the wrong-doer by the fact of infringement, thus conferring jurisdiction upon a court of equity to administer the trust and to compel the trustee to account. That would be a *reductio ad absurdum*, and if accepted would extend the jurisdiction of equity to every case of tort where the wrong-doer had realized a pecuniary profit from his wrong. All that was meant in the opinions referred to was to declare according to what rule of computation and measurement the compensation of a complainant would be ascertained in a court of equity, which, having acquired jurisdiction upon some equitable grounds to grant relief, would retain the cause for the sake of administering an entire remedy and complete justice, rather than send him to a court of law for redress in a second action. The rule adopted was that which the court in fact applies in cases of trustees who have committed breaches of trust by an unlawful use of the trust property for their own advantage—that is, to require them to refund the amount of profit which they have actually realized. This rule was adopted, not for the purpose of acquiring jurisdiction, but in cases, where having jurisdiction to grant equitable relief, the court was not permitted by the principles and practice in equity to award damages in the sense in which the law gives them, but a substitute for damages, at the election of the complainant, for the purpose of preventing multiplicity of suits; and the particular rule was formulated, as will be seen by reference to the cases already referred to, out of tenderness to defendants, in order to mitigate the severity of the punishment to which they might be subjected in an action at law for damages, and because it was thought more equitable merely to deprive them of the actual profits arising from their wrong than to make no allowances in estimating damages for the cost and expense of the business, in the prosecution of which they had violated the rights of the complainant. The same reason operated in the establishment of the similar rule acted upon in the cases of *Hilton* v. *Woods* (L. R., 4 Eq., 432) and *Jeyon* v. *Virian*, (L. R., 6 Ch. App., 742,) already cited in a previous part of this opinion. The rule itself is reasonable and just, though sometimes perverted and abused. It has been constantly acted upon by the courts; but it is a rule of administration and not of jurisdiction, and, although the creature of equity, it is recognized as well at law as one of the measures, though not the limit, for the recovery of damages.

The case is not within the principle according to which in certain circumstances a court of equity decrees a wrong-doer to be a trustee *de son tort*, and exerts its jurisdiction over him in that character. Where a defendant has wrongfully intermeddled with property already impressed with a trust he may be required as a trustee to account for it, as was done in the case of *The People* v. *Houghtaling*, (7 Cal., 348,) because trust property may be followed, wherever it can be traced, into whosesoever possession it comes, except that of a *bona fide* purchaser, without notice. It is the character of the property, and not the wrong done in converting or withholding it, that constitutes the wrong-doer a trustee.

Our conclusion is that a bill in equity for a naked account of profits and damages against an infringer of a patent cannot be sustained; that such relief ordinarily is incidental to some other equity, the right to enforce which secures to the patentee his standing in court; that the most general ground for equitable interposition is to insure to the patentee the enjoyment of his specific right by injunction against a continuance of the infringement; but that grounds of equitable relief may arise other than by way of injunction, as where the title of the complainant is equitable merely, or equitable interposition is necessary on account of the impediments which prevent a resort to remedies purely legal, and such an equity may arise out of and inhere in the nature of the account itself, springing from special and peculiar circumstances which disable the patentee from a recovery at law altogether, or render his remedy in a legal tribunal difficult, inadequate, and incomplete, and as such cases cannot be defined more exactly each must rest upon its own particular circumstances as furnishing a clear and satisfactory ground of exception from the general rule.

The case of *Garth* v. *Cotton* (1 Dickens, 183) furnishes an interesting and curious illustration of one of the excepted cases. In that case Lord Hardwicke sustained a bill in equity in a case of waste for an account of timber felled and sold where there could be no injunction in favor of a complainant unborn at the time of its commission whose estate was a contingent remainder supported by a limitation to trustees to preserve it, the defendant being the owner of a prior term of years and the ultimate remainder man in fee. The Lord Chancellor proceeded on the ground of collusion between the defendants and a nominal or imputed breach of trust on the part of the trustees to preserve the contingent remainder in permitting the wrong, and distinguished the case from *Jesus College* v. *Bloom* (3 Atk., 262) particularly on the ground that the complainant could have no remedy at law. Another instance of an exception is mentioned by Vice-Chancellor Page Wood in the extract from his judgment in the case of *Smith* v. *The London and Southwestern Railroad Co.*, (Kay's Rep., 415,) contained in a previous part of this opinion.

It does not appear from the allegations of the bill in the present case that there are any circumstances which would render an action at law for the recovery of damages an inadequate remedy for the wrongs complained of, and as no ground for equitable relief is presented we are of opinion that the circuit court did not err in sustaining the demurrer and dismissing the bill. Its decree is therefore affirmed.

THE

OFFICIAL GAZETTE

OF THE

United States Patent Office.

Subscriptions for 1882.

The OFFICIAL GAZETTE is published every Tuesday, two volumes a year, commencing in January and July. Terms: To all subscribers within the United States and Canada, $5 per annum; to foreign subscribers, $7; single copies, 10 cents; bound volumes, $3.50 per volume. No club rates. *Payment in advance.* All orders should be addressed to "The Commissioner of Patents, Washington, D. C."

Amendment of Rules 85 and 86.

DEPARTMENT OF THE INTERIOR,
UNITED STATES PATENT OFFICE,
Washington, D. C., April 1, 1882.

Rule 85 (Rules of Practice, revised September 1, 1880) is hereby amended by striking out the last sentence, viz: the words "If the reissue shall be granted, the cost of the abstract of title will be refunded."

Rule 86 is hereby amended so as to read:

"Applicants will be required to file with their petitions for reissue—

"1st. A statement setting forth particularly the defects or insufficiencies in the specification which render the patent inoperative or invalid, and in cases where more was claimed and allowed than the applicant was entitled to claim as new such part or parts must be distinctly pointed out.

"2d. In such statement the applicant must explain how such errors arose, in order that the question of inadvertence, accident, or mistake may be determined.

"3d. The statement must be accompanied with the oath of the applicant that said errors arose without any fraudulent or deceptive intention.

"From the decision of the examiner, holding that the statement or oath is insufficient, an appeal may be taken to the Commissioner in person."

E. M. MARBLE,
Commissioner of Patents.

Approved to take effect April 15, 1882.

S. J. KIRKWOOD,
Secretary of the Interior.

Issue of April 18, 1882.

DESIGNS.

12,867.—PICKLE, PRESERVE, OR SIMILAR VESSEL.—*David Barker*, Steubenville, Ohio, assignor to *Charles G. Summers*, Baltimore, Md. Application filed February 15, 1882. Term of patent 3½ years.

12,868.—HANDLE FOR A SPOON OR FORK.—*Alonzo Hebbard*, New York, N. Y., assignor to *Dominick & Haff*, same place. Application filed February 28, 1882. Term of patent 7 years.

12,889.—FRINGE.—*Eugene A. Kemper*, Philadelphia, Pa. Application filed February 7, 1882. Term of patent 3½ years.

2,890.—FONT OF PRINTING-TYPE.—*Andrew Little*, New York, N. Y. Application filed March 9, 1882. Term of patent 7 years.

12,891.—PADLOCK.—*Thomas Lyons*, Hartford, assignor to *The Russell & Erwin Manufacturing Company*, New Britain, Conn. Application filed March 2, 1882. Term of patent 14 years.

12,892 and 12,893.—ADVERTISING OR ORNAMENTAL DISK OR PLATE. *Elhanan L. Moodie*, New York, N. Y., assignor of one-half to *Charles H. Gillespie*, same place. Applications filed March 14, 1882. Term of patents 3½ years.

12,894.—HAT.—*H. Stansbury Norse*, New York, N. Y. Application filed February 17, 1882. Term of patent 3½ years.

12,895.—CARPET.—*Horatio Smith*, Kidderminster, county of Worcester, England, assignor to *William Mansell Daintrey*, New York. Application filed March 14, 1882. Term of patent 3½ years. Registered in England October 25, 1881.

12,896.—WATCH-CASE.—*Henry Untermeyer*, New York, N. Y. Application filed November 11, 1881. Term of patent 7 years.

12,897.—DOOR-HANGER.—*Stephen W. Jones*, South Union, Me. Application filed March 7, 1882. Term of patent 14 years.

12,898.—HEATING-STOVE.—*John W. Kennedy*, Troy, assignor to *The Union Stove Works*, New York, N. Y. Application filed March 15, 1882. Term of patent 7 years.

12,899 and 12,900.—FONT OF PRINTING-TYPE.—*John K. Rogers*, Brookline, Mass. Applications filed March 16, 1882. Term of patents 3½ years.

TRADE-MARKS.

[Certificates of registration of Trade-Marks numbered 8,191 and upward are registered under the act of March 3, 1881.]

9,294.—OIL.—*John D. Archbold*, New York, N. Y. Application filed March 11, 1882.

"The arbitrarily-selected word 'ANGORA.'"

9,295.—ELECTRO-MAGNETIC APPLIANCES FOR THE CURE OF VARIOUS DISEASES.—*Josiah Baker*, East Somerville, Mass. Application filed March 24, 1882.

The portrait of the registrant and the fac-simile of his signature.

9,296.—COOKING-STOVES.—*Bridge and Beach Manufacturing Company*, St. Louis, Mo. Application filed May 9, 1881.

"The word 'SUPERIOR.'"

9,297.—COOKING-STOVES.—*Bridge and Beach Manufacturing Company*, St. Louis, Mo. Application filed May 9, 1881.

"The representation of a bunch of grapes with its leaves, tendrils, and stem, and the word 'SUPERIOR.'"

2,298.—COOKING-STOVES.—*Bridge and Beach Manufacturing Company*, St. Louis, Mo. Application filed May 9, 1881.

"The representation of a grape-leaf and the word 'SUPERIOR.'"

9,299.—REMEDY FOR THE CURE AND EXTRACTION OF CORNS.—*John C. Echard*, Staunton, Va. Application filed March 13, 1882.

"The word 'EXCELSIOR.'"

9,300.—CERTAIN SPECIFIC MEDICINE.—*Edgar B. Hurrell*, Cincinnati, Ohio. Application filed January 30, 1882.

"The arbitrary word 'SANTINELL.'"

9,301.—CIGARS.—*W. R. Irby & Bro.*, New Orleans, La. Application filed March 27, 1882.

"The words 'NEW ORLEANS COTTON EXCHANGE' and the representation of the Exchange building."

9,302.—SPOOL-COTTON.—*Kerr & Co.*, Paisley, county of Renfrew, Scotland, East Newark, N. J., and New York, N. Y. Application filed March 27, 1882.

"The dollar sign, '$.'"

9,303.—CERTAIN MEDICINAL PREPARATIONS.—*J. Warren Lowell* Cape Elizabeth, Me. Application filed March 24, 1882.

"The arbitrarily-selected letters and word 'CAULOCOREA.'"

9,304.—CERTAIN MEDICINE.—*William R. Merwin* and *George H. Leslie*, Detroit, Mich. Application filed January 30, 1882.

"The word 'MAGNETIC' and the two half-length male figures, with the clinched fist placed between them, represented as emitting flashes of electricity."

9,305.—PIPE CUTTING AND THREADING MACHINES.—*D. Saunders' Sons*, Yonkers, N. Y. Application filed March 24, 1882.

"The arbitrary symbol composed of the letters 'I X L.'"

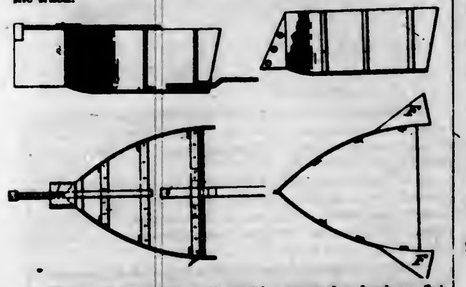
LABELS.

2,665.—Title: "JAMAICA GINGER ALE."—*Gustavus D. Dows*, Boston, Mass. Application filed March 16, 1882.

2,666.—Title: "KEMPSHALL'S PATENT SCREW SOCKET WINDOW SPRING BOLTS."—*Eleazer Kempshall*, New Britain, Conn. Application filed March 23, 1882.

2,667.—Title: "RICE'S PINE SALT."—*North American Chemical Company*, (Limited,) Montreal, Quebec, Canada. Application filed March 24, 1882.

2,668.—Title: "LAREDO BAKING POWDER."—*D. H. Randolph & Co.*, Laredo, Tex. Application filed February 6, 1882.



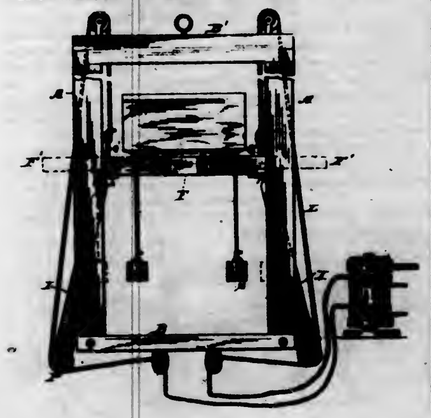
2,669.—Title: "IMPROVED GLIDDEN" (FOR BARBED FENCES.)—*Worcester Barb Fence Company*, Worcester, Mass. Application filed March 6, 1882.

PATENTS

GRANTED APRIL 18, 1882.

256,451. SNOW-PLOW. SILAS ADAMS, Gardner, Mass. Filed Oct. 26, 1881. (No model.)

Brief.—The plow has a flat tread or bottom and is without runners. Said bottom is turned up slightly at the front, and a hinged colter enables the operator to direct its course and widen the track.



Claim.—1. The combination, with a snow-plow having a flat bottom without runners and adapted to press uniformly over the road-bed, of a colter fastened to the fore end of the plow by strong hinges with operating devices, as set forth.

2. The combination, with a snow-plow having a flat bottom without runners and adapted to press uniformly over the road-bed, of a colter and operating devices, as described.

3. The combination, with a snow-plow having a flat bottom to run upon the snow and turned up slightly at its fore end, of the colter and its operating devices, as described.

4. In combination with the plow constructed, as described, with the flat bottom without runners, of the wings F F, as set forth.

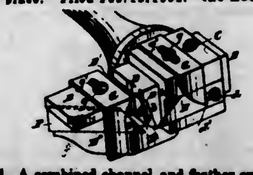
256,452. WOOD AND COAL ELEVATOR. GEORGE B. ALLIS, Little Rock, Ark. Filed Mar. 3, 1882. (No model.)

Claim.—1. In an elevator and dumping device, a box hinged to a platform moving in guides formed by the supporting-frame, and adapted to be automatically dumped, substantially as set forth.

2. In an elevator and dumping device, as described, a frame having a box-supporting platform moving therein, a fuel-box hinged to said platform, and means whereby the box and platform are raised and the box automatically dumped.

3. In an elevator and dumping device, a frame consisting of the posts A and cross-beams B B' B', in combination with the supporting-pieces I, platform F, and fuel-box C, substantially as set forth.

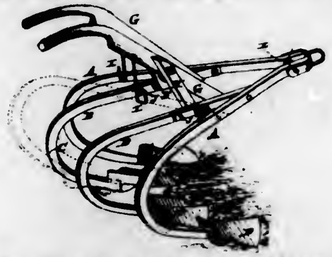
4. In an elevator and dumping device, the combination of a vertical supporting-frame, A B B', supports I, and platform F, moving in the frame, with a fuel-box, C, hinged to the platform, the platform and its supports being actuated by cords passing over pulleys secured to the supporting-frame and the platform-supports.



5. In an elevator and dumping device, the combination of a fuel-box supported and moved as described with the hinged arms F' and locking mechanism, substantially as described.

256,453. SHOE-FASTENER. ISAAC BANISTER, Newark, N. J., and ROBERT B. BANISTER, Providence, R. I. Filed Dec. 5, 1881. (Model.)

Claim.—A shoe-fastener composed of the loop-plate C, base-plate A, provided at one end with the cross-head *a'*, its opposite end being returned to form a hook and adapted to project through the leather or other material, as described, and the tongue or clasp B, hinged to the said cross-head, and having its free end returned, as shown and described, and adapted to pass through said loop-plate C and be sprung over and held into engagement with the rounded or hooked end of the aforesaid plate A, all in the manner and for the purposes set forth.



256,454. CHANNEL AND FEATHER CUTTER. PATRICK P. BARRY, Chicago, Ill., assignor of one-half to Henry B. Vandercook, same place. Filed Feb. 13, 1882. (No model.)

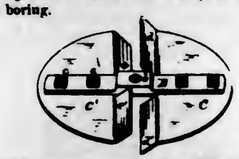
Claim.—1. A combined channel and feather cutter containing the laterally-adjustable block B, carrying the inclined adjustable blade F and the vertical adjustable blade D, and the laterally-adjustable horizontal blade E, applied to the stock, all combined for operation together substantially as and for the purposes specified.

2. The combination, with the stock of a shoemaker's tool, of the adjustable block B, the inclined adjustable blade F, and the vertical adjustable blade D, both applied to the said bar, the horizontal adjustable blade E, applied to the stock, one or more gages, G, and a gage, A, substantially as and for the purposes specified.

256,455. CULTIVATOR. SMITH A. BATSON, Batson's Store, Tenn. Filed Feb. 18, 1882. (No model.)

Claim.—In a cultivator, the combination of the outer beams, A, the inner beams, B, constructed in two sections, hinged together and having their front ends attached to said outer beams, A, and the handles G, having hooks I, all constructed and arranged substantially as set forth.

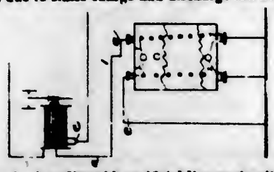
256,456. PLASTERED WALL. AUGUST H. BROEKER, St. Louis, Mo. Filed Jan. 27, 1882. (No model.)



Claim.—1. The herein described mode of producing a surface upon a plastered wall, which consists in cementing a textile fabric closely thereto and then coating the fabric with paint, said wall not being painted or waterproofed, substantially as described.

2. A plastered wall having a textile fabric cemented closely and directly thereto, and said fabric having paint applied thereto, said wall not being painted or waterproofed, substantially as described.

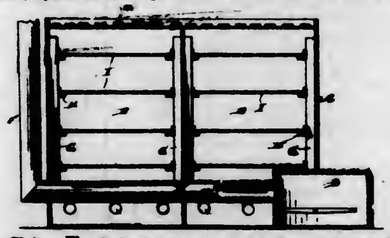
256,457. EARTH-AUGER. WILLIAM BRUNNER, North Lewisburg, Ohio. Filed Jan. 30, 1882. (No model.)



Brief.—The inner edges of the upturned disks have a bearing against the edges of the cross-bar, whereby the disks are braced in the act of boring.

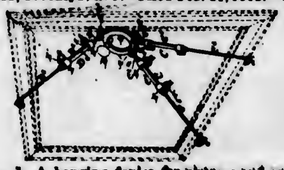
Claim.—In an earth-auger, the combination of the screw-threaded and pointed handle A, the bar B, and the plates C C', the blades of which are disposed in slanted parallel lines, with the inner ends of these inclined upward abutting against the bar, substantially as shown and described.

256,458. RHEOSTAT FOR MULTIPLE TELEGRAPHY. MADISON BUELL, Buffalo, N. Y. Filed Jan. 23, 1882. (No model.)



Brief.—A series of primary circuits of induction-coils are connected by ordinary switch-plugs directly in the artificial line until its resistance equals that of the main line. The secondaries are then connected up in series in a similar manner, but in an independent earth-circuit. In this way the electro-static capacity of the artificial line is made equal to that of the main line, and disturbances due to static charge and discharge are avoided.

Claim.—1. An adjustable artificial line or circuit which consists of the adjustable artificial line-circuit *a* and an adjustable artificial earth-circuit, *c*, both combined together in one or more spools, substantially as and for the purpose hereinbefore set forth.

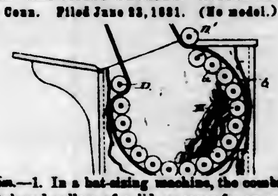


2. A rheostat composed of a series of spools of adjustable resistance, each separate spool having two wires, *a c*, thereon, side by side, one representing the artificial line *a*, the other the earth-line *c*, and insulated from each other, and arranged and operating substantially in the manner and for the purpose herein specified.

256,459. FRUIT-DRIER. JAMES D. BURDETT and LEWIS C. HILL, Myrtle Creek, Oreg. Filed Dec. 6, 1881. (No model.)

Claim.—The fruit-drier herein described, consisting of the case A, having inlets L and open tops M, the chambers B, having independent doors C, guides H, bars G, trays I, of shorter length than the transverse plane of the several chambers, arranged alternately, as shown, the furnace D, and pipe E, leading through each of the chambers, all arranged and combined to operate as set forth.

256,460. HANGING DEVICE FOR PICTURES AND MANIKINS. ALEXANDER CAMPBELL, Brooklyn, N. Y. Filed Feb. 21, 1882. (No model.)

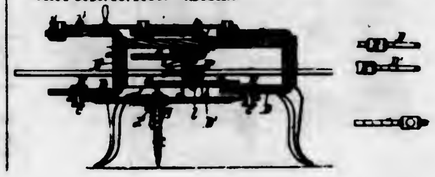


Claim.—1. A hanging device for pictures and manikin articles, constructed with a bow, ring, or frame, A, and a series of adjustable suspension and distending rods, C D, substantially as shown and described.

2. A hanging device for pictures and manikin articles, constructed with a bow, ring, or frame, A, and a series of suspending or distending rods, C and D, formed in sections, as shown, such sections being capable of adjustment one in relation to the other, substantially as and for the purpose described.

3. In a suspension device for pictures and manikin articles, the combination, with the ring or frame A, provided with lugs or projections A' A² A³ A⁴, of the rods C C and D, formed in sections C' C² C³ and D' D² D³, sliding within or upon each other, and held in position by clamps or similar holding means, E, substantially as shown and described.

256,461. HAT-SIZING MACHINE. HERMAN CHITTENDEN, Danbury, Conn. Filed June 23, 1881. (No model.)



Claim.—1. In a hat-sizing machine, the combination, with a tank or tub and rollers, of a lid or cover for an opening in such tank, hinged in position and adapted to be turned back for use as a hatter's plank, substantially as described.

2. The tank, its steam-pipe and plank, combined with a series of rolls and a belt to drive such rolls simultaneously all in one direction and at the same speed, substantially as described.

3. The series of fixed rollers *a a* and the belt *b* to drive them, combined with the idlers D D' and the receiving tank or box, substantially as described.

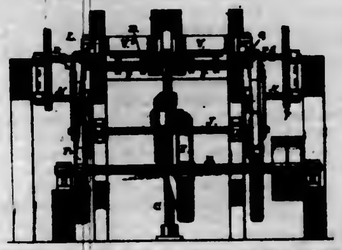
256,462. ELLIPSOGRAPH. EZRA E. CLARK, Worcester, Mass. Filed Sept. 26, 1881. (Model.)

Claim.—1. In combination with the rectangular frame A, the cranks D D D' D', rods *d d'*, and hub H, the pivots of the rods being adjustable upon the respective cranks, and the whole being arranged to carry the stock in an elliptical path of movement, substantially as described.

2. As a means of actuating the cranks D D D' D', the cranks C C C' C', secured in the axes of the former, and being in their turn united by connecting-rods which compel them to rotate in unison, substantially as stated.

3. As a means of accelerating or retarding the speed of rotation of the stock upon its axis to maintain the knife or pen normal to the curve of the ellipse, as stated, the cross-head H', adapted to traverse the frame A in the same direction as the rod *d'*, and actuated by the cranks *c* and *c'*, and the slotted plate or arm *n*, affixed at its base to the stock and straddling a pivot depending from the cross-head, substantially as herein set forth and described.

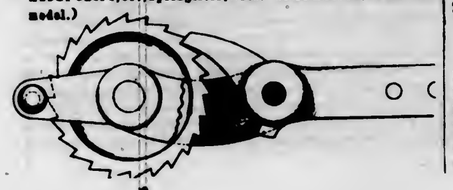
4. The instrument as an entirety consisting of the frame A, cranks C C C C D D D D', slides or rods *d d'*, connecting rods or bars *b b b' b'* of the frame F, cross-head H, with its stud or pivot *i*, and adapted to traverse the frame A, and slotted plate or arm *n*, straddling such pivot *i*, substantially as and for the purposes described.



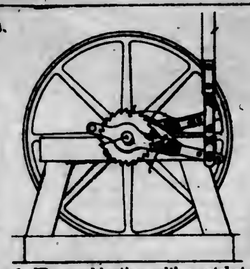
256,463. JOURNAL-BEARING. WILLIAM L. CLARK, Webster City, Iowa. Filed Jan. 27, 1882. (No model.)

Claim.—A hollow journal-box or journal, filled with liquid and firmly closed, substantially as and for the purpose described.

256,464. MACHINE FOR SAWING AND GROOVING BRAKES. FRANK H. GOWEN, Glenwood, assignor to Adolphus Gorman, San Francisco, Cal. Filed May 27, 1881. (No model.)



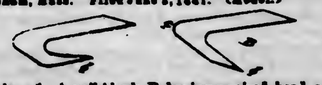
Brief.—Two automatically-operated alternately reciprocating carriages carry the belts over a horizontal saw. Small vertical saws beneath cut the grooves.



Claim.—1. In a machine for cutting and finishing shakes and other articles from a block or bolt, the combination together of the horizontally-running circular saw, the tool-carrying mandrels *g g*, the reciprocating carriages V or V', for holding and feeding the bolts in an alternate manner, or one in advance of the other upon opposite sides of the saw, the intermittent feed device Q L G H, and the mechanism for throwing the feed of one carriage into gear from the movements of the other carriage, all substantially as herein described, to operate as set forth.

2. In combination with the saw and the traveling carriages having feed-racks on them, the pistons Q, the sliding bearings of their shafts, the levers I, having upright arms arranged to project in the paths of the carriages, the lever G, and its catch H, substantially as described.

256,465. RATCHET-PAWL FOR POWER-CONVERTERS. HENRY CROFT, Jr., Springfield, Ohio. Filed Mar. 18, 1882. (No model.)



256,466.

Claim.—1. The combination, with a ratchet-wheel, of a driving-pawl, a pivoted pawl-carrier to which said pawl is pivoted, and an extension of said pawl beyond its pivotal point, whereby upon applying power to said extension of the pawl a positive lock is effected between the engaging end of the pawl and the ratchet.

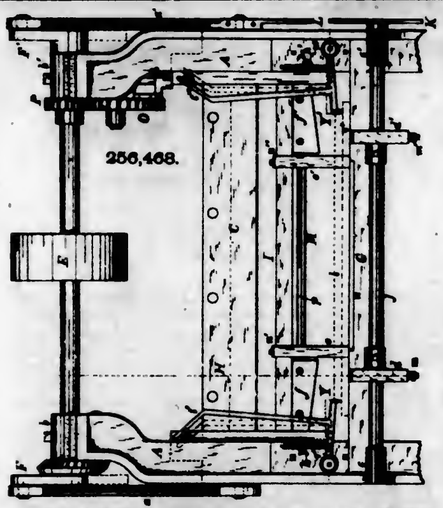
2. The combination, with a ratchet-wheel, of an encompassing pawl-carrier held to said ratchet by frictional contact and provided with a detent or stop, and a pawl pivoted to said carrier and likewise provided with a detent or stop, whereby upon the backward stroke of the pawl the frictional contact of the carrier and ratchet insures the entire disengagement of the ratchet and pawl, as and for the purpose specified.

256,466. WIRE-FENCE NAIL. CHARLES W. DEAN, South Wareham, Mass. Filed June 8, 1881. (Model.)

Claim.—1. A nail-blank, B, having a raised head, *c*, and divergent sharp-pointed legs of unequal length, having the outer bevels of their points parallel with each other, as set forth.

2. A nail having a raised head and divergent sharp-pointed legs of unequal length, the shorter leg having the bevel of its point bent parallel with the long leg, substantially as herein shown and described.

256,467. BUTTER-MOLD. JOSEPH DE CARLY, Smith's Ranch, Cal. Filed Aug. 5, 1881. (Model.)



Claim.—1. In a butter-mold, a cylinder formed of three sections, as shown, having at each end a series of springs provided with hooks for securing the edges of the cloth, in combination with the curved arms E, as and for the purpose set forth.

2. In a butter-mold, a cylinder formed of three sections, as shown, in combination with the curved arms I, carrying the disks I', the arms J, and the lever K, substantially as specified.

3. In a butter-mold, a cylinder, as described, having the springs C, containing the hooks C', and the curved clamping-arms E, in combination with the levers F G, having the arms G' and spring H, and with the arms I, carrying the disks I', having the lever K and arms J, substantially as and for the purpose set forth.

256,468. HOOP-MAKING MACHINE. JOHN H. DOUGHERTY, Rochester, N. Y., assignor, by mesne assignments, to John Gonnell, same place. Filed Aug. 29, 1881. (No model.)

Brief.—A reciprocating head carries a slicing-knife and a bar centrally pivoted, which carries a lapping-knife at each end. Means are provided for oscillating this bar, so that the lapping-knives shall cut alternately. Pointing-knives are driven by cams horizontally against the plank. The plank is fed on a table operated by cams, so as to be alternately horizontal and inclined in position.

Claim.—1. The combination of the reciprocating dividing-knife C, the movable lapping or tapering knives *f f'*, arranged to act alternately on the plank, and the pointing-knives *g g'*, substantially as and for the purposes set forth.

2. The combination, with the reciprocating dividing-knife C, knife-stock I, and bar M, pivoted to the knife-stock and carrying at either end the lapping or tapering knives *f f'*, substantially as described.

3. The combination, with the reciprocating dividing-knife C, of the lapping or tapering knives *f f'* and the pointing-knives *g g'*, and mechanism for moving the lapping-knives and for alternately operating the pointing-knives, substantially as and for the purposes set forth.

4. The combination of the reciprocating dividing-knife C, knife-stock I, the movable lapping-knives *f f'*, and means for adjusting the position of the lapping-knives relatively to the dividing-knife at each reciprocation of the latter, substantially as and for the purposes set forth.

5. The combination of the reciprocating dividing-knife C, knife-stock I, pivoted bar M, and lapping-knives *f f'*, arranged to be adjusted lengthwise of said bar to lap hoops of different lengths, substantially as described.

6. The combination of the knife C, reciprocating knife-frame H, provided with studs *s' s''*, pointing-knives *g g'*, and clamping-dogs Y Y', having bent arms *i' i''*, substantially as described.

7. The combination of the reciprocating dividing-knife C, swinging bar M, lapping and tapering knives *f f'*, and rock-shaft N, substantially as described.

8. The combination of the slotted frame A A, bed-plate G, cranks F F', pitmen *a a'*, dividing-knife C, swinging bar M, lapping and beveling knives *f f'*, rock-shaft N, gearing O P, and cam *q*, substantially as described.

256,469. DRAG-SAW. ROBERT R. HARNEST, Hochheimsburg, Ohio, assignor of one-half to William P. Murray, same place. Filed Jan. 9, 1882. (Model.)

Claim.—1. The saw-frame consisting of the upright frame A, having sill B, and the braces C, pivoted to the frame A and provided with foot-board D, whereby the operator is afforded a convenient standing-place and enabled to hold the braces by his weight in any position to which they may be adjusted.

2. A drag-sawing machine consisting of the frame A, pivoted braces C, having foot-board D, pendulous lever E, provided with a jointed operating-lever, and saw I, connected with lever E, as explained, whereby the machine is adapted to be folded into a compact form for storage or shipment, as set forth.

3. In a drag-sawing mechanism, the combination of a moving arm or lever, E, slotted and furnished with a transverse bolt, and a saw-carrying pitman, H, having a notch of a depth exceeding the space between the pitman and the end of the slot, whereby the detachment of the pitman when in its operative position is prevented.

256,470. PLASTIC COMPOSITION AND VULCANITE. GEO. S. EVANS, New York, N. Y. Filed Sept. 16, 1881. (Specimens.)

Claim.—1. The process of making from gums—such as gum-kauri or gum-manila—a plastic material suitable for waterproofing or for vulcanization, which consists in mixing such gum with palm-oil and then heating the mixture, as set forth.

2. A plastic material capable of forming with a suitable solvent, like oil or turpentine, a waterproofing substance or capable of being vulcanized, consisting of a gum—such as gum-kauri or gum-manila—united or combined with palm-oil, substantially as and in the proportions described.

3. The process of vulcanizing gums—such as gum-kauri or gum-manila—which consists in rendering them plastic and then treating them with a vulcanizing substance, like sulphur or iodine.

4. A vulcanite in which a gum—such as gum-kauri or gum-manila—treated with palm-oil is united with a vulcanizing substance.

5. The method of vulcanizing substances, which consists in treating them with chloride of aluminium, substantially as described.

6. A vulcanite consisting of a suitable vulcanizable substance united or combined with chloride of aluminium.

7. The process of vulcanizing gums, which consists in rendering them plastic and then treating them with chloride of aluminium, as described.

8. The process of converting gums—such as gum-kauri or gum-manila—into a suitable vulcanite, which consists in making a plastic material of the gum by uniting it with palm-oil, then heating the mixture until sufficiently cooked, and then incorporating with it chloride of aluminium, either dry or wet, with or without heat, substantially as described.

256,471. PLASTIC COMPOUND AND VULCANITE. GEO. S. EVANS, New York, N. Y. Filed Mar. 9, 1882. (No specimens.)

Claim.—1. The process of producing a solution of caoutchouc for incorporation into plastic compounds, which consists in mixing the caoutchouc with palm-oil or analogous non-siccative oil in a heated condition, substantially as and in the proportions described.

2. The process of producing a plastic compound suitable for vulcanization, which consists in mixing caoutchouc with palm-oil or analogous non-siccative oil in a heated state and then adding to the mixture a resinous gum, substantially as described.

3. The process of vulcanizing plastic compounds, which consists in incorporating with such plastic compound chloride of magnesium or other suitable chloride of the earthy alkalies, substantially as and in the proportions set forth.

4. A composition for incorporation into plastic compounds, consisting of a solution of caoutchouc and palm-oil or analogous non-siccative oil, substantially as and in the proportions described.

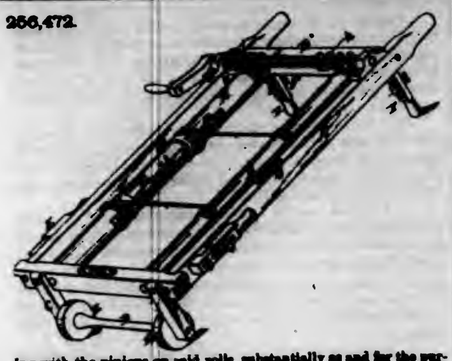
5. A plastic composition suitable for vulcanization, consisting of caoutchouc, palm-oil or analogous non-siccative oil, and a resinous gum, substantially as and in the proportion described.

6. The plastic composition herein described, suitable for electric insulation, water-proof coating, &c., the same consisting of caoutchouc, palm-oil or analogous non-siccative oil, and resinous gum, mixed together and subsequently vulcanized, substantially as described.

256,472. BIER. CHARLES J. RUEBHAUSE, Canton, Ohio. Filed Jan. 14, 1882. (No model.)

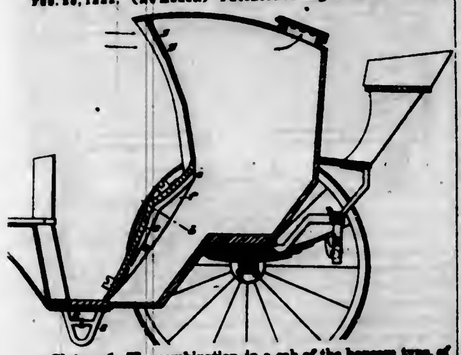
Claim.—1. A bier composed of a rectangular frame, two rolls connected by ropes, and mechanism for rotating said rolls with an axle and supporting-wheels, E, placed under and connected with one end of said frame, substantially as and for the purpose described.

2. The combination of the rectangular frame of a bier, two rolls pivoted thereto, and carrying thimbles and worm-pinions with a transverse shaft carrying right and left hand worms meshing with the pinions on said rolls, substantially as and for the purpose described.



3. The combination, with the frame of a bier, of legs thereto capable of longitudinal adjustment and adapted to be folded against the sides of said frame, substantially as and for the purpose described.

4. The combination of the frame of a bier with legs made in sections and provided with interlocking rocks, flanges, and slots, and a thumb-nut, substantially as and for the purpose described.



5. The combination of the frame of a bier, shafts H, and thimbles having a central recess, *e*, with ropes provided with links *i*, and a rod adapted to pass through said links and under the thimbles, substantially as and for the purposes set forth.

6. The combination of the frame of a bier, provided with longitudinally-adjustable legs, with spirit-levels secured to the rails of said frame, substantially as and for the purpose described.

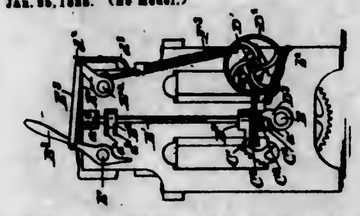
256,472.

256,473. CAB. FREDERICK FORDER, London, England. Filed Feb. 25, 1882. (No model.) Patented in England Nov. 1, 1878.

Claim.—1. The combination, in a cab of the hansom type, of a raised pillar, *d*, on each side of the doorway with oblique angle-shaped doors *e*, substantially as and for the purpose described and shown.

2. In a cab of the hansom type, the ventilating arrangements consisting of the openings *g g* and ventilating roof-trap having the apertures *h h*, &c., substantially as described and shown.

3. The combination, in a cab of the hansom type, of a rigid or of a semi-yielding back stay, *l*, and in the latter case with or without spring-blades *n n*, with leather robbins *o o*, connecting the open ends of the back stay with the open back ends, *p p*, of the side springs, substantially as and for the purpose described and shown.



4. In a cab of the hansom type, a runner, *s*, fixed under the foot-board, on each side thereof, and provided with a cross-bar, *t*, to hold the step, substantially as and for the purpose described and shown.

256,474. DEVICE FOR CUTTING BOILER-TUBES. JAMES J. FRANKLIN, Tyler, Tex. Filed Feb. 17, 1882. (Model.)

Claim.—1. The combination of the shell or casing A, having recess B, the heads C D, the right-and-left-hand screw G, having rigid nut C and loose nuts H H, carrying flanged wedges I, and the block L, having cutter N and inclined grooves K, substantially as and for the purpose set forth.

2. The combination, in a tube-cutter, of the shell A, having head D, forming an annular flange of larger diameter than the tubes to be cut, and provided with stem or shank E, the detachable bearing-rings F, the longitudinally-grooved block L, having adjustable cutter N, and mechanism for forcing said block in an outward direction, as set forth.

256,475. CRIMPING-MACHINE. SAMUEL A. GOULD, Chicago, Ill., assignor to Henry B. Polsdorfer, Evansville, Ind. Filed Jan. 25, 1882. (No model.)

Claim.—1. In a crimping-machine, the combination, with the operating-lever B', of the collar B', provided with the jaws a^2 a^3, and the vertical shaft B', adapted to have both a lateral and a vertical movement, substantially as and for the purpose set forth.

2. In a crimping-machine, the combination, with the vertical shaft B', of the collar B', having the integral projection C', the connecting-arm C', the shifting-lever D, provided with the yoke end a^4, and the clutch D', substantially as described.

3. In a crimping-machine, the combination, with the operating-lever B', of the collar B', having the jaws a^2 a^3, the vertical shaft B', the collar B', having the integral projection C', the connecting-arm C', the shifting-lever D, provided with the yoke a^4, and the clutch D', all constructed and arranged to operate as described.

4. In a crimping-machine, the combination, with the vertical shaft B', of the collar C', having the integral projection C', the spring F', the tripping-cam D', and the shaft or roller B, carrying the series of cams C, substantially as described.

5. In a crimping-machine, the combination, with the operating-lever B', of the collar B' of the vertical shaft B', the collar C', having the integral part C', the spring F', the tripping-cam D', and the shaft or roller B, substantially as and for the purpose set forth.

6. In a crimping-machine, the combination, with the shaft or roller B, carrying the series of cams C, of the gear-wheel H', the pinion H, the horizontal shaft I', the clutch D', and the shifting-lever D, substantially as described.

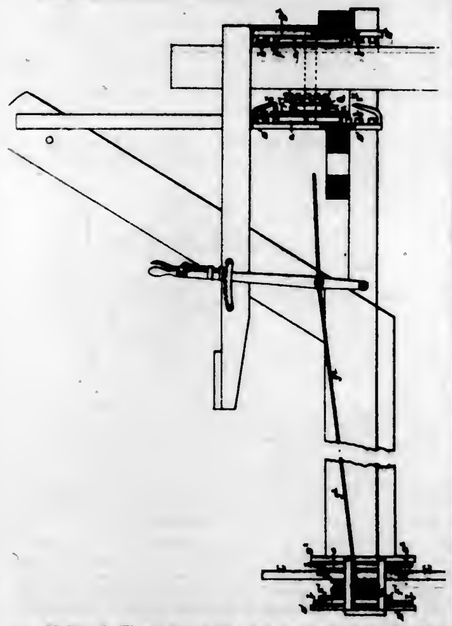
7. In a crimping-machine, the combination, with the operating-lever B', of the connecting-bar b^3, the crank-arm E', the spiral spring F', and the arm A^2 of the rock-shaft F', substantially as and for the purpose set forth.

8. In a crimping-machine, the combination, with the die-plate D', of the cam-rods E F', the crank-arm E', the connecting-bar E', and the operating-lever B', substantially as and for the purpose described.

9. In a crimping-machine, the combination, with the die-plate D', of the eyebolt d', the hook d, and the spring F', as described.

10. The combination, with a crimping-machine, of the rock-shaft F', having one end turned upward at right angles to form the arm A^2, and carrying the downward-projecting arms d^2, substantially as and for the purpose described.

256,476. MANUFACTURE OF ARTICLES FROM PLASTIC MATERIALS. TIMOTHY SULLIVAN, New York, N. Y. Filed Jan. 13, 1882. (No model.)



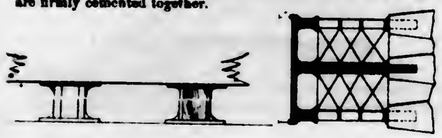
Claim.—1. An article—as a button, for example—the mass of which is formed from ground horn or hoof and the face from a thin film of celluloid or other pyroxyline compound, the two being united

by heat and pressure to form one homogeneous mass, substantially as set forth.

2. An article—as a button, for example—the mass of which is composed of ground horn or hoof and the face of a thin transparent film of celluloid or other pyroxyline compound having a design on its back, and the two being united by heat and pressure to form one homogeneous mass, as set forth.

256,477. HARVESTER-FRAME. PAUL HANSON, Salem, Miss. Filed Sept. 27, 1881. (No model.)

Claim.—1. The combination of the frame, the main axle, the toothed bars connected to said frame, and the scrolls connected to the said axle and engaging with the teeth of said toothed bars, whereby the frame may be raised or lowered by turning the scrolls, substantially as set forth.



2. The combination and arrangement of a bar, D', formed with the teeth b and dovetailed groove throughout its length, a shaft or axle, E, having a shoulder adapted to fit into said dovetail groove, and a disk or similar device, F', encircling said shaft and provided with a scroll-rib, *a*, adapted to fit between said teeth *b*, whereby the revolution of the scroll-rib and disk will raise or lower the toothed bar D', substantially as set forth.

3. The combination of the frame, the main axle, the grain-wheel axle, toothed bars connected to said frame, the scrolls connected to the said axles and engaging with the teeth of said bars, and means for connecting said parts, whereby the frame may be raised or lowered at both sides at the same time while the machine is in motion, substantially as set forth.

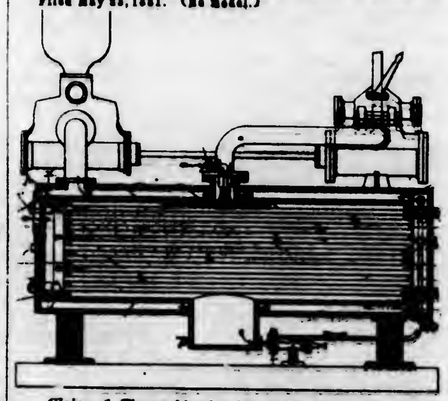
4. The combination of a toothed plate, D' *b*, scroll-ribbed disk F' *a*, mounted upon an axle at right angles to said toothed plate, and an endless chain, whereby said scroll-ribbed disk may be revolved forward and backward to raise and lower the frame, substantially as set forth.

256,478. COLUMN, SHAFT, GIRDER, &c. HENRY J. HARRISON, Liverpool, County of Lancaster, England. Filed Nov. 8, 1881. (No model.) Patented in England Nov. 4, 1881.

Brief.—Into a hollow iron shell is loosely fitted a wooden core, the shell having first been heated to a degree below redness. Melted pitch is then forced into the interstices. When cooled both are firmly cemented together.

Claim.—1. In a column, beam, or other structure substantially such as described, the combination of a metallic body or casing and an internal wooden core secured to the metal throughout its length by a strongly-adhesive cement, and adapted to carry a material portion of the weight or strain to which the structure is subjected.

2. A hollow metallic column, shaft, girder, mast, strut, stay, post, pole, spar, or like structure, in combination with an internal core of wood, firmly cemented to the same by a strongly-adhesive tough pitch or asphalt introduced in the liquid state and setting hard, substantially as described.



3. A hollow metallic column, shaft, girder, strut, stay, post, or like structure provided with an internal core of wood projecting beyond the end of the metal and firmly cemented to the metal, substantially as and for the purpose explained.

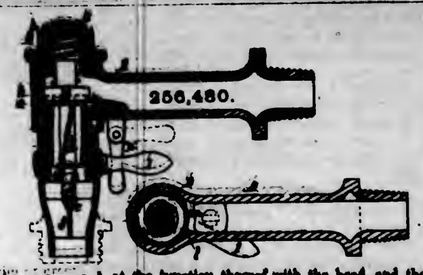
4. A hollow metallic structure substantially such as shown and described, having a wooden core filling its interior and held therein by strongly-adhesive cement and transverse bolts, as set forth.

5. The mode of attaching internal wooden cores securely to hollow metallic structures, consisting in heating the iron structure to a heat barely sufficient to char the wood, and then pouring in melted pitch or asphalt, so as to fill up all the interstices and securely cement the core to the metallic structure.

6. The iron girders filled with wooden planks or beams, breaking joint with each other, and having the interstices filled up with cementing material, substantially as described.

256,479. CONDENSER. WILLIAM D. ROCKER, Oakland, Cal. Filed May 23, 1881. (No model.)

Claim.—1. The combination, in a condenser, of a series of tubes supported at one or both ends in a tube-sheet movable in a stuffing-box inside of the case or shell, the adjusting-screws connected with the gland or follower and extended through the outer head of the condenser, whereby the packing in the stuffing-box may be compressed from the outside of the condenser without removing any of its parts, substantially as described.



2. The combination, in a horizontal tube surface-condenser, of the steam and cold spray inlets leading through the outlet water-space into the tube-spaces, the hot-well located below the said inlets, the air-pump, the pipe leading from this pump to the boiler, the branch pipe leading to the cold-water spaces of the condenser, and the cocks applied to said pipes, substantially as described.

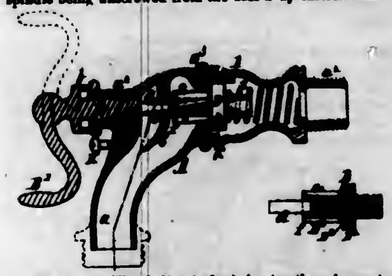
256,480. FAUCET. JOHN HOWES, Worcester, Mass. Filed Nov. 10, 1881. (No model.)

Brief.—The projection *l* is located at the junction of the neck and head within the shell, and its purpose is to produce a whirl or spiral action within the head to prevent vibration of the valves.

Claim.—1. The combination, substantially as hereinbefore described, of the body or shell A, having the externally-screw-threaded projection *a'* and valve-seat *a*, formed as shown, the independent valve-piece D, provided with the depending stem *d*, supported and guided within the part *a'* of said shell, and the screw-threaded thimble or nozzle B, having the bridge bar or plate *e* across its interior below the end of the valve-stem, the parts being constructed and adapted for operation as and for the purposes set forth.

2. The combination, as hereinbefore described, of the body A, having the screw-threaded extension *a'*, provided with an offset

Rim or groove, *b*, at the junction thereof with the head, and the screw-threaded valve-operating thimble B, having its top end fitted to and adapted for making a close joint at said offset or groove when in its elevated position, as and for the purpose set forth.



2. The shell A, provided with the deflecting leg or flange *m*, located within the neck-passage adjacent to the valve-seat *a*, whereby the current of water is deflected upward, as and for the purpose set forth.

3. In a water-service faucet, the combination, with the shell A and valve D, having interlocking lugs and grooves *h*, for preventing rotation of said valve, of an inclined projection, *l*, or deflector, whereby a whirl or spiral action is imparted to the water in contact with said valve, substantially as and for the purpose set forth.

5. The combination, with the rotating screw-threaded thimble B, provided with the handle I, of the hinged stop-pin K, fixed in the under part of the shell A, substantially as and for the purpose set forth.

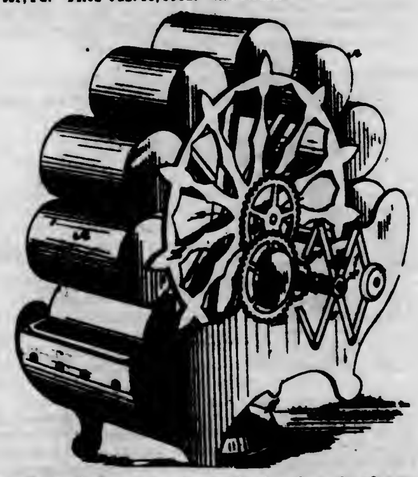
256,481. FAUCET. JOHN HOWES, Worcester, Mass. Filed Nov. 10, 1881. (No model.)

Brief.—A apron C serves to break the force of and deflect the stream of water so that it will not impinge against the end of the spindle B and adjacent surface. The valve is formed of several parts, the rim or disk *f* around the stem turning the water away from the spindle-opening. The spline I engages a slot in the valve-head and prevents rotative movement of the valve. The curved ribs *e* give a rotative stream as the water passes, thus forming the side of the groove against the spline I and preventing vibration and rattling of the parts by the action of the water. Stop-screw K arrests the movements of the crank E' and prevents the spindle being unscrewed from the boss *d'* by carelessness.

Claim.—1. The shell or body A, having the valve-seat, curved rib, and spindle-boss located as shown, and provided with the deflecting-apron C, cast integral with said shell and extending laterally across the interior with its lower edge directed toward the channel of the rib, as shown and described.

2. The combination, with the shell A, having the valve-seat E, screw-threaded boss *a'*, and rib *a*, and provided with the deflecting apron C, arranged as shown, of the valve D, having a series of ribs fitted to and guided in the opening of the valve-seat, the stem *d*, passing through and guided by said apron, and the screw-threaded spindle B, with the head or cap *h*, and crank-handle E', as and for the purposes set forth.

3. The valve constructed of the recessed head-piece D', the center or hub D', with ribs or flanges *e* and end disks, *f g*, the packing-ring D', and the screw-threaded stem *d*, all combined, adjusted, and secured together in the manner shown and described.



4. The combination, with the valve-seat E and valve D, provided with interlocking lugs and grooves or means for preventing rotation of the valve upon its seat, of the shank or hub D', having a series of curved or spirally-twisted ribs, *e*, substantially as and for the purpose set forth.

5. The combination, with the valve D, provided with the guiding and supporting stem *d*, passing through the apron C, of the hub D', provided with the rim-flange *f*, as shown, and for the purpose set forth.

6. In combination with the shell A, having the lug *i* and projecting bars *a'*, the valve-operating spindle or screw B, having a cap-ferrule, *h*, fitting onto the end of said bars, as and for the purpose set forth.

7. The combination, with the shell A and screw-spindle B, of the stop K, adapted for engaging a lug on the spindle cap or head and arresting outward action of said spindle at a given position, while permitting inward action thereof to the full limit of said screw, substantially as set forth.

256,482. MOTOR. ANTHONY ISEN and ALBERT ISEN, Lancaster, Pa. Filed Jan. 18, 1882. (No model.)

Claim.—1. In a motor, the combination of a series of receptacles for volatile liquid with tubes connecting them diametrically in pairs, and vertical wheels or frames, which support the ends of said receptacles and turn with them.

2. A series of receptacles for volatile liquid, in combination with wheels or frames which turn with said receptacles, and radially-adjustable brackets or supports connecting said receptacles to said frames, for the purposes set forth.

3. In a motor, the combination of a series of receptacles for volatile liquid with tubes connecting them diametrically in pairs, vertical wheels or frames which have gudgeons formed in their outer faces, and bearings which support said gudgeons, substantially as set forth.

4. In a motor, the combination of a series of receptacles for volatile liquid and tubes connecting them in pairs with vertical wheels or frames and brackets, whereby the ends of said receptacles are attached to said frames in order to turn therewith, substantially as set forth.

5. The connecting-tubes attached at different points to their respective cylinders along the length thereof, in combination with said cylinders or receptacles and their supporting-frames.

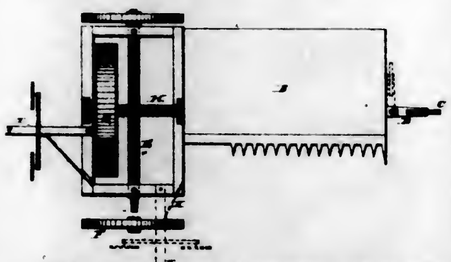
6. The combination of the cylinders A and tubes B with brackets C and frames E, each bracket being provided with a ledge to receive one end of a cylinder, and made radially adjustable by screw-and-slot connection with its frame.

7. In combination with tubes and supporting-frames E, independent of said tubes, a series of cylinders or receptacles arranged at intervals, so that they will not conduct heat to one another.

8. In combination with receptacles for volatile liquid, connected by tubes in pairs, a tank of warm water, in which the receptacles forming each pair dip alternately, and an exterior jacket, which directs the warm air from a lamp or other caloric device around the sides and the ends of said tank.

9. In combination with receptacles for volatile liquid, connected by tubes in pairs, a tank of warm water, in which the receptacles forming each pair dip alternately, and an exterior jacket or casing, which directs the warm air from a lamp or other caloric device around the sides and the ends of said tank, said jacket or casing having in one end a door or movable part that opens for the convenient withdrawal of said tank.

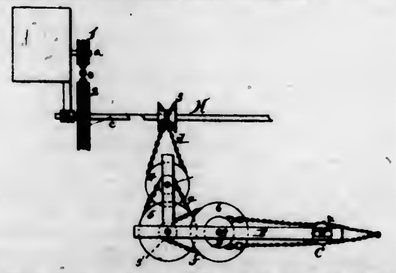
256,483. CIGARETTE. SIGMUND JACOBY, New York, N. Y. Filed Jan. 21, 1882. (No model.)



Claim.—1. In a cigarette having a mouth-piece, B, which carries a trade name or mark, the combination thereof with the transparent, or partly transparent, wrapper A, which is carried over the mouth-piece to cover the trade name or mark, substantially as described.

2. In a cigarette, the wrapper A, folded over the butt-end, and formed to produce a groove or depression, *b*, in combination with the igniting appendage *c*, which is anchored in said groove or depression, substantially as specified.

3. In a cigarette, the wrapper A, twisted at the butt-end to form a projecting teat, *a*, which is laid flat on the end of the cigarette and surrounded by a groove, *b*, to produce a proper anchor for the igniting appendage *c*, substantially as described.

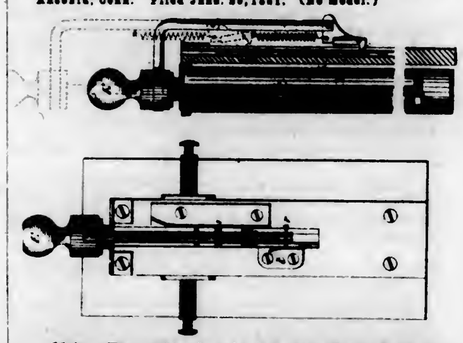


256,484. HARVESTER. THOMAS A. JOSSE, Fairbury, Ill., assignor to Samuel M. Barnes, same place. Filed Dec. 6, 1881. (No model.)

Claim.—1. In a harvester, the combination, with the frame having a vertically-moving axle secured thereto, the said axle being provided with a ground-wheel, of spindles secured to the said frame and adapted to receive removable wheels, and a draft-tongue adapted to be removably secured to the sides or end of said rectangular frame, substantially as set forth.

2. In a harvester, the combination, with the frame thereof, having a caster-wheel secured to its outer end, of a vertically-movable axle having a ground-wheel secured thereto, means for securing two removable wheels to the said frame at right angles to the said ground-wheel, and a removable draft-tongue adapted to be secured to the sides or end of the rectangular frame, substantially as set forth.

256,485. RAILWAY-CAR BRAKE. CHAUNCEY E. KENDALL, Buffalo, N. Y. Filed Mar. 2, 1882. (No model.)



Claim.—1. In combination with a motor, the grooved pulleys 1 and 2, shafts *a* and *c*, and endless chain *b*, arranged under the engine, for transmitting movement to brake-shaft H, and the pulleys 3 4 5 6, arranged under a car, with endless chains thereon, for transmitting motion from the brake-shaft to pulleys B, D, and C in frame E, and to brakes, all arranged and operating substantially as and for the purpose specified.

2. In combination with any suitable devices for transmitting motion from the angling brake-shaft H to grooved pulley 6, and in combination therewith, the chain-wheel or pulley B, moving with pulley 6, having the risers *b b* in its grooves, also the loose wheel D, running on its hub A, which forms part of pulley B, also the grooved wheel C on an axle running in the oblong slots *a a* in frame E, said pulleys C also running in saddle *m*, with a spring, *c*, in connection therewith, and with the endless chain G, all arranged and operating substantially as and for the purpose specified.

3. In combination with the pulley B, having its loose wheel D, pulley C in spring-saddle *m* and running in oblong slots *a a*, the endless chain G, one section or part composed of large links G′ and the remainder of smaller links, as and for the purpose specified.

4. In combination with the frame E, the saddle *m m′*, with the grooved pulley C running therein, its axle running in ends of said saddle and also in oblong bearings *a a* in frame E, and the spring *c*, operating in connection with said saddle, chain G G′, and pulley B D, all arranged and operating substantially as and for the purpose specified.

256,486. ELECTRIC SIGNAL-TRANSMITTER. JOHN KING, Ansonia, Conn. Filed June 20, 1881. (No model.)

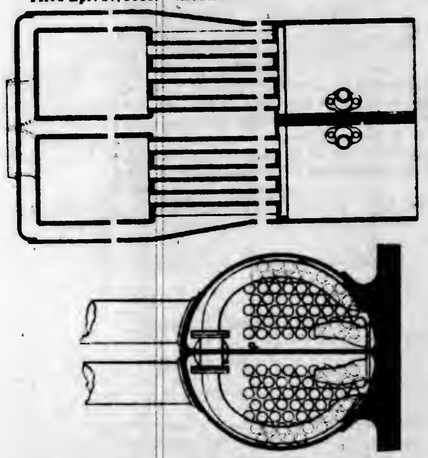
Claim.—The combination of a dash-pot and the plunger arranged therein for slow descent, an arm extending from the plunger, the finger hinged at one end of said arm and so as to move in a path parallel with the plunger, a plate parallel with said arm, to which the wires to be connected are brought, the points of connection arranged in the path of the descending armature, and device, substantially such as described, to turn the armature out of the path of said points as the armature ascends and to bring it into a path to connect said points as the armature descends, substantially as described.

256,487. CORN-PLANTER. WILLIAM E. KNECHEL and FRITZ ERICSS, Springfield, Ill. Filed Jan. 16, 1882. (No model.)

Brief.—A rod or bar having end projections is pivoted in an upright position within the feed-spout, and is operated by a peculiar shaped wheel which, by forcing the rod from side to side, causes an intermittent discharge of the seed.

Claim.—1. In a corn-planter, the rod K, provided with the star-wheel J and the cog-wheel L, in combination with the knotted cord I and the revolving drop C, all the parts constructed and arranged substantially as set forth.

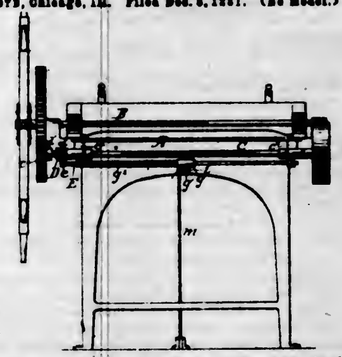
2. In a corn-planter, the rod K, provided with the star-wheel J, the cog-wheel L, and the wheel M, in combination with the knotted cord I, the revolving drop C, the rod E, and spout D, substantially as set forth.



256,488. NAIL FOR WIRE FENCES. SUMNER LEONARD, Plymouth, Mass., assignor to himself, Abner Leonard, and William F. Stoddard, all of same place. Filed Jan. 23, 1882. (No model.)

Claim.—1. The hooked wire constructed with the angular recess *a* arranged in its upper end, substantially as set forth.

2. The hooked nail made not only with a wedge-shaped point, *b*, at its lower end, but with an angular recess, *a*, arranged in its upper end, as set forth.



256,489. STEAM-BOILER. JAMES LOSE, Wyandotte, Kans. Filed Apr. 27, 1881. (Model.)

Claim.—1. A locomotive-boiler divided into two divisions longitudinally by a vertical partition, each of said divisions being capable of performing the service of an independent boiler, and both having a common shell, in the manner shown and described.

2. The combination, in a locomotive-boiler, of the divided fire-box, the divided smoke-box, and the independent exhaust-nozzles and smoke-stacks, so arranged that each may be used alternately or separately, substantially as shown and described.

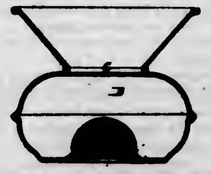
256,490. STEREOTYPE-SHAVING MACHINE. GEORGE E. LLOYD, Chicago, Ill. Filed Dec. 8, 1881. (No model.)

Claim.—1. The combination, in a stereotype-shaving machine, of the foot-treadle G, connecting-rod *m*, and rock-shaft *l* with the reciprocating rod E, fork *e*, and clutch D, substantially as and for the purpose described.

2. The combination, in a stereotype-shaving machine, with the expansion-spring *g′*, of the reciprocating rod E and clutch D, for the purpose hereinbefore specified.

3. A device for transmitting steam-power to perform the cutting movement of a stereotype-shaving machine, consisting of a pulley on the end of the drive-shaft, near the other end of which is a clutch engaging with its counterpart box on the contiguous side of a pinion which transmits its intermittent motion to a gear-wheel on the end of the hand-lever shaft, said clutch being forced into gear through the medium of a foot-lever and being returned to its original position by the expansion-spring on the reciprocating shaft, substantially as and for the purpose hereinbefore described and set forth.

256,491. BARREL. JOHN J. LEOK, Ripon, Wis. Filed Aug. 29, 1881. (No model.)



Claim.—1. In that class of barrels which are adapted to be taken apart for shipping, the combination, in a single series, of two or more staves, retaining-bands secured to the exterior of said series, and a series of staples looped over said retaining-bands and permanently secured to the exterior surface of the staves, all adapted to retain said staves in their proper relative position to each other, substantially as and for the purpose set forth.

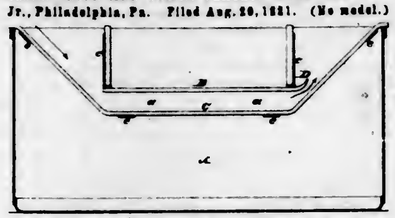
2. The combination of two or more series of staves, the staves of each series being connected together by separate retaining-bands attached with staples to the exterior surface of said series, elastic packing *g* between the edges of the respective sections, heads K and hoops F, and end fastenings for the retaining-bands, substantially as and for the purpose specified.

3. In barrels the staves of which are connected together in two or more sections, the retaining-bands O O, each provided with knobs *s* at one end and means for securing the other end, grooves E E, formed in the exterior surface of the stave for the reception of the retaining-bands C, and staples D, for retaining said band in said groove, substantially as and for the purpose set forth.

4. In barrels formed in detachable sections, the combination of sections B B, provided with shoulders H, said sections being formed of staves retained in contact by external retaining-bands secured in grooves by staples and end fastenings, heads K, chine-hoops I I, screw J, and detachable hoops F, all substantially as and for the purpose set forth.

256,492. CUSPIDOR. WILLIAM F. HALLEY, Cleveland, Ohio. Filed Feb. 25, 1882. (No model.)

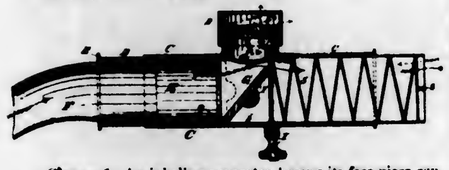
Claim.—1. In cuspidors, an improvement consisting of the interior curved or conical-shaped projection, F, in line with the area of the opening G, and a counter-weight secured within said projection in the manner substantially as described.



2. In cuspidors, a curved or conical-shaped projection extending up from the bottom thereof toward and in line with the opening above into the interior, substantially as described, and for the purpose set forth.

256,493. SAW-HANDLE CLAMP. WILLIAM MCMINN, Philadelphia, Pa. Filed Jan. 27, 1882. (No model.)

Claim.—A plate with a fixed screw at one end and opening at the other end, in combination with a plate having openings at opposite ends, and a loose screw, forming an improvement in saw-handle clamps, substantially as and for the purpose set forth.



256,494. APPARATUS FOR GALVANIZING AND COATING SHEET-IRON AND OTHER PLATES. JAMES MULHOLLAND, Jr., Philadelphia, Pa. Filed Aug. 20, 1881. (No model.)

Claim.—1. The pot A, in combination with the rack C, of depressed form and constructed as described, and the rack B, constructed as described, sustained within the rack C, above the same, the rack B being suspended from its sides and the rack C being suspended from its ends, the horizontal way *a* existing between the two racks, substantially as and for the purpose set forth.

2. The pot A, in combination with the top rack, B, and the lower rack, C, of depressed form, the two racks being constructed as described and detachably suspended, as stated, the rack B having projecting guards D, substantially as and for the purpose set forth.

256,495. INHALER. JOHN H. NELSON, North East, Pa. Filed [illegible] (No model.)

Claim.—1. An inhaling apparatus having its face-piece connected to a tube provided with a contained valve operated by a movable sleeve, which is adapted to slide upon the tube when the face-piece is pressed against the face, substantially in the manner set forth.

2. The combination, substantially as shown, with the face-piece of an inhaling apparatus, of the tube B, sleeve C, spring S, and valve G, arranged in substantially the relations and for the purposes mentioned.

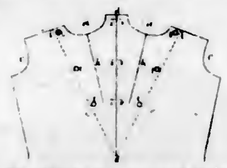
3. The combination, with the face-piece of an inhaling apparatus, of the tube B, spring S, and valve G, with the sleeve C, having thereon the exhalation-valve H and a bearing for the spring S, substantially as and for the purposes mentioned.

4. The combination, with the face-piece of an inhaling apparatus, of the tubes B and E, the valve G, bar or bridge I, spring S, and sleeve C, substantially as and for the purposes mentioned.

256,496. COFFIN. CHRISTOPHER H. OLSON, Decatur, Ill. Filed Jan. 25, 1882. (Model.)

Claim.—The combination of the lid furnished upon its under side with hooks with the glass frame furnished with corresponding loops, by which the two may be connected at will, as set forth.

256,497. WARDROBE-BEDSTEAD. ERNEST OATLEFF, New York, N. Y. Filed Jan. 11, 1882. (No model.)

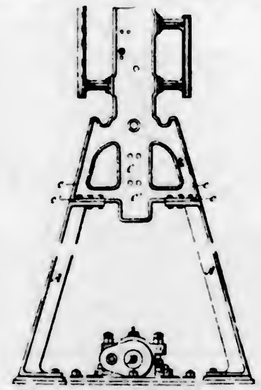


Claim.—1. The combination, with the stationary frame and swinging bottom of a folding bedstead, of an independent weight or weights suspended from the stationary frame in position to be engaged and lifted by the inner end of the swinging bottom when dropped to its horizontal position, so as to counterbalance the same, substantially in the manner and for the purpose herein set forth.

2. The combination, with the foot-piece M, hinged to the outer end of the swinging bed-bottom A E, of an arm, P, fixed to the stationary head-board or frame of the bedstead to project therefrom inside of the side pieces C C of the bed, and of a concealed connecting link or rod, N, carried inside of the frame and pivoted to the foot piece above its hinge, substantially in the manner and for the purpose herein set forth.

3. The combination, with the under side of the swinging bed-bottom A A, and with a panel, Q, fitted within an opening in the bottom, of hooks *r r* upon the edge of the panel, adapted to engage a rod fitted across the opening and form a detachable pivoted joint, permitting the panel to swing in the opening and be readily removed therefrom, substantially in the manner and for the purpose herein set forth.

4. The combination, with the stationary frame of a folding bedstead, and with fixed side pieces *a a* upon the swinging frame A A thereof, of detachable side pieces *b b*, secured by dowel-pins *s* and a tongue-and-groove joint, *t*, substantially in the manner and for the purpose herein set forth.

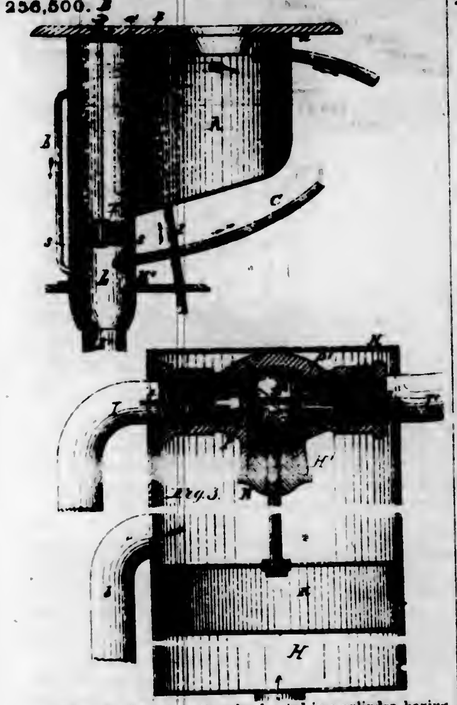


256,498. SHIRT. ALBERT R. PERKINS, Newton, assignor to Simons, Raich & Whitton, Boston, Mass. Filed Feb. 27, 1882. (No model.)

Claim.—1. The shirt-front in one piece of cloth, having at its middle and to extend down from its upper edge the slit *d e*, and also having in its upper part the two neck-notches *a a*, arranged with such slit and the shoulder-slopes, substantially as set forth.

2. The shirt-front in one piece of cloth, having the slits *d e*, *e g*, and *e f* and the two neck-notches *a a* arranged in it, (the said front,) substantially as described and represented.

256,499. FRAME FOR GANG-SAW MILLS. DE WITT C. PRESCOTT, Marinette, Wis. Filed Feb. 19, 1881. (No model.)



Claim.—1. The lower or supporting frame composed of two independent sections, A A, arranged transversely to the line of cut and inclined toward each other, in combination with the upper or saw frame, C, the side pieces of which, at their lower ends, rest on the lower frame and extend from one section to the other of the latter, and are secured thereto, thereby uniting the said sections of the lower frame, substantially as described.

2. The independent sections A A of the lower or supporting frame, tapering from the bottom upward, and arranged transversely to the line of cut, inclining inward toward each other, in combination with the independent saw-frame C, the side pieces, c of which are seated on the upper ends of the sections A and extend across from one to the other, being secured to each, substantially as and for the purposes set forth.

256,500. WATER-CLOSET. ROBERT REACH, Washington, D. C., assignor of one-half to Charles G. Sweet and Judith Sweet, both of same place. Filed Nov. 23, 1881. (No model.

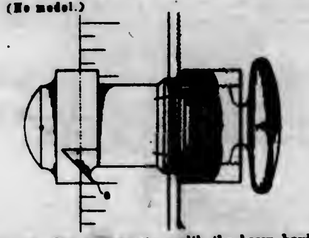
Brief.—Water is kept in the bowl to the height *y y* and by means of pipe *h* to a level in cylinder H sufficient to close induction-valve F on float K. When the water is let out of the bowl and cylinder the float falls and the valve opens. When plunger T is closed the water rises in the bowl and cylinder to the required height and closes the induction-port. Pipe *h* prevents an overflow. C and W are ventilating-pipes.

256,500.

Claim.—1. An automatic valve located in a cylinder, having inlet and outlet water-pipes I and I', shoulders I' and I'', and flange *p*, and operated by piston K, in connection with piston F, by opening and closing the opening *e''*, substantially as shown, and for the purpose described.

2. The combination of cylinders H and H', metallic stopper and piston-guide N, shoulders I' and I'', flange *p*, and pistons F and K, substantially as shown, and for the purpose described.

3. The combination of the pipes S' and S'', flange *p*, shoulders I' and I'', cylinders H and H', metallic stopper and piston-guide N, and pistons F and K, substantially as shown, and for the purpose described.

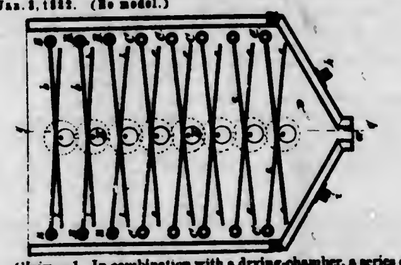


256,501. CLAMP FOR HOLDING THE TIPS OF BILLIARD-CUES. JOHN RECKTENWALT, Buffalo, N. Y., assignor of one-half to John Kreitner, same place. Filed Jan. 30, 1882. (No model.)

Claim.—1. As an improved article of manufacture, a clamp for retaining the tips of billiard-cues in position, said clamp consisting essentially of a socket, C, having the clamping-screw J J' and plate I, the connecting part B and bifurcated yoke D, provided with an adjustable nut, E, having the clamping-screw G G' and disk H, the whole being constructed and combined substantially in the manner as and for the use and purpose specified.

2. In billiard-cue clamps, the combination, with the body B, having the socket C, provided with a vertical aperture, A'', and transverse aperture K, and its upper end bifurcated at D, of the sliding nut E, with the adjusting-screw G G' and swiveled disk H, and the adjusting-screw J J', having a swiveling clamping-plate I, operating in said transverse opening K, the whole being constructed and arranged for operation substantially as and for the purpose stated.

256,502. SCALE. WILLIAM W. REYNOLDS, Rutland, Vt., assignor to the Howe Scale Company, same place. Filed Dec. 6, 1881. (No model.)

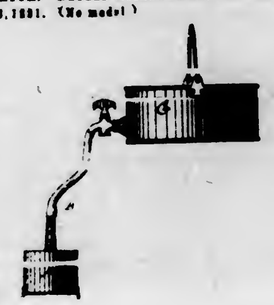


Claim.—1. The combination, with the beam having serrations, of the counterpoise provided with the set-screw having upon its abutting end one or more annular projections or teeth arranged to register with or take into said serrations, substantially as described.

2. The combination of the beam having the serrations and the counterpoise cut away, as shown, so as to make the index-point prominent, and provided with a set-screw having upon its abutting end the annular projections or teeth arranged to register with or take into said serrations, substantially as described.

3. A platform-scale of the kind described, provided with a table, as S, extending on all sides of the column *p*, and with a brace, as *b*, which extends from the deck of the scale to the column *p*, and thence to the under side of the table, thus holding the table firmly in position and supporting the column, substantially as described.

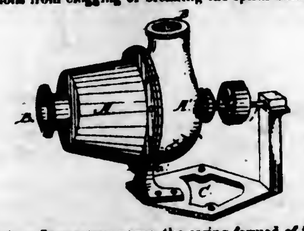
256,503. DRIER. GEORGE P. RUNYON, Chicago, Ill. Filed Jan. 3, 1882. (No model.)



Claim.—1. In combination with a drying-chamber, a series of rocking shafts provided with arms, arranged substantially as described, whereby the material to be dried will by the movement of the shafts and arms be agitated and fed, substantially as specified.

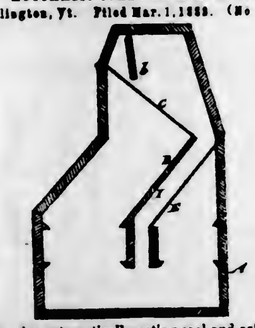
2. In combination with a drying-chamber, a series of rocking hollow shafts, C, provided with tubes or arms *c*, arranged substantially as described, and connecting-tubes *d e*, for the purpose of permitting a circulation of steam through the tubes and agitating the material while being dried, substantially as specified.

3. In combination with a drying-chamber, a series of shafts provided with arms, arranged substantially as described, and shafts E, for the purpose of agitating the material being dried and permitting it to fall from the arms by the movement of such arms, substantially as set forth.



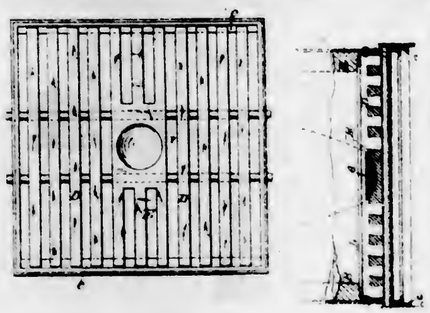
256,504. PERCOLATOR. NATHAN ROSENWASSER, Cleveland, Ohio. Filed May 3, 1881. (No model.)

Claim.—The combination, with a vessel, G, and adjustable tube F, of a percolator, A, having a large filling and discharge orifice at its lower end and a restricted opening, E, at its upper end, with which connects the lower end of the adjustable tube or pipe F, substantially as set forth.



256,505. ROTARY PUMP. DAVID KUSS, Hot Springs, Ark. Filed Dec. 8, 1881. (No model.)

Brief.—The supply end A is tapering and accommodates a tapering spiral blade. The discharge end is enlarged to prevent obstructions from clogging or breaking the spiral blade.



Claim.—In a rotary pump, the casing formed of the two sections A A', the front portion, A, of which is of a tapering shape, adapted to receive the spiral blade F, of a corresponding shape, and the rear portion, A', of an enlarged diameter, said sections A A' being provided with the supply and discharge openings B B', respectively, substantially as and for the purpose specified.

256,506. AUTOMATIC COAL AND ASH SIFTER. JOSEPH H. ROY, Burlington, Vt. Filed Mar. 1, 1882. (No model.)

Claim.—An automatically-acting coal and ash sifter combining in its construction a suitable case, A, for containing the screens and partitions, a swinging ash-guard, b, a wire-gauze screen, C, a solid partition, D, extending across the interior of the case, a supplemental wire-gauze screen, E, a chute, I, and receptacles G, H, and F, the parts being constructed and arranged substantially as shown and described, whereby they are caused to divide the substance treated into three separate and distinct grades of different sizes and values and to receive them in different receptacles, from which they can be readily moved, as set forth.

256,507. GRATE-BAR FOR CRUCIBLE-FURNACES. MICHAEL SCHERBERY and JOSEPH PEREIS, Chicago, Ill. Filed Mar. 16, 1881. (No model.)

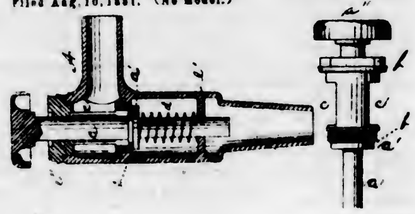
Claim.—In a crucible-furnace, the grate-bars D, the central ones being cast together solid at their center and hollowed out on their upper face, and the block c, of refractory material, adapted to rest within the recessed grate-bars and receive the bottom of the crucible, substantially as and for the purpose set forth.

256,508. GAS-GOVERNOR FOR VULCANIZERS. THOMAS SHAW, Philadelphia, Pa. Filed Feb. 9, 1882. (No model.)

Claim.—1. In a governor for vulcanizers, a tube supplying the liquid fuel or gas to the vulcanizer, and means for closing the same by the ascent of a mercury column, in combination with a casing containing a chamber communicating with the mercury column and a chamber communicating with the vulcanizer, and devices, substantially as described, whereby the mercury-chamber can be contracted or expanded to set the mercury column at any desired height prior to the admission of steam, as specified.

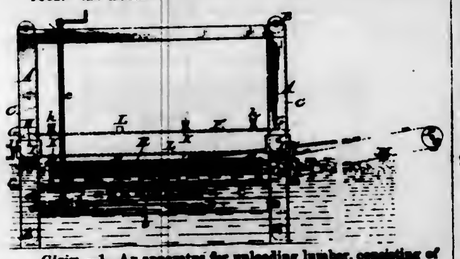
2. The combination, in a governor for vulcanizers, of the casing r, standard containing a mercury-channel communicating with the casing, plunger c, set-screw d, spring interposed between the screw and the plunger, and branch having a channel forming a communication between the vulcanizer and the chamber below the plunger, all substantially as specified.

3. The within-described improvement in tubes for the mercury columns of gages, the same consisting of a plate or standard having a groove or channel and a glass plate covering the said groove, as set forth.



4. The combination, with a regulator for vulcanizers, of a branch having a capillary opening or channel constituting the communication between the vulcanizer and the regulator, as set forth.

256,509. VIGNETTING ATTACHMENT FOR PHOTOGRAPHIC-PRINTING FRAMES. JOHN F. SISSEL, Rockland, Me. Filed Apr. 12, 1881. (No model.)



Claim.—In a printing and vignetting frame, the combination of the frame A with the slides B and C, the wedges D, and the straps or elastic bands r, substantially as and for the purpose set forth.

256,510. WATER-FAUCET. JOHN STEPHENSON, Haverhill, Mass., assignor of one-half to John H. Pollowe, same place. Filed Aug. 10, 1881. (No model.)

Claim.—In a faucet for drawing liquids, the seat-piece b, fitted within the case A, as shown, having openings c c, and arranged to form a seat for the valve a', a journal for the valve-stem a, and a cap for the case A, and operating in combination with the stem a, spring d, and case A, substantially as shown, and for the purpose specified.

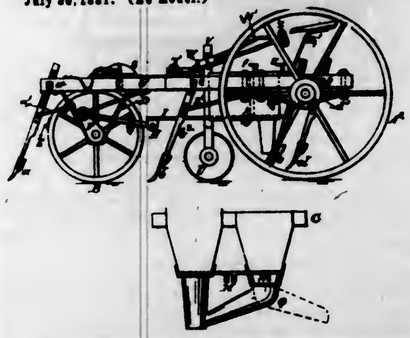
256,511. APPARATUS FOR DRAWING LUMBER FROM THE CRIB. JAMES W. STILLWELL, Hannibal, Mo. Filed Mar. 2, 1882. (No model.)

Claim.—1. An apparatus for unloading lumber, consisting of a vertically-adjustable turn-table platted in the water in which the lumber is floated, and a carrier located above the turn-table and adapted and arranged to remove the boards therefrom, as explained.

2. In combination with the turn-table E, the endless carrier F, provided with slats L and brushes A, as and for the purpose set forth.

3. In combination with the carrier F, a turn-table, E, and bed or platform D, and chains or bands C, connected with the platform and adapted to elevate or lower the turn-table, as explained.

4. In combination with the turn-table E, the vertically-adjustable carrier F, as and for the purpose set forth.



5. A lumber feeding or carrying device provided with brushes A and cross-slats L, substantially as and for the purpose set forth.

6. In combination with the frame A and vertically-adjustable turn-table E, the carrier F and adjustable supporting-blocks I, provided with set-screws J, as shown.

7. In combination with the vertically-adjustable turn-table having rack c, the pinion d, carried by a sliding shaft, e, as set forth.

8. In combination with turn-table E and carrier G, the endless carrier M, arranged and operating as shown and described.

256,512. CORN-PLANTER. WILLIAM H. SWARTOUT, Salineville, Ohio, assignor to George H. Saltzman, same place. Filed July 26, 1881. (No model.)

Claim.—1. The combination, with the frame C and the standard of the wheel U, rotating in its bearings, and adjustable vertically, of the slotted plate X and the lever W, pivoted to the upper end of the standard of the wheel U, and having one of its ends fitting loosely and sliding laterally and longitudinally in the slot in plate X and its other end under the control of the driver, substantially as set forth.

2. In a corn-planter having a grain-box and a fertilizer-box, the combination, with the fertilizer-box, of a discharge-spout bent laterally and extended to and adjustable to the front or rear of the discharge-spout of the grain-box, to discharge the fertilizer into the same furrow into which the grain is dropped, substantially as set forth.

256,513. CLOTHES-HORSE. HENRY H. SWART, Winchester, Conn. Filed Feb. 4, 1881. (No model.)

Claim.—A standard, A, and house B combined, the post extending through the house and forming a vertical shaft, whereon, are secured independently by means of pins b two or more coiled-spring reels, E, substantially as described.

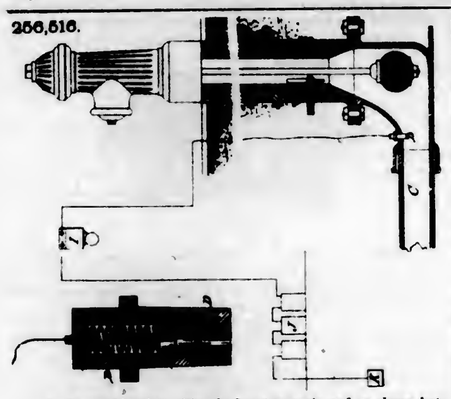
256,514. SADDLE-TREE. NOBLE TRAE, Newark, N. J. Filed Nov. 28, 1881. (No model.)

Claim.—1. In a harness-saddle, the combination of a tree provided with a cantle bridge, and having the blocks G and H, or either of them, formed upon the lower side of the arch, as described, with a flap secured to the jockey, as set forth, and butted against the shoulders formed by the said blocks, substantially as and for the purpose set forth.

2. The fastening for the stiffener J, consisting of the lugs e, cast upon the lower ends of the tree and adapted to be clinched upon the stiffener, substantially as and for the purpose set forth.

3. The combination, in a casting for a leather-covered seat, of the ribs g, with the lower side of the cantle, substantially as and for the purpose set forth.

256,515. STEAM-ACTUATED VALVE. HUGH H. THOMAS, Duke Centre, Pa., assignor of one-fifth to Alvin H. Low, same place. Filed Mar. 8, 1881. (No model.)

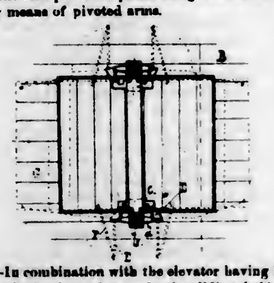


Claim.—In a single-acting steam-pump or high-pressure engine having a single piston, the direct steam-ports b b' of the steam-actuated valve, so arranged as to each serve alternately as an induction-port to the valve-plunger at one part of the stroke and as an eduction-port at another part of the stroke, substantially as described, and for the purposes specified.

256,516. ELECTRIC ALARM FOR HYDRANTS AND WATER-MAINS. VEDRIC THOMPSON, Cutchogue, assignor of one-half to A. Sidney Boone and Thomas H. Rhodes, both of Brooklyn, N. Y. Filed Nov. 4, 1881. (No model.)

Claim.—1. As an electric alarm attachment for hydrants and water-mains to indicate freezing therein, the plug, case, or envelope D, hollow and water-tight, and provided with a movable circuit-closer, whereby the expansion of the water in freezing will close the circuit, but will not clog the closer, as set forth.

2. In combination with a hydrant or main and an alarm, battery, and their wires, a plug, case, or envelope, D, hollow and water-tight, and provided with a movable circuit-closer, whereby the expansion of the water in freezing will close the circuit and give the alarm, as set forth.



256,516.

3. In combination with a hydrant or main and an alarm, battery, and their wires, the plug D, hollow and water-tight, and provided with the piston E, whereby the expansion of the water in freezing will close the circuit and give the alarm, all as set forth and described.

256,517. ELEVATOR. STEPHEN H. THORNTON, Baltimore, Md. Filed Oct. 10, 1881. (No model.)

Brief.—Lugs on the elevator engage pivoted plates with volute ends on the side posts, the plates being connected with sliding half-doors by means of pivoted arms.

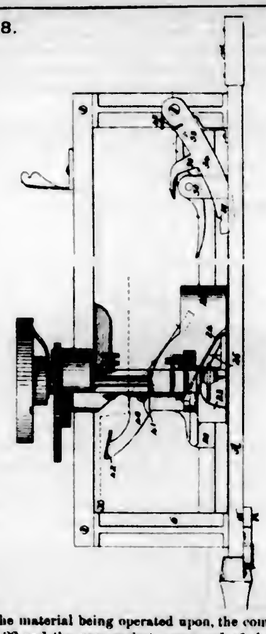
Claim.—In combination with the elevator having lugs C, the pivoted plates D, having volute ends, the sliding half-hatches G, and arms E F, as set forth.

256,518. MACHINE FOR SEWING UP MOUTHS OF BAGS. ORVILLE E. VAN VECHTEN, Brooklyn, N. Y. Filed Dec. 21, 1881. (No model.)

Brief.—Improvement on Letters Patent No. 246,644, dated September 6, 1881, and consists in the clamping-frame, thread-severing device, bed-plate, and presser-foot used in connection with a traveling sewing-machine, as specified in the claims.

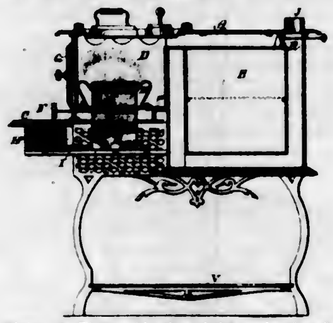
Claim.—1. The clamping-frame composed of the two members, as A B, hinged together, and provided with intermeshing serrated edges, in combination with a traveling sewing-machine, substantially as described.

2. The combination of the clamping-frame composed of the two members, as A B, hinged together, the segment-bar, as 17, fast to one of the members and extending through a bearing in the other, and a traveling sewing-machine, substantially as described.



3. The clamping-frame composed of the two members, as A B, having intermeshing serrated edges, and provided with the segment-bar 17, and the spring-catch and lug 15, in combination with the traveling sewing-machine, all substantially as described.

4. The combination of the clamping-frame, the traveling sewing-machine carrying the actuating-lever, as 40, the thread-carrier, as 34, arranged to be actuated by said lever, and the pivoted shear-blade arranged to be operated by the thread-carrier, substantially as described.



5. The combination, with a work-holding device acting to sustain the work stationary, of a sewing-machine constructed to travel bodily with respect to the work-holding device, and having the bed-plate, as 22, and the hinged spring-seated presser-foot, between which the seam-line of the material to be sewed passes, all substantially as described.

6. In a sewing-machine constructed to travel bodily with respect to the material being operated upon, the combination of the bed-plate 22 and the presser-foot, composed of the curved plates 23 24, the hinged bar 25, and the spring 28, substantially as described.

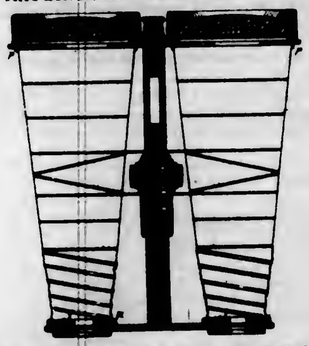
256,518.

256,519. OIL-STOVE. ADOLPH VELGUTH, Milwaukee, Wis. Filed Nov. 28, 1881. (No model.)

Claim.—1. The combination of the combustion-chamber D, having bottom P, provided with air passages or openings Q, burners E, wick-tubes N, reservoirs M, tubes I, and reservoir H, substantially as set forth.

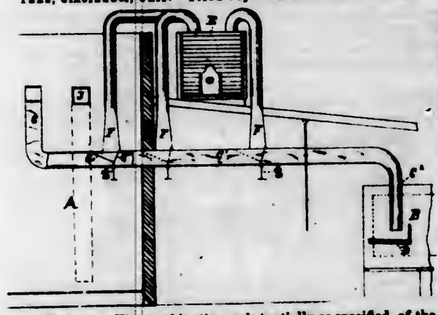
2. The combination of burner E, wick-tube N, supporting-arms O O, bottom P, and oil-reservoir M, said burner being supported above said reservoir, out of contact therewith, whereby the oil may be drawn from said reservoir to said burner without the transmittal of heat from the flame to the oil, as set forth.

256,520. DRUM-STRAP. AUGUST VOSEN, Brooklyn, N. Y. Filed Apr. 5, 1881. (No model.)



Claim.—1. A drum-strap for adjusting and tightening the cords and holding the upper and lower heads of drums to the body of the same, which consists of a strip of leather or other suitable material cut in the form described and shown, and provided with slits or apertures, and adapted to be folded and receive in the apertures the metallic lacing-pieces, folded in the manner substantially as and for the purposes described.

2. The metallic lacing-piece for drum-straps, consisting of the strip having projection *f*, and adapted to be inserted in the apertures of the strap and bent upon the same, substantially as and for the purpose set forth.



3. A drum-strap of the form and folded as described and shown, and provided with apertures, in combination with metallic lacing-pieces laced and folded, substantially as set forth.

256,521. OPERA-GLASS. JOHN WATTENHOUSE, New York, N. Y. Filed Mar. 17, 1881. (No model.)

Claim.—The combination of rings *a* and *b*, attached and fastened as described, whereby the frame is prevented from turning or collapsing, as set forth.

256,522. AUTOMATIC FURNACE-FEEDER. ARTHUR WATERS, Cincinnati, Ohio. Filed Sept. 12, 1881. (No model.)

Claim.—1. The combination, substantially as specified, of the tube C', attached to the discharge end of an apparatus constructed to collect and discharge cuttings, sawdust, &c., by pneumatic force, the branch pipes C², furnace B, and curved flanged plate D, arranged within the furnace beneath the discharge end of pipes C².

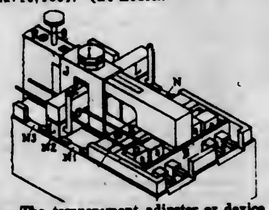
2. The combination, substantially as specified, of the discharge-tube of a pneumatic apparatus, as C, house A, tubes C', C², and J with the valve I and its operating-rod *i*, and furnace B, said parts being arranged to discharge either into house A or furnace B, as desired, and tube J, communicating with the exhaust end of tube C, so that the cuttings stored in house A may be drawn into tube C and discharged into the furnace when the valve in tube J is opened.

3. The combination of tube C', screen G, hinged wings G', and branch pipe F, arranged to operate as specified.

4. The combination, substantially as specified, of tubes C, C', C², and F, with screens G, wings G', and tank E, for the purpose set forth.

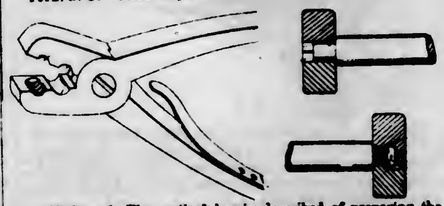
256,523. STEAM-ACTUATED VALVE. GEORGE W. WHITMAN, Columbus, Ohio. Filed Nov. 19, 1881. (No model.)

Claim.—1. In a steam-pump valve having ports formed on the interior of the steam-chest and extending to either end thereof, said ports alternately receiving steam from the interior of the valve, whereby the valve is operated, a shaft and an eccentric, whereby a rocking movement is imparted to the valve, substantially as and for the purpose set forth.



256,523.

2. In a steam-pump valve, the shaft I, said shaft being provided with an eccentric, *g*, on its end, whereby a rocking motion is imparted to the valve, substantially as and for the purpose shown and described.

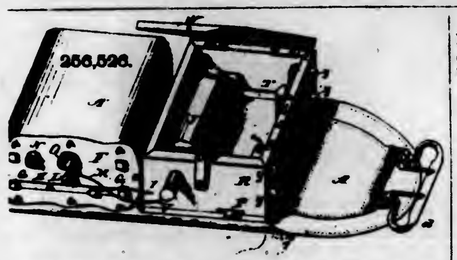


3. In a steam-pump valve, the combination, with the lugs *i* and *j*, of the shaft I, said shaft being provided with an eccentric, *g*, for imparting a rocking motion to the valve, and the arm h, substantially as and for the purpose shown and described.

256,524. TEMPERAMENT-ADJUSTER FOR MUSICAL INSTRUMENTS. WALTER KNOX WHEELER, San Francisco, Cal. Filed Aug. 10, 1881. (No model.)

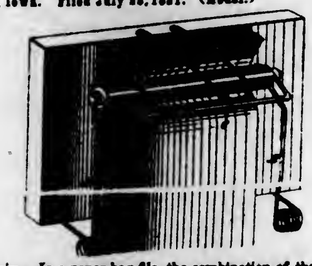
Claim.—The temperament-adjuster or device for aiding in tuning key-board musical instruments, consisting of the body or support provided with four strings, and having upon its upper side edges the slots N' N² N³, in combination with the bridge L, composed of the gripping-jaws having string-slots and adapted to be moved and placed in either of the slots N' N² N³ and to be adjusted transversely, whereby the twelve chromatic tones of an octave may be obtained.

256,525. METHOD OF AND IMPLEMENT FOR UNITING THE ENDS OF BELTING. WILLIAM M. WHITING, Elizabeth, N. J., assignor to the Whiting Stronghold Belt Clasp Company, New York, N. Y. Filed July 15, 1881. (No model.)



Claim.—1. The method herein described of preparing the ends of leather belts for insertion within screw-threaded metal clasps for joining the same, consisting in first compressing and solidifying the material of the belt at the ends by a compressing-instrument and then forming a screw-thread upon the compressed and solidified portions, substantially as described.

2. As a means of solidifying and treating the ends of belts for joining the same by a clasp, an implement constructed, substantially as described, in the form of pinchers, the faces of the jaws of which are formed with corresponding threaded recesses, e, as shown and described.



256,526. ELECTRIC BELT. THADDEUS W. WILLIAMS, Milwaukee, Wis. Filed Feb. 27, 1880. Renewed Feb. 20, 1882. (Model.)

Claim.—Devices for applying galvanic and electric currents to the human system, consisting in the combination of belt A, pocket X, battery A', having hermetically-sealed cover F, provided

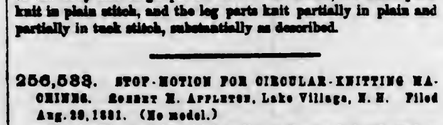
with openings N and O, helix J, and helix-box R, provided with switch P, vibrator T, switch Q, pins *a b d g*, and lid W, all substantially as and for the purpose specified.

256,527. PAPER-BAG FILE. LORIN R. WITHERELL, Davenport, Iowa. Filed July 28, 1881. (Model.)

Claim.—In a paper-bag file, the combination of the roller B with the spring-clamp A, and provided with the stop-hook C, substantially as and for the purposes described.

256,528. TIRE-UPSETTER. ALEXANDER WOMACK, Emmettville, Idaho. Filed Dec. 10, 1881. (Model.)

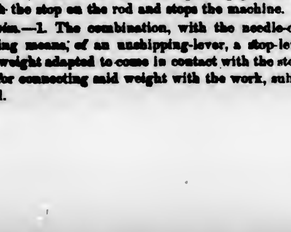
Claim.—1. The combination of the slotted head A, the sliding cross-head H, the cams or dogs F J, the levers G K, arranged, as herein described, for operating said cams or dogs simultaneously, the forked lever M, and connecting-rods O, all arranged and operating substantially as set forth.



2. In a machine for upsetting tires, the combination of the slotted head A, having cross-piece D, sliding cross-head H, and the shafts E I, having toothed dogs or cams F J, and levers G K, the latter, K, being provided with eyes L, through which the levers G pass, substantially as set forth.

256,529. NUT-LOCK. WILLIAM H. WOOD, Orange, N. J. Filed Feb. 26, 1882. (No model.)

Claim.—The nut-lock composed of the strip E, divided by longitudinal and transverse slits into lips F, with their ends adjacent to each other, and adapted to be folded so that their ends will bear each against the side of a nut, substantially as set forth.



256,530. CLAMP. JOHN S. ADAMS, Boston, Mass. Filed Aug. 29, 1881. (No model.)

Claim.—1. The spring G, in combination with the sliding jaw D and clamp-iron E, as and for the purpose set forth.

2. The combination of the spring G, clasp F, clamp-iron E, jaw D, and bar A, substantially as and for the purpose set forth.

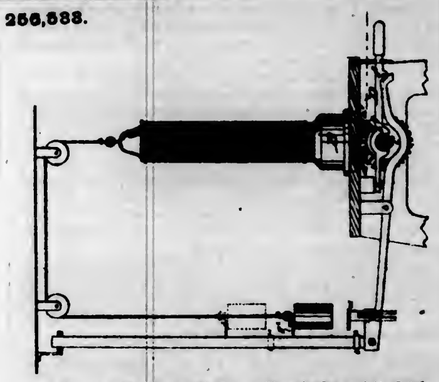
256,531. CAR-COUPLING. PETER A. AIKMAN, Windsor, Ontario, Canada, assignor to himself and William R. Merwin, Detroit, Mich. Filed Feb. 17, 1882. (No model.)

Claim.—1. In a car-coupling device, and in combination with a recessed or channeled draw-bar, a dog-latch, and a spring constructed and operating substantially as specified, a cam-lever and pin, substantially as and for the purposes described.

2. The combination, with the chambered and channeled draw-bar A B, of the dog D, provided with a slot, *b*, at its pivotal point, the spring E, the pin H, resting on the dog and provided with an enlarged head, and the cam-lever G, pivoted between lugs E E of the draw-bar, substantially as and for the purpose specified.

256,532. DRAWERS OR TIGHTS. ROBERT H. APPLETON, Lake Village, N. H. Filed July 23, 1881. (No model.)

Claim.—1. In circular seamless-leg drawers or tights, the combination, with the knitted leg parts, of the body and thigh parts knit in tuck-stitch and the knee parts knit in plain stitch, substantially as described.



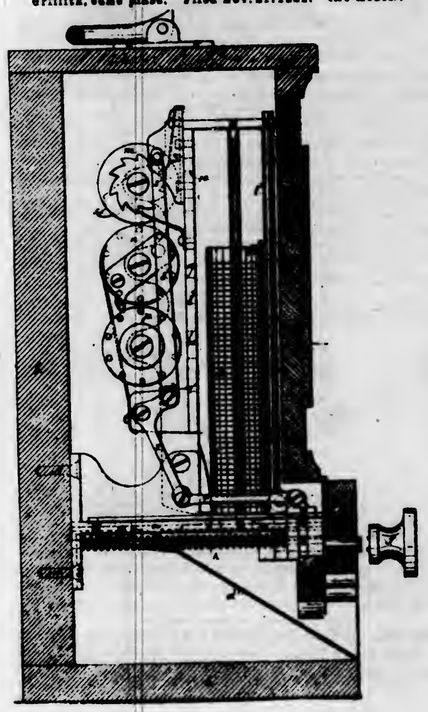
2. In circular seamless-leg drawers or tights, the combination of the body and thigh parts knit in tuck-stitch, the knee parts knit in plain stitch, and the leg parts knit partially in plain and partially in tuck stitch, substantially as described.

256,533. STOP-MOTION FOR CIRCULAR-KNITTING MACHINES. ROBERT H. APPLETON, Lake Village, N. H. Filed Aug. 26, 1881. (No model.)

Brief.—The weight which pulls up the work is adapted to come in contact with an adjustable plate on a stop-lever, which latter engages an unshipping-lever, by which the driving mechanism of the needle-cylinder is thrown out of gear and the working of the knitting-machine stopped. A vertical rod connected to the end of the said stop-lever has an adjustable stop connected to it, and the work-pulling-up weight has a like adjustable stop or catch secured to it, which catch on the weight engages or comes in contact with the stop on the rod and stops the machine.

Claim.—1. The combination, with the needle-cylinder and its driving means, of an unshipping-lever, a stop-lever, a work-pulling weight adapted to come in contact with the stop-lever, and means for connecting said weight with the work, substantially as specified.

256,533.



2. The combination, with the needle-cylinder and its driving means, of an unshipping-lever, a stop-lever, an adjustable stop-plate attached to said lever, a work-pulling weight adapted to come in contact with the stop-plate, and means connecting said weight with the head of the work, substantially as described.

3. The combination, with the needle-cylinder and its driving means, of an unshipping-lever, a stop-lever, a vertical rod connected to said stop-lever, an adjustable stop on said rod, a work-pulling weight adapted to come in contact with said stop, and means connecting said weight with the head of the work, substantially as set forth.

4. The combination, with the needle-cylinder and its driving means, of an unshipping-lever, a stop-lever, a vertical rod connected to said stop-lever, an adjustable stop on said rod, a work-pulling weight provided with a laterally-adjustable catch adapted to come in contact with said stop, and means for connecting said weight with the head of the work, substantially as described.

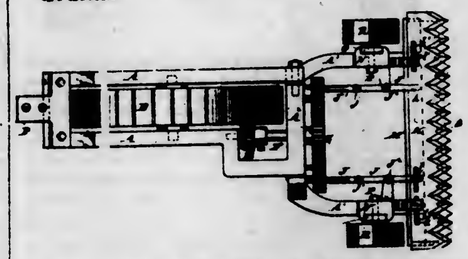
256,534. CHECK-REGISTER. ADRAIN H. AUSTIN, New York N. Y., assignor to himself, Joseph P. Tobin, and Joseph G. Griffith, same place. Filed Nov. 21, 1881. (No model.)

Claim.—1. The combination, in a check-register, of the pusher-button *f*, rod *g*, separator *i*, finger 2, upon the separator below the surface of the bed, the plate *f'*, behind the pile of checks, the bed *a*, with an opening for the check to pass through, and the stationary incline *a'*, as and for the purposes set forth.

2. The combination, in a check-register, of a bed, *a*, supporting a pile of checks, a pusher to carry off the lowest check in the pile, a finger to support one edge of the check that drops below the surface of the bed, the plate *f'*, behind the pile of checks, and a stationary incline, *a'*, a case to contain the register, supports for the plate *a*, upon which the register can be slid out, and an inclosing-door for the said case, substantially as set forth.

3. The combination, with the bed *a*, pusher *g*, separator *i*, finger 2, and plate *f'*, of the links *r* and *d'*, lever *s*, ratchets, pawls, and counting-wheels *m*, *n*, and *p*, behind the openings in the plate *f'*, substantially as set forth.

256,535. BARBED METALLIC FENCE-RAILS. GEORGE C. BARRE, Des Moines, Iowa. Filed May 23, 1881. (No model.)



Claim.—The improved barbed metal fence-rail composed of a metal strip having its parallel edges folded toward each other, and pressed flat upon a series of flat-headed tacks, and soldered fast and twisted, substantially as shown and described, for the purposes specified.

256,536. MANUFACTURE OF ROOT OR TONIC BEER. LOUIS BROEMS, Baltimore, Md. Filed Mar. 30, 1881. (No specimens.)

Brief.—The roots are infused together in the water. The infusion is strained, colored, sweetened, and charged with carbonic acid gas.

Claim.—In the manufacture of root or tonic beer, the herein-described compound, consisting of Canada snake-root, Jamaica-ginger root, angelica-root, hops, sassafras, black-mustard seed, prickly-ash bark, tartaric acid, and malo-citrate of iron, substantially as set forth.

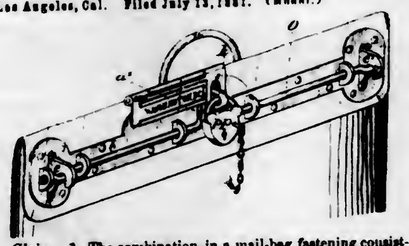
256,537. LAWN-MOWER. HENRY C. BENDER, Montgomeryville, and HIRAM C. BENDER, Lansdale, Pa. Filed Dec. 1, 1881. (No model.)

Claim.—1. In a lawn-mower, a light open frame adapted to be sprung open to receive the driving-wheel and its axle between its sides, and provided with means to secure the two sides rigidly together at their free ends, so as to inclose the driving-wheel in a rigid frame, said frame being mounted upon three wheels, one being a large driving-wheel in the rear and the others being two small adjustable wheels in front, in combination with said wheels, means to adjust the front wheels, a revolving spur-wheel driven by the large driving-wheel, two pinions driven by said spur-wheel and revolving in the same direction, two oppositely-reciprocating cutters, an L frame or bar to support said cutters, and levers to connect said cutters, respectively, to their respective pinions, substantially as and for the purpose specified.

2. In a lawn-mower, a light open frame adapted to be sprung open to receive the driving-wheel and its axle between its sides, and a stud or arm secured to one side, and means to secure the free end of said arm to the other side to inclose the driving-wheel in a rigid frame, all as shown and described.

3. In a lawn-mower, the combination of a frame carrying the driving-wheel B, with its gear-wheel C, bevel-pinion E, shaft F, spur-wheel G, the two pinions H, rotating in the same direction, arms J', levers J, and knife-bars K and L, substantially as and for the purpose specified.

4. In a lawn-mower, the combination of a frame carrying the driving-wheel B, with its gear-wheel C, bevel-pinion E, shaft F, spur-wheel G, the two pinions H, rotating in the same direction, arms J', levers J, knife-bars K and L, and guide-rollers R, substantially as and for the purpose specified.



5. In a lawn-mower, the spur-wheel G, pinions H, pivoted arms J', levers J, provided on the ends with slots, knife-bars K and L, respectively provided with slots *k* and pins *l*, plate M, frame A', and plates *m*, substantially as and for the purpose specified.

256,538. SEAMLESS FELT BOOT. MELVILLE R. BISSELL, Grand Rapids, Mich., assignor to the Grand Rapids Felt Boot Company, same place. Filed Feb. 6, 1882. (Model.)

Claim.—As an improved article of manufacture, a seamless felt boot consisting of the foot portion, with the leg portion thereof provided with the overlapping flaps B B' for closing the same, and fastening devices for securing the flaps together, the foot and leg portion being made in one and the same piece without seam, and one of said flaps being formed on its inner side with a recess extending its entire length, and adapted to receive the remaining flap, whereby undue thickness is prevented and a more perfect and comfortable fit is attained when the two flaps are brought together, substantially as described.

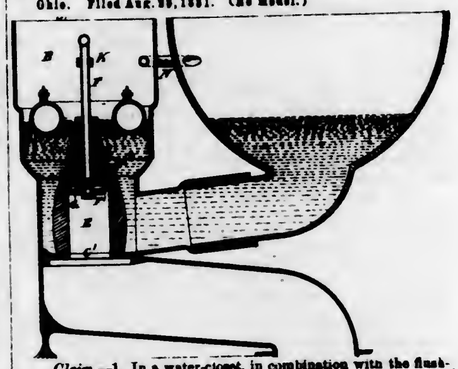
256,539. MAIL-BAG FASTENING. EMILE AUGUST BRANDAU, Los Angeles, Cal. Filed July 13, 1881. (Model.)

Claim.—1. The combination, in a mail-bag fastening consisting of the rod O, turning in bearings or supports upon the closing-flap of the bag, and provided with cranks, which may be engaged and held after the bag is closed by hooks or jaws *c c'* and the staple *k*, projecting from the rear of the bag through slots in the plate upon which the cranked rod is mounted, substantially as herein described.

2. The bag having the flap or cover provided with a shaft, O, having cranks adapted to engage hooks or jaws *c c'* and staple *k*, which projects through the cover from the rear wall of the bag, in combination with the hinged slotted address-plate *a a*, which may be folded down over the staple, and the crank *a'*, substantially as and for the purpose herein described.

3. In a mail-bag in which the side portions are adapted to be turned or folded into the body, as described, the openings or eyelets through the folded portions, in combination with the jaws *c c'*, the staple *k*, the cranked rod O, and the hinged folding address-plate *a a*, substantially as and for the purpose herein described.

256,540. ADJUSTABLE REST FOR ROCK-DRILLS. WM. T. BROWER, Stockton, Cal., assignor of one-half to Theodore W. Sterling. Filed Aug. 31, 1881. (No model.)



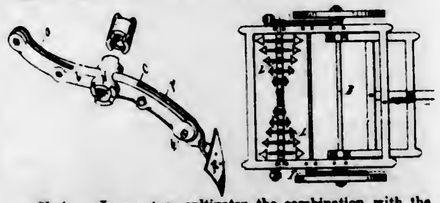
Claim.—1. In combination with a rock-drill having a supporting strap or rod, N, the swiveling bearing-block G, having a slot or groove, *e*, said block G being supported by the pivoted legs or props A, substantially as herein described.

2. The extensible legs or props A, the top plate, D, with its sockets E, and the swiveled bearing-block G, with its slot or groove *e*, having a friction-roller, I, in combination with a rock-drill having a supporting strap or rod, N, substantially as herein described.

3. The bearing-block G, having a groove or slot, *e*, with a friction-roller, I, said block being journaled, pivoted, or swiveled upon a top plate, D, by means of the staple, screw, or pivot H, and supported by adjustable and extensible legs or props A, in combination with a rock-drill having a strap or rod, N, substantially as and for the purpose herein described.

4. The adjustable support for machine rock-drills, consisting of the extensible props or legs A, pivoted to a top plate, D, and surmounted by the swiveling bearing-block G, with its adjusting-hold *i* and pin *m*, and having a groove or slot, *e*, with a friction-roller, I, substantially as herein described.

256,541. WATER-CLOSET. AUGUST F. BLESCH, Columbus, Ohio. Filed Aug. 29, 1881. (No model.)

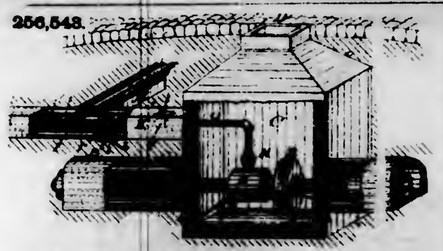


Claim.—1. In a water-closet, in combination with the flushing-valve M, a lever and float, L, a chamber, B, inclosing the float and connected with the discharge-pipe, and a plunger, C, automatically operated so as to settle slowly on its seat, and so cause a gradual rise of water in the chamber, and consequently slow movement of the valve M in closing, substantially as set forth.

2. In combination with the discharge-pipe of a water-closet, an automatic plunger formed substantially as set forth, and the perforated water-induction pipe F, serving as a guide for the plunger, and fitted with cup-leathers above and below the perforations, substantially as set forth.

3. In combination with the automatic plunger C, the supply-pipe F and plunger-valve H, substantially as set forth.

4. In combination with the automatic plunger C, plunger-valve H, and lever H^3, the forked and pivoted rod K, pawl K', and seat-spindle I, all arranged substantially as set forth.



256,542. CULTIVATOR. EDWARD E. HOSTWICK, Union City, Mich. Filed Oct. 20, 1881. (No model.)

Claim.—In a rotary cultivator, the combination, with the transverse shaft and means, substantially as described, for operating said shaft, of the duplex arms L, having clutch-hubs N and slots O, and the shanks P, secured within said slots by bolts *a* and break-pins *b*, all constructed and adapted to operate as specified.

256,543. HOT-WATER OR STEAM MAIN OR PIPE. RICHARD H. BURL, New York, N. Y., assignor to the American Heating and Power Company, of New York. Filed Nov. 16, 1881. (No model.)

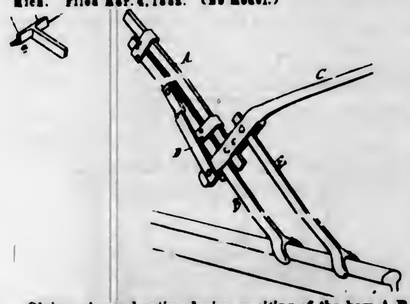
256,543.

Claim.—1. A system of mains or pipes for conveying steam or hot water under ground, comprising conveying and distributing mains, the latter connecting at one end with said conveying-mains and having their other end free, so as to be able to expand throughout their entire length, substantially as described.

2. The combination, with the conveying-mains, of distributing-mains having one end free, so that they can freely expand or contract, and service-pipes led off from said distributing-mains only, substantially as described.

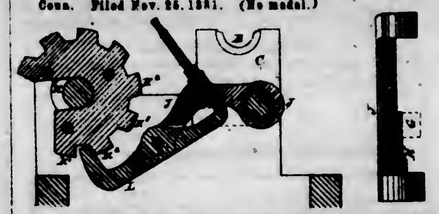
3. In a system of underground mains or pipes, the combination, with the conveying-mains, of distributing-mains having one end free and provided at suitable intervals with connections or means for the ready attachment of service or supply pipes, substantially as described.

4. The combination, with the distributing-mains having one of their ends free, as described, and provided at suitable intervals with connections for service or supply pipes, of an inclosing pipe or box having corresponding connections or openings closed where there are no service-pipes attached by suitable caps or plugs, substantially as and for the purpose set forth.



256,544. RUBBER BOOT OR SHOE. WHEELER CABLE, Boston, Mass. Filed Nov. 10, 1879.

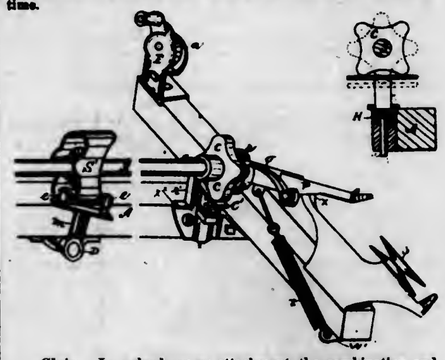
Claim.—1. A rubber boot or shoe provided with a tap-sole formed in one with the sole, and constructed as herein described, extending backward about to the heel, gradually decreasing in thickness along the shank, and disappearing or becoming merged in the sole at or near the heel, substantially as set forth.



2. The improved process herein described of making rubber boots or shoes, said process consisting in shaping the upper over a last or form, rolling the integral sole and tap-sole as part of a continuous sheet of homogeneous rubber compound, cutting such combined sole and tap from said sheet with a thin projecting margin along the edges, turning up such margin, and cementing it with the integral sole and tap to the upper, subsequently applying the heel, and finally vulcanizing the whole, substantially as set forth.

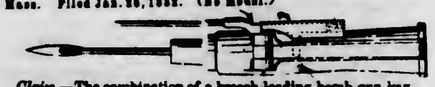
256,545. CAR-SHUNTER. LA FAYETTE COLLINS, Bay City, Mich. Filed Nov. 4, 1882. (No model.)

Claim.—A car-shunting device consisting of the bars A B E and straps D, pivotally secured to the lever C, when constructed, arranged, and operating substantially as and for the purposes set forth.



256,546. WOOD-SCREW MACHINE. ASA S. COOK, Hartford, Conn. Filed Nov. 25, 1881. (No model.)

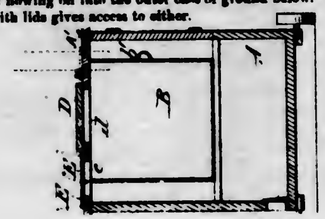
Claim.—The pawl L, hinged to the rocking frame out of the axis of motion of said frame, and operated by an adjusting-screw extending upward from said pawl between its center of motion and the axis of said frame, in combination with said frame, the former H, arm G, shaft C, threading-tool D, and the cam K, substantially as described.



256,547. CHECK-ROW ATTACHMENT. JOSHUA H. COX and JAMES P. HERRISEY, Joliet, Ill., assignors to Amos H. Klinefelter and Andrew Dillman, same place. Filed Jan. 3, 1882. (No model.)

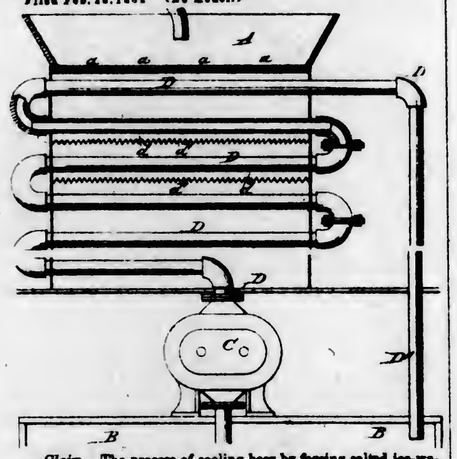
Brief.—On the cross-shaft, to which the forked levers are attached, is secured a cam-wheel, that rests upon the head of a spring-pressed plunger. The plunger is depressed by the rotation of the cam-points bearing upon the head; but as soon as a point commences to pass the center the head is forced upward by the spring and the rotary motion of the cam-shaft is arrested at the proper time.

Claim.—In a check-rower attachment, the combination and arrangement of beam A, shaft S, cams c and S', forked lever P, ratchet r, pawl o, coil-spring *s*, plunger o^3, coil-spring H, and barrel *u*, as and for the purpose set forth.



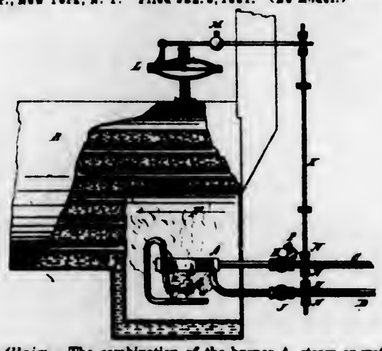
256,548. BOMB-GUN. PATRICK CUNNINGHAM, New Bedford, Mass. Filed Jan. 26, 1882. (No model.)

Claim.—The combination of a breech-loading bomb-gun having a hinged barrel and provided with the slot *l* with the socket B, having spring *i*, and the rod C, provided with the projection *g*, substantially as shown.



256,549. WATER-CLOSET AND GARBAGE SINK. WILLIAM H. DANIELL, Pottsville, Pa. Filed May 21, 1881. (No model.)

Brief.—A perforated receptacle retains the solid matters, the liquid flowing off into the outer case or ground below. An opening with lids gives access to either.



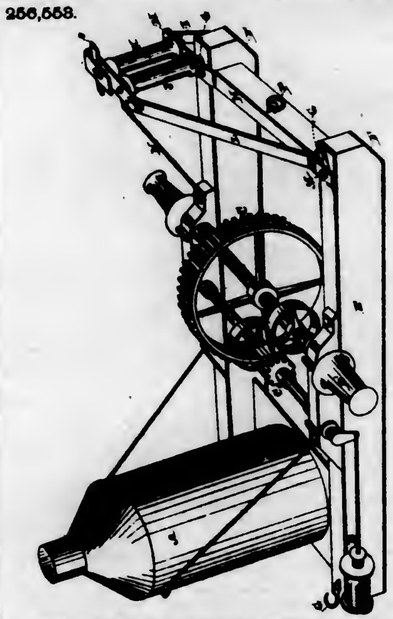
Claim.—The combination, with the outer receptacle, A, having cover A', provided with openings *d e*, closed by lids D E, of the inner perforated receptacle, B, substantially as and for the purpose specified.

256,550. COOLING BEER. DAVID W. DAVIS, Detroit, Mich. Filed Feb. 28, 1882. (No model.)

Claim.—The process of cooling beer by forcing salted ice-water into and through a coil of cooling-pipes upon which the hot beer drips, and then returning the salted ice-water back into the tank from which it was taken, substantially as described.

256,551. HYDROCARBON-BURNER. EDWARD H. DICKERSON, Jr., New York, N. Y. Filed Jan. 6, 1881. (No model.)

Claim.—The combination of the burner A, steam or water and naphtha pipes communicating therewith, a pressure-regulator, cocks in the pipes, and adjustable connections between the regulator and cocks, substantially as specified, whereby both the amounts and the relative supply of the naphtha and water are determined by the regulator, while the total stoppage of the fuel-supply is prevented, as set forth.



256,552. DRIVE-CHAIN. JAMES M. DODGE, Chicago, Ill. Filed Jan. 7, 1882. (Model.)

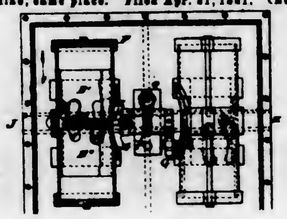
Claim.—A drive-chain link having at one end a coupler-hook that is provided with bridge-piece *c* and retainers or keepers *a a* and at the other end a divided end bar, the whole adapted to operate as described, for the purposes set forth.

256,553. LOGGING-ENGINE. JOHN DOLBEER, San Francisco, Cal. Filed Feb. 22, 1882. (No model.)

256,553.

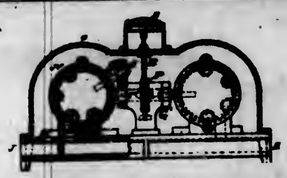
Claim.—1. The means herein described for moving logs, consisting of the ropes or chains Q, secured to the log, passing thence to the anchored snatch-blocks, in combination with a gypsy having the vertical guide-rollers J K, or an equivalent guiding device, substantially as and for the purpose herein shown.

2. In combination with an engine and apparatus having a gypsy, as shown, the supporting frame-work having the longitudinal bearing-timbers E, beveled or curved at the front and shod so as to form runners upon which the machine may be moved from place to place.



3. In combination with an engine, gearing, and gypsy D, as shown, the vertical flanged guide-rollers K L, having a space between them in a line with the gypsy, or an equivalent fixed guiding device, substantially as and for the purpose herein described.

4. The vertical flanged guide-rollers J K, having their lower ends journaled in the support H, the roller K being made to tilt outward at an angle, as shown, in combination with the top journal-support, L, made movable about the point M, and a locking bar or plate, substantially as described.

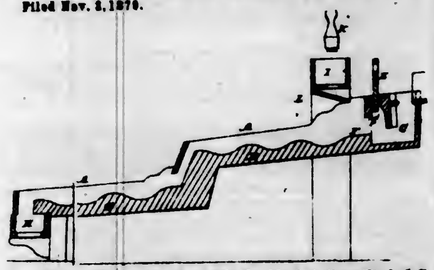


5. The steam-operated gypsy D, mounted upon the longitudinal supporting-runners E, beveled or curved in front and having the point of attachment P or G for a rope, in combination with the rollers J K, or equivalent guide, and the rope Q, leading from the apparatus to an anchored snatch-block, and thence between the guide-rollers to the gypsy, substantially as and for the purpose herein described.

6. The means herein described for moving logs, consisting of the rope or chain Q, secured to the log and leading through an anchored block, by which the direction of the log is fixed, and thence through guides J K upon the engine-frame to the steam-driven gypsy D, substantially as herein described.

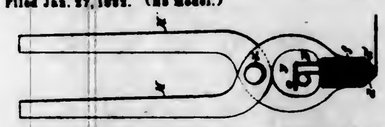
256,554. PISTON FOR WATER-METERS, &c. ARTHUR P. BERRY, Brooklyn, N. Y., assignor of one-half to Charles P Houghton, same place. Filed Apr. 21, 1881. (No model.)

256,554.



Claim.—1. The combination of a piston with its cylinder, such piston containing induction and eduction ports for each end, arranged therein so that it will, when slightly rotated within said cylinder, have at one end an induction-port opened and an eduction-port closed and at the other end an eduction-port opened and an induction-port closed alternately, so that the piston will both take and discharge water at each of its strokes, substantially as described.

2. The piston provided with channels or passages, in combination with the induction and eduction ports of the piston-cylinder, substantially as described.



3. The combination of the piston and piston-cylinder with a ball-and-socket joint, the ball being connected to the piston by means of a spindle and the socket being contained in a crank, substantially as described.

256,555. AMALGAMATING AND CONCENTRATING RIFFLE. SUSANA E. EVANS, San Francisco, Cal., assignor of two-thirds to Alexander Lowthwaite and Samuel P. Taylor, same place. Filed Nov. 2, 1879.

Claim.—In combination with the blanket, the riffle-bed G, made with gentle undulating curves, whereby the nap of the blanket is prevented from lying flat by the flow of the current of water.

256,556. TINMAN'S TONGS. CHARLES R. EVERSON, Macedon, N. Y., assignor of one-half to L. Jerome Woolsey, same place. Filed Jan. 27, 1882. (No model.)

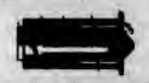
Claim.—A tinner's tongs consisting of pivoted cross-legs H H' and blades *d d'*, the legs being spread apart above the blades, and the latter being provided with gages secured adjustably to one blade and extending over the upper edges of both, substantially as set forth.

256,557. CURTAIN-FIXTURE. HUGH FARLEY, Philadelphia, Pa. Filed Feb. 6, 1882. (No model.)

Brief.—A spring surrounding the axle-pin at one end keeps the roller securely against the rubber brackets.

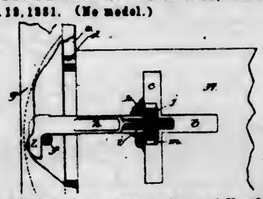
Claim.—1. The combination of roller A, provided with caps C and E, axle-pins D and F, rubber springs H, having holes *h* and plates *h'*, and spring G, substantially as described.

2. The combination of roller A, provided with caps C and E, axle-pins D and F, springs G and H, substantially as and for the purpose specified.



3. The combination of screen B with a roller at top and bottom thereof, said rollers being provided with rigid axle-pin D, adjustable axle-pin F, springs G and H, substantially as shown.

256,558. GLOVE. HENRY S. FLOOD, San Francisco, Cal. Filed Aug. 15, 1881. (No model.)

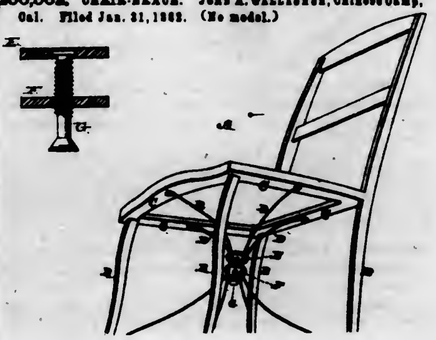


Claim.—As a new article of manufacture, gloves, gauntlets, mittens, and similar hand wear having a supplementary waterproof backing, substantially as and for the purpose herein described.

256,559. ADJUSTABLE SPRING-BOLT. PETER FOGG, Somerville, Mass. Filed Mar. 28, 1881. Renewed Nov. 4, 1881. (Model.)

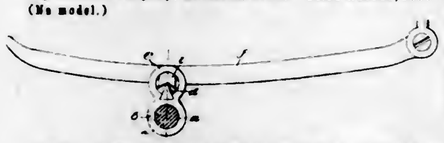
Claim.—As an improved article of manufacture, the herein-described catch, composed of the case, the spiral spring, and the screw-threaded stud, extended loosely in the said case and provided with the bolt *f*, made adjustable longitudinally thereon, all substantially as set forth.

256,560. BED-FASTENING. PETER FOGG, Somerville, Mass. Filed Dec. 19, 1881. (No model.)



Claim.—A bed-fastening composed essentially of the hook *h l*, having a screw-threaded shank, and a nut, *j*, provided at its side, next the hook *l*, with a spur to cut into the side rail and prevent the nut and fastening from being moved laterally out from the grooves in the side rail, substantially as described.

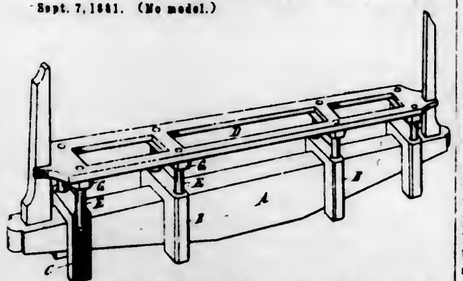
256,561. TREE-PROTECTOR OR INSECT-BARRIER. CHARLES M. FULLER, Catasauqua, Pa. Filed Feb. 11, 1882. (No model.)



Claim.—An insect guard or barrier consisting of a band or girdle of any suitable material, in combination with a coating of fatty, soft, or sticky matter and sand or other grain-like material, as shown and described, and for the purpose set forth.

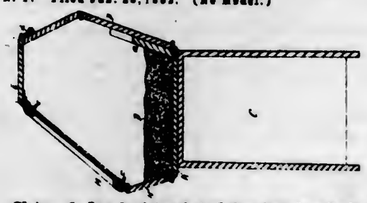
256,562. CHAIR-BRACE. JOHN A. GALLAGHER, Chinese Camp, Cal. Filed Jan. 31, 1882. (No model.)

Claim.—The chair-brace consisting of the combination and arrangement of the brace wire *a* or rods D D, secured to the seat above and to the legs below, and converging to the center, and the plates E and F upon said braces, with their thumb-screw G, operating said plates to separate or approach to tighten or loosen the brace-rods, substantially as herein described.



256,563. TREADLE-SUPPORT FOR SEWING-MACHINES. GEORGE W. GREGORY, Boston, Mass., assignor to the Wood Sewing Machine Company, Hartford, Conn. Filed Nov. 10, 1881. (No model.)

Claim.—1. The collars *c*, provided with the V-shaped bearings and caps, combined with a treadle having ears recessed or adapted at their under sides to rest on the V-shaped bearings, and rounded at their upper sides to be held down by the caps, substantially as described.

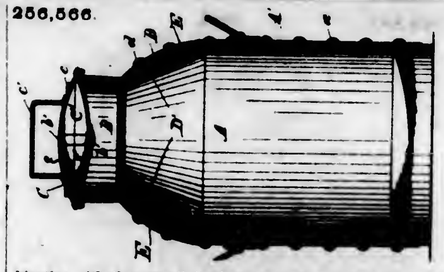


2. The rod *a*, the collars *c*, adjustably secured thereto and provided with V-shaped bearings *d*, and covering-caps *e*, combined with the treadle having ears *l*, recessed to rest on the bearings *d* and rounded at their upper sides to be held down by the said caps substantially as described.

256,564. WAGON-SPRING. JONATHAN W. HARRISON, Wayne, Mich., assignor of one-half to Orange Butler, same place. Filed Sept. 7, 1881. (No model.)

Claim.—The saddles or yokes B, constructed to straddle the bolster, and provided with sockets on each side of said bolster, in combination with the spiral springs C, the bed-plate D, and the pins E, secured at their upper ends to the bed-plate, said pins being constructed to closely fit the saddle-sockets, and provided with studs to fit inside of the springs, as and for the purpose specified.

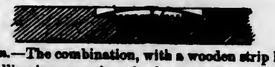
256,565. BURIAL-CASE. JACOB H. HERRENBRG, Brooklyn, N. Y. Filed Jan. 25, 1882. (No model.)



Claim.—1. In a burial-casket of the class described, the upholstered base, provided with back piece or support, secured to said base, and the movable side, end, and top pieces, substantially as shown and described.

2. The combination of the base, upholstered as explained, the back piece secured thereon, the hinged sides and top connected therewith, and the end pieces, one of the hinged pieces being inclined at an angle with the base and provided with a transparent panel, substantially as and for the purposes set forth.

256,566. REFRIGERATING-CAN. JOSEPH HEPPLEY, Sr., Philadelphia, Pa., assignor to Wm. Esch, same place. Filed Sept. 7, 1881. (No model.)



Claim.—1. A refrigerator-can consisting of the body A and neck D', re-enforced by the corrugated sheathing A' *a* D *d*, in combination with the cover C, having concave-convex top *c c'*, vent-tube *b'*, strainer *b*, and protecting-ring *c*, substantially as set forth.

256,566.

2. In a refrigerating-can, the cover C, having the concave-convex top *c c'*, in combination with the vent-tube *b'*, having strainer *b* and protecting-ring *c*, substantially as set forth.

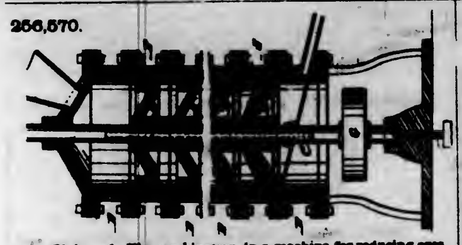
256,567. MODE OF INCASING KNOTS OR OTHER DEFECTS IN WOOD. BRITAIN HOLMES, Buffalo, N. Y., assignor to himself and Edward Holmes, same place. Filed Oct. 21, 1881. (No model.)

Claim.—The combination, with a wooden strip having a knot, of a metallic piece covering the knot portion, with its edge embedded in the wooden strip around the knot, as and for the purpose set forth.

256,568. METHOD OF CLOSING THE PORES OF KNOTS IN STAVES, &c. BRITAIN HOLMES, Buffalo, N. Y., assignor to himself and Edward Holmes, same place. Filed Nov. 23, 1881. (No model.)

Claim.—The within-described mode of treating knots or other defects in wood to render them water-tight, consisting in subjecting the knot and the wood immediately surrounding it to a heavy pressure by means of a tool, *b*, or its equivalent, either with or without a revolving motion, substantially as described, whereby the knot is securely fastened in place and rendered water-tight, as specified.

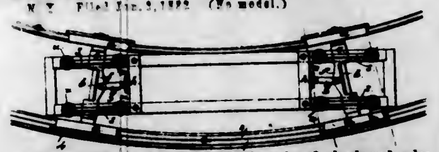
256,569. APPARATUS FOR ROASTING ORES. CHARLES HORNSCHUH, Brooklyn, N. Y. Filed June 17, 1881. (No model.)



Claim.—1. In a furnace for roasting ores and other materials, the combination of a series of open-bottomed troughs, arranged one above the other, and a series of open-bottom triangular frames, located between the lower edges of the troughs, and adapted to receive and distribute air throughout the mass of material, and divide and direct the material to the successive troughs, and finally to the hearth of the furnace, substantially as described.

2. In a roasting-furnace, the herein-described series of open-bottom angular troughs extended across the furnace and arranged to leave air-spaces between their upper edges and the walls of the furnace, in combination with the frame C, arranged between the lower edges of the troughs, and adapted to receive heated air or gas at their ends and to direct the same through their bottoms into the mass of material, whereby the air or gas will pass through the material and then through the air-spaces, as indicated, and also the material will be directed by said frames to the successive troughs, and finally to the hearth of the furnace, substantially as described.

256,570. MACHINERY FOR REDUCING ORE, &c. FREDERICK J. HOYT, New York, N. Y., and WILLIAM H. HOYT, Jersey City, N. J. Filed May 14, 1881. (No model.)

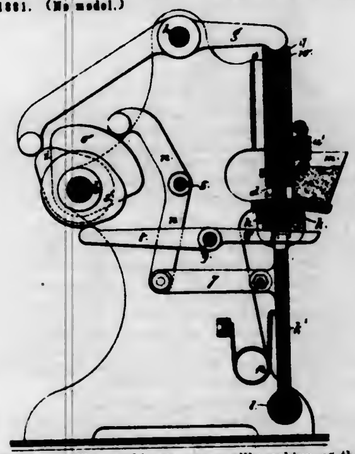


256,570.

Claim.—1. The combination, in a machine for reducing ores, of the vertical rotary shaft, with the crusher-disks A, provided with hammers *a*, the pulverizing-disks B, arranged below the crushing-disks and formed with smooth beveled edges, the cylinder composed of sections, one for each crushing and pulverizing disk, and the anvils *b*, arranged opposite the hammers, whereby the ore is first crushed by the hammers and then pulverized between the shell and the pulverizing-disks, substantially as described.

2. The combination, with the vertical rotary shaft, of the crushers A, the pulverizers B, and the shell composed of sections D, bolted together, one of said sections being provided for each crusher and pulverizer, substantially as described.

256,571. CAR-TRUCK. CHARLES W. HUNT, West Brighton, N. Y. Filed Jan. 9, 1882. (No model.)



Claim.—The combination, with the pairs of wheels and axles, the former having outside flanges, of the journal-boxes *e*, the bars *f*, connecting such journals in pairs, the links *g*, pivoted to the frame and bars *f*, respectively, the bearers *i* or *s*, and the side frames of the car, substantially as set forth.

256,572. ARTIFICIAL FUEL. JOHN T. JACKSON, Des Moines, Iowa, assignor of one-half to P. P. Ingalls, same place. Filed July 21, 1881. (No specimens.)

Claim.—An artificial solid fuel composed of adhesive and inflammable tar, common soil, and incompact and incoherent fibrous vegetable substances—such as dry grass, weeds, straw, forest-leaves, and manure—substantially as and for the purposes set forth.

256,573. MACHINE FOR MAKING PILLS, LOZENGES, &c. JOHN T. JONES and CHARLES T. JONES, Utica, N. Y. Filed Dec. 9, 1881. (No model.)

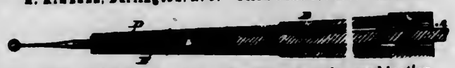
Claim.—1. The combination, in a pill-machine, of the die-plate *c*, segmental die-holder *k*, powder-holder *m*, punches *d*, lifters *e*, and their supporting and actuating devices, substantially as set forth.

2. The combination, in a pill-machine, of the die-plate *c*, the segmental die-holder *k*, arm *k'*, and shaft *l* for said die-holder, the lifters *e*, bar *r* below the die-plate, the lever *t*, and cam *s'*, for raising the lifters, substantially as set forth.

3. In a pill-machine, the combination, with the segmental die-holder and dies, of the powder-holder *m*, the pressing-punches *d*, lifters *e*, and means for swinging the segmental die-holder for the delivery of the compressed pills and the reception of powder, substantially as set forth.

4. The combination, in a pill-machine, of a swinging segmental die, pressing and delivery punches, a driving-shaft, cams, and levers operating to swing the segmental die and actuate the punches and lifters, respectively, substantially as set forth.

5. The combination, with the punches and head-block in a pill-machine, of the cam and lever for moving the same, and the adjustable bearing between the lever and the head-block, substantially as set forth.

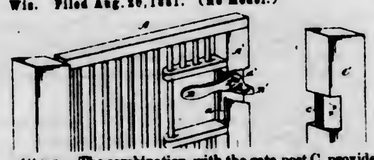


6. The combination, with the segmental die-holder and die, the pressing-punches, the lifters, the bar for the same, the change able graduating-plate, and the mechanism for giving motion to the dies, punches, and lifters, respectively, substantially as set forth.

256,574. NUT-LOCK. WALLACE C. KELLY, Hastings, Mich. Filed Feb. 16, 1882. (No model.)

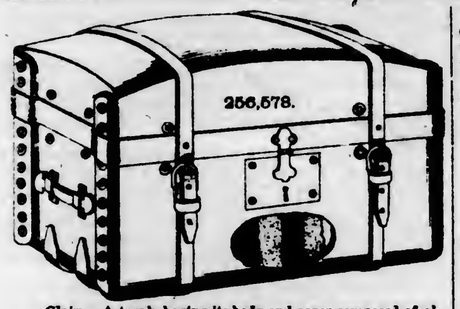
Claim.—A fish-plate having bolt-holes and a vertical groove above each bolt-hole, a nut having radial grooves, and a key for locking the nut and fish-plate together, the whole combined and operating to lock the parts by the gravity of the key, as set forth.

256,575. HAND-PIECE FOR DENTAL ENGINES. WILLIAM H. KIMBALL, Burlington, N. J. Filed June 1, 1881. (Model.)



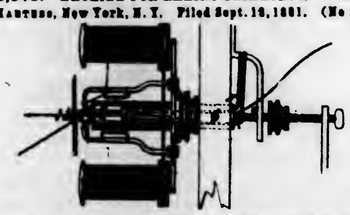
Claim.—The burr having a spiral groove, *n*, in combination with the shaft A, having a tubular spring-jaw, D, and a pin, E, projecting into the tubular portion of the shaft, and the exterior sleeve, B, which is adapted to compress said jaw, substantially as and for the purpose set forth.

256,576. STOVE-KNOB. JOHN C. KOEHLER, Philadelphia, Pa., assignor to William L. McDowell, same place. Filed Jan. 25, 1882. (No model.)



Claim.—The knob having an eye, the wedging-pin, and the stove portion having an opening and projecting lugs, the parts being combined and operating substantially as and for the purpose set forth.

256,577. GATE-LATCH. LEONARD L. LIGHTCAP, Hazel Green, Wis. Filed Aug. 20, 1881. (No model.)

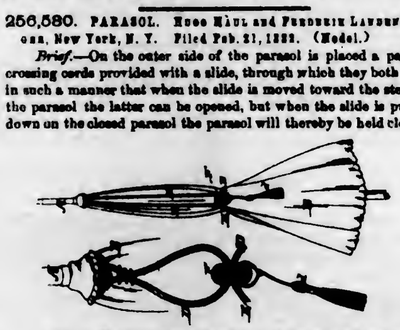


Claim.—The combination, with the gate-post C, provided with recess *c* and inclines *c'*, arranged on either side, of gate A, having its front post provided with the transverse slot *a*, and latching device B B', provided with hole *b* and slot *b'*, whereby said device may be pivotally secured in slot *a* by means of pin *a'*, and limited in its movements therein by means of pin *a'*, the several parts constructed and arranged substantially as described, shown, and for the purpose set forth.

256,578. TRUNK. CYRUS MARTS, Washington, D. C. Filed Feb. 23, 1882. (No model.)

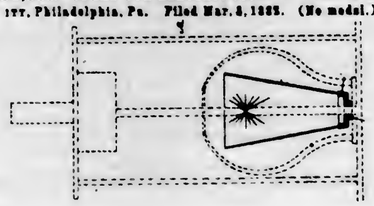
Claim.—A trunk having its body and cover composed of alternate layers of rubber and textile material, a lining of wood, and an interposed cushion of cloth or fabric, substantially as and for the purpose set forth.

256,579. MACHINE FOR MAKING TRIMMINGS. FREDERICK MARTENS, New York, N. Y. Filed Sept. 19, 1881. (No model.)



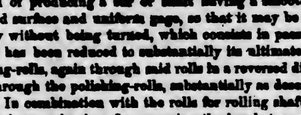
Claim.—1. The combination of a fixed guide-tube having interior cross-wires near its front end, longitudinal looping-rods passing through said tube, and a rotary bobbin-carrying flier upon said tube, substantially as described.

2. The combination of a fixed guide-tube provided with interior cross-wires, a rotary spirally-grooved guide-shaft for delivering the main gut, longitudinal looping-rods passing through said tube, a rotary flier adapted to carry bobbins, and a guide-roller adjacent to the looping-rods, substantially as described.



256,580. PARASOL. HUGO NIEL and FREDERIK LANDENBERGER, New York, N. Y. Filed Feb. 21, 1882. (Model.)

Brief.—On the outer side of the parasol is placed a pair of crossing cords provided with a slide, through which they both pass in such a manner that when the slide is moved toward the stem of the parasol the latter can be opened, but when the slide is pulled down on the closed parasol the parasol will thereby be held closed.



Claim.—The parasol attachment consisting of the two strands or cords D E, connected to the parasol at *a* and at G, and combined with the slide F, through which said cords or strands are passed, and in which they are crossed, substantially as and for the purpose specified.

256,581. GUARD FOR ELECTRIC LIGHTS. WILLIAM MCDEVITT, Philadelphia, Pa. Filed Mar. 8, 1882. (No model.)

Claim.—The improvement in electric lights, consisting of the combination, with the carbon points, of a mica chimney or guard which arrests the lateral escape of molten particles and a cup which receives said particles, substantially as and for the purpose set forth.

256,582. BRUSH. DANIEL A. MCPHAIL, Detroit, Mich. Filed Feb. 4, 1882. (No model.)

Claim.—A brush wherein the head is provided with a sawkerf at the base of the channel which contains the bristles, substantially as and for the purposes set forth.

256,583. DENTAL BRACKET. HENRY C. MERRILL, Wollaston, Mass. Filed Feb. 6, 1882. (No model.)

Claim.—1. The pawl H, sectoral ratchet F, and the gears E, D, and D, arranged and combined, as set forth, with the three arms G, C, and C and the swivel A, arranged with and applied to each other as explained.

2. The combination of the radial arm K, jointed to the arm G, with the three arms G, C, and C and the swivel A, and with the gears, sectoral ratchet, and its pawl, arranged with and applied to the arms G, C, and C as represented.

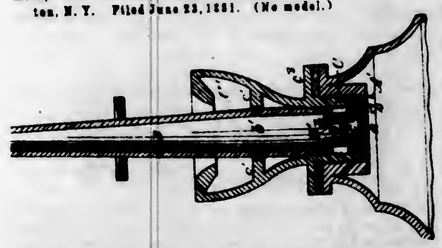
3. The combination of the arms M K G C C and toothed sectors D D, gear E, ratchet F, and pawl H, arranged and applied substantially as set forth.

256,584. ART OF ROLLING METAL BARS. LEWIS MILLER and FREDERICK BISHOP, Akron, Ohio. Filed Jan. 7, 1881. (No model.)

Claim.—1. As an improvement in the art of hot-rolling bars, the method of producing a bar or shaft having a smooth hard surface and uniform gage, or that it may be used in machinery without being turned, which consists in passing the bar, after it has been reduced to substantially its ultimate gage in the finishing-rolls, again through said rolls in a reversed direction, substantially as described.

2. As an improvement in the art of hot-rolling bars, the method of producing a bar or shaft having a smooth, hard, and polished surface and uniform gage, so that it may be used in machinery without being turned, which consists in passing the bar, after it has been reduced to substantially its ultimate gage in the finishing-rolls, again through said rolls in a reversed direction, and then through the polishing-rolls, substantially as described.

3. In combination with the rolls for rolling shafting or bars, the turning mechanism for reversing the bar between its passage through the rolls, substantially as described.



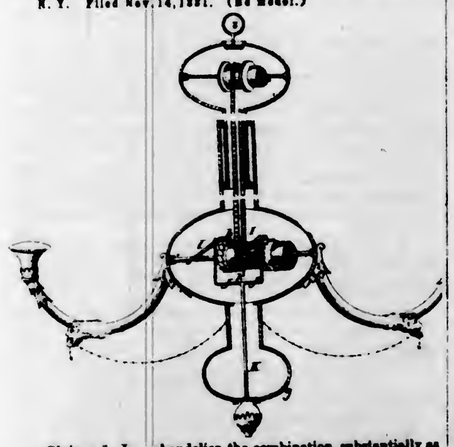
256,585. LACING-STUD. SAMUEL MONTGOMERY, New York, N. Y. Filed Feb. 25, 1882. (No model.)

Claim.—1. In a spring lacing-stud provided with a base having suitable attaching devices, the combination, with the spring-top, of the conical-shaped knob formed thereon, the point of said knob bearing against the base of the stud, substantially as and for the purposes set forth.

2. In a spring lacing-stud provided with a base having suitable attaching devices, the combination, with the spring-top, of the conical-shaped knob and the top or cover therefor, the said knob bearing against the base of the stud, substantially as shown and described.

3. In a lacing-stud having a spring-top and connected conical knob bearing against the base for closing the mouth of the stud, the throat for the reception of the lacing-cord, bent, substantially as shown, so as to extend below the base of the stud, and a base provided with suitable attaching devices, for the purposes and objects named.

256,586. OILER-NOZZLE. STEPHEN S. NEWTON, Binghamton, N. Y. Filed June 23, 1881. (No model.)



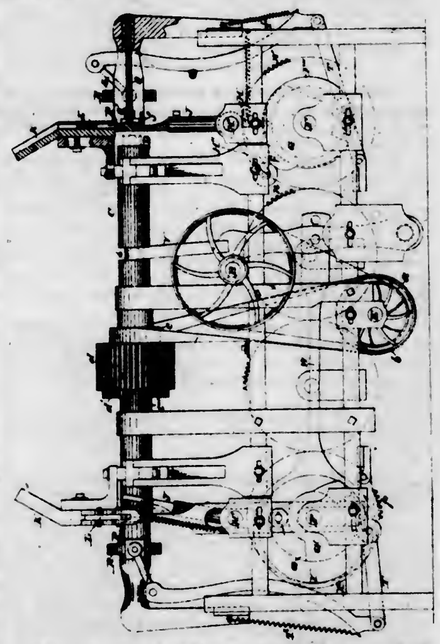
Claim.—1. In an oiler-nozzle, the combination, with the drip-cup and internally-threaded socket having an opening in its lower end for the passage of oil, of the threaded tip B, adapted to close said opening by a downward movement relative to the socket, and to be withdrawn from the socket by an upward movement to permit oil to pass from the drip-cup into the can, substantially as set forth.

2. In an oiler-nozzle, the drip-cup C, having an internal flange, *c'*, in combination with the rising and falling tip B, having a drip-port, *b'*, so arranged that when the tip is screwed down to prevent the discharge of oil from the can the said port *b'* shall be below the flange *c'*, substantially as set forth.

3. In an oiler-nozzle, the combination, with the socket C, provided with a central port, *a*, and the packing-washer *c*, of the delivery-tip having the tubular extension B' and ports *b*, substantially as set forth.

256,587. CHANDELIER. STEPHEN S. NEWTON, Binghamton, N. Y. Filed Nov. 14, 1881. (No model.)

Claim.—1. In a chandelier, the combination, substantially as hereinbefore set forth, of the following elements, namely: the telescoping supporting-tubes, an expanded bulb carried by the lower tube, a chain or flexible supporting device connecting the tubes, a coiled spring, and a drum concealed entirely within said bulb, the drum adapted to engage with the chain and to be rotated by the spring, and mounted on a shaft situated across the central line of the telescoping tubes, a stop-wheel which is rotated by said shaft, a locking-piece which at one end is fastened in the plane of rotation of said stop-wheel and at the other is movable in said plane into and out of engagement with said wheel, and an operating-rod passing through the bottom of the inclosing-bulb.



2. In a chandelier, the combination of a stationary tube, a sliding tube, a bulb carried by the sliding tube at or near the lower end thereof, a drum mounted at or near the upper end of the stationary tube, a spring which rotates said drum, a drum situated and concealed entirely within said bulb, a chain extending from the upper drum downward around the lower drum, and thence upward to the stationary tube, a stop mechanism which engages with the lower drum and prevents the winding of the chain, and an operating-rod extending downward from said stop mechanism, substantially as set forth.

3. In a chandelier, a winding-drum and spring attached to the upper stationary tube, a drum and spring attached to the lower sliding tube, a chain attached to the upper drum, passing downward around the lower drum and up to and attached to the stationary tube, and a stop mechanism to limit the rotation of one of the drums, both of said drums being constructed and arranged to engage with the chain, substantially as set forth.

4. In a chandelier, the combination, with the toothed flanges *b* and the vibrating dogs I, of the arms J and the rod K, substantially as set forth.

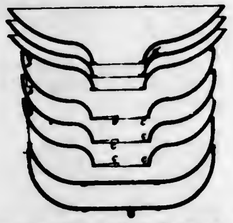
256,588. BUTTON-TURNING LATHE. GEORGE L. PALLATT, Philadelphia, Pa., assignor of three-fourths to Ostheimer Brothers and William T. Pallatt, all of same place. Filed July 23, 1881. (No model.)

Brief.—Hoppers at each end of the machine feed blanks alternately to the spindles, one of which operates to cut in connection with its chucking device while the other is dropping its completed work.

Claim.—1. The two rotating and sliding tool-carrying shafts, having necks *s* and geared together, and the gear-wheel *d*, in combination with forked yoke V, embracing both of said shafts, operating-arm W, and shaft F, substantially as set forth.

2. In a button-machine, a rock-shaft, H', in combination with a button-carrier secured thereto, and an operating-shaft, F, carrying cams, which give to the said shaft H its longitudinal and rocking reciprocating motions, substantially as set forth.

3. In a button-machine, a sliding-rock-shaft, H', having lug H and arm H", in combination with a button-carrier secured on said shaft, and operating-shaft F, provided with a cam which acts on said arm to rock shaft H', and with a cam-grooved pulley which acts on said lug to slide said shaft H' longitudinally, substantially as set forth.



4. In a button-machine, the spout or chamber K and the feed-piece L, pivoted to and operating within said chamber, in combination with arm M, shaft F, cam G, and spring N, whereby the rotation of said shaft operates the said feed-piece, substantially as set forth.

5. In a button-machine, a chuck or button-holder, in combination with a carrier, J, a sliding rock-shaft, H', to which said carrier is secured, and a shaft and cams which give longitudinal and rocking reciprocating motions to said shaft H', substantially as set forth.

6. In a button-machine, the expandible chuck or button-holder P, in combination with sleeve R, screw R', and a cam-shaft, F, and intermediate lever-connection for closing said chuck on the button, substantially as set forth.

7. In a button-machine, the split and hollow chuck or button-holder P, in combination with sleeve R, screw R', and the mechanism for rotating the same in opposite directions, and the loose spring-pressed throw-off Q, the latter being inclosed in the chuck, substantially as and for the purpose set forth.

256,589. CUSPIDOR. HENRY L. PALMER, Brooklyn, N. Y. Filed Mar. 4, 1882. (No model.)

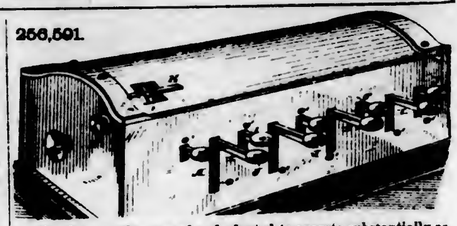
Claim.—1. In a cuspidor, the bowl, the breast, and the top or flaring mouth made separable from each other, and each of the said three parts provided with locking-joints, substantially as and for the purposes set forth.

2. In a cuspidor, the bowl, the breast, and the flaring mouth or top made separable from each other and provided with interlocking joints, and all the said parts constructed and arranged to be nested together, substantially as and for the purposes set forth.

3. The herein-described improved cuspidor, in which the flaring mouth or top and bowl are connected by an intermediate detachable breast, said breast being arranged to be coupled with the bowl and flaring mouth or top by locking-joints, and all the parts being constructed, substantially as shown, so as to nest together, in the manner and for the purposes set forth.

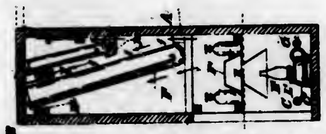
4. In a cuspidor made in separate pieces, the locking device for securing two adjacent parts, the same consisting of the projecting pin e, attached to one part, and the prongs *f f*, applied upon the walls of the slot cut in the adjoining part, substantially as shown and described.

256,590. DOUBLE CATHETER. EDWARD PRAHAR, Brooklyn, N. Y. Filed Dec. 19, 1881. (Model.)



Claim.—The catheter of soft rubber, having a smooth exterior surface and of uniform diameter, or nearly so, and formed as a single tube at one end for the reception of the syringe, and the remainder of the instrument divided into two tubes, one of which forms the injecting-duct running to the point of the instrument, or nearly so, and the other the discharge-tube *a*, terminating at the back end within the main tube, and having the eyes *e* and *f*, substantially as set forth.

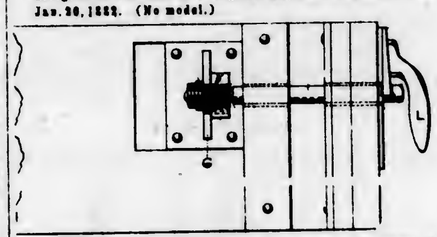
256,591. ADDING-MACHINE. FAWCETT PLUMB, Streator, Ill. Filed June 17, 1881. (Model.)



Claim.—1. In an adding-instrument, the combination, with the casing having the graduated slots, and the slotted top and pointers F E, of a transverse shaft, G, carrying the wheels C and H, and cam S, a short shaft arranged parallel to shaft G and carrying the wheels D and R, the levers L L, bar M, cam N, and a series of operating-levers, all arranged and adapted to operate substantially as set forth.

256,591.

2. In an adding-instrument, the combination, with the shafts G and O, of the bar M, pawl N, levers L L, and elastic bands connecting the latter with the shaft O, substantially as set forth.

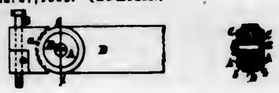


256,592. PHOTOGRAPHIC SILVER-BATH HEATER. BENJAMIN F. POWELSON, Buffalo, N. Y. Filed Nov. 19, 1880. (No model.)

Claim.—1. A photographic silver-bath heater consisting of a case, A, having doors A' and B, in combination with a heating device arranged in the lower chamber, E', a heat-distributer, F', and a suitable means, substantially as specified, for holding the baths in the upper chamber, as and for the purposes described.

2. A photographic silver-bath heater consisting of a case, A, having a heating device, C', or its equivalent, in the lower part of the case, and a suitable means, substantially as described, for supporting the bath in an inclined position in the upper part of the case.

256,593. WAGON END-GATE. GIDEON QUICK, Auburn, N. Y., assignor of one-half to George H. Hoyle, same place. Filed Jan. 20, 1882. (No model.)

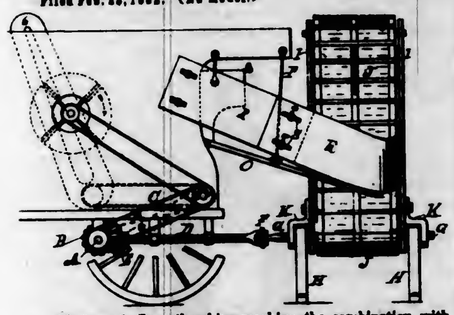


Claim.—1. As an improvement in end-gate fasteners; the plate M, having a locking-spring, *l*, and an oval hole, in combination with a mutilated scroll-cam having a wedge-shaped edge, a spring-seat, *k*, and an operating-handle, L, said cam being pivoted to said plate, as and for the purposes herein described and specified.

2. The combination, in an end-gate, of a plate secured thereto and having an ear and hub having oval holes with bushings, and a cleat having an oval hole and bushing, substantially as described and set forth.

3. An oval locking-spindle having at one end a notch and at the other a threaded extension of round form, upon which is screwed an adjusting-nut, substantially as and for the purposes described and specified.

4. The combination of the mutilated scroll-cam having a spring-seat and handle with an oval spindle having a notch at one end and a threaded extension at the other, as and for the purposes described and specified.



256,594. TRACE-COUPLING. ISAAC H. RANDALL, Boston, Mass., assignor of one-half to Bryant Higgins, same place. Filed Jan. 27, 1882. (No model.)

Claim.—1. The combination of plates A, disks C, having projections or pins *b*, bolt or screw E, with means of connecting the same to harness or saddle, and with a trace, lug, or hook-clasp, substantially as specified.

2. In combination with a trace, plates A, having extensions *a*, bolt or screw B, for securing the plates to the harness, disks C, having projections or pins *b*, and bolt or screw E, substantially as described.

256,595. STRAW-STACKER. DAVID RANKIN, Boston, Pa. Filed Feb. 28, 1882. (No model.)

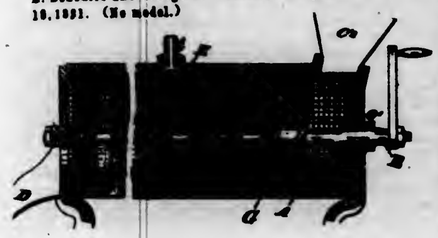
Claim.—1. In a thrashing-machine, the combination, with the usual stacker-shaft, 1, of the transverse shaft A, longitudinal shaft D, and stacker-shaft G, carrier-belt J, and means, substantially as shown and described, for rotating said shaft and carrier-belt in either of two opposite directions at will, as and for the purpose set forth.

2. The combination of the shafts 1, A, D, and G, belt C, gears B E, coupling F, carrier J, brackets K, and stops H, substantially as shown and described.

3. In a thrashing-machine, the combination of the shoe 2, the rigidly-attached suspended bridge-plate O, the adjustably-secured sectional curved guide R, and the carrier or stacker J, substantially as shown and described.

4. The guide R, comprising two sections, the one secured adjustably to the other and curved at its outer end, in combination with a thrashing-machine and stacker, substantially as shown and described.

256,596. INK FOR DYEING PURPOSES. PETER REID, Passaic, and JOHN HARTWOOD, Belleville, N. J., assignors to the Celluloid Manufacturing Company, New York, N. Y. Filed Mar. 9, 1882. (No specimens.)



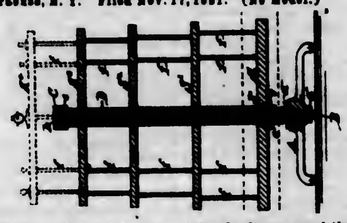
Claim.—An ink or color composed essentially of pyroxyline, a coloring agent, camphor, and a suitable menstruum, for the uses and purposes substantially as set forth.

256,597. MANUFACTURE OF PYROXYLINE FOR USE IN TOPICAL PRINTING. PETER REID, Passaic, and JOHN HARTWOOD, Belleville, N. J., assignors to the Celluloid Manufacturing Company, New York, N. Y. Filed Oct. 18, 1881. (No specimens.)

Claim.—1. The process herein described of setting or fixing a design on fabrics, &c., which consists in printing or impressing the design on the fabric with a solution composed essentially of dissolved pyroxyline and a coloring agent, substantially as set forth.

2. An ink or color for topical printing, composed essentially of dissolved pyroxyline and a coloring agent, substantially as set forth.

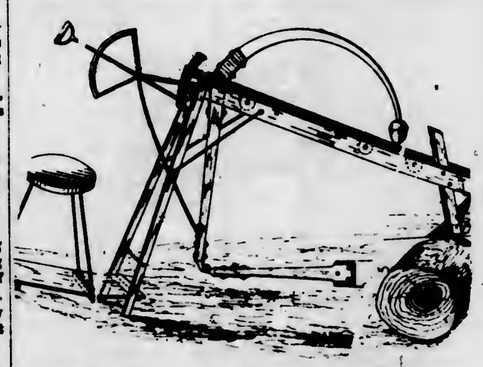
256,598. MACHINE FOR CLEANING FRUIT. SAMUEL A. RICH and WALTER S. OTHO, Buffalo, N. Y., assignors to Chas. E. Benedict and George B. Webster, same place. Filed Aug. 10, 1881. (No model.)



Claim.—In a fruit-cleaning-machine, the reticulated cylinder A, provided with a hopper, C, outlet-spout D, and nozzle H, in combination with the shaft E and brushes G, substantially as and for the purposes specified.

256,599. PRODUCTION OF COLORING-MATTER. CHRISTIAN E. RUDOLPH, Höchst-on-the-Main, Germany, assignor to Farbwerke, vormals Meister, Lucius & Brüning, same place. Filed Jan. 5, 1882. (Specimens.)

Brief.—This yellow coloring-matter is produced by the treatment of acetanilide in solution with dehydrating agents.



Claim.—A yellow coloring-matter having the characteristic properties herein mentioned, obtained from a mixture of acetanilide and hydrochlorate of aniline by heating the same in the presence of chloride of zinc or some other dehydrating agent, substantially as and for the purpose set forth.

256,600. REVOLVING BOOK-CASE. DUNCAN M. SCRELL, Syracuse, N. Y. Filed Nov. 17, 1881. (No model.)

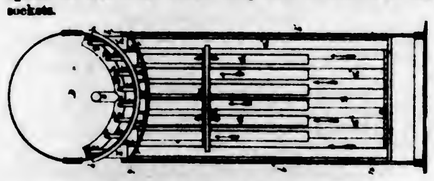
Claim.—A knockdown revolving book-case consisting of a vertical central supporting-rod, B, detachably connected to a base, A, a tube or sleeve, D, surrounding said rod and suspended from the upper end thereof, and provided at its base with an external collar, *r*, a bottom shelf, S, having a central aperture fitted to slide over the tube D, said shelf S resting on the collar *r*, superstructed shelves S' S' S' S', having a central aperture by which they slide over the tube D, and detachable spindles *f f*, interposed between the respective shelves and supporting the same, all constructed and arranged substantially as described and shown.

256,601. DRAG-SAW MACHINE. SIMON O. SUDOR, Hillsdale, Iowa. Filed Aug. 2, 1881. (No model.)

Claim.—1. In a drag-saw, the combination, with the inclined legs and parallel bars, of a saw-lever journaled between said bars and projecting slightly above them to receive a counterbalance-weight, while the lower end of said lever is provided with hinges, by which it is connected with the shank of the saw, and a saw-handle having the perforated segmental portion and adapted to move within the semicircular guide secured to the rear ends of the parallel bars, substantially as set forth.

2. In a drag-saw, the combination, with the parallel bars and legs and a saw operated by suitable means, of spring-holders situated between the bars and adapted to hold the saw elevated above the wood, substantially as set forth.

3. In a drag-saw, the combination, with the saw-lever, of a two-part handle, one portion being secured to the lever and provided with a sector-bar at its outer end, and the other portion be-

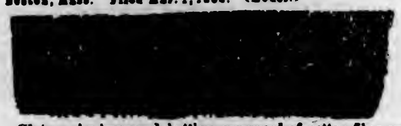


ing constructed to be adjustably secured to the sector-bar, substantially as set forth.

4. In a drag-saw, the combination, with the saw-frame, lever, weight, saw, and guide T, of a handle secured to the saw-lever and provided with the segmental portion W', as and for the purpose described.

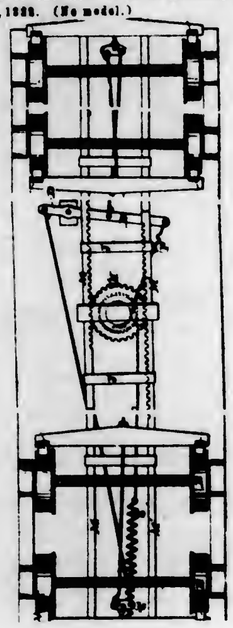
5. In a drag-saw, the combination, with the saw-frame, lever, weight, and saw, of an adjustable handle having the perforated segmental portion W', and moving within an arc-shaped guide, T, secured to the parallel bars, substantially as set forth.

256,602. STEAM-BOILER. GEORGE SEWELL, Newark, N. J. Filed July 20, 1881. (No model.)



Brief.—A plate provided with sockets is arranged outside and against the shell of the boiler. Drop-tubes are fastened in said sockets.

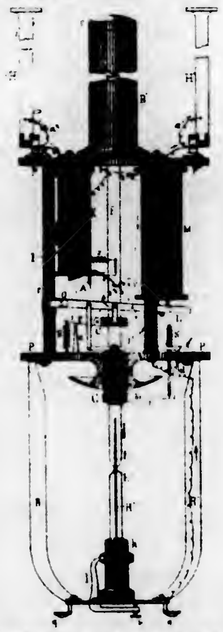
Claim.—1. Socket-plate A, with drop-tubes G, G', and G'' secured to and within sockets A', in combination with a cylindrical boiler, D, substantially as and for the purpose set forth.



2. Pipes D' *p s o b* and check-valve *b*, in combination with hanging or pending tubes G, G', and G'', substantially as described, and for the purpose set forth.

256,603. BATTING. GEORGE H. SMITH and JOSEPH H. BEALE, Boston, Mass. Filed Mar. 1, 1882. (Model.)

Claim.—An improved batting, composed of cotton fiber and wood excelsior formed into sheets, substantially as described, as and for the purposes set forth.



256,604. CAR-BRAKE. AMOS C. SPRINGER, San Francisco, Cal., assignor of one-half to S. W. Holladay, same place. Filed Jan. 27, 1882. (No model.)

Claim.—1. In a car-brake device, a series of rack-bars adapted to move pinions and winding devices which operate the brake-shoes, said rack-bars being provided with sliding telescopic connections to take up the slack, substantially as and for the purpose set forth.

2. In a device adapted to brake a series of cars simultaneously, the combination of telescopic rack-bars and winding devices with the spring P, interposed between the brake-lever D and the shaft I, substantially as and for the purpose described.

256,605. ELECTRIC LAMP. ELIHU THOMSON, New Britain, Conn., assignor to the American Electric Company, same place. Filed June 20, 1881. (No model.)

Claim.—1. The combination, with the upper carbon electrode in an electric lamp, of two differentially-moving clamps, each arranged so that its clamping edges or jaws tend to propel the carbon downward or to prevent movement of the carbon upward through the clamp, and means for disengaging said clamps to allow the carbons to come together upon an abnormal increase in the length of arc.

2. The combination, substantially as described, with an armature-lever, of two lifting-clamps connected thereto at different distances from its fulcrum, so that said clamps may have a different range of movement with a given movement of the armature.

3. The combination, substantially as described, with a carbon electrode, of two differentially-moving clamps and an operating-armature provided with supporting-links or similar rigid supporting devices for both clamps.

4. The combination, substantially as described, with the upper carbon in an electric lamp, of differentially-moving clamps arranged, as described, to move at different speeds, and each consisting of a movable body and pivoted clamping-toe, said clamping-toes being arranged with relation to the carbon, as described, to look against the carbon, so as to prevent a movement upward of the carbon through a clamp or to move the carbon downward positively with a clamp.

5. The combination, substantially as described, with a carbon rod, of two differentially-moving clamp-bodies, clamping-toes arranged, as described, so that a shifting downward of the clamp with relation to the carbon rod is prevented by the locking of the toe upon the rod, springs for holding the clamping-toes in engagement with the carbon, and stops arranged to release said clamping-toes.

6. In an electric lamp, clamps C and G, movable toes *f i*, springs S S', and stops *c* and *d*, in combination with a movable armature or its equivalent, and means for giving a differential movement to the clamps, whereby the following actions upon a carbon pencil are effected, viz: a free release of said carbon pencil when said armature is urged upon by its controlling-magnet, a lift of said pencil from contact with the other carbon pencil when said armature is acted upon by its controlling-magnet, and a downward feed due to a difference of range of said clamps when said armature is again released from said magnet.

7. The combination, substantially as described, with two lifting or propelling clamps having a different range of movement, of a propelling electro-magnet for said clamps, a derived-circuit electro-magnet, and a circuit closer and breaker for intermittently controlling the flow of a current through the propelling electro-magnet in obedience to the changes of arc-resistance.

8. The combination, substantially as described, with the plate P', supporting the lamp mechanism and its inclosing-case B, of the depending ribs R R' R'', placed with their edges to the light, clamping devices for the lower carbon carried by said ribs, supports *q q*, and the globe carried by said supports and surrounding the ribs and the light-giving focus.

9. In an electric lamp, a hanging support consisting of the parts H H', substantially such as described, and movable joints *m m*, whereby a rapid change of the position of said lamp is effected, in combination with a lamp-body, B, and extension B', and removable cap thereto, T, whereby a removal of carbons may be rapidly and conveniently effected, as described.

10. The combination, substantially as described, of an electric lamp hung on pivoted supports, and a shunt-circuit closer for completing a path around the lamp when the lamp is changed from its vertical position.

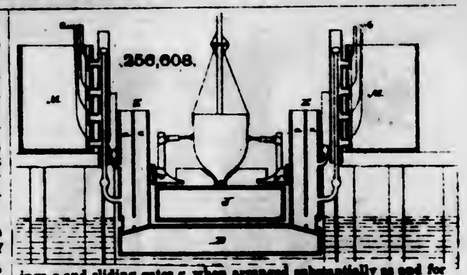
11. The combination, substantially as described, of the rigid supporting-arms, the hinged hanging arms, and a shunt-circuit closer, all combined in the manner set forth, so that when the lamp is swung from the vertical, said lamp is cut out of circuit.

12. The combination, substantially as described, of the main frame of the lamp, the jointed supports H H', casing and tubular extension B B', removable cap T, and automatic cut-out for completing a circuit around the lamp when the latter is swung into a horizontal position for the purpose of inserting a new carbon.

256,606. RIDING-SPUR. JUDSON L. THOMSON, Syracuse, N. Y. Filed Sept. 13, 1881. (No model.)

Claim.—The spur S, having the smooth-faced shoulder *a'* and screw-shank *b*, both integral with the spur, and the set-screw or pin *c*, passing movably through the shoulder *a'*, all constructed, combined, and operating substantially in the manner described and shown.

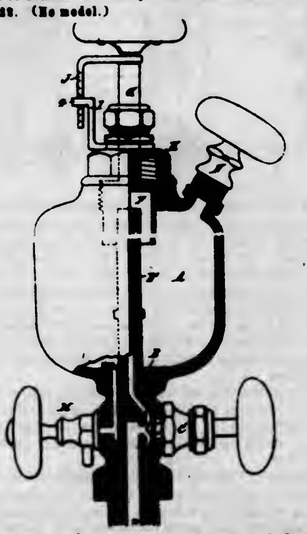
256,607. COMPOSITION FOR REFRACTORY FURNACE LININGS AND BOTTOMS. ALEXANDER R. TUCKER, Rhymney Iron Works, South Wales. Filed Sept. 24, 1881. (No specimens.) Patented in England June 17, 1881, in France Oct. 7, 1881, and in Belgium Oct. 8, 1881.



Claim.—The herein-described composition for lining Bessemer converters and furnaces, and for the making of converter-bottoms, tuyeres, and refractory bricks, the same consisting of ground ganister or sandstone, or similar ground siliceous material mixed with tar or similar hydrocarbons, preferably with the addition of a little coal-dust, in the proportions and manner herein described.

256,608. FLOATING DRY-DOCK. LIPS S. WATTS, San Francisco, Cal. Filed July 16, 1881. (No model.)

Claim.—1. In a floating dry-dock provided with the hinged brackets U and I, the lifting power of which is a dock adapted to be sunk and raised, the hollow pontoon or float , with its side gates *h*, adapted to be sunk upon the lifting-dock and to receive the vessel upon itself, substantially as and for the uses and purpose herein described.



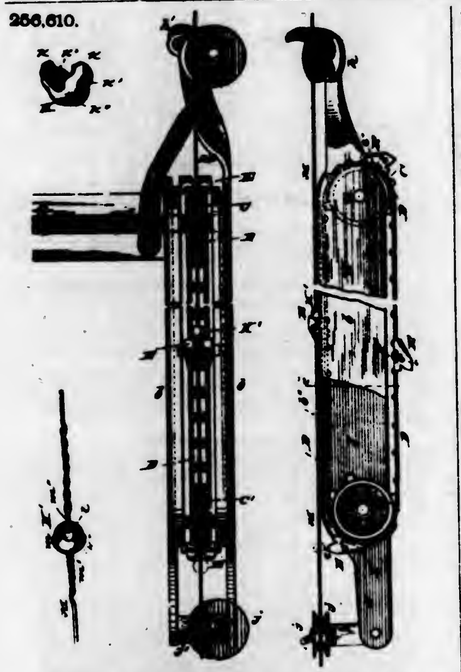
2. The floating dry-dock C, in combination with the pontoon J, having side gates, h, and keel and bilge-blocks *m*, designed to receive a vessel, the side shores, *a*, supported by the uprights *a*, and rendered adjustable by means of the hinged arms *w*, into which they screw, substantially as and for the purpose herein described.

3. In combination with the lifting-dock C, with its air-chamber D and upright compartments *a* and openings *e*, the loose-jointed inner pipes, L, outer pipes, M, and water-tanks M, with their openings *q* and sliding gates *r*, when arranged substantially as and for the purpose herein described.

4. In a floating dry-dock having a lifting-dock adapted to be sunk or raised, and water-tanks connected with said lifting-dock for filling it with water, the outer connecting-pipes, M, attached to the tanks and in open connection therewith, and the inner pipes, L, attached to the lifting-dock and in open connection therewith, and adapted to have a vertical play in the pipes M, and a side and end play by means of the ball-joint O, and the wide follower *p*, with its packing, when arranged substantially as and for the purpose herein described.

256,609. LUBRICATOR. ADOLPH WEBER, Detroit, Mich., assignor to himself and Henry W. Reed, same place. Filed Jan. 11, 1882. (No model.)

Claim.—1. The pipe D, having valve-seat and plug E, formed of one casting, and having a channel connecting with pipe D', combined with the valve C, vessel A, condensing-chamber F, and means for raising and lowering the same at will, as and for the purpose specified.



2. The vessel A, having inlet-aperture N, the plug E, having channel connecting with pipe D', the pipe D, and valve-seat, the valve C, the outlet *n* through the plug E, the condensing-chamber F, and means for adjusting its capacity at will, combined with means, I J, for indicating said capacity, all as and for the purpose set forth.

256,610. CORN-PLANTER CHECK-ROWER. RALPH W. ALEXANDER, Galesburg, Ill. Filed Jan. 26, 1882. (No model.)

Brief.—Knotted wire stretched across the field engages forked heads secured to an endless belt mounted upon sprocket-wheels for imparting motion to the seed-slide as the machine advances. Tappets or knots for check-row wire formed from a blank of malleable iron grooved and pierced for the reception of given lengths of wire.

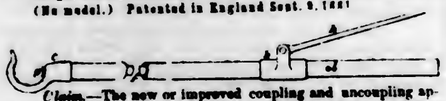
Claim.—1. In a check-rower, the combination, substantially as described, with a tappet-wire, of a belt provided with forked heads adapted to receive motion from the tappet-wire and to impart movement to the seed-slides of the planter through suitable connecting mechanism.

256,610.

2. A belt having forked heads carried on sprocket-wheels or pulleys and adapted to impart movement to planter seed-slides, in combination, substantially as described, with a wire having tappets adapted to act on said forked heads by contact therewith.

3. In a check-rower, in combination with an actuating tappet-wire, a belt mounted on pulleys or sprocket-wheels and provided with forked heads which move with the belt, whereby the action of one tappet on the wire upon one of the forked heads will move and bring another forked head into position for the action of a succeeding tappet, substantially as described, and for the purpose specified.

4. In combination, the belt mounted on pulleys or sprocket-wheels and provided with forked heads E, tappet-wire, guide-pulleys for the tappet-wire, and means for transmitting motion from the belt to the planter seed-slides, substantially as and for the purpose specified.

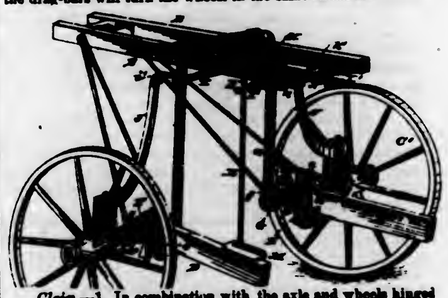


5. The belt D, having forked heads E, adapted to be actuated by a tappet-wire, sprocket-wheels C C', in combination with the shaft G, to which said belt imparts an intermittent rotary motion, whereby said shaft may impart movement to the planter seed-slides with intervals of rest between each movement of said seed-slides.

6. In combination with the belt having heads E, with side ledges, lugs, or projections, *c''*, and the sprocket-wheels, the side frame-bars, *b b*, having grooves *b''*, in which the ledges *c''* slide to hold the belt from rising while a forked head is in contact with a tappet on the wire, substantially as and for the purpose specified.

7. A tappet for corn-planter check-row tappet-wires formed of a blank, K, with holes *k'*, which holes form a hole, *k'''*, transverse to the hole *l*, both formed by closing the blank, substantially as and for the purpose specified.

8. In combination with sections of wire having interlocking eyes as *w''*, a tappet-ball having holes *l* and *k'''* transversely to each other and adapted to receive said eyes on the sections of wire, substantially as and for the purpose specified.



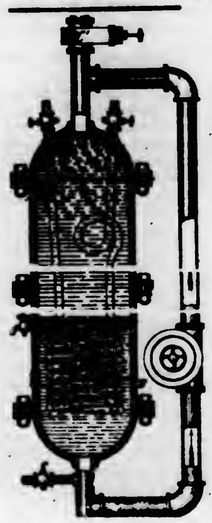
256,611. CAR-COUPLING TOOL. BENJAMIN ASKEW, Edinburgh, County of Mid-Lothian, Scotland. Filed Feb. 13, 1882. (No model.) Patented in England Sept. 9, 1881.

Claim.—The new or improved coupling and uncoupling apparatus, consisting of the combination of the tubes *a'*, hook *c*, spring *d*, rod or tube *f*, and lever A, substantially as hereinbefore described, and shown on the sheet of drawings hereunto annexed.

256,612. CULTIVATOR. ROBERT T. AVERY, Galesburg, Ill., assignor of one-half to Cyrus H. Avery, same place. Filed Sept. 9, 1881. (Model.)

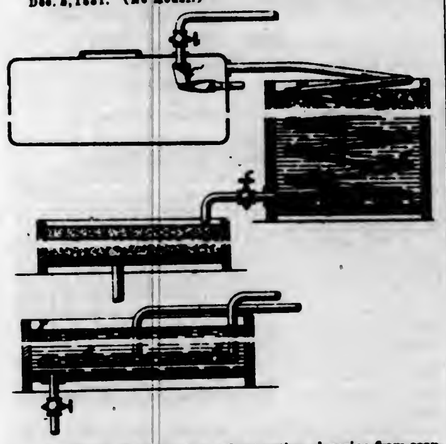
Brief.—The wheels may turn to the right or left on vertically-hinged spindles. The arms from the spindles are linked to a pivoted cross-bar, and may be operated by a lever or connected by other bars and rods to the drag-bars, so that the lateral swing of the drag-bars will turn the wheels in the same direction

Claim.—1. In combination with the axle and wheels hinged thereto and arms projecting from the wheel-spindles, the transverse pivoted bar I and links *i'*, connecting the arms J, a bar, I', extending rearwardly from the bar I, by means of which the bar I may be oscillated and the wheels deflected, substantially as and for the purpose specified.



2. In combination with the axle or frame having swinging wheels with arms J, the bars I I', sliding bar K, and plow-beam D, the rods or arms L, adapted to move the wheels by the lateral movement of the plow-beam, substantially as and for the purpose specified.

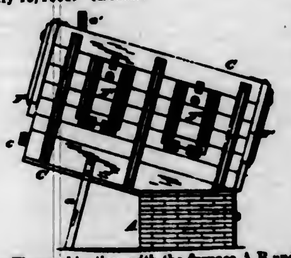
3. In combination with the bars I I', for operating the swinging cultivator-wheels, and with the sliding bar K, the rigid bar N, to which the bar I' may be locked, substantially as and for the purpose specified.



4. In combination with the sliding bar K and plow beam or gang, the rod L, adapted to move freely in the bar K to permit the plow-beam to swing vertically without moving the bar K, and to move said bar K when the plow-beam is swung laterally, substantially as and for the purpose specified.

5. In combination with the axle or frame having swinging wheels with arms J, the links *i'*, bars I I', sliding bar K, having a series of adjusting-holes, *k'''*, and plow-beam D, the rods or arms L, adapted to move the wheels by the lateral movement of the plow-beam, substantially as and for the purpose specified.

256,613.



256,614. PROCESS OF EXTRACTING GLYCERINE FROM SALT SOAP-LYE. BENJAMIN T. BABBITT, New York, N. Y. Filed Dec. 5, 1881. (No model.)

Claim.—1. In the process of extracting glycerine from soap-lyes, the atomizing or spraying of the lyes by superheated steam, substantially as specified.

2. The process of extracting glycerine from soap-lyes, consisting in first atomizing or spraying the lyes by means of superheated steam, next condensing the spray, next filtering the liquid resulting from condensation, and finally evaporating the water contained in the liquid, substantially as specified.

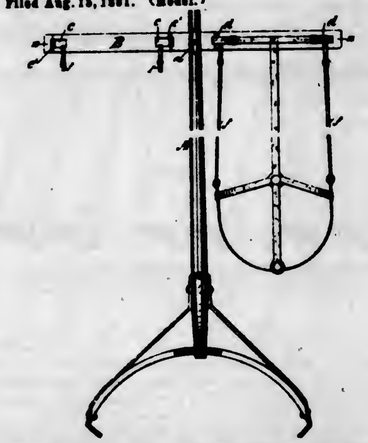
256,615. FRUIT-DRIER. WILLIAM J. BACON, Addison, Mich. Filed July 18, 1881. (Model.)

Claim.—The combination, with the furnace A B and inclined casing C, having flues D and trays E, arranged as described, of the inclined hot-air exit-pipe *c*, arranged under the inclined roof of the casing, and provided with a series of inlets, *c' c' c'*, and outlet *c'*, substantially as shown and specified, for the purpose set forth.

256,616. MECHANISM FOR TRANSMITTING POWER FROM WINDMILL-SHAFTS. A. S. BARNS, Evansville, Wis. Filed Mar. 3, 1882. (No model.)

Claim.—1. In a windmill, the combination, with the wind-wheel shaft carried by a turn-table, of an endless-belt connection between the same and the driven mechanism, substantially as set forth.

256,616.



2. In a windmill, the combination, with the tower, the turn-table, and the wind-wheel shaft, of a driven mechanism located at or near the bottom of the tower, and an endless-belt connection between the wind-wheel shaft and such driven mechanism, substantially as set forth.

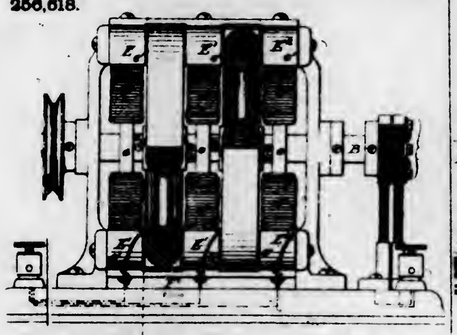
3. In a windmill, an endless-belt connection with the wind-wheel shaft, in combination with means for untwisting or permitting the untwisting of the belt without reversing the driven mechanism, substantially as set forth.

4. In a windmill, the combination of the endless-belt connection with means operated by hand for untwisting or permitting the untwisting of the belt without reversing the driven mechanism, substantially as set forth.

256,617. WAGON-YOKE. WILLIAM A. BARRE, Coloma, Mich. Filed Aug. 18, 1881. (Model.)

Claim.—1. An improved yoke for supporting tongues of wagons, adapted to be suspended under the horses from the back-pads, substantially as and for the purpose set forth.

2. The yoke B, formed with the slots *c*, and provided with the pins *c'*, whereby the straps *d d* and the haldback-straps *f f* may be attached to it, substantially as and for the purposes set forth.



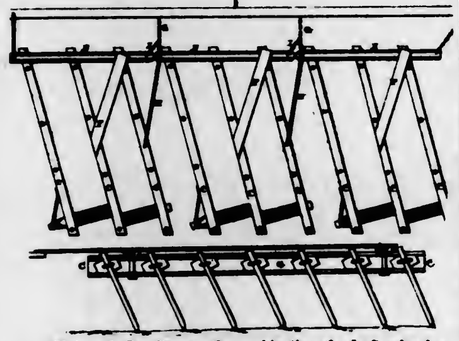
3. The combination, with the short pole A, of the yoke B, pivoted to the said pole and provided with the straps *d f*, substantially as and for the purpose set forth.

256,618. DYNAMO-ELECTRIC MACHINE. GEORGE H. BARUS, New York, N. Y. Filed July 29, 1881. (No model.)

Brief.—The field and armature magnets are formed of flat cores with enlarged segmental pole-pieces, and wound with wire nearly flush with the projections of the pole-pieces. The magnets are arranged side by side, the armature-magnets being fixed to the shaft of the machine. The poles of the field-magnets are connected by iron plates. The machine may be connected in multiple arc or series.

Claim.—1. An electro-magnet for dynamo-electric machines or electric motors, consisting of a broad flat web of iron with en-

256,618.



larged polar extensions, and wire wrapping nearly flush with the flat sides of said polar extensions.

2. A dynamo-electric machine or electric motor having a series of stationary field-magnets and rotary armatures arranged side by side, and each consisting of a broad flat web of iron with enlarged polar extensions, and wire coils nearly flush with the flat sides of said polar extensions, all substantially as described.

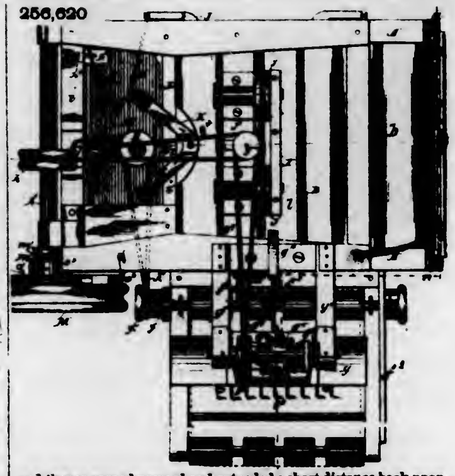
3. The combination of a series of field-magnets, E E', &c., of a dynamo-electric machine or electric motor having segment-shaped poles, with similarly-shaped rotary armatures, and a strip or strips of iron connecting the curved faces of the segmental poles of the field-magnets, substantially as specified.

256,619. HARROW. JAMES H. BARLEY, Sedalia, Mo. Filed Jan. 21, 1881. (No model.)

Claim.—1. In a harrow, the combination of a draft rod or bar with the sections of the harrow, the chains G, which unite the sections to the draft-rod, and the chain I, which unites the corner of the adjacent section to the chain G, substantially as shown.

2. In a harrow, the combination of the draft-rod, the chains G I, and the diagonal brace or chain, which unites the two sections of the harrow together, substantially as described.

3. In a harrow, the extensions E, made to project beyond the two edges of the sections of the harrow, with the chains G, which are connected to said extensions and unite the sections of the harrow to the draft-bar, substantially as set forth.



4. In a harrow, the combination, with the double-flanged beam C, of the polygonal stop-blocks J, and the harrow-tooth clamped thereto and against the edges of the flanges, which act as stops to the movement of the blocks, substantially as specified.

5. In a harrow, the combination of a tooth-holder with the double-flanged beam, the plate being clamped thereto and inserted between the flanges of the beam which holds the plate and tooth in position, substantially as and for the purpose shown and described.

256,620. GRAIN-FEEDER AND BAND-CUTTER FOR THRASHING-MACHINES. THOMAS J. BARLOW, Bald Knob, Tex. Filed July 28, 1881. (Model.)

Claim.—1. The combination, with the traveling apron B, having hinged rake-heads provided with teeth capable of projection and retraction through its slots, and provided with arms projecting within the apron, of the ways D, inclined upon their lower sides,

256,620

and thence carved upward and extended a short distance back upon the upper surface of the frame, supporting the apron and co-operating with the aforesaid arms of rake-head, substantially as and for the purpose specified.

2. The combination, with the apron B, having hinged rake-head provided with the teeth C, projecting through a perforated slot, b^3, therein, and provided with arms b^4 and stops b^5, of the ways D, having their forward ends curved upward and carried back upon the apron-supporting frame past the forward end of the latter, and adapted to engage with the aforesaid arms of the rake-head, substantially as and for the purpose set forth.

3. The combination, with the apron-supporting frame E and board d, of the crank-shaft d', lever e, rods e' e^2, the adjusting-screw e^3, and the slide e^4, substantially as and for the purpose set forth.

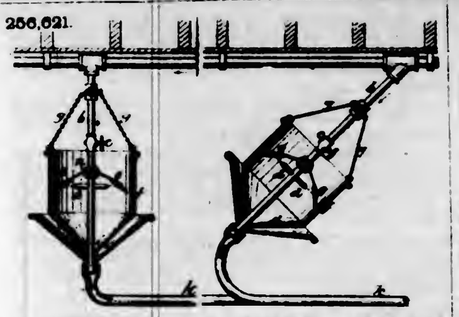
4. In a grain-feeder for threshers, the combination, with the pivoted bar or board J, arranged at one side of the feeder, of the spring holding it in its vertical position, the rod h', bell-crank lever K, hooked rod h^2, bolt h^3, and the feed-table having one of its shafts or rolls provided with a fixed and a loose pulley, substantially as and for the purpose set forth.

5. In a grain-feeder for threshers, the combination, with the spring check-board J, arranged at one side of the feeder, of the rods h' h^2, lever K, spring h^3, hooked rod h^4, pulleys K' K'', the belt h^5, and the feed-table having one of its rolls provided with a fixed pulley, f', and a loose pulley, f, substantially as and for the purpose set forth.

6. The combination of the toothed bar G', cutter proper, g^2, crank-shaft g^3, the beveled pinions g^4 g^5, shaft g^7, frame g', belt g^8, and pulleys g^9 g^{10}, substantially as and for the purpose set forth.

7. The combination, with the shaft h' of the feeder, having a fixed disk provided with a pin or projection, o', of the pulley M, having the weights n, spring r, levers N o^4, wire o^5, and arm o, substantially as and for the purpose specified.

8. The combination, with the shaft h', having the disk provided with the projection o', and the feeder-frame having the projection q, of the pulley M, having eye P, weights n, disk n^2, spring r, lever N, arm o, lever o^4, wire o^5, and catches o^6 o^7, substantially as and for the purpose specified



256,621. ATOMIZER. JAMES BROOS, Paterson, N. J. Filed Mar. 17, 1882. (No model.)

Brief.—A casing surrounds the spraying-tubes. This casing is open at its top, closed at its bottom, and adjusts vertically with relation to the spray-tube. An adjustable deflector is placed above the spray-jet and within the surrounding casing. These attachments prevent particles of fluid of a palpable size from reaching the room that is to be moistened.

Claim.—1. In an air-moistener, the combination, with a spraying or atomizing jet, of a casing inclosing the same and adapted to permit the impalpable misty particles to escape and diffuse into the air while arresting or retaining the heavy or palpable particles, substantially as herein set forth.

2. In an air-moistener, the combination, with spraying or atomizing jets, of a casing inclosing the same, covered or closed at

256,621.

the bottom and open at the top, substantially as and for the purpose set forth.

3. The combination, in an air-moistener, with a spraying or atomizing jet, of a casing inclosing the same, covered or closed at the bottom and open at the top, and a waste-pipe or drain connected with the bottom of the casing, substantially as herein set forth.

4. An improved air-moistener formed by the combination of a spraying or atomizing jet, a casing inclosing the jet, closed or covered at the bottom and open at the top, and a deflector placed over the jet within the casing, substantially as herein shown and described.

5. The combination, in an air-moistener, of a spraying or atomizing jet, a casing inclosing the same, and a catch-basin placed under the said casing, substantially as and for the purpose set forth.

6. The combination, with an atomizing or spraying jet, of a casing placed about the same, open at the top, covered at the bottom, and means for adjusting said casing up or down with relation to the jet.

7. In an air-moistener, the combination, with a spraying or atomizing jet, a casing inclosing the same, open at the top or sides, and a deflector placed over the jet within the casing, of means for adjusting the deflector up or down with relation to the jet, substantially as herein set forth.

8. In an air-moistener, the combination, with the jet-pipe b, of the casing f, suspenders g, and adjustable clasping-sleeve h, arranged and operating substantially as and for the purpose set forth.

256,622. METHOD OF MANUFACTURING CRYSTALLIZED ANHYDRIDE OF GRAPE-SUGAR FROM A WATERY SOLUTION OF GRAPE-SUGAR. ARNO BEHR, Jersey City, N. J. Filed Feb. 28, 1882. (No specimens.)

Brief.—Improvement on process for which Letters Patent No. 250,333 were issued December 6, 1881.

Claim.—The process of manufacturing crystallized anhydrous grape-sugar herein described, which consists in concentrating a watery solution of grape-sugar of a purity between eighty-five and ninety-five until it contains only about thirteen per cent. of water, and in introducing such solution into molds of ordinary construction, and keeping it, while in the molds, in a room in which the temperature is maintained at about 90° Fahrenheit for from one to two weeks, or until thorough crystallization has taken place, and in then expelling the liquid from the crystallized product by means of a centrifugal machine, in which the molds are placed.

256,623. PROCESS OF MANUFACTURING CRUSHED ANHYDROUS GRAPE-SUGAR. ARNO BEHR, Jersey City, N. J. Filed Feb. 28, 1882. (No specimens.)

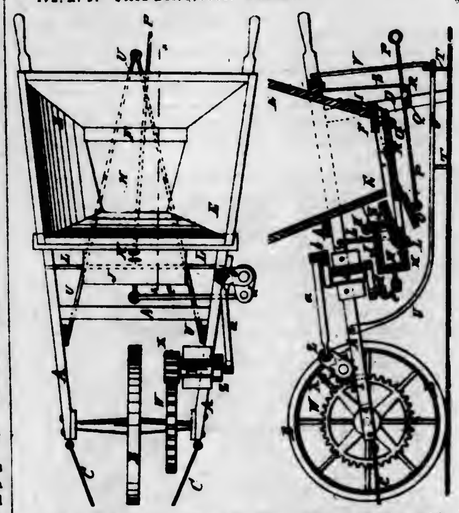
Brief.—Improvement on process described in Letters Patent No. 250,333, dated December 6, 1881.

Claim.—The herein-described process of manufacturing crystallized anhydrous grape-sugar, which consists in first producing a coarse crystallization of anhydrous grape-sugar by subjecting a concentrated watery solution of grape-sugar to a temperature of about 90° Fahrenheit for a sufficient period of time to effect complete crystallization, and in then crushing the crystallized mass, and finally draining it in a centrifugal machine.

256,624. LAMP. DANIEL BENNETT, Baldwin Township, Allegheny County, Pa. Filed Jan. 20, 1882. (No model.)

Claim.—1. A glass-lamp fount, A, having a socket, a, on its under side, with separate inclines or thread-sections a' of glass formed on the inside wall of such socket, substantially as set forth.

2. A glass lamp having in the base of its bowl a socket, a, with separate inclines or thread-sections a' of glass on the side wall of the socket, and a glass stem, B, with threaded glass pin b, adapted to screw into the socket a, substantially as set forth.



256,624.

3. A glass lamp having a separable bowl, stem, and foot formed of glass, the connections between such parts being formed of threaded glass pins and sockets, the latter having separate inclines or thread-sections on their side walls, substantially as set forth.

4. A lamp having a separable glass bowl and stem, the connection being formed of threaded pin b and socket a, with part threads a' thereon, and with a drip-cup formed of glass integral with and on the upper end of the stem, substantially as and for the purposes set forth.

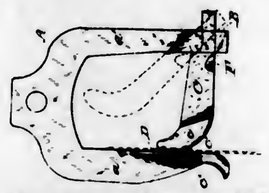
256,625. FERTILIZER-DISTRIBUTER. JEROME L. SHERRY, Flatlands, assignor to himself and George B. Forrester, Brooklyn, N. Y. Filed Dec. 8, 1881. (Model.)

Claim.—1. In a fertilizer-distributer, the combination, with the hopper E, of the vibrating distributing-plate H, pivoted at its rear end to the under side of the hopper, and provided with adjustable gage-valve M and stop-valve O, and the means for vibrating the said plate, substantially as and for the purpose set forth.

2. In a fertilizer-distributer, the combination, with the hopper E, provided with the strip F in its bottom, of the vibrating distributing-plate H, pivoted to the said strip at its rear end, and connected to the hopper by its flexible strip I, and provided with the adjustable gage-valve M and stop-valve O, and means for vibrating the said distributing-plate, substantially as and for the purpose set forth.

3. In a fertilizer-distributer, the combination, with the vibrating distributing-plate H, provided with the discharge-opening, and the rod Q, attached to the legs D, of the stop-valve O, hinged to the said plate, the rod P, provided with the stop R, and the slotted upright S, substantially as and for the purpose set forth.

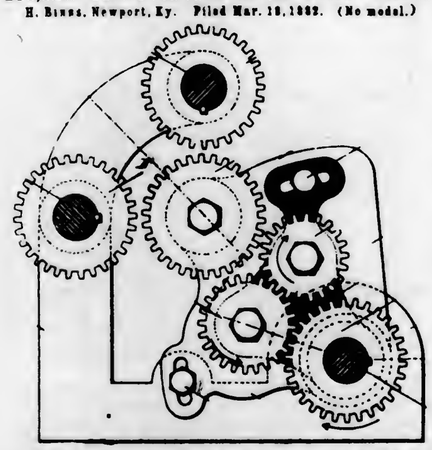
4. In a fertilizer-distributer, the combination, with the frame A and the toothed bar U, of the swinging bail V, substantially as herein shown and described, whereby the said toothed bar can be held down to its work and supported above the ground, as set forth.



5. In a fertilizer-distributer, the combination, with the frame A and the open-bottom hopper E, of the vibrating distributing-plate H, pivoted at its rear end to the hopper, and provided with a discharge-opening and regulating-valves, the bent rod L, and the means for vibrating the said plate, substantially as and for the purpose set forth.

6. In a fertilizer-distributer, the combination, with the drive-wheel B, the hopper E, and the vibrating distributer-plate H, pi-

oted to the hopper, and provided with the end plate, K, of the gear-wheels W X, the cranks Z *b d*, and the connecting-rods *a c*, substantially as and for the purpose set forth.



7. In a fertilizer-distributer, the combination, with the vibrating distributing-plate H, projecting in front of the hopper and covered by the board J, of the gage-valve M, hinged to the said plate, and the screw N, substantially as and for the purpose set forth.

256,626. TEMPORARY BINDER. JOHN A. BURSTLER, Marion, Pa. Filed Feb. 13, 1882. (Model.)

Claim.—As an improvement in temporary binders, the combination, with the casting A, having the arm *a'*, in the lower end of which is formed an inclined mortise or slot, B, of the adjustable and removable clamping-jaw C, having the entire surface of its inner end curved, and provided near its rear end with lateral nibs F, to prevent it from entering too far into slot or mortise B, substantially as and for the purpose specified.

256,627. DEVICE FOR TRANSMITTING MOTION. WILLIAM H. BINNS, Newport, Ky. Filed Mar. 18, 1882. (No model.)

Claim.—The six gears and two tumblers combined substantially in the manner set forth.

256,628. ROLL FOR GRINDING-MILLS. RICHARD BIRKHOLZ, Milwaukee, Wis., assignor to Edward P. Allis, same place. Filed Dec. 8, 1881. (No model.)

Claim.—1. In a grinding-roll, the tubular porcelain body having the smooth unbroken ends with beveled faces, in combination with the recessed end plates having corresponding unbroken surfaces, and the means for drawing said plates firmly against the ends of the body, as described and shown, whereby the body is maintained in a central position and prevented from fracturing.

2. The combination of the shaft, the end plates mounted and secured against rotation upon the shaft and provided with smooth tapered recesses, the porcelain body having smooth tapered end, and the tie-rods extended through the body and the end plates, as shown.

3. As a new article of manufacture, a tubular cylindrical porcelain body having on its end the unbroken, squared, and beveled surfaces *a b*, as shown and described.

4. The combination of the porcelain body having the flat and beveled surfaces at its ends, the smooth recessed end plates, the fastening devices, and the washers inserted between the body and end plates and bearing between both the flat and the beveled surfaces, as shown.

5. The porcelain roll having smooth conical ends seated in and driven by frictional communication with correspondingly-recessed end plates urged forcibly toward the roll, substantially as described and shown.

256,629. COMBINED PENCIL-POINT PROTECTOR AND TWINE-CUTTER. CLARK W. BOMAR, New York, N. Y., assignor to Joseph Rockendorfer, same place. Filed Jan. 23, 1882. (No model.)

Claim.—The point-protecting tube provided with an internal blade, *d*, and twine-admitting slot or opening *f*, substantially as hereinbefore shown and described.

256,630. SEPARATOR FOR STARCH. WILLIAM T. BOOTH and ALEXANDER H. BELL, New York, N. Y.; said Bell assignor to said Booth. Filed Oct. 5, 1881. (No model.)

Claim.—1. In a starch-separator, the combination, with supports provided with rollers, of the shaking sieve-frame having guide-bars sliding on said rollers, substantially as set forth.

2. In a starch-separator, the combination, with the frame A, the drive-shaft *d*, the eccentric *h*, and the screen B, provided with yoke *i* at its upper end, of the springs *l*, interposed between the said screen and fixed guides at each end of the screen, substantially as and for the purpose set forth.

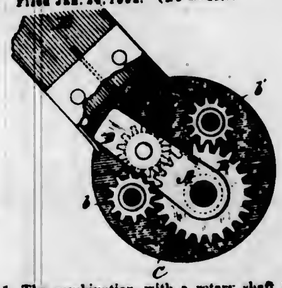
3. In a starch-separator, the combination, with the frame A, provided with the grooved rollers *b*, the shaft *d*, the eccentric *h*, and the guides *m*, of the screen B, provided with guide-irons *e* and the yoke *i*, and the springs *l*, interposed between the screen and said fixed guides, substantially as and for the purpose set forth.

256,631. RAILWAY-CAR. CALEB H. BRADLEY, West Chester, Pa. Filed Feb. 21, 1882. (No model.)

Claim.—In a car-roof, the man-opening C, having the raised margin *d*, the flanged cover E, the catches *n*, and the hooks G, having handles *g* projecting above the roof, substantially as specified.

256,632. PITCHFORK. FRANCIS L. BRANDON, Hicksville, Ohio. Filed Mar. 2, 1882. (No model.)

Brief.—A single strip forms the end tines and is arched in the middle to form the back of the fork. The middle tines pass through openings in the cross-piece, are turned upward, and attached to the arch.



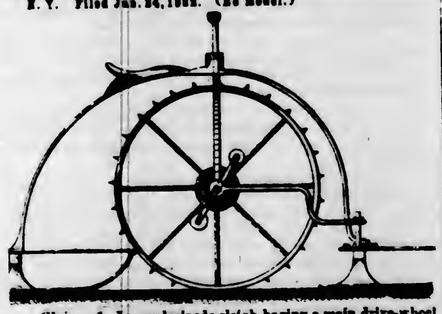
Claim.—1. The single strip or piece A, forming the end tines, B B, and bowed or arched at its center to form an upturned back, D, as and for the purpose specified.

2. The combination, with the arched piece A, forming the two end tines, and with the middle tines of the cross brace or strip provided with openings through which the tines pass, and secured on the latter, as herein shown and specified.

3. The combination, with the single strip A, forming the end tines, B B, and bowed or arched at its middle portion to form a back, D, and the cross-piece E, having a series of openings, F, of the middle tines, the rear ends of which are passed through these openings and then turned upwardly and secured to the arch C, as herein shown and specified.

4. The combination of the arched piece A, forming the end tines, B B, the cross piece or strip E, having a series of openings, F, the middle tines having upturned ends, and the rod or handle secured to the arch and cross-piece, substantially as herein shown and described.

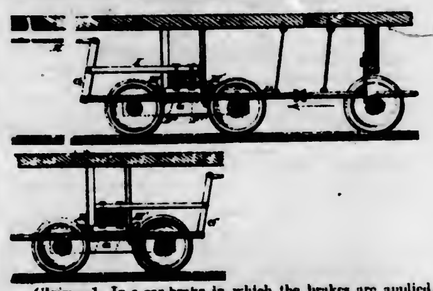
256,633. MECHANICAL MOVEMENT. JAMES B. BRAY, Waverly, N. Y. Filed Jan. 24, 1882. (No model.)



Claim.—1. The combination, with a rotary shaft having a rigid wheel thereon, a loose wheel meshing with the said rigid wheel and arranged on a fixed center, of a swinging frame hung upon the said shaft and having a loose wheel or its equivalent, as described, meshing against the said rigid wheel and adapted to jam between it and the said wheel on the fixed center, as and for the purpose described.

2. The combination, with a rotary shaft having a rigid toothed wheel thereon, a loose pinion fixed on a stationary bearing and gearing with said rigid wheel, and a swinging frame hung upon the rotary shaft and carrying a loose pinion, also gearing with the rigid wheel, and adapted, as described, to jam the same with the relatively fixed pinion, as described.

3. The combination, with the frame-plates C C and the arm E, rigidly attached thereto, of the rotary shaft A, carrying rigid wheel B, the pinions *b b'*, arranged on fixed centers on opposite sides of the swinging frame and in gear with the wheel B, and the swinging frame D, having a pinion, *a*, adapted to jam with either of the wheels *b b'*, to rotate the main shaft in either direction, as described.

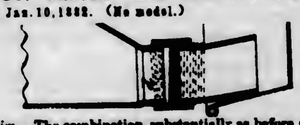


256,634. VELOCIPEDE-SLEIGH. JAMES B. BRAY, Waverly, N. Y. Filed Jan. 24, 1882. (No model.)

Claim.—1. In a velocipede-sleigh having a main drive-wheel and a pair of front and rear runners, the combination, with said drive-wheel arranged to turn on a vertical center, of one of said pair of runners arranged on an independent vertical center and connected with the drive-wheel for a parallel deflection, substantially as shown and described.

2. In a velocipede-sleigh, the combination, with the drive-wheel and the pivoted runners arranged to turn about independent vertical centers, of the double crank-pedals E and the rods F, connected at one end to the cranks at a point concentric with the wheel and by their other ends to the pivoted runners, substantially as described.

256,635. CAR-BRAKE. JAMES B. BRAY, Waverly, N. Y. Filed Jan. 24, 1882. (No model.)



Claim.—1. In a car-brake in which the brakes are applied by pressure upon a buffer-rod transmitted from the engine, the combination of short buffer-rods extending through the trucks, the brake-beams having a direct connection with the buffer-rods through springs, a traction-rod extending from truck to truck for transmitting the movement of one buffer to the other, and levers for connecting the buffer-rods to the traction-rod, as and for the purpose described.

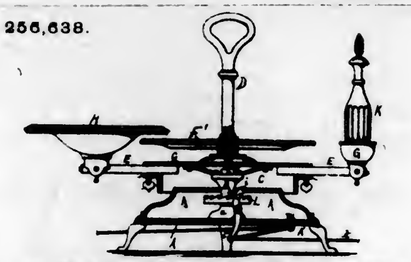
2. The combination of the brake-beams, the short buffer-rods extending through the trucks and passing through a guide attached to the brake-beams, and having rigid collars *a*, spiral springs arranged between the collars and the brake-beams, the levers G G', and the traction-rod H, as and for the purpose described.

3. The combination of the brake-beams, the short buffer-rods with collars *a*, extending through the trucks and passing through a guide attached to the brake-beams, the springs arranged between the collar *a* and the brake-beams, the fulcrum-bar I, attached to the truck-beam, the levers G G', and traction-rod H, substantially as shown and described.

256,636. HANGER. ORRIN CLARK BURDICT, Buffalo, N. Y. Filed Jan. 10, 1882. (No model.)

Claim.—The combination, substantially as before set forth, of the open feed-pan, the grain-hopper, and the adjustable screw-nozzle of said hopper.

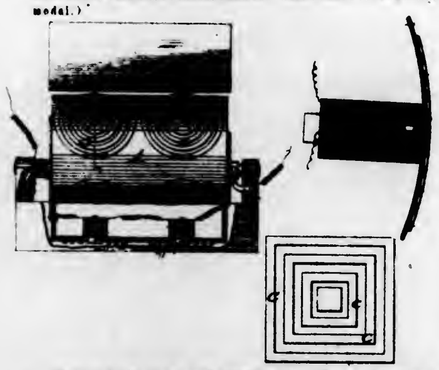
256,637. SASH-HOLDER. JAMES CAMPBELL and GIBSON SIMONSON, Harrison, Ohio. Filed Mar. 1, 1882. (No model.)



Claim.—1. In a sash-fastener, the combination, with the lock-plate provided with the lug G, of the pivoted cam E, provided with the semicircular series of teeth F, the pivoted lever B, projecting outside the lock-plate and above the lug thereon, and having the segmental rack-teeth D, engaging the teeth on the cam, and the spring H, interposed between the lug on the lock-plate and the pivoted lever, all substantially as shown and described.

2. In combination with the case A, spring-lever B, geared to cam E, the segmental slot I, and screw K, for locking the parts in position, substantially as herein set forth.

256,638. SERVER. ROBERT J. CARSON, Detroit, Mich., assignor of one-fourth to Edward Sheldon Norton, St. Paul, Minn. Filed Jan. 24, 1882. (No model.)



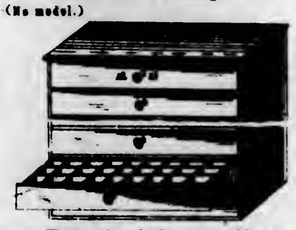
Claim.—1. The combination of the stand A and revolving plate C with the adjustable frames F F' G H, substantially as set forth.

256,638.

2. The stand A, revolving plate C, adjustable frames F F' (I I), and means for revolving said plate and adjustable frames upon said stand, substantially as set forth.

256,639. MAGNETIC ORE-SEPARATOR. SAMUEL E. ST. O. CHAPLEAU, Ottawa, Ontario, Canada. Filed Jan. 26, 1882. (No model.)

Claim.—1. In a magnetic ore-separator, the combination of an electro-magnet and a series of supplemental attractive surfaces separated from the magnetic pole and arranged in relation thereto, substantially as described and shown.

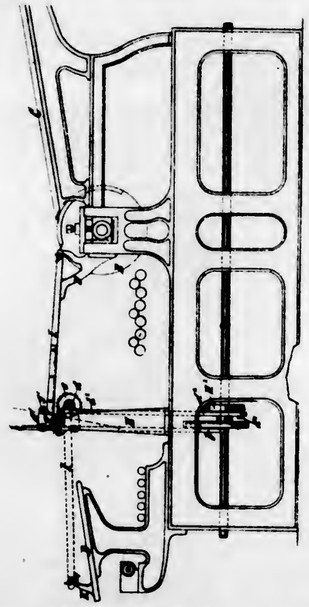


2. In an ore-separator, the combination of a magnet and a series of supplemental surfaces of magnetic material insulated and disconnected from the magnet, but arranged in relation thereto, substantially as shown.

3. In an ore-separator, the combination of a hopper, a magnet, and series of magnetic rings or plates encircling the pole of the magnet, as and for the purpose described.

4. The combination, substantially as described, of the revolving cylinder provided with the series of electro-magnets and supplemental surfaces, as described, and means whereby the magnets are rendered active and inactive alternately.

5. The combination of the revolving cylinder, the electro-magnets and supplemental surfaces mounted thereon, the feed-hopper, the two receptacles, and means, substantially as described, for magnetizing and demagnetizing the magnets.



256,640. CASE OR CABINET FOR THE DISPLAY OF WATCH-CRYSTALS. NORMAN CLARK, Sterling, Ill. Filed Nov. 11, 1881. (No model.)

Claim.—1. The watch-maker's case or cabinet provided with trays or drawers B, having rectangularly-arranged compartments marked and numbered, respectively, to indicate convexities and diameter of crystals, substantially as set forth.

2. A tray for watch-crystals, having compartments regularly marked and numbered from left to right to indicate the convexities and from front to rear to indicate the diameters or the reverse arrangement, substantially as set forth.

256,641. DELIVERY APPARATUS FOR PRINTING-PRESSES. CALVERT B. COTTRELL, Westerly, R. I. Filed Dec. 24, 1881. (No model.)

Claim.—1. The combination, with the impression-cylinder and the receiving-table arranged in front thereof, of bars or rods carrying a gripper-shaft and grippers and having both a swinging-over and a longitudinal movement, substantially as and for the purpose herein described.

2. The combination, with the impression-cylinder and the receiving-table arranged in front thereof, of bars or rods carrying a gripper-shaft and grippers having a swinging-over motion, and also having a longitudinal movement back and forth during each swinging movement in either direction, substantially as and for the purpose herein described.

3. The combination, with a shaft having a rotary motion alternately in opposite directions and a concentric tubular shaft having a similar but independent motion, of frames fixed on the first-mentioned shaft, bars or rods carrying a gripper-shaft and grippers and movable longitudinally in said frames, and wheel-work for imparting to said bars or rods their longitudinal movements, substantially as and for the purpose herein described.

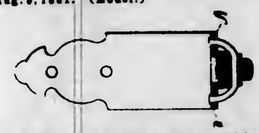
4. The combination of the shaft F, sleeve G, pinion *a*, and frame *g*, fixed to said shaft, pinions *c' f*, fixed to said sleeve, bars or rods I, connected wheels *d' e*, and rack-bars *b' d'*, all substantially as herein described.

5. The combination, with delivery-grippers and a gripper-shaft, of toggle-links for opening said grippers and holding them open, and springs for closing them, substantially as herein described.

6. The combination, with a longitudinally-divided gripper-shaft and arms projecting from the two parts thereof, and grippers also attached to both parts of said shaft, of toggle-links connecting said arms and serving to keep the grippers apart, and springs for drawing them together, substantially as herein described.

7. The combination of the divided gripper-shaft J J', the grippers *i i'*, the arms *h k'*, the toggle-links *l l*, and the stops *m q*, substantially as herein described.

8. The combination, with gripper-carrying rods or bars, sliding boxes fitted thereto, a gripper-shaft fitted to said boxes, and pairs of grippers attached to said shaft, of converging fingers attached to said gripper-shaft and cams upon said rods or bars for holding said fingers closed, substantially as herein described.



256,642. NUT-LOCK. WILLIAM COURTENAY, New York, N. Y., assignor to the Gelatinized Fibre Company, of New York. Filed Jan. 28, 1882. (No model.)

Claim.—1. A compound washer having a body, A, of fiber, and upon one side only of the body A a flanged cap, B, secured to it by pinching or crimping.

2. A compound washer having a body, A, of fiber, and a flanged cap, B, made of thin metal, so that the edges of cap may tend to bend up around and lock the nut when the latter is screwed home, substantially as described.

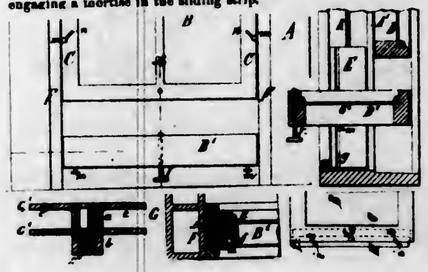
256,643. TRUNK-CASTER. JOHN J. GOWELL, Newark, N. J. Filed Aug. 9, 1881. (Model.)

Claim.—1. In a trunk-caster, a U-shaped journal carrying a roller, the former passing through the latter and having its extremities upwardly returned and adapted to be secured, substantially as and for the purposes herein set forth and shown.

2. In combination in a trunk-caster, a U-shaped journal carrying a roller, and a plate adapted to receive the extremities of said journal, arranged and operating substantially as and for the purposes set forth and shown.

3. In combination, a plate having bearings for the horizontal part of the U-shaped journal, and a U-shaped journal the horizontal portion of which carries a roller, the whole being arranged and operating substantially as and for the purposes herein set forth and shown.

4. In a trunk-caster, a U-shaped roller-bearing journal riveted to a plate perforated or recessed to admit the roller, substantially as and for the purposes set forth and shown.



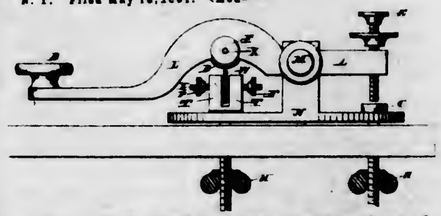
5. The combination of plates A B, the latter having depending bearings, and a U-shaped journal carrying a roller, all of said parts being arranged and operating substantially as and for the purposes herein set forth and shown.

6. In combination in a trunk-caster, the plates A B, the latter having depending recessed bearings, and a U-shaped journal passing through said plates and securing all said parts together, the whole being arranged and operating substantially as and for the purposes set forth and shown.

7. The combination, in a trunk-caster, of the plate A, perforated to admit the roller, the plate B, having depending journal-bearings passing through said perforated plate, and a U shaped journal, all of said parts being arranged and operating substantially as herein set forth and shown.

256,644. WINDOW-SASH. JOHN F. COX, Brooklyn, N. Y. Filed Feb. 18, 1882. (No model.)

Brief.—The sashes are pivoted to sliding strips by means of a bolt passing through a plate secured to the sliding strip and having a collar of smooth interior and engaging in a plate on the sash having a collar of threaded interior. The sash is locked to the sliding strip by a diagonally-sliding plate in a mortise in the sash engaging a mortise in the sliding strip.



Claim.—1. A window-sash constructed substantially as herein shown and described, consisting of mortised sash B, mortised sliding strips E, diagonally-moving tongues H, and pivoting devices G, all arranged and operated as set forth.

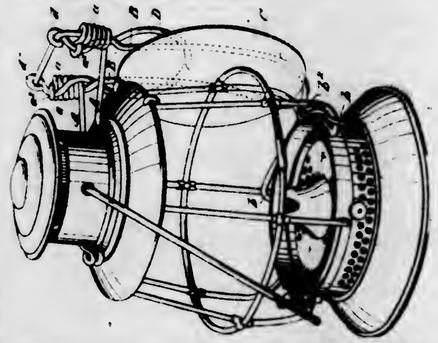
2. The combination, with the sash B, having edge-mortises *f*, diagonal slots *a*, and pins *b*, and sliding strips E, having vertical mortises *g*, of the tongues H, having diagonal slots *i*, substantially as herein shown and described, said tongues being adapted for holding the sash and sliding strips parallel with each other, as set forth.

3. In a window-sash, as a means for pivoting the sash to the side sliding strips, the combination therewith of the pivoting device G, consisting of plate G', provided with collar *c*, of smooth interior plate, G², provided with collar *b*, of screw-threaded interior and screw-bolt G³, arranged and operating substantially as herein shown and described.

256,645. TELEGRAPH-KEY. GEORGE CUMMING, New York, N. Y. Filed May 10, 1881. (Model.)

Claim.—1. The combination, with the operating-lever and base of a telegraph-key, of two rollers or disks, one on the lever and the other on the base, said rollers having a peripheral contact and serving as the hammer and anvil for said key, substantially as described.

2. The combination of the lever and base of a telegraph-key with two disks having a peripheral contact, and arranged at approximately right angles to each other, and serving as the hammer and anvil for said key, substantially as described.

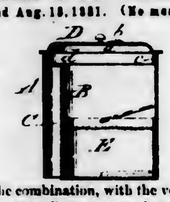


3. The combination of lever L, standard T, wheels or disks D and W, axles X X, and set screws or nuts F F, substantially as and for the purpose set forth.

256,646. TELEGRAPHIC ELECTRODE. GEORGE CUMMING and CLARA M. BRIESENDORF, New York, N. Y. Filed Aug. 12, 1881. (Model.)

Claim.—In electrical instruments, co-operating peripheral contact-electrodes arranged in planes at approximately right angles to each other and having their contact-surfaces brought to a mere line or edge, substantially as described.

256,647. LANTERN-CARRIER. ANDREW J. CURTIS, Monroe, Mo., assignor of one-half to Fred. L. Palmer and Allen M. Bashelder. Filed Mar. 7, 1882. (Model.)

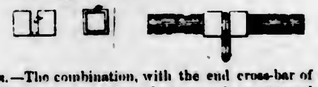


Claim.—1. A lantern-carrier consisting of clasps A provided with spiral springs *a* and eyes *a'*, an upright frame, B, having two posts secured together near their lower ends, and then bent out-

ward and provided with hooks *b*, and a holder, D, having eyes *d*, and passing through the eyes a^2 of the clasps, substantially as and for the purpose herein described.

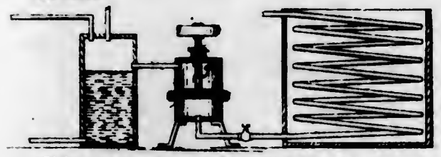
2. A lantern-carrier constructed substantially as above described, and provided with a reflector, C, soldered or otherwise secured thereto, substantially as and for the purpose specified.

256,648. CULINARY VESSEL. WILLIAM H. DANIEL, Pottsville, Pa. Filed Aug. 18, 1881. (No model.)



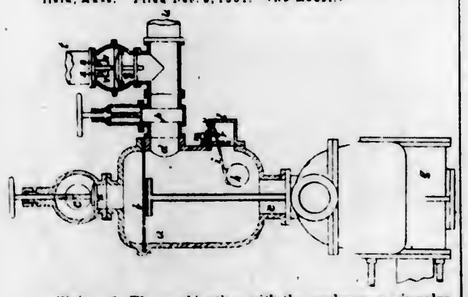
Claim.—1. The combination, with the vessel A, having a partition, B, forming a flue, C, open at each end, of the lid D, provided with a plate, *d*, adapted to cover the upper end of said flue, substantially as specified.

2. The combination of the vessel A, having a partition, B, forming a flue, C, adapted to be opened and closed, the lid D, having an opening, *a*, provided with cover *b*, and the reversible pan E, having a perforated bottom or diaphragm, and provided with two bails, substantially as shown and described.



256,649. CHAIN CROSS-BAR. SALOMON DAVIDSON, New York, N. Y. Filed Feb. 24, 1882. (No model.)

Brief.—The coupling-piece engages both the bar and the box by means of openings therein.

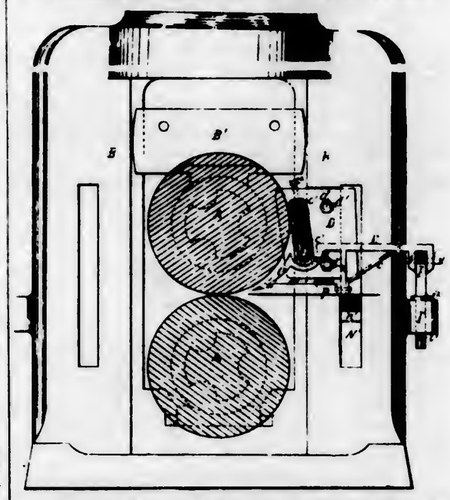


Claim.—The combination, with the end cross-bar of a vest-chain and the ornamental box thereon, each constructed with a transverse opening or recess of the separate transverse coupling-piece engaging the openings or recesses in both the bar and the box, and serving as a medium to connect the bar and box to the vest chain, substantially as and for the purposes described.

256,650. APPARATUS FOR UTILIZING WASTE HEAT IN AMMONIA REFRIGERATING APPARATUS. THOMAS DAVIS and CHARLES E. DAVIS, Indianapolis, Ind. Filed Mar. 17, 1882. (No model.)

Claim.—In an ammonia refrigerating apparatus, the combination therewith of a motor driven by the ammonia-gas discharged from the refrigerator and exhausting into the absorber, substantially as described.

256,651. STEAM-CONDENSER. CHARLES P. DEANE, Springfield, Mass. Filed Dec. 5, 1881. (No model.)



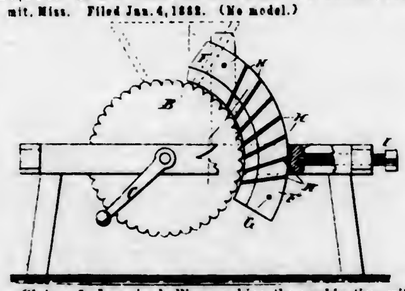
Claim.—1. The combination, with the condenser *a*, air-valve *m*, and float *h*, of the check-valve *q*, arranged and operating substantially as and for the purpose described.

2. The combination, with the condenser *a*, air-valve *m*, float *h*, and lever *i*, of the check-valve *q*, arranged and operating substantially as and for the purpose described.

3. The combination, with the main condenser *a* and the float *h*, placed therein, of the removable side chamber, *l*, the air-valve *m*, placed in the wall of the side chamber, and the lever *i*, connecting the float with the air-valve, all arranged and operating substantially as and for the purpose described.

256,652. MACHINE FOR ROLLING SHEET METAL. ALBERT J. DEMMLER, Pittsburg, Pa. Filed Feb. 2, 1882. (No model.)

Claim.—1. In a machine for cold-rolling thin iron plates, the combination of two reducing-rolls and two feed-rolls parallel with the reducing-rolls, with the passages between such two sets of rolls in different planes, substantially as and for the purposes set forth.



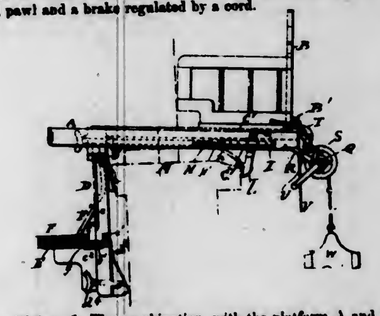
2. The combination of two reducing-rolls, A, two feed-rolls, C C', and friction-roll C^3, having bearing upon one of the reducing-rolls and also on one of the feed-rolls, substantially as set forth.

3. The combination of two reducing-rolls, two feed-rolls parallel with the reducing-rolls, but with passage through such two sets of rolls in different planes, and a guide for directing the plates from the feed to the reducing rolls, substantially as set forth.

4. The combination of reducing-rolls A, feed-rolls C C' parallel with but above the plane of passage through the reducing-rolls, inclined guide e^3, and horizontal table e, substantially as set forth.

5. The combination of housings B, reducing-rolls A, feed-rolls C C', friction driving-roll C^3, and adjustable bearing-plates D, secured to the inner side faces of the housings, substantially as described.

256,653. RICE-HULLING MACHINE. SHAD B. DENBEY, Summit, Miss. Filed Jan. 4, 1882. (No model.)



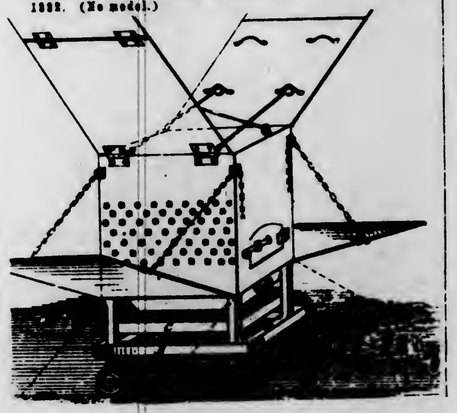
Claim.—1. In a rice-hulling machine, the combination, with the corrugated cylinder B, of the curved, rabbeted, and grooved plates F, supported by suitable means, and the steel plates H, substantially as herein shown and described, whereby the hulls will be removed from the rice by the action of the said spring-plates, as set forth.

2. In a rice-hulling machine, the combination, with the curved plates F, supported by suitable means, grooved and rabbeted upon their inner surfaces, of the steel plates H, substantially as herein shown and described, whereby the inner parts of the said steel plates will be free to vibrate, as set forth.

3. In a rice-hulling machine, the combination, with the curved, rabbeted, and grooved plates F, supported by suitable means, carrying the steel plates H, of the hand-screw I and the cross head or bar J, substantially as herein shown and described, whereby the said curved plates can be adjusted to bring the edges of the steel plates closer to or farther from the face of the corrugated cylinder, as set forth.

256,654. COMBINED WINDOW-CLEANING CHAIR AND FIRE-ESCAPE. ANNA HORNITZER, New York, N. Y. Filed Dec. 16, 1881. (No model.)

Brief.—The clamping device consists of a swinging bar on the under side of the chair, having angular sill-blocks and clamping-plates on its ends, which are adjustable in racks on the sides of the chair. The swinging bar has arms connected to a nut traveling on a screw-rod. A rope-ladder with a basket on its free end is secured to a windlass on the chair, the windlass having a ratchet and pawl and a brake regulated by a cord.

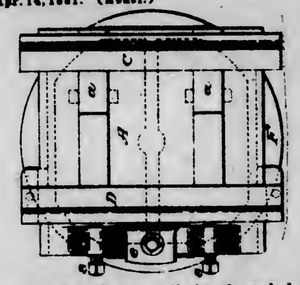


Claim.—1. The combination, with the platform A and step-frame D, of the clamping device G, consisting of clamping-bar G', blocks G^2, end plates, L, racks I, screw H, traveling nut H', and pivoted bars a a, constructed, arranged, and operated substantially as herein shown and described.

2. As a means for supporting the combined chair and fire-escape in position on a window-sill, the combination, with the screw-adjusted bar G', of the blocks G^2, serrated end plates, L, and racks I, substantially as herein shown and described.

3. The combination, with the window-cleaning chair provided with platform A, step-frame D, and suitable clamping devices and hangers, all constructed, substantially as herein shown and described, of the rope ladder P, windlass Q, ratchet S, pawl T, connected eccentric regulating-lever and cord U V, and basket W, all arranged and operated as set forth.

256,655. DRYING AND HEATING APPARATUS. AUGUSTA DENYER, Catford, County of Kent, England. Filed Jan. 30, 1882. (No model.)

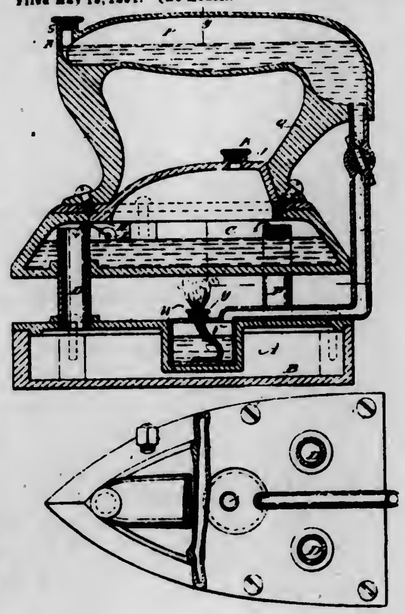


Claim.—1. In an apparatus for drying the walls of buildings, a furnace having one of its walls provided with perforations or openings, and having deflectors hinged one above and one below said openings, substantially as before set forth.

2. The combination, substantially as before set forth, of a furnace having one or more of its walls provided with openings, the deflectors hinged respectively above and below said openings and adapted to be set at an angle with the wall or walls, and means for supporting the deflectors.

3. The combination, substantially as before set forth, of a furnace having one or more of its walls provided with openings, the deflectors hinged respectively above and below said openings and adapted to be set at an angle with the wall or walls, means for supporting the deflectors, and the curtains.

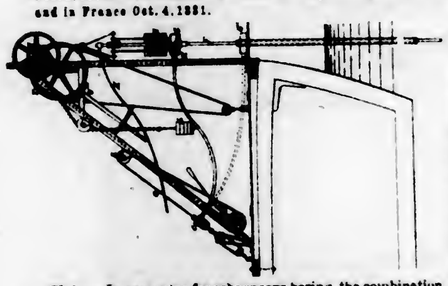
4. In a drying apparatus such as described, the combination, substantially as before set forth, of the deflectors, the hooked rods, the vertical bar provided with a rack, and the pinion.



256,656. PLANER-CHUCK. GEORGE B. DURREE, Chicago, Ill. Filed Apr. 14, 1881. (Model.)

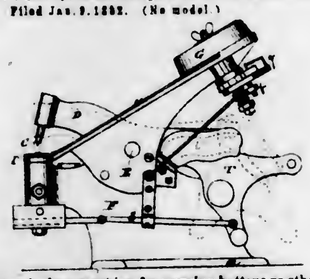
Claim.—1. The base-piece A F, slotted, notched, and otherwise constructed, substantially as described, jointly with the movable bar C, having laterally-extended arms *a a* and pins *b b*, for the purpose set forth.

2. The base-piece A F, slotted, notched, and otherwise constructed, substantially as described, jointly with the clamping-bar D, having the slotted arm *c*, flanged fingers *i i n n*, and the screws S and *f*, as and for the purpose set forth.



256,657. SAD-IRON. JOHN M. EDMUNDS, Salt Lake City, Utah, assignor to himself and Governeur M. Forbes, same place. Filed May 18, 1881. (No model.)

Claim.—1. In a steam-heated sad-iron the water-chamber C, supported above and connected to the steam-chamber A, which forms the bottom of the iron, by screw-threaded tubes D D, passing through an intermediate heating-space and projecting inside the chamber C to near the top thereof, whereby only steam is allowed to escape into the steam-chamber, as and for the purpose specified.



2. The steam-chamber A, provided with a recess, W, formed in its top plate to receive a lamp, V, in combination with the water-chamber C and tubes D, the latter being arranged one near the nose and the other two near the heel of the iron, as and for the purpose specified.

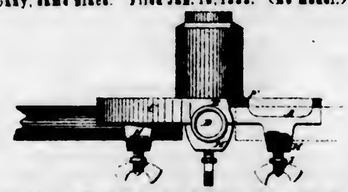
256,658. APPARATUS FOR SUBAQUEOUS BORING. THOS. HAWLEY, Hawley, Dartford, County of Kent, England. Filed Feb. 2, 1882. (No model.) Patented in England Apr. 5, 1881, and in France Oct. 4, 1881.

Claim.—In apparatus for subaqueous boring, the combination of a barge or floating vessel, a boring-tube loaded with adjustable weights and suspended from a framing on the vessel, a driving-shaft worked by an engine or other motor on board of the vessel, and a flexible or jointed shaft and gearing connecting the said driving-shaft to the boring-tube, substantially as and for the purposes set forth.

256,659. MACHINE FOR SETTING BUTTONS. ANDREW EPPLER, Jr., Quincy, Mass., assignor to David Whittemore, same place. Filed Jan. 9, 1882. (No model.)

Claim.—1. In a machine for securing buttons or other equivalent fastening devices having tubular shanks, the combination of a guide or roadway, a rising and falling setter, a feeding and supporting device located under the setter, and provided with pockets each adapted to receive a fastening device from the roadway, and mechanism for rotating said feeding device step by step, the location of the feeding and supporting device under the setter adapting it to support each fastening device during the action of the setter, as set forth.

2. The combination, with the rotary feed-plate having button-receiving pockets or recesses, of the roadway or guide having a yielding end or section adapted to yield to prevent injury to buttons partially inserted in the pockets of the feed-plate, and to force such buttons into the pockets, as set forth.

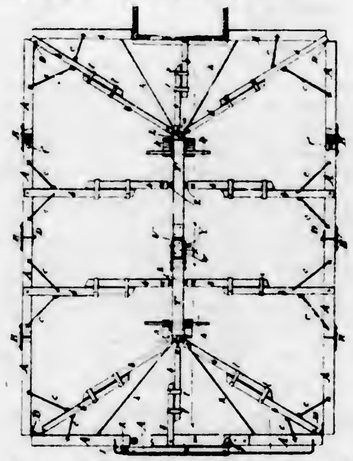


3. The combination of the rotary feed-plate having pockets or recesses and a spring-lip, *b*, adapted to hold each button in place under the setter, as set forth.

4. As a means for rotating the feed-plate step by step, the reciprocating rack Q, the pinion N, journaled loosely in the spindle of the feed-plate, and provided with an arm, O, having a pawl, P, and a ratchet, M, rigidly attached to the spindle of the feed-plate and rotated intermittently by the pawl P, as set forth.

5. The pivoted lever D, supporting at one end the setter, and provided at the other end with a stud or roller, V, combined with the pivoted lever T, having the cam-groove, U, with which said stud is engaged, as set forth.

6. The combination of the setter, its supporting-lever D, the pivoted operating-lever T, having a cam-groove engaged with a stud on the lever, the rotary feed-plate I, the rack Q, rotating said feed-plate through intermediate mechanism, and a rod, S, connecting the rack with an arm of the lever T, as set forth.

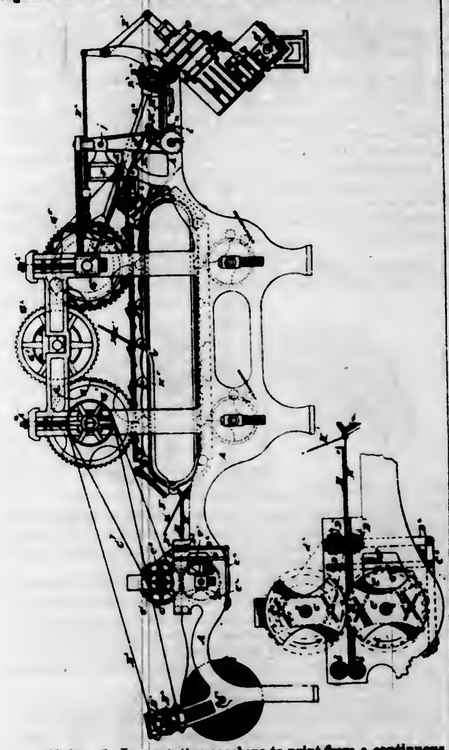


256,660. LAMP-CHANDELIER. JOHN A. EVARTS, Meriden, Conn., assignor to the Bradley & Hubbard Manufacturing Company, same place. Filed Jan. 10, 1882. (No model.)

Claim.—1. The herein-described improvement in lamp-chandeliers, consisting of the disk A, to which the arms are to be secured, constructed with radial openings having bearings E F at the outer and inner ends of the said opening upon one side, and with the intermediate bridge, H, across the said opening, and forming a bearing upon the opposite side, all formed in casting and in one and the same piece, substantially as described.

2. The herein-described improvement in lamp-chandeliers, consisting of the disk A, to which the arms are to be secured, constructed with radial openings, forming bearings F at the outer and inner ends of the said opening upon one side, and with the intermediate bridge, H, across the said opening, and forming a bearing upon the opposite side, with the set-screw I through the said intermediate bearing, substantially as described.

256,661. PORTABLE CORRAL. CHARLES A. TARNAGON, The Dalles, Oreg. Filed Dec. 7, 1881. (No model.)



Claim.—1. A portable corral constructed substantially as herein shown and described, consisting of the separate panels A, having wheels G, the posts S, having wheels *k*, and connected by a bar, T, the extensible braces *b*, the hook-rods *c d e f*, and the tie-ropes *g h*, as set forth.

2. In a portable corral, the combination, with the separate panels A, of the cabin L, mounted upon wheels M N, substantially as herein shown and described, whereby the said cabin can be moved with the corral, as set forth.

3. In a portable corral, the combination, with the adjacent panels A, of the latches B and the pins C, substantially as herein shown and described, whereby the said panels are held from longitudinal and lateral movement, as set forth.

256,662. PRINTING, BINDING, AND TRIMMING MACHINE. HENRY P. PRENTISS, Philadelphia, Pa., assignor of one-half to Isaac Pike; said Prentiss and Pike assignors of one-third to Isaac S. Sharp, all of same place. Filed Nov. 7, 1881. (No model.)

Brief.—An endless chain of type-carriages hinged together is caused to travel upon an endless track. As the carriages move upwardly their nippers take the sheet from feed-rollers at the front of the machine, and after the first impression is received and as the carriages move forward the nippers holding the sheet are caused to turn it over onto the preceding form in time to present its unprinted side to receive an impression from another cylinder. As the carriages continue moving on the nippers carry the sheet between tape-pulleys, and in passing from these tapes to the fly a line of paste is put upon the center of each sheet, the fly then depositing it, pasted side down, upon a table upon which is a book-cover. When a sufficient number of sheets for the book or pamphlet (in the machine illustrated thirty-two pages) are received on the table it is caused to carry the ends of the printed sheets into the bite of rollers, which press the sheets together while moving them over a slot in an inclined table, in which position a folding-blade doubles the sheets by forcing them through the slot and into the bite of other rollers, which cut the ends, trim the front, and deliver a completed book. The paper is fed forward intermittingly to the nippers at the front of the machine from a web by two sets of feed-disks, the segments of which are adjustable for different lengths of sheets.

Claim.—1. In a printing-machine to print from a continuous roll of paper, an endless chain of type-carriages, in combination with one or more inking-cylinders and two impression-cylinders, said cylinders being adapted to print from every alternate type-carriage, one of said cylinders printing from the type omitted by the other, substantially as and for the purpose specified.

2. In a printing-machine to print from a continuous roll of paper, an endless chain of type-carriages, in combination with nippers arranged upon said carriages and adapted to hold the sheet of paper, inking devices to ink the type, two impression-cylinders arranged to print from every alternate type-carriage, and mechanism, substantially as described, to cause said nippers to be oscillated in passing from one impression-cylinder to the other, for the purpose of laying the sheet upon the type-carriage immediately preceding, substantially as and for the purpose specified.

3. In a printing-machine, a feeding device adapted to feed given lengths of paper from a continuous roll, a cutter or knife to cut said roll of paper into sheets, an endless chain of type-carriages provided with nippers adapted to catch and hold the paper, an inking device to ink the type on said carriages, and two impression-cylinders arranged to print from every alternate type-carriage, in combination with a cam to actuate said nippers to reverse and transfer the sheet to the next adjacent type-carriage after passing under one impression-cylinder and before it passes to the next, receiving bands or tapes, a pasting or fastening device to paste or fasten the sheet down the middle, a fly-frame, a receiving-table, and folding and trimming mechanism, substantially as described, said apparatus working to print and bind books from a continuous roll of paper, substantially as described.

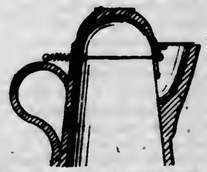
4. In a printing-machine, the feeding device which consists of the notched disks C, rolling in contact, as shown and described, in combination with their shafts and means, substantially as described, to adjust and secure said disks side by side in pairs, substantially as and for the purpose specified.

5. In a printing-machine, the combination of the rollers *h*, shafts *e*, carrying disks C, gear-wheels C', cam C², arms C³, rods D' and D³, knife D, and rollers D² and D⁴, and fingers E, substantially as and for the purpose specified.

6. In a printing-machine, the carriages F, hinged together at *f* and running upon a track, F⁶, by wheels F', and provided with means, substantially as described, to secure the type-forms in place, in combination with nippers H H', secured respectively to pinions h^2 and h^3, segment-racks *h'*, and cams H^2, to actuate said segment-racks, substantially as and for the purpose specified.

7. In a printing-machine, a type-carriage, F, provided with nippers H H', secured to shafts H^2 H^3, pivoted at one end of said carriage, in combination with mechanism, substantially as described, to operate said nippers during the movement of said carriage, substantially as and for the purpose specified.

8. In a printing-machine, the combination of the endless chain of carriages F, carrying nippers H H', pivoted at one end, and racks F', inking devices to ink the type on said carriages, two impression-cylinders, G G', having impression-surfaces *g*, gears G^2, and adapted to print from every alternate carriage, fingers E, receiving-tapes *i*, cams H^2, and intermediate mechanism, substantially as described, to actuate the nippers to the end that the nippers of every alternate carriage F shall open and catch the paper from fingers E, lay it upon the carriage, and after passing under cylinder G shall reverse the sheet and lay it upon the next adjacent carriage, then pass under cylinder G', and open slightly to allow the sheet to be run off quickly by the tapes *i*, substantially as and for the purpose specified.



9. In a printing-machine, the combination of the endless chain of carriages F, having racks F', cylinders G and G', having teeth G^3, and intermediate gear-wheel, G^2, substantially as and for the purpose specified.

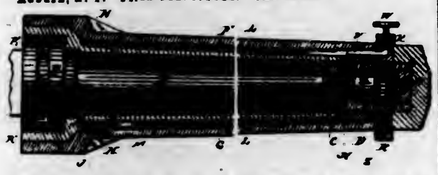
10. In a printing-machine, the endless chain of type-carriages and their nippers, in combination with tapes *i*, wheels I, shafts I', arms I', pasting or fastening wheel J, fly-frame K, receiving-table M, rollers R, mechanism, substantially as described, to reciprocate said table, and folding and trimming mechanism, substantially as and for the purpose specified.

11. In a combined printing and binding machine, the combination of the reciprocating receiving-table M, with rollers R, oblique table T, with slot *t*, folding-knife P, trimming rotary cutters O' and O^4, and mechanism, substantially as described, to reciprocate the table and folding-knife at given intervals, substantially as and for the purpose specified.

12. In a printing-machine, the combination of the cam G^4, rod K^2, crank K', pawl K^3, ratchet-wheel L, cams *l*, rollers *m*, receiving-table M, frame A, spring m^2, and rollers R R, substantially as and for the purpose shown and described.

256,663. GLASS SIRUP-CAN AND HOLD FOR MAKING THE SAME. HENRY PRUDHAM and CHARLES H. BRADY, Wellsburg, W. Va. Filed Mar. 17, 1882. (No model.)

Claim.—1. A glass strup-can having a closed top of like material and continuous with the body of the can, and a pouring-lip, substantially as and for the purpose specified.



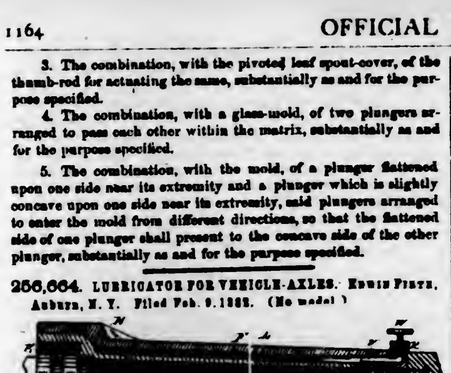
2. A glass strup-can having the cover *b* integral with the body of the can, and the projecting pouring-spout *a*, substantially as and for the purpose specified.

3. The combination, with the pivoted leaf spout-cover, of the thumb-rod for actuating the same, substantially as and for the purpose specified.

4. The combination, with a glass-mold, of two plungers arranged to pass each other within the matrix, substantially as and for the purpose specified.

5. The combination, with the mold, of a plunger flattened upon one side near its extremity and a plunger which is slightly concave upon one side near its extremity, said plungers arranged to enter the mold from different directions, so that the flattened side of one plunger shall present to the concave side of the other plunger, substantially as and for the purpose specified.

256,664. LUBRICATOR FOR VEHICLE-AXLES. EDWIN PIATT, AUBURN, N. Y. Filed Feb. 9, 1882. (No model.)



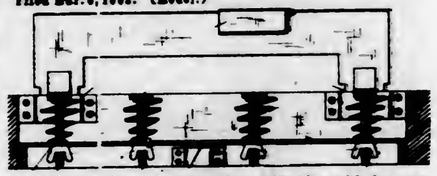
Claim.—1. The combination of the spindle having at its end a swiveled thimble with the axle-box, suitably connected to said thimble, substantially as set forth.

2. The herein-described spindle, provided at its end with two shoulders of decreasing diameters to receive an exteriorly-threaded thimble swiveled upon the inner shoulder and held in place by a ring or collar firmly secured upon the outer one, substantially as set forth.

3. The spindle provided at its end with a swiveled exteriorly-threaded thimble, in combination with the axle-box consisting of shells F G, having intermediate space, L, said shell G being provided with openings M, notches N, and flange K, the double-threaded nut R, having flange S, channel V, and plug W, and the cap or lock-nut U, substantially as and for the purpose set forth.

256,665. DOOR LOCK AND LATCH. OLE FLAGSTAD, Hamar, Norway. Filed Oct. 22, 1881. (Model.)

Claim.—1. The combination, with the spring-actuated latch and barrel having a projecting arm rigidly secured thereto, of a connecting-link pivotally secured to the spring-actuated catch at one end, and provided at its opposite end with an oblong slot, by which it is connected to the arm of the barrel, and a spring constructed substantially as described and adapted to connect the arm of the barrel to the face-plate of the lock, substantially as set forth.



2. The combination, with the spring-actuated latch, working-barrel provided with a projecting arm, connecting-link constructed as described and adapted to connect said arm of the barrel to the spring-actuated latch, and a spring adapted to exert an outward pressure on the said arm, of a collar provided with a split or opening, the opposing ends of the said collar forming the limit of movement of the said barrel and arm, substantially as set forth.

3. The combination, with the working-barrel provided with notched faces, of handles having projections formed on the ends thereof and adapted to engage with the projections, a spindle connecting the handles to the barrel, the split collar for holding the barrel in position, and means for connecting the barrel to the spring-actuated catch.

4. The combination, with the handles K, spindle O, collars W, barrel L, and split collar M, of the spring N, connecting-link P, catch C, guide-rod I, spring J, and bag M, all constructed and arranged substantially as shown.

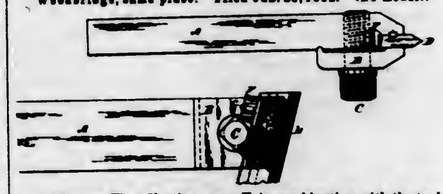
5. The combination, with the bolt provided with the two vertical and one transverse slots and the spring-actuated tumbler, constructed as described, and provided with a projecting end adapted to move in the above-named slots, of a spring-actuated dog provided with an opening in one side for the reception of one end of the tumbler when the bolt is shot outward, and a follower adapted to hold the dog away from the tumbler when the bolt is housed, substantially as set forth.

256,666. BEDSTEAD. FREDERIC G. FOSS, Roxborough, Pa. Filed Mar. 6, 1882. (Model.)

Claim.—1. In a bed-bottom, the combination, with the upper and lower slats and the interposed springs, of the screw-bolts provided with thumb-nuts, whereby the bed-bottom may be adjusted, substantially as and for the purposes specified.

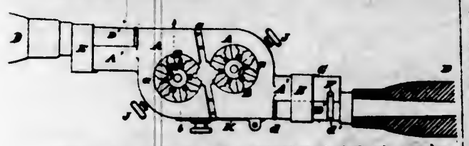
2. In combination with a bed-bottom, the longitudinal frames adapted to be secured thereto or to the bed-bottom, and the shelf adapted to set upon said frames, substantially as and for the purpose specified.

256,667. CHURN-DASHER. CHARLES FRIEDBORN, Clare, Mich. Filed Jan. 6, 1882. (Model.)



Claim.—1. The dasher made substantially as herein shown and described, consisting of the apertured conical plate A, having the concaved deflectors D, provided with end supports secured upon its upper surface, substantially as set forth.

2. In combination with the conical plate A, the concaved deflectors D, made as described, and set upon the plate A with their convex faces directly over the openings *b*, as herein shown and described, whereby the jets of cream that rise through the apertures *b* will be laterally deflected by contact with the convex surfaces of the deflectors and driven into contact with the jets that rise through the adjoining apertures *a*, as set forth.



3. The concaved deflectors D, formed with the supports *g g*, and having the upturned flanges *f f*, which are curved off, as shown at *i i*, the deflectors being secured upon the conical plate A, substantially as and for the purposes described.

256,668. CUTTER-HOLDER FOR LATHES. FREDERICK H. GARDNER, Hartford, Conn., assignor to himself and JAMES H. Woodbridge, same place. Filed Jan. 26, 1882. (No model.)

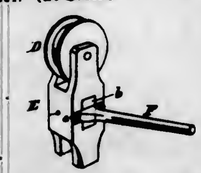
Claim.—The adjusting-screw F, in combination with the tool-holder A B C and the tool D, provided with a rack, substantially as described.

256,669. DIE AND DIE-STOCK. JOH. GASSMANN, Jackson, Mo., assignor of one-half to Adam Hoffmann, same place. Filed Nov. 1, 1881. (No model.)

Claim.—1. The combination of holders A A, having projections A' A' and cylindrical cavities *a a*, dies within said cavities, screw-threaded shanks C C, extending from the holders, sockets *a' a'* in said projections, and handles D D, having shanks D' D', as set forth.

2. The combination of holder A, having die-cavity *a*, sectional die B, and central holding and securing screw H, as set forth.

3. The combination, with the die-holders adjustably connected together by screw-threaded shanks C, working in sockets *a'*, of the handles screwed on the shanks and held to the die-holders by the key-pins *f*, substantially as described.

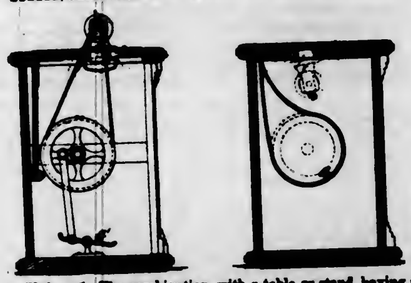


4. The combination, with the handle D, screw-threaded shank C, and projection A' of the die-holder, of the key-pin F and the strap E to hold the parts together, as set forth.

5. The combination, with the two die-holders, of the click adjustably attached to one holder and having spring-toe N working on a stud, Q, of the other holder, substantially as set forth.

6. The combination, with a set of dies, B, fitting in a holder, A, of the central retaining-screw, H, with notch *h'*, allowing the removal of any one of the dies *b*, substantially as set forth.

7. The combination, with the projecting portion A' of the die-holder A, of the shank D' of handle D, circumferentially grooved to receive a key-pin, F, the retaining slip-strap E, and the retaining spring-pin G, substantially as set forth.



256,670. GATE-HINGE. IRA GAGEN, Schoolcraft, Mich. Filed Oct. 8, 1881. (No model.)

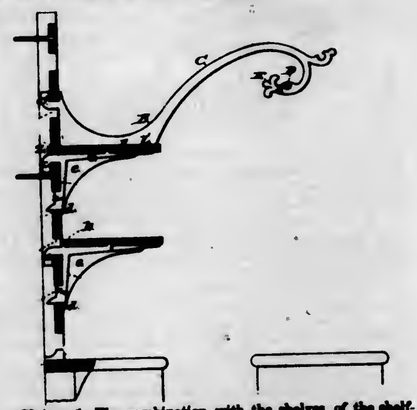
Claim.—1. A hinge attachment for gates, consisting of a block, E, holding wheel D, said block being recessed to receive a block, *b*, in combination with block *b*, having a bolt, F, pivoted thereto, substantially as and for the purposes described.

2. In combination with a gate, the recessed block E, holding grooved wheel D, and the block *b*, having bolt F pivoted thereto, all constructed substantially as set forth and shown.

256,671. TABLE OR STAND FOR MACHINES, &c. AMOS F. GERALD, Fairfield, Me. Filed Jan. 19, 1882. (No model.)

Claim.—1. The combination, with a table or stand having a rail-like top portion, of a revolving top portion carrying a machine and pivoted within the rail-like top portion, a cover for the revolving top portion hinged to the same, a stop for supporting the cover when the revolving portion is turned to bring the machine right side up, a wheel for transmitting motion to the machine, arranged as described, whereby it will guide the cover to the stop when the revolving portion is turned to bring the machine right side up, and a catch for retaining the revolving portion in position, substantially as specified.

2. The combination, with a table or stand having a rail-like top portion and a revolving portion pivoted within the same, of a machine or other article fitted in an opening in the revolving portion, and hinges and a catch for securing the machine to said portion, so that it may be dropped through the opening to enable the revolving portion to be turned and to carry it through the rail-like portion, substantially as specified.



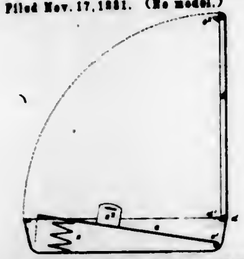
3. The combination, with a table having a rail-like top portion, of a revolving top portion pivoted within the same, carrying a machine, and provided with two openings, through which a driving-belt may pass, and which form between them a bar on which the belt is supported when thrown off the machine, and a cover hinged to said revolving portion and adapted to conceal it, the said revolving portion having a groove in its under surface for receiving the belt when the said revolving portion is inverted, substantially as specified.

4. The combination, with a table having a rail-like top portion, and a revolving top portion provided with two openings for the passage of a driving-belt, forming between them an intermediate bar, on which the belt may be supported when not in use, of a machine or other article fitting in an opening in the revolving portion, and hinges and a catch for securing the machine to said portion, so that it may be dropped down through the opening to enable the revolving portion to be turned to carry the machine through said rail-like portion, and a hinged cover for concealing the revolving portion when inverted, the said revolving portion having a groove in its under surface, in which the belt is received when said portion is inverted, substantially as specified.

5. The combination, with a table or stand having a revolving top portion, carrying a machine, of an oil-drip cup which turns or revolves with said top portion and has its edges reverted or turned inward, so that when turned upside down its reverted or turned-in edges will catch and retain the oil contained within it, substantially as specified.

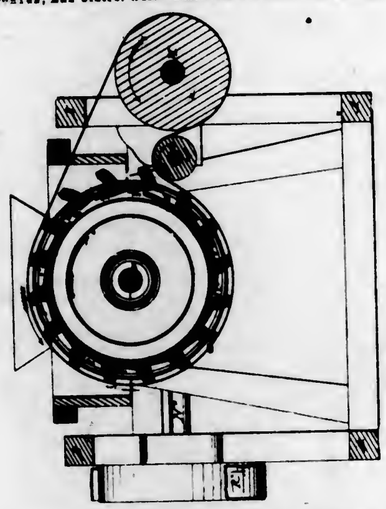
256,672. SHELVING-BRACKET. DAN GREEN, Mason City Ho. Filed Dec. 24, 1881. (No model.)

Brief.—A rear hook on the top of each bracket engages the rear edge of each shelf. The bracket has also a hook and extension with a filling-piece which engages slots in an upright. The top bracket is placed above the shelf in a reversed position, and carries only the engaging-hook. It is provided with a goose-neck extension having a bearing for an exhibiting-rod.



Claim.—1. The combination, with the shelves, of the shelf-brackets having rear hook, *h*, extending upward and forward to engage the rear edge of said shelves, substantially as specified.

2. A shelf-bracket having in addition to the hook *c* and projection *d* of its upright bearing the offset or filling-step *a*, designed to engage and fill the slot of the upright support above said projection and prevent the bracket from rising, substantially as specified.



3. The reversed or overhung bracket B, having the hook *c* and the goose-neck or forward extension, G, provided at its end with a bearing, *e*, for an exhibiting-rod to be arranged over and parallel with the counter, substantially as specified.

256,673. CIGARETTE-BOX. GUSTAV GOLIASCH, Berlin, Germany. Filed Nov. 17, 1881. (No model.)

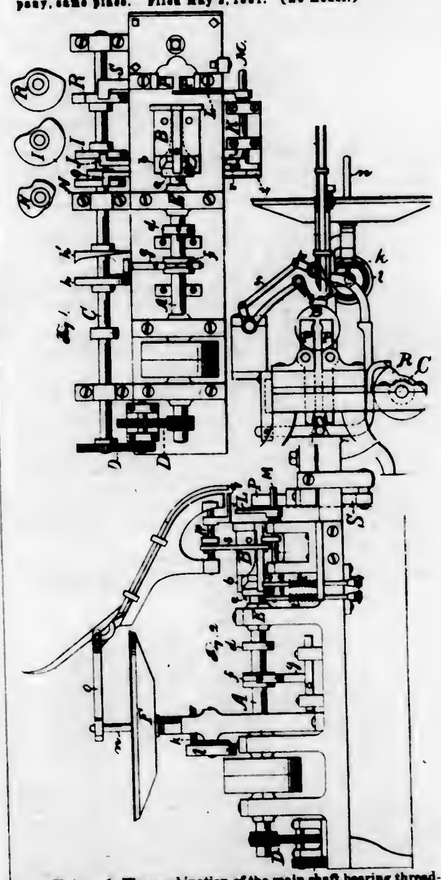
Claim.—The described box for cigars, matches, &c., consisting of a case, *a*, hinged cover *b*, and a pivoted plate, *c*, pressed constantly upward by a spring, and having the lugs *c'*, and a connecting rigid or elastic band, substantially as described and shown.

256,674. COCKLE-SEPARATING MACHINE. WILLIAM E. CORTER, Eau Claire, Wis. Filed Oct. 11, 1881. (No model.)

Claim.—1. The combination, with the main frame and the conveyer-shaft mounted thereon, of the cylinder-supporting frame and a perforated cylinder provided with tubular bearings and mounted concentric with said shaft, substantially as set forth.

2. The combination, with a perforated rotary cylinder, of an outer jacket formed of pivoted staves or sections adapted to automatically open and close when the machine is in operation, as and for the purpose set forth.

3. The combination, with the perforated cylinder and a stave-formed jacket, the several staves of which are capable of independent action, of an outer concentric jacket provided with suitable openings to receive the several staves of the stave-formed jacket, as and for the purpose described.



4. The combination, with the inner jacket provided with the stave portions, and the outer jacket, of springs fixed to the outer jacket, having their free ends connected with the outwardly-projecting arms of the staves of the inner jacket, substantially as set forth.

5. The combination, with the perforated cylinder, the jacket provided with stave portions, and the outer jacket, of belts operating to impart a rotary motion to the cylinder and to close the stave-jacket onto the perforated cylinder, substantially as set forth.

6. The combination, with the cylinder having the end portion of its jacket provided with outlet-openings, of a spout-like apartment to receive the discharged contents of the jacket and deliver them through an outlet-opening, substantially as set forth.

7. The combination, with the perforated cylinder provided with the stave-like jacket, of an exhaust-fan and pipe, arranged substantially as set forth.

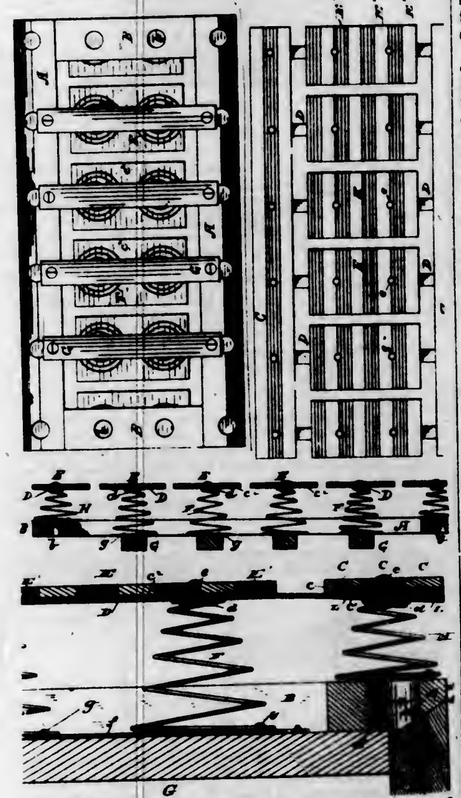
256,675. MACHINE FOR THREADING BOLTS. CHARLES H. GRAHAM, Unionville, Conn., assignor to the Union Nut Company, same place. Filed May 2, 1881. (No model.)

Claim.—1. The combination of the main shaft bearing threading-dies and mechanism for opening and closing said dies by a longitudinal reciprocation of said shaft, the parallel cam-shaft, intermediate connecting-gearing, and cams A A', operating upon an extension from the main shaft to reciprocate it, substantially as described, and for the purpose specified.

2. In combination with the main shaft A, provided with the central rod, *a*, and hinged jaws *b*, carrying the dies, the cone *e*, collar *d*, adjusting-screws *i i*, collar *f*, sliding frame *g*, and pair of side cams, A A', substantially as described, and for the purpose specified.

3. In a bolt-threading machine, the combination of the main shaft and threading-dies, the holding-jaws P P, wedge *u*, lever S, and cam R, substantially as described, and for the purpose specified.

4. In a bolt-threading machine, the combination of the main shaft and threading-dies, the holding-jaws P P, wedge *u*, lever S, cam R, and the automatic feed mechanism for feeding the bolts from the pan or hopper through a trough to the holding-jaws, substantially as described, and for the purpose specified.



5. The combination of the main shaft bearing threading-dies and mechanism for opening and closing said dies by a longitudinal reciprocation of said shaft, the parallel cam-shaft, intermediate connecting-gearing, cams A, A', and R, lever S, wedge *u*, and jaws P P, substantially as described, and for the purpose specified.

6. In a bolt-threading machine, the combination of the main shaft and threading-dies, the holding-jaws P P, wedge *u*, lever S, cam R, rock-shafts *p* and M, and cams N and I, for operating said rock-shafts, substantially as described, and for the purpose specified.

7. The combination of the main shaft bearing threading-dies and mechanism for opening and closing said dies by a longitudinal reciprocation of said shaft, intermediate connecting-gearing, cams A, A', and R, lever S, wedge *u*, jaws P P, and the automatic feed mechanism, substantially as described, and for the purpose specified.

8. The combination of the cam R, lever S, wedge *u*, jaws P P, and the automatic feed mechanism, substantially as described, and for the purpose specified.

256,676. SEAT. HENRY S. HALL, Philadelphia, Pa. Filed Jan. 3, 1882. (Model.)

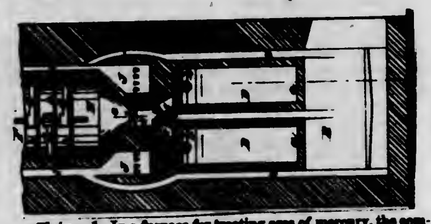
Claim.—1. A seat having upon one side a support composed of two or more elastic strips, C C, connected together by a flexible fibrous fabric, the springs H H beneath said strips and fabric, and the metallic bands or strips D D, situated transversely to the strips C C and between said strips and the springs H H, substantially as set forth.

2. A seat having upon one side a support composed of two or more elastic strips, C C, a flexible fibrous fabric secured to the under side of said strips, the springs H H below the strips, the intermediate metallic plates or bands, D D, and the blocks or building-up pieces L L between the strips C C and the plates or bands D D, substantially as set forth.

3. In a seat, the combination, with the main frame, of several series of springs, flexible metallic bands D D across the tops of the springs, independent seat-sections E E, each supported separately upon a single transverse series of springs and constructed of a series of wooden slats, E', situated transversely to the band D below it, and a flexible fibrous fabric, *e'*, between said metal band and the series of slats E', the metallic band D, extending beyond the fabric *e'*, and devices which connect together the outer ends of the metal bands D, substantially as set forth.

4. In a seat having a main frame, the combination of several transverse series of springs, flexible metallic bands D, each arranged across the top of a series of springs, wooden strips C, connected rigidly to the metallic bands D at the ends and extending the full length of the seat, and intermediate seat-sections, E E, each of which is supported upon a single series of springs, and is constructed of a flexible fibrous fabric, and a series of wooden slats attached to said fabric and situated transversely to the series of springs, substantially as set forth.

5. In a seat having a main frame, the combination of several series of transverse springs, flexible strips C, connecting together the end springs of the several series, the flexible metallic bands D, arranged across the tops of the springs of the several series, and intermediate seat-sections, E E, each supported upon a single series of springs and constructed of strips E', situated transversely to the series of springs and of a length greater than the width of the flexible metal band D by which they are supported, substantially as set forth.



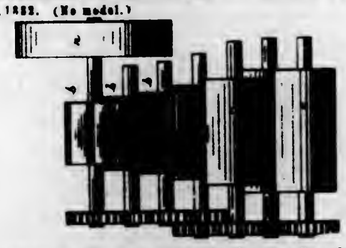
6. In a seat having a main frame, the combination of the cross-bars G G, secured to the under side of the main frame, springs H H, supported upon the side pieces and the end pieces of the main frame, the intermediate springs, F F, arranged to form, in conjunction with the springs H H, several transverse series, strips C C, arranged along the sides of the seat and extending from end to end, the flexible metallic bands D D, arranged across the tops of the series of springs, and the intermediate seat-sections, E E, each supported above a single series of springs, F F, independently of the other sections and of the side strips, C, substantially as set forth.

7. In a seat, a series of springs arranged along the edge of the seat, a series of two or more flexible strips, C C, arranged above said series of springs in close proximity to each other, seat-sections arranged behind said edge strips, and the metal bands D D, connecting the flexible edge strips and the rear seat-sections, said rear sections being supported upon the frame of said seat independently of the edge strips, substantially as set forth.

8. In a seat, a series of springs arranged along the edge of the seat, springs arranged in several series transversely across the top, flexible strips C C, extending across the tops of the edge series, a flexible fibrous fabric, *e*, which secures together the edge strips, C C, the metal bands D D, extending transversely to the strips C C across the seat, and the independent seat-sections E E, each arranged above and transversely to the metal band D and each supported upon a single transverse series of springs, substantially as set forth.

9. A seat having a wooden side piece, A, beveled at its outer lower portion, as at *a'*, in combination with a series of removable transverse cross-bars, G, and attached to said side piece in rear of the front supporting-rail, I, substantially as set forth.

256,677. FURNACE FOR TREATING THE ORES OF MERCURY. EDWARD G. HALL, Healdsburg, and HYRUS D. HASKINS, Guernoville, Cal. Filed July 28, 1881. (No model.)



Claim.—1. In a furnace for treating ores of mercury, the combination, with the chambers D, provided with inclined floors and arched tops, of the chamber E, having a funnel-shaped bottom arranged above the said chambers, and provided with the diaphragms A, projecting from opposite sides of the chamber nearly across the same, and the revolving arms G, and communicating with the said chamber at its bottom, substantially as and for the purpose set forth.

2. In a furnace for treating ores of mercury, the combination, with the chamber E, having a funnel-shaped bottom and the fire-place B, of the chambers D, having inclined floors, and communicating with the said chamber, and arranged between the said chamber and fire-place, substantially as and for the purpose set forth.

3. In a furnace for treating ores of mercury, the combination, with the chambers D, the annular wall I, and the chamber E, having its lower part contracted, of the furnaces J, arranged in the space formed by the said annular wall and the lower contracted part of the chamber, substantially as and for the purpose described.

4. The annular space I, surrounding the chamber E, and connected with the flues H and furnaces J, as and for the purpose herein shown and described.

256,678. MACHINE FOR CRUSHING AND GRINDING LIME-STONE-ROCK, &c. JACOB HAUER, Chewsville, Md. Filed Jan. 4, 1882. (No model.)

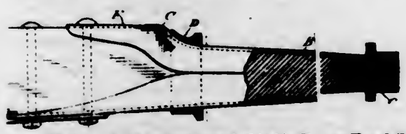
Claim.—1. The combination, with the grooved crushing-rolls *b b b* and smooth pulverizing-rolls *c c c*, so arranged that each roll on one side of the machine operates against two rolls on the opposite side, of guides *d*, arranged as set forth, substantially as described, and for the purpose set forth.

2. The combination, with the crushing and pulverizing rolls *b c*, of the inclined frame A A, provided with recesses *e e* in its inner faces, substantially as described, and for the purpose set forth.

256,679. LAMP-CHIMNEY. HARRY L. HAWES, Whitewater, Wis. Filed Feb. 3, 1882. (No model.)

Claim.—1. The lamp-chimney composed of a glass bottom and a metal top, and so joined together as to admit a circulation of air between them, to prevent heating the bottom, and thereby save breakage, substantially as described.

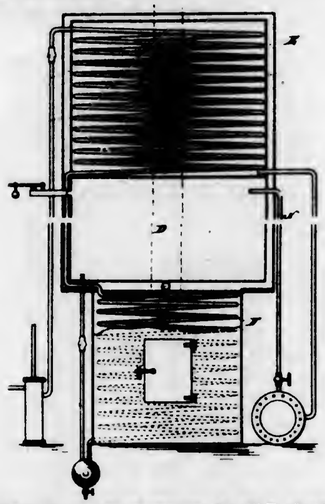
2. A lamp-chimney composed of a metal top and a glass bottom, fastened together by means of a groove on the inside of the metal top, sprung over three or more projections on the outside of the glass bottom, which mesh into the groove in the metal top, substantially as described.



256,680. FLOOD-GATE. DAVID H. HEMINGWAY, Newport, Miss. Filed Dec. 12, 1881. (No model.)

Brief.—When the gates are tilted in a horizontal position the slack of the connecting-cord is taken up by an arm on the lower gate, and this also avoids a straight pull on said cord through the axes of the gates in their return to normal position.

Claim.—The combination, with the head-gate and its notched standard, hinged in the race, as described, of the lower gate, similarly hinged, and provided with a suitable guide, and the connecting rope or chain, the whole adapted to operate substantially as specified.



256,681. AXLE-SKEIN. JOHN HERRMANN and PETER HERRMANN, Evansville, Ind. Filed Mar. 6, 1882. (Model.)

Claim.—1. The sheet-metal thimble B, ears F and G, and shoulder C, made in one piece, in combination with the ring D, constructed as and for the purpose set forth.

2. The sheet-metal thimble B, having ears F G and shoulder C, in combination with the ring D, stud E, and nut *e*, substantially as and for the purpose set forth.

256,682. STEAM-GENERATOR. DANIEL HESS, Winona, Miss. Filed Feb. 7, 1882. (No model.)

Claim.—1. In a steam-generator, the coil E, placed within a chamber surrounded by a jacket, said jacket and chamber being heated by the exhaust-steam, in combination with a superheating-coil located in and forming the fire-box, arranged substantially as and for the purpose set forth.

2. In a steam-generator, the combination of the steam-generating coil E, the superheating-coil F, and the reservoir D, constructed and arranged as and for the purpose set forth.

256,683. SHIFTING SEAT FOR VEHICLES. JACKSON W. HEWITT, Jackson, Mich. Filed Feb. 14, 1882. (No model.)

Claim.—1. The combination, in a two-seated vehicle having a rear shifting seat, of the vehicle-body with the front seat hinged at its rear edge, so as to be turned back and lowered within the vehicle-body, and having a support constructed so that the seat can be raised at one end and brought into a vertical position at one side of the vehicle-body, substantially as and for the purpose described.

2. The combination, in a two-seated vehicle, of the support D, for the front seat, extending transversely across the body of the vehicle, and hinged at one of its ends to one of the sides of the said body, with the front seat hinged to the said support at one of its side edges, the said support being adapted to be raised at one end, and the seat being connected with the support so as to either rest upon the same or to be swung backward, so that the rear slidable seat can be brought over the seat and the support, substantially as described.

3. The combination, in a vehicle having a rear shifting seat, of the front seat, hinged at its rear edge, with the support D for the front seat, hinged at one end to one side of the body and extending from side to side of the same, a device for locking down the free end of the support, and the bracket F, constituting a rest for the free end of the support, and also adapted to be engaged by the said locking device, substantially as described.

4. The combination, with the seat C, hinged at its rear edge to a support, D, that is hinged at one end to one of the sides of the body and extended transversely across the latter, of the bracket F, secured to the opposite side of the body and provided with verti-

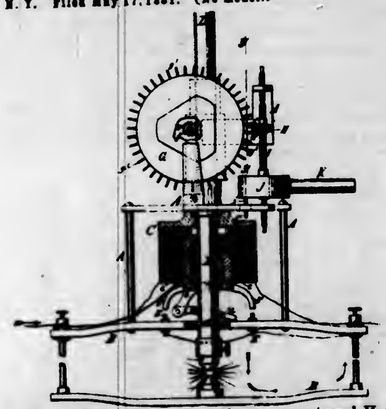
cal recesses, and the pins upon the said support located to enter the recesses in the bracket when the free end of the support is rested thereon, substantially as described.

5. The combination, with the hinged support D, of the seat C, hinged to said support, and the bumpers h upon the under side of the seat and the upper side of the support, substantially as described.

6. The combination, with the rear slidable seat, B, of the front seat, C, hinged at its rear edge and adapted to be turned down in order to admit of the rear seat being moved over it, and a locking device adapted to be engaged with the front seat so as to hold the same down in position for use, or to be engaged with the rear seat after the front seat has been swung back and the rear seat moved forward and over it, substantially as described.

7. The combination, with the rear sliding seat having the bent lips L, of the rails I, supporting the seat and engaged by said lips, the bars a^2, supporting the rails and secured to the vehicle-body, and the angular stop-plates P, having their upper ends inserted between the bars and the rails, said stop-plates being detachably secured to the braces R, substantially as set forth.

8. The combination, with the vehicle-body, of the support D for the front seat, hinged at one end to one side of the body, and the seat C, hinged to said support, and having its ends concaved upon the under side thereof, in the manner shown and for the purpose described.

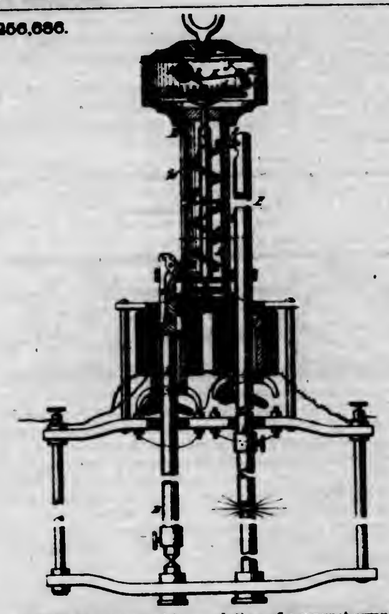


9. The combination, with the support D for the front seat, hinged at one end to the vehicle-body, of the seat C, hinged at its rear edge to the said support, and the check-plates H', applied substantially as shown and described, and for the purpose specified.

256,684. PRIMER FOR CARTRIDGES. ALFRED JAMES NEANE, Bridgeport, Conn., assignor to the Union Metallic Cartridge Company, same place. Filed Feb. 2, 1882. (No model.)

Claim.—The metallic plate or anvil A, provided upon its inner face with the central boss, *a*, and presenting upon its periphery a number of sharp corners for engagement with the interior of the cup B, substantially as shown and described.

256,685. ELECTRIC LAMP. CARL PAUL HORSACK, New York, N. Y. Filed May 17, 1881. (No model.)



Claim.—In an electric lamp, the escapement-pawl H, wheel G, having peripheral teeth *g'*, pinion F, and the carbon-rack D, in combination with the clutch *a* and means, substantially as described, for operating said clutch, as and for the purpose specified.

256,686. ELECTRIC LIGHT. CARL PAUL HORSACK, New York, N. Y. Filed May 17, 1881. (No model.)

Claim.—1. In a carbon-feed for electric lights, the combination of a spiral incline with one or more carbon-holders arranged to be supported upon and to gradually descend the said incline, according as the carbon is consumed.

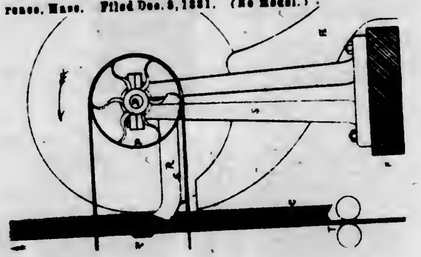
2. In combination with a revolving spiral incline supporting one or more carbon-holders for electric light, and with mechanism

256,686.

regulating the velocity of its revolution, of a magnet arranged to stop and start such spiral, according as the carbon is consumed.

3. The combination of an upright revolving spiral supporting one or more sliding carbon-holders of an electric light, with an escapement-wheel mounted upon the axis of the said spiral and with an escapement-pawl oscillating at right angles to the wheel's plane of motion.

4. The pivoted spiral incline C, supporting one or more carbons of an electric light, and having a disk or plate, N, transverse to its axis, in combination with the sliding magnet-core M, provided with devices *n n*, arranged to stop the motion of the said spiral by contact with eccentric points of the said disk, substantially as specified.



5. The combination of the spiral incline C, pivoted in the vertically-slotted tube D, with the sliding carbon-holders B, provided with horizontal supporting-arms *a*, guided by the said slots, substantially as specified.

6. In combination with the spiral incline C and with the carbon-holders B of an electric light, the spring-raised pivoted arm *a*, and a stop, *f*, to limit its upward throw, for the purpose of supporting the rod during its downward movement and yielding to its upward movement, substantially as specified.

7. In an electric lamp, the combination, with the carbon rod B, having a laterally-projecting arm, *a*, of the supporting spiral incline C, having its lower end terminating with a detached and pivoted portion, L, to allow it to revolve past the stationary arm *a* when the carbon is consumed, substantially as specified.

8. The combination, in an electric lamp, of a central spiral revolving incline, a series of carbon-holders supported by and arranged laterally or annularly around the said spiral, and one central actuating-magnet, substantially as specified.

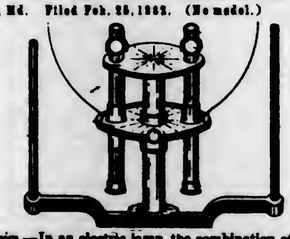
256,687. CARD-GRINDING MACHINE. JOHN J. HOEY, Lawrence, Mass. Filed Dec. 8, 1881. (No model.)

Claim.—1. In a card-grinding machine, the standards S S', adjustable guide R, and grinding-wheel G, substantially as and for the purpose set forth.

2. In a card-grinding machine, the standards S S', shaft D, pulley P, and grinding-wheel G, provided with the spout H, in combination with the adjustable guide R, constructed and arranged substantially as and for the purpose set forth.

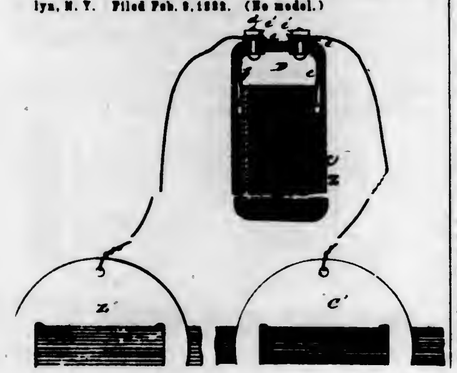
3. The combination, with the tension-rollers of a card-setting machine, of the standards S S', adjustable guide R, and grinding-wheel G, substantially as and for the purpose set forth.

256,688. NUT-LOCK. JOHN M. HOLLAND, Utica, Ill. Filed Dec. 28, 1881. (No model.)



Claim.—In a nut-lock, the combination, with the screw-bolt *a* and nut *c*, of the polygonal-formed collar E and the washer D, having upon its inner face or side a holding device and upon its opposite side or face a scalloped rim or flange, *d*, extending around the entire circumference of said washer, and having its interior side of polygonal form to correspond with the form of the collar, substantially as shown, and for the purpose set forth.

256,689. COMBINED MARKING AND CUTTING INSTRUMENT. EMMA C. HOLLEY, Brooklyn, N. Y. Filed Nov. 11, 1881. (No model.)

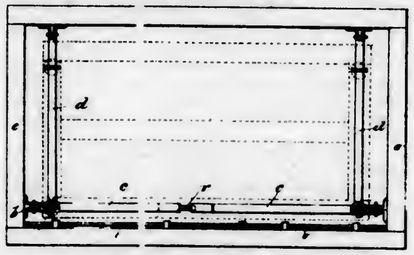


Claim.—An instrument composed of a hollow handle, A, having inclosed therein an emery-holder, B, of a marking-wheel, C, and a pencil and eraser, D and E, substantially as herein specified.

256,690. ELECTRIC LAMP. CHARLES T. HOLLOWAY, Baltimore, Md. Filed Feb. 28, 1882. (No model.)

Claim.—In an electric lamp, the combination of a plate supported by a stem, a clamping carbon-holder above the plate, a metal tube under the plate and just below the carbon-holder, and a globe-holder to move vertically on the stem, and with a hole to provide for the tube, as and for the purpose set forth.

256,691. GALVANIC BATTERY. GEORGE H. HOPKINS, Brooklyn, N. Y. Filed Feb. 9, 1882. (No model.)

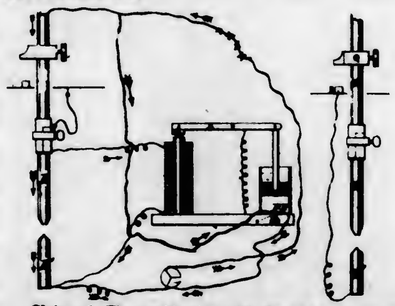


Claim.—1. In a medical battery having zinc and copper electrodes separated by bibulous paper, the combination of the springs *b c* with the cover D and inclosing-case A, substantially as herein specified.

2. In a medical battery, the combination of the case A, cover D, plates Z C, bibulous paper B, springs *b c*, and bolts *d*, having nuts *c c'*, substantially as specified.

3. As an improved article of manufacture, a medical battery consisting of zinc and copper plates separated by bibulous paper, and inclosed in a case having a close-fitting cover provided with contact-springs, as herein specified.

256,692. PLATFORM-SCALES. WILLIAM W. HOPKINS, Thorntown, Ind., assignor to the Hopkins Improved Scale Company, same place. Filed Oct. 20, 1880. (No model.)

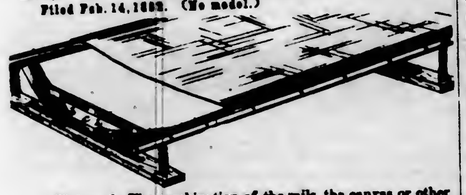


Claim.—1. A platform-scale having a fixed frame, a movable platform, a hollow pillar or case attached to and moving with said platform, the two levers *l d*, hung pivotally at one end to one of the sides of said fixed frame, the two levers *e e*, hung pivotally to the ends of said fixed frame and sustaining near their fulcra the free ends of levers *d d*, the rod *r*, supporting the free ends of levers *e e*, and the scale-beam *i*, from which the said rod *r* is suspended, substantially as set forth.

2. A platform-scale having a hollow pillar or casing supported by the platform and moving therewith, in combination with a scale beam and the actuating-rod of said beam, said rod and beam being inclosed in said pillar, whatever the position of the latter.

256,693. ELECTRIC LAMP. ERWIN J. HOUSTON, Philadelphia, Pa., assignor to the American Electric Company, New Britain, Conn. Filed June 3, 1881. (No model.)

Brief.—An automatic cut-out for electric lamps, adapted to use in street-lamps where it is desired to utilize the light for a predetermined time. An adjustable collar is affixed to the carbon-carrier, and either short-circuits the lamp direct or holds the carbon from further descent until the current from the generator becomes sufficiently strong in a high-resistance shunt-circuit to operate an electro-magnetic cut-out, which throws a low-resistance shunt around the lamp.



Claim.—1. The combination, with the carbon-carrier, of an electric lamp, devices, substantially as described, attached to and moving with said carrier, and adjustable in the manner and for the purpose set forth, so that the movement of the carrier may be stopped at any predetermined time.

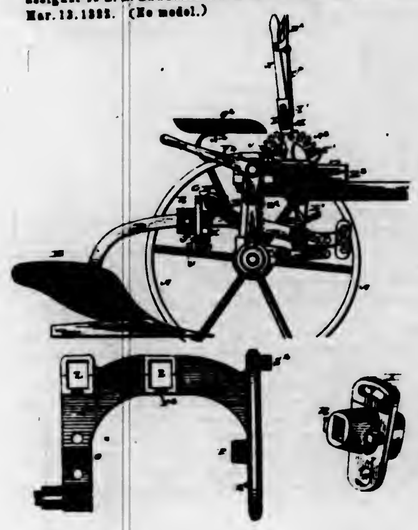
2. The combination, with the carbon-carrier, of a lug or projection connected to or moving with the carrier, a block or anvil with which the lug or projection upon the carrier may make contact, said lug and anvil being adjustable with relation to one another, and circuit-connections, substantially as described, to the anvil, adapted to form a derived or branch circuit around the lamp when the lug or projection moving with the carrier is in contact with the block or anvil.

3. The combination, with a carbon-carrier, of a ring or collar adjustable thereupon and a stop or anvil electrically connected to the opposite carbon, so that when the collar and the stop are in contact the carbons are short-circuited and the light is extinguished.

4. The carbon rod of an electric lamp, and an adjustable collar, acting as a stop, in combination with circuit-closing devices, substantially as described, whereby an automatic extinguishment of said electric lamp takes place at times previously determined upon.

256,694. BED-BOTTOM. ELISABETH B. HULL, Clinton, Ill. Filed Feb. 14, 1882. (No model.)

Claim.—1. The combination of the rails, the canvas or other suitable flexible material, the inclined arms projecting from the rails and supporting the same, the connecting cross-bar united to the arms by hinged joints, which form the fulcrums upon which the said arms turn, and the supporting-slats, substantially as described.



2. The combination of the rails, the canvas or other suitable flexible material, the inclined arms provided with wheels to facilitate their movement and prevent noise, the pivoted bars connecting the arms, and the supporting-slats, substantially as described.

3. The combination of the rails, the canvas or other suitable flexible material, the inclined arms provided with wheels, and the supporting-slats provided with grooves, in which said wheels run, substantially as described.

4. The combination of the rails, the canvas or other suitable flexible material, the inclined arms, the supporting-slats, the transverse bars, to which the arms are pivoted, and the springs or straps connecting the slats and rails to prevent undue rocking or tilting of the bed, substantially as described.

5. The combination of the rails, the canvas or other suitable flexible material, the connecting cross-bar, and the inclined arms provided with a series of holes adapted for the hinging of the connecting-bar at different points, substantially as and for the purpose set forth.

256,695. SULKY-PLOW. FRANKLIN B. HUNT, Richmond, Ind., assignor to L. L. Lawrence and H. H. Moon, same place. Filed Mar. 13, 1882. (No model.)

Claim.—1. The oscillator J, provided with a wedge-shaped hole for the oblique adjustment of the plow-beam, in combination with the set-screws R R, by which the beam is adjusted obliquely and held in place when adjusted, substantially as set forth.

2. The oscillator J, provided with a wedge-shaped hole and set-screws for the oblique adjustment of the beam, and the hole T and slot V for the lateral adjustment of the plow, substantially as set forth.

3. The hanger I, pivoted to the crank or bail C, and provided with the bearing S, bolt W, and corrugations X, in combination with the oscillator J, provided with the hole T, slot V, and corrugations X, for the purpose specified.

4. The oscillator J, provided with a wedge-shaped hole and set-screws for the oblique adjustment of the plow-beam, and the hole T, slot V, and corrugations X for the lateral adjustment of the beam, in combination with the hanger I, pivoted to the bail C, and provided with integral bearing S, and corrugations X, the corrugations being held in place, when adjusted, by means of the bolt W, substantially as set forth.

5. The oscillator J, provided with a wedge-shaped hole and set-screws for the oblique adjustment of the plow-beam, and the hole T and slot V for the lateral adjustment, in combination with the hanger I, provided with the pivot S for the hole T, and bolt W, substantially as set forth.

6. The seat-arch B, cast in a single piece and provided with the bearings O P, slots P^1, socketed bearings Z Z, and hollow bearing S^2, substantially as set forth.

7. The seat-arch, cast in a single piece and provided with the bearings for the bail C, socketed bearings Z Z, bearing S^2 for the lever Y^1, and the vertical bearing R^2 for the slide V^1, to which the land-wheel axle is attached, substantially as set forth.

8. The seat-arch, cast in a single piece and provided with the vertical part R^2, said vertical part being sloped or beveled and corrugated, for the purpose specified.

9. The seat-arch B, cast in a single piece and provided with socketed bearings Z Z, cast as integral parts of the arch, said bearings being provided with slots P^1, substantially as set forth.

10. The seat-arch B, cast in a single piece and provided with socketed bearings Z Z, said bearings having the slots P^1, bearings O P for the bail, hollow integral bearing S^2 for the lever, and the vertical part R^2 for the slide V^1, substantially as set forth.

11. The seat-arch, cast in a single piece and provided with the integral bearing S^2, in combination with the slide V^1, carrying the cam-lever C^1 and the block D^1, and connected with the bearing S^2 by means of lifting-bar X^1 and lever Y^1, the whole provided to be cast ready for use without fitting, substantially as set forth.

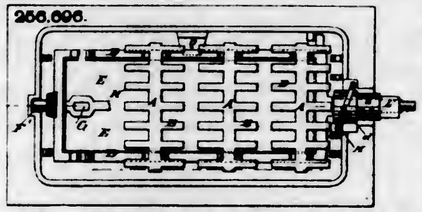
12. In combination with the integral bearing S^2 of the seat-arch, slide V^1, cam-lever C^1, and block D^1, the lever Y^1 and lifting-bar X^1, pivoted together by means of a socket-joint and held together by means of the bolt Z^1, substantially as set forth.

13. The seat-arch provided with the bearing S^2, in combination with slide V^1, the lifting-bar X^1, and lever Y^1, pivoted to the seat-arch by means of said bearing S^2, and the bolt B^2 for securing said lever in place, substantially as set forth.

14. In combination with the sloping and corrugated part R^2 of the seat-arch and the slide V^1, carrying the land-wheel spindle, the sloping corrugated block D^1, lifting-bar X^1, and lever Y^1, for raising and lowering the wheel A^1, substantially as set forth.

15. In combination with the slide V^1, cam-lever C^1, having a lug, F^1, and the corrugated block D^1, provided with lug E^1, whereby the cam-lever is adapted to lock and unlock the slide, substantially as set forth.

16. The corrugated part R^2 of the seat-arch and the corrugated part D^1, made sloping or beveled, as seen in Fig. 5, in combination with the cam-lever, by means of which the slide V^1 is clamped firmly to the seat-arch, substantially as set forth.



17. In combination with the seat-arch, the slide V^1, placed adjustably on the part R^2, and held in position, when adjusted, by means of the sloping or beveled corrugated block D^1, substantially as set forth.

18. In combination with the sloping corrugated part R^2 of the seat-arch, slide V^1, and sloping corrugated block D^1, the lifting-bar X^1 and the lever Y^1, for raising and lowering the wheel A^1.

256,696. SIFTING-GRATE. HENRY H. JAMES and JOHN C. DENNAN, Bangor, Me. Filed Nov. 5, 1881. (No model.)

Claim.—1. The combination of the frame E, having longitudinal bars D, with recessed projections *a b*, and the end pivots, F F', arranged in bearings of the stove or furnace frame, the bar H, having slots G, and the rocking bars B, having arms C, with spring-wire J, arranged in aperture *c*, whereby said frame and bars are held as described.

256,696.

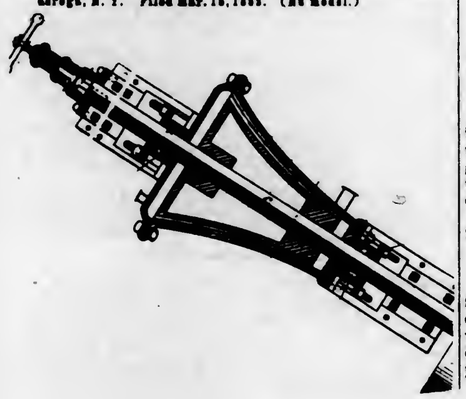
2. In a grate, the combination, with the frame E, provided with pivots F F, of the rocking grate-bars A, the arms C, the bar H, the hook K, the sleeve L, surrounding the pivot F, and the cam-flange M on the sleeve L, substantially as herein shown and described, and for the purpose set forth.

3. In a grate, the combination, with the frame E, provided with pivots F F, of the rocking grate-bars A, the bar H, the hook K, the sleeve L, the cam-flange M, and the arm Q, substantially as herein shown and described, and for the purpose set forth.

4. In a grate, the combination, with the frame E, provided with pivots F F, of the swinging grate-bars A, the arms C, the rod H, the hook K, sleeve L, and the cam-flange M, provided with one or more notches, *d*, substantially as herein shown and described, and for the purpose set forth.

5. The combination, with the bar H, having end hook, K, and the frame E, having the flattened end pivot, F, of the sleeve L, having diagonal cam-flange M and square end L', and the crank O, having the square opening N and notch P, as and for the purpose specified.

6. In a grate, the sleeve L, constructed, as shown and described, with a squared outer end, and provided with a cam-flange, M, diagonal to the longitudinal axis of the sleeve, as set forth.



7. A grate made substantially as shown and described, and consisting of a series of rocking grate-bars resting on a pivoted frame, which has one of its pivots surrounded by a sleeve which is provided with a cam-flange or ridge passing into the opening of a hook at the end of a slotted bar, uniting the downwardly-projecting arms of the rocking grate-bars, all as set forth.

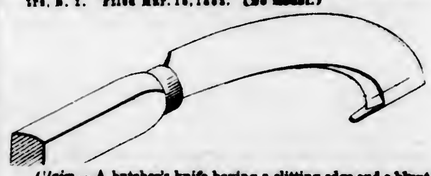
256,697. AIR-VENT FOR VESSELS CONTAINING LIQUIDS. GEORGE JAISWAY, Junction City, Ohio. Filed Oct. 18, 1881. (No model.)

Claim.—The combination, with the conical vent *a*, provided with the orifice *b* in its tapering end, and cover *c*, having the orifice *d*, of the concave diaphragm A, provided with the central orifice, *k*, and ball-valve *l*, substantially as described, and for the purpose set forth.

256,698. PULP-ENGINE. WALLACE W. D. JEFFERS, Ticonderoga, N. Y. Filed Mar. 16, 1882. (No model.)

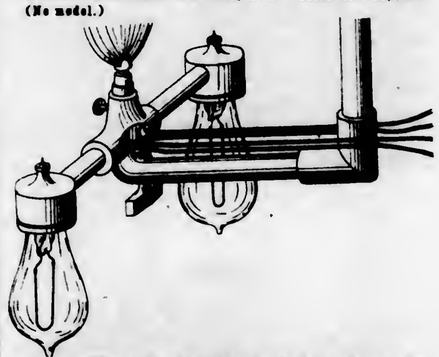
Claim.—1. In a pulping-engine, the outer shell and inner grinder, constructed of conoidal shape, with their walls inwardly curved from end to end, substantially as and for the purposes specified.

2. In a pulping-engine, the outer shell and inner grinder, formed of conic sections of varying angles, substantially as and for the purposes specified.



3. In a pulping-engine, the outer shell and inner grinder or roll, constructed of conoidal shape, the longitudinal line of working-surfaces at or near the small or inlet end being more nearly parallel to the axis of rotation than the working-surfaces at or near the larger or discharge end, substantially as specified.

256,699. TRUNK-HANDLE. CHARLES JENKINS, St. Louis, Mo., assignor to the Eichman Trunk Manufacturing Company, same place. Filed Feb. 22, 1882. (No model.)

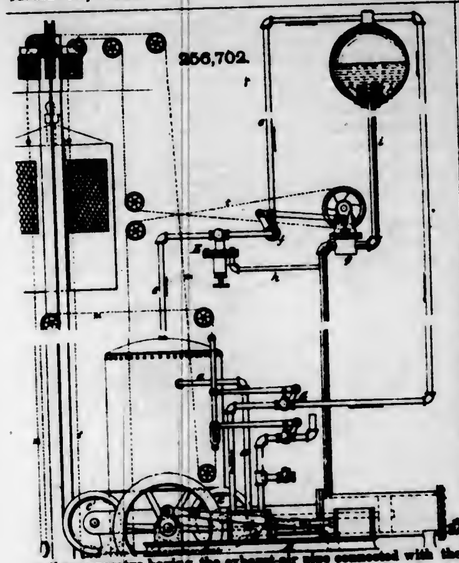


Claim.—The handle A, having flanged caps B B, in combination with brackets C C, having loops *c*, forming abutments against which the caps bear, as set forth.

256,700. SKINNING-KNIFE. MELVIN JINKS, Seneca Centre, N. Y. Filed Mar. 15, 1882. (No model.)

Claim.—A butcher's knife having a slitting-edge and a blunt guard extending beyond and approximately at right angles to said edge, substantially as described.

256,701. COMBINED GAS AND ELECTRIC-LAMP FIXTURE. EDWARD H. JOHNSON, New York, N. Y. Filed Nov. 28, 1881. (No model.)



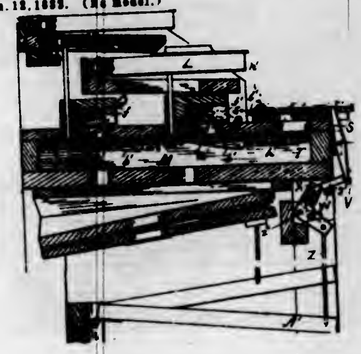
Claim.—The combination, with an arm of a gas-fixture, of an incandescent electric lamp having proper wire connections, and attached to such arm by a ring or hollow support passing over the gas-burner, the gas-burner and the electric lamp being capable of use either simultaneously or independently of each other without changing their relative position, substantially as set forth.

256,702. HYDRAULIC AND PNEUMATIC ELEVATOR. GEO. JOHNSON, Cincinnati, Ohio, and WALTER H. BAILEY, New York, N. Y. Filed Oct. 8, 1879.

Claim.—1. A hydraulic elevating apparatus having its lifting-cylinder constructed with a closed or air-tight head on its idle end, provided with an outwardly-opening check-valve, whereby a vacuum is effected and maintained on the outer side of the piston during the descending movement to serve to counterbalance, or partly counterbalance, the weight of the car.

2. A pneumatic or combined hydraulic and pneumatic ele-

256,702.



vating apparatus having the exhaust-air pipe connected with the jacket or the suction-pipe of the air-compressing pump, whereby the exhaust-air is utilized by the compressor or discharged through the jacket, serving to cool the air-cylinder and assist the working of the compressor, substantially as herein set forth.

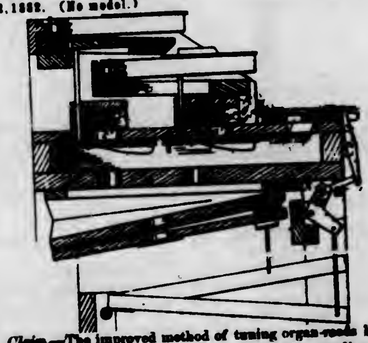
3. A hydraulic elevating apparatus having a water-reservoir provided with a submerged float-valve guarding the water-exit therefrom to the lifting-cylinder, whereby said exit remains open during a sufficiency of water, but is closed by the descent of the float when the water falls below a normal level, thus preventing the inflow of air to the lifting-cylinder, substantially as shown and described.

4. The combination, in a hydraulic elevating apparatus operated by the pressure of air or other elastic fluid acting on a hydraulic column, of an automatic valve governing the supply of air-pressure on the hydraulic column, consisting of an air-throttling valve in the air-supply pipe connected with a movable partition or diaphragm, the chamber below which is connected with the water-column, while the chamber above the partition or diaphragm is in direct and open connection with the air-pipe around the stem connecting the throttling-valve and diaphragm, whereby the valve-stem works without friction, thus rendering the action of the valve certain and sensitive.

5. The combination of the diaphragm e and air-throttling valve *a*, connected together, the water-pressure pipe A, communicating with one side of the diaphragm, the spring assisting said pressure, and the air-supply pipe *c*, communicating with the other side of the diaphragm, substantially as herein shown and described.

256,703. APPARATUS FOR TUNING ORGAN-REEDS. GEO. B. KELLY, Boston, and ELWIN H. SMITH, Cambridge, assignors to the Mason & Hamlin Organ Company, Boston, Mass. Filed Jan. 12, 1882. (No model.)

Claim.—1. An apparatus for tuning organ-reeds, composed of a series of organ-reeds of any desired compass or scale, each reed of which is arranged in a separate reed-chamber and to be sounded of itself under the action of suitable wind mechanism, and is of a pitch higher than that of a corresponding reed in practical use, in combination with a holder of a construction to hold a reed while being tuned to and by the corresponding reed of higher pitch in said series of reeds, in communication with wind mechanism, in a manner to have the tongue of the reed unconfined in any chamber or compartment and open and free to be worked upon by the tuner, all substantially as and for the purpose described.



2. An apparatus for tuning organ-reeds, composed of two series of organ-reeds of any desired but of the same compass and scale, and having each reed of each series arranged in a separate reed-chamber and to be sounded of itself under the action of suitable wind mechanism, and the reeds of the one series of a higher pitch than those of the other series, in combination with a holder of a construction to hold a reed while being tuned to and by the corresponding reed of higher pitch in the one series of reeds, in communication with wind mechanism, in a manner to have the tongue of the reed unconfined in any chamber or compartment and open and free to be worked upon by the tuner, all substantially as and for the purpose described.

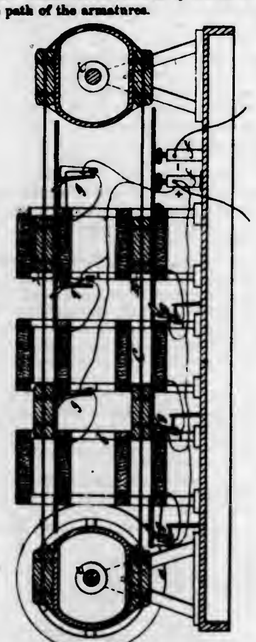
3. A holder or clamp for an organ-reed, composed of jaws constructed and arranged to open from and close upon a reed-block and when closed leave the reed-tongue open and free to be handled, in combination with a wind mechanism which is in communication with the tongue of the reed, all substantially as described, for the purpose specified.

4. A holder or clamp for organ-reeds, composed of jaws F r', the one, F, stationary, but adjustable in position, and the other, r', arranged to be moved toward and away from the stationary jaw, and both otherwise constructed to hold a reed-block between them and have the reed-tongue open and free to be handled, in combination with a wind mechanism which is in communication with the reed-tongue, all substantially as described, for the purpose specified.

5. A reed-clamp composed of a stationary and a sliding-jaw, in combination with a vertical lever, U, having spring V, a pusher-rod, W, a bell-crank lever, B', a pitman-rod, Z, and a treadle, A', arranged together to work upon the sliding jaw r', substantially as and for the purpose described.

256,704. METHOD OF TUNING ORGAN-REEDS. GEORGE B. KELLY, Boston, and ELWIN H. SMITH, Cambridge, assignors to the Mason & Hamlin Organ Company, Boston, Mass. Filed Jan. 12, 1882. (No model.)

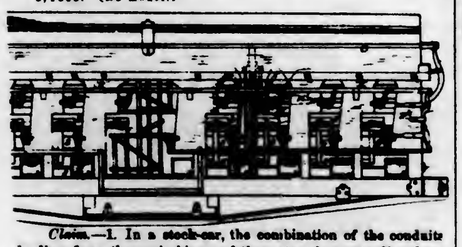
Claim.—The improved method of tuning organ-reeds herein described, the same consisting in simultaneously sounding with the same or similar wind mechanism two reeds—to wit, a reed to be tuned, unconfined in any chamber or compartment, and a reed confined in a chamber or compartment and having a pitch higher than the pitch the reed being tuned is to have when in practical use in an organ—and then filing or scraping or otherwise manipulating the tongue of the reed to be tuned, bringing it in its said position to correspond in pitch and temperament to the reed of higher pitch, all substantially as and for the purposes specified.



256,705. WATER-PROOF PAPER-HANGING. CHARLES T. KUNNUS, Cleveland, Ohio. Filed Oct. 8, 1881. (No specimens.)

Brief.—The paper is first coated with a solution of glue and glycerine and dried, when it is treated with a secondary solution of turpentine or naphtha, one-half part; india-rubber dissolved in naphtha, one-fourth part; linseed or other vegetable oil, one-eighth part; rosin or beeswax dissolved in turpentine, one-eighth part.

Claim.—A wall-paper rendered water-proof by treating the paper with a composition of viscous material and glycerine as a preparatory ground for the application thereto of a coating of a compound consisting of the ingredients herein formularized, or their equivalents, in about the proportions specified, and in the order and by the process substantially as described, and for the purpose set forth.

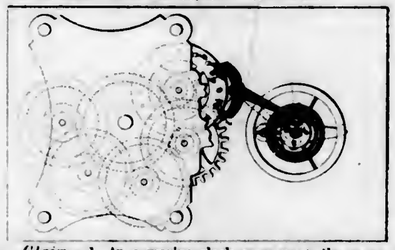


256,706. ELECTRIC MOTOR. JOHN DU BOIS KIELY, Toronto, Ontario, Canada. Filed Oct. 18, 1881. (No model.) Patented in Canada, Nov. 25, 1881.

Brief.—Armatures carried by a flexible band are drawn through axial magnets and pass around pulleys at the ends of the machine. The circuits are controlled by means of levers which project in the path of the armatures.

Claim.—The combination, with armatures arranged at intervals on a non-conducting belt and magnets fixed at intervals on one or both sides of the belt, of the lever circuit-closers *g*, one of whose arms serves to make and break the circuit for each magnet and the other to project in the path of the armatures for being operated, as described.

256,707. CATTLE-CAR. ELIAS KOHLER, York, Pa. Filed Feb. 3, 1882. (No model.)

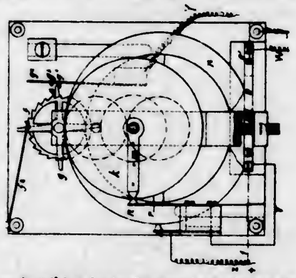


Claim.—1. In a stock-car, the combination of the conduits leading from the grain-bins, and the water-pipes extending from a water-tank through passages in the conduits, the double valves and levers for operating them simultaneously in opposite directions from the end of the car, the valves in the water-pipes adapted to be operated by suitable mechanism, and the tilting troughs and mechanism for operating the same from the end of the car, the whole arranged in such manner that the troughs may be filled with food or water or emptied, substantially as specified.

2. The combination, in a stock-car, of a water-tank at the top, the pipes leading from the same to the troughs, the said troughs being mounted on rock-shafts, whereby they may be emptied to prepare them for the reception of feed or water, the controlling-valves, and operating-rods and locking devices, all arranged to operate substantially as and for the purposes set forth.

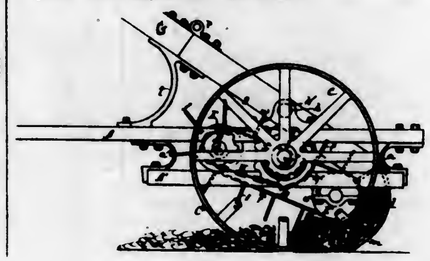
3. In combination with the movable bottom of the car, the folding partitions hinged thereto, substantially as specified.

4. In combination with the stock-car and its movable floor and folding partitions, the flexible partitions and their rollers, arranged substantially as and for the purposes specified.



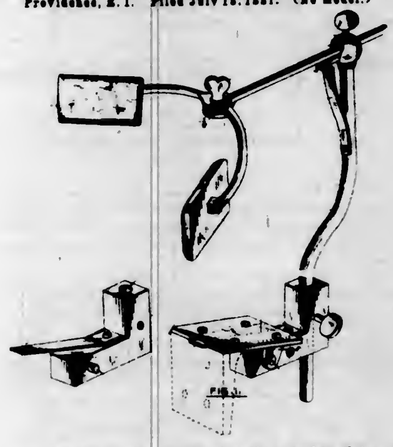
256,708. CLOCK-MOVEMENT. FREDERIC A. LAMB, New Haven, Conn. Filed Dec. 30, 1881. (No model.)

Claim.—1. In a marine clock-movement, the verge constructed with banking-pins *i i*, projecting from the working-surface of the verge, substantially as described.



2. In a marine clock-movement, the verge constructed with banking-pins *i i*, projecting from the working-surface of the verge, made in one and the same piece with the lever or arm C, substantially as described.

256,709. STRIKING DEVICE FOR ELECTRIC AND OTHER CLOCKS. ALPHONSE LEMOINE, Paris, France. Filed Dec. 9, 1881. (No model.) Patented in France Oct. 24, 1881.



Claim.—A striking device for electric or other clocks, consisting of an insulated disk, *k*, provided with a conducting-segment, *l*, and a conducting-disk, *n*, having projections *p*, in combination with a connecting conductor-strip, *m*, two insulated contact-springs, *r s*, and two contact-springs, *v v'*, operated by an insulated pin, *u*, mounted in the pendulum, the whole actuated to make and break an electric circuit a suitable number of times at the end of each hour and cause the sounding device to strike the hour, as described.

256,710. HAY-LOADER. GEORGE W. LE VIN, Chicago, Ill., assignor of one-half to Marshall Beck, same place; said Le Vin and Beck assignors of one-third to Edwin Hopkins, same place. Filed Aug. 9, 1881. (No model.)

Claim.—In a hay-loader, the combination, with the frame A A', having brackets H and *t*, and chute G, having trunnions *h h*, and supported in said bearings or brackets, with rake-teeth *m m*, attached to its rear curved end, of the shaft or axle B', carrying wheels C C, the pulleys C' D, chain W, drums E E', and apron F, having elevating-fingers *f*, and working on a different plane from that of the lower slotted floor, *g*, of the chute, substantially as shown and described.

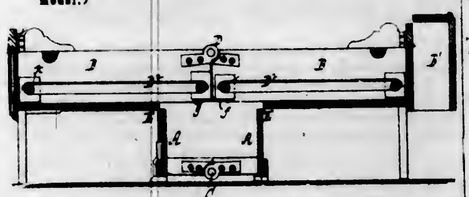
256,711. BACK FOR PIANO-STOOLS. WILLIAM S. LISCOMB, Providence, R. I. Filed July 16, 1881. (No model.)

Claim.—1. The combination of a securing-plate, a pivoted mortised block for receiving a vertical back-rest standard, and a spring for controlling the block, substantially as described.

2. The combination, with the pivoted mortised block provided with a spring, of the vertical standard, adjustable in said block, back-pads, and a flexible joint or joints between said pads and said standard, substantially as described.

3. The combination of the standard, the pad-bar, the ball-and-socket joint, and the spring, substantially as described.

4. The combination, with a flexibly-supported standard, of a pair of back-pads flexibly mounted on arms which are adjustable with relation to each other, substantially as described.



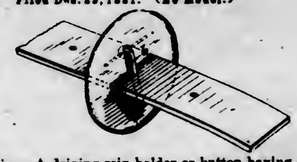
5. The combination, with a stool, a standard, and a pad-bow of a pair of back-pads separately hinged on vertical axes to said pad-bow, substantially as described.

6. The combination, with the swiveled back-pads, the bow, and the pad-bar, adjustably jointed and provided with a clamping-screw, of the standard and a spring-controlled joint at or near the connection of the bar with the standard, substantially as described.

7. The combination, with a stool-back standard, of a pivoted base-block, in which said standard is mounted, and a spring for forcing said standard forward, and an abutment for the block which limits the rearward movement of the standard, substantially as described.

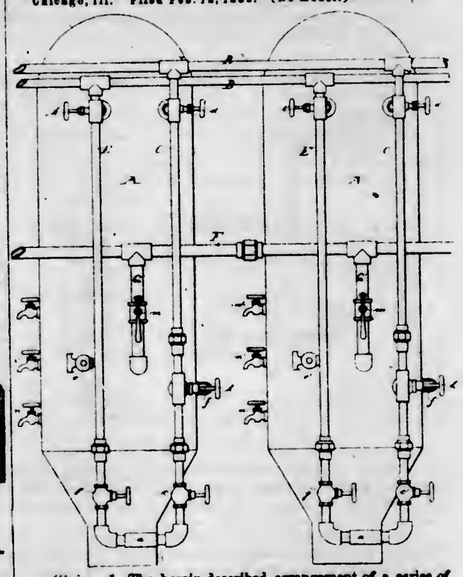
8. The combination, with a stool, of the spring base-block flexibly jointed with relation to the stool, the vertically-adjustable standard, the pad-bar flexibly jointed to the standard, and the pad-bow and pads, substantially as described.

256,712. BUREAU-BEDSTEAD. WILLIAM MARSCH and FREDERICK BERTRAM, Brooklyn, N. Y. Filed Mar. 8, 1883. (No model.)



Claim.—The combination, substantially as hereinbefore set forth, of the base-frame divided into two sections, A A, hinged together by hinges C, located adjacent to the lower edges of the sections for permitting the said sections to tilt, as described, with the bedstead composed of two sections, B B, hinged together in the vertical plane of the base-frame hinges, and also hinged to said base-frame sections, as and for the purpose set forth.

256,713. HOG-RING PINCHERS. ERBE MASON, Macon County, Ill. Filed Jan. 3, 1882. (No model.)



Claim.—The herein-described pinchers, having the longer or upper jaw, *a*, encompassing an arc equal to one-half of a circle, and the lower or shorter jaw, *a*, encompassing an arc equal to one-quarter of a circle, each jaw being provided with the groove extending around it, and the lower one being provided with the recess *d*, the said pinchers being adapted to have the end of the lower jaw placed against the end of the hog's snout, and to have the upper jaw forced down while the lower remains idle, so that a half-circle or a half of the full length of the blank will be under this upper jaw and be operated upon thereby continuously and regularly, thereby insuring the even and regular bending of the blank to form a circle, as set forth.

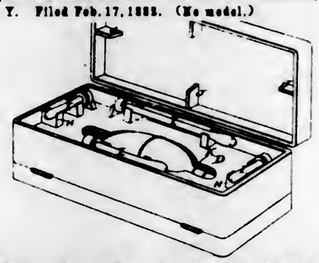
256,714. DRIVING-REIN HOLDER OR BUTTON. STEPHEN A. MARKER, Hartford, Conn., assignor to John W. Gray, same place. Filed Dec. 29, 1881. (No model.)

Claim.—A driving-rein holder or button having a transverse opening through it for the reception of the rein or strap thereof, and a tongue suitably connected directly to the holder or button for securing the rein or strap thereto, substantially as and for the purpose set forth.

256,715. LARD AND TALLOW TANK. JAMES K. MARTIN, Chicago, Ill. Filed Feb. 18, 1882. (No model.)

Claim.—1. The herein-described arrangement of a series of tanks, A A', each connected with a steam-pipe, B, water-pipe D, and lard or tallow conveying pipe F by suitable branches and

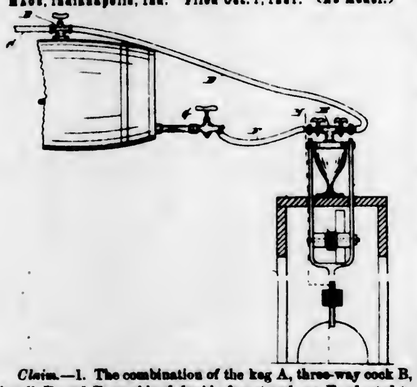
valves for adapting either tank alternately to be used for rendering or purifying purposes, substantially as set forth.



2. The combination of a series of tanks, A A′, connected with pipe F by branches G and G′, each having a valve, *m* and *m*′, for the purpose of conveying lard or tallow from any one tank to another, substantially as and for the purpose set forth.

3. The combination of a series tanks, A A′, each connected with the lard or tallow pipe F by branches G G′, having valves *m* and *m*′, and each tank containing a curved and perforated pipe, *g*, that is connected by a branch, *f*, with the steam-pipe B, all substantially as and for the purpose set forth.

4. The combination, with a series of tanks connected by pipe F and branches G and G′, having valves *m m*′, of the steam-pipe B and water-pipe D, both connected by branches with the top and bottom of all the tanks and provided with suitable valves, substantially as and for the purpose set forth.

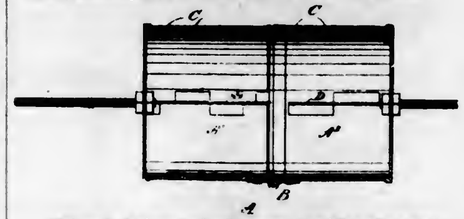


5. The combination of a series of tanks, A A′, each connected with pipe F by branches G G′, having valves *m m*′, each tanks being also connected at top and bottom with steam-pipe B by branches C C′, having valves *d d*′ and *e e*′, and having perforated pipes *g g*′, that connect the pipes *f f*′ with the branches C C′, and have valves *h h*′, and with water-pipe D by branches E E′, having valves *j j*′ and *k k*′, all substantially as and for the purpose set forth.

256,716. SYRINGE-BOX. THOMAS F. MATTHEWS, New York, N. Y. Filed Feb. 17, 1882. (No model.)

Claim.—An invertible syringe-box having hinged covers forming two of its opposite sides, an intermediate fixed partition converting the box into two compartments, one of which is adapted to hold a syringe and the other a set of pipes therefor, clamps on one of the covers, adapted to hold the pipes in place in their compartment when said cover forms the bottom of the box, and an aperture in said partition, which serves as a guide by which to place a syringe in one compartment and permit a part of the syringe to be seen through the other compartment when the box is inverted, as set forth.

256,717. APPARATUS FOR DRAWING BEER. CLEMENT A. HAUG, Indianapolis, Ind. Filed Oct. 1, 1881. (No model.)

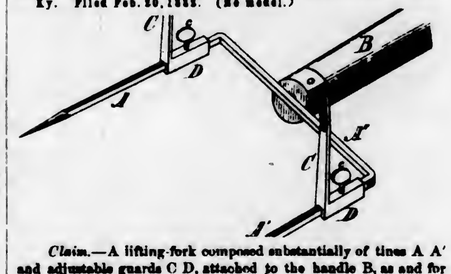


Claim.—1. The combination of the keg A, three-way cock B, tubes C, D, and F, combined double faucet and cap E, adapted to be applied to the glass, and faucet G, all substantially as shown and described, and for the purposes specified.

2. The combination, in an apparatus for drawing beer under pressure, and which prevents the escape of gases, of a cap, E, for said glass, which fits tightly thereon, a vertically-movable rod attached to said cap, and a handle for manipulating said rod and holding said cap firmly upon said glass, substantially as set forth.

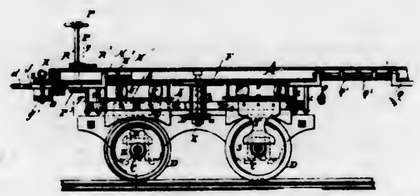
3. In an apparatus for drawing beer under pressure, a combined double faucet and cap, E, having two openings not connected with each other, each having a cock, and both opening independently of each other through the bottom side into the glass, one being for the admission of beer and the other being for the admission or expulsion of air, all substantially as specified.

256,718. COFFEE AND NUT ROASTER. THOMAS F. MCCAFFERY, Philadelphia, Pa. Filed Feb. 10, 1882. (No model.)



Claim.—1. An improved coffee roaster, consisting of two open-ended cylindrical sections hinged together at their open ends, with the end of one projecting into the other, and provided with pivots projecting from their closed ends, substantially as herein shown and described.

2. In a coffee and nut roaster, the combination, with the cylindrical sections A′ A², provided with apertures C, of the hinge B, uniting the two sections, substantially as herein shown and described and for the purpose set forth.

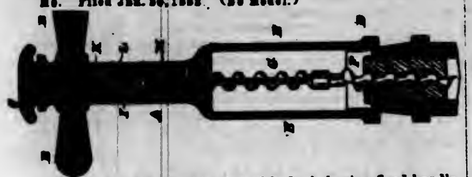


3. In a coffee and nut roaster, the combination, with the sections A′ A², provided with apertures C C, and internal projecting strips, D, of the hinge B, uniting the two sections, substantially as herein shown and described and for the purpose set forth.

256,719. LIFTING-FORK. GEORGE W. MCDANNOLD, Kenton, Ky. Filed Feb. 20, 1882. (No model.)

Claim.—A lifting-fork composed substantially of tines A A′ and adjustable guards C D, attached to the handle B, as and for the purpose herein set forth.

256,720. CAR-BRAKE. JOHN MEISSNER, New York, N. Y., assignor of one-half to Henry Fleischman, same place. Filed Sept. 30, 1881. (No model.)

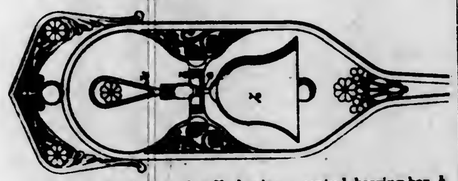


Claim.—1. The combination, with the brake-shoe frame L, of the draw-bar N, provided with suitable devices for connecting it to said frame, substantially as herein shown and described.

2. The combination, with the brake-shoe frame L and brake-shaft P, provided with lever P², of the draw-bar N, having socket A, and provided with lugs *q*′, substantially as herein shown and described, whereby the brake is set, as set forth.

3. The combination, with the brake-shoe frame L, brake-shaft P, provided with lever P², and draw-head O, of the draw-bar N, provided with frame-connecting devices *q*′, and having slotted coupling-pin hole *f*, substantially as herein shown and described, whereby the brakes may be set while the cars are coupled, as set forth.

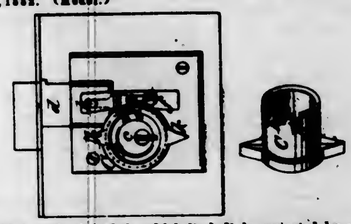
256,721. CORK-EXTRACTOR. WILLIAM HEYNE, St. Louis, Mo. Filed Jan. 26, 1882. (No model.)



Claim.—1. The combination of body A, having fixed handle B, ring D, connecting-arms E, screws F and G, and plunger C, the screw-shaft *m* secured to the plunger so to turn freely therein, as and for the purpose set forth.

2. The combination of body A, provided with handle B, the ring D, connecting-arms E, screws F and G, plunger C, and sleeve I, the latter secured to the shaft by nut K and to the plunger by transverse pin L, all substantially as and for the purpose set forth.

3. In combination with body A, ring D, arms E, screws F and G, and plunger C, the spring M, as and for the purpose set forth.



256,722. CALL-BELL FOR TABLE-WARE. WATSON J. MILLER, Birmingham, and HENRY BERRY, Huntington, Conn. Filed Mar. 11, 1882. (No model.)

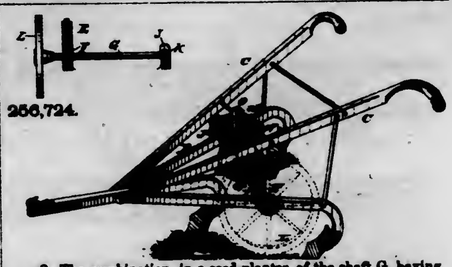
Claim.—1. A center-handle having a central bearing-bar, *b*, across its loop, said bar being annularly grooved at *c* to form an arbor, and in connection therewith the detachable bell A, having its handle *b* obliquely turned just above the bowl, and the oblique hook *c* engaging said arbor, substantially as specified.

2. The combination, with the center-handle *a* and its centrally-grooved transverse bearing-bar *b*, of the detachable bell *h* and its handle-hook *c* above the bowl, substantially as specified.

256,723. DRAWER-LOCK. FRANK W. MIX, Perrysville, Conn., assignor to the Eagle Lock Company, same place. Filed Jan. 6, 1882. (Model.)

Claim.—1. A lock in which its bolt is projected by a sleeve fitting upon the lock-cylinder and engaging with a slide connected to the said bolt; substantially as herein shown and described.

2. The notched sleeve C and slotted slide *f*, provided with the lugs *i*, combined with the cylinder *b* and bolt *d* of a lock, substantially as and for the purposes set forth.



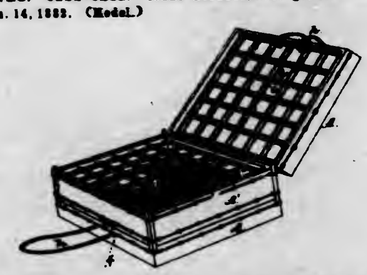
3. In a lock, the pivoted catch *m* and screw *o*, in combination with locking-cylinder C, substantially as and for the purposes set forth.

256,724. SEED-PLANTER. EDWARD P. MORRIS, Glade Hill, Va. Filed Jan. 5, 1882. (No model.)

Brief.—One end of the shaft on which the hopper and feed and bearing wheels are mounted is journaled to an oscillating bearing. The shaft near the bearing-wheel is spring-pressed, which allows it to conform to the inequalities of the ground.

Claim.—1. The combination, in a seed-planter, of a shaft for the seed-dropping wheel, which is adapted to oscillate vertically at one end, and a hopper which is supported upon the shaft and connected to a cross-rod above it by means of a slotted bar, to allow the hopper to oscillate with the shaft, substantially as specified.

256,724.



2. The combination, in a seed-planter, of the shaft G, having seed-dropping wheel H, the slotted standard E, having elastic sliding bearing F, the slotted standard J, having oscillating bearing K, the driving-wheel L, and a suitable frame-work having opening and covering plows, substantially as shown and described.

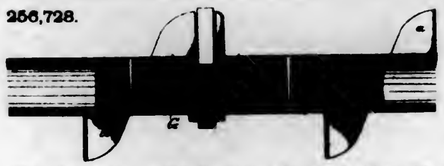
256,725. COMBINED BUCKLE AND SNAP-HOOK. WILLIAM H. MUNSS, Cleveland, Ohio. Filed Feb. 21, 1882. (No model.)

Claim.—The combination, with the end bar, E, and its hook F, curved inward toward the next bar, G, of the bar G of the buckle, and the fastening stud or tongue C, adapted to hold a strap, which, when passed over the bar G and secured, as shown, serves to form a stop to insure the engagement of a snap hook or link with the hook F, substantially as specified.

256,726. CELL-CASE. ISAAC NICHOLS, Chicago, Ill. Filed Jan. 14, 1882. (Model.)

Claim.—In an egg-carrier, the combination, with the intermediate frame, A′, having net-work *d e d* and cross-bar L, of the end frames, A A, having end walls, *b b*, handles *h* A, and net-works *c d c*, hinged to the frame A′ at *a a*, and provided with fastenings *f f*, and the short abutting supports *i*, substantially as and for the purposes specified.

256,727. GONG-BELL. GEORGE B. OWEN, Winsted, Conn. Filed Feb. 25, 1882. (Model.)



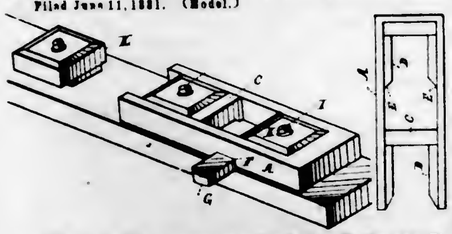
Claim.—1. A gong-bell constructed substantially as herein shown and described, and consisting of the foot A, bent standard B, sounder C, gong E, and rod F, as set forth.

2. In a gong-bell, the combination, with the sounder C, carrying the gong, of the rod F, substantially as herein shown and described, whereby the sounder is connected with a sounding-board, and the gong is made to have a louder, clearer, and more musical tone, as set forth.

256,728. BEARING AND COUPLING FOR SCREW-CONVEYER SHAFTS. HENRY PALMER, Chester, Pa. Filed Mar. 13, 1882. (No model.)

Claim.—The combination of two sections of a conveyer-shaft

256,728.



and a journal-bar, *D*, adapted to couple the same together, with a tubular bearing, G, extending into one or both of the shafts, and a bracket or hanger for carrying the said bearing, all substantially as set forth.

256,729. RAISINGS FOR UPHOLSTERY OF FELT. WILLIAM K. PARKER, New Haven, Conn., assignor of one-half to English & Mersick, same place. Filed Mar. 13, 1882. (No specimens.)

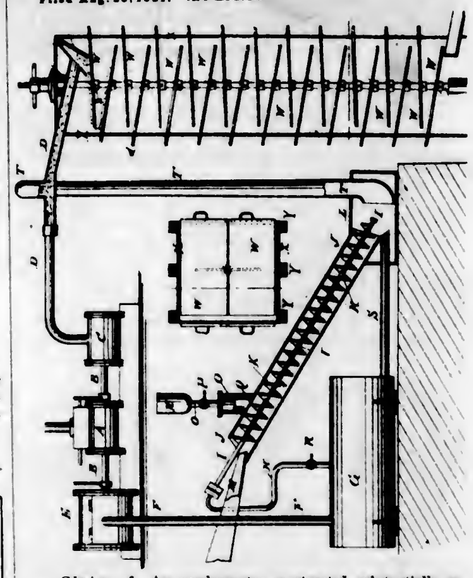
Claim.—The herein-described improvement in raisings for upholstery, consisting in felt having its surface coated with a stiffening material preparatory to the cutting of the raisings therefrom, substantially as described.

256,730. NUT-LOCK. LAWSON G. PEEL, Haslehurst, Miss. Filed June 11, 1881. (Model.)

Claim.—1. The combination, with the bar H, the nuts K, their washers, and the key G, of the locking-frame A, having internal flanges, D, beveled at E, transverse bar C, and notches F, arranged substantially as described.

2. The nut-locking frame A, consisting of the longitudinal and transverse bars, the internal flanges, D, beveled at E, and notches F, substantially as and for the purpose described.

256,731. WASH-BOILER FOUNTAIN. ELIS PITTEY, East New York, N. Y. Filed Jan. 9, 1882. (No model.)



Claim.—A wash-boiler fountain consisting of a circular base having a diametrical channel, an upright discharge-tube connected to one end of said channel, independent semi-circumferential channels provided with independent openings and connected with the opposite end of said diametrical channel, and an interior tapering projection at the point of connection of the diametrical and semi-circumferential channels, all substantially as described.

256,732. ART OF ORNAMENTING METALS. JOHN D. PLASCHAMP, Chicago, Ill. Filed Feb. 15, 1882. (Specimens.)

Claim.—The art of ornamenting watch-cases by first soldering variously-shaded ornamental metals upon a body or ground metal and then trimming away the metal beyond the outlines of the sunken metal, and then blending and ornamenting the sunken metal, substantially as specified.

256,733. AMALGAMATOR. CHARLES PORTER, Omaha, Nebr. Filed Aug. 25, 1881. (No model.)

Claim.—1. An amalgamator constructed substantially as herein shown and described, and containing the following elements, viz: a mixing-tube in which rotates a conveyer and air-distributer and having a quicksilver-atomizer attached, a receiving-box connected with the mixing-tube and with an air-compressor, a transfer-pipe through which the contents of the receiving-box are projected by an air-blast into a water-pipe, and a water-forcing device by which the contents of the water-pipe are carried into an amalgamating-box and delivered upon a series of plates arranged within the box, all as set forth.

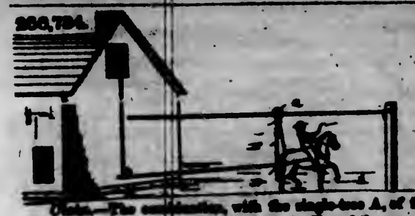
2. The combination, with the chamber G, having pipe H, of the perforated tubular shaft I, having spiral flange K, the inclined open-ended tube J, the air-tight chamber L, and the apron M, as and for the purpose described.

3. The combination, with the tube J and a quicksilver-reservoir, N, connected therewith, of the discharge-pipe O, enlarged toward its lower end, having the valve P, and provided with an atomising-diaphragm, Q, as and for the purpose described.

4. The combination, with the pipe D, of the distributer U and the upper adjustable amalgamating-plates inclined in opposite directions and coming short of the casing, as and for the purpose specified.

5. In an amalgamator, the combination, with the mixing-tube J, of the receiving-box L, the air-blast pipe S, conductor-pipe T, and water-pipe D, substantially as herein shown and described.

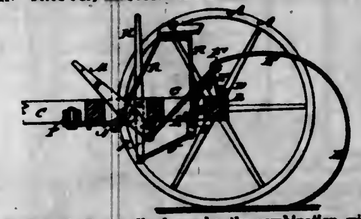
6. In an amalgamator, the combination, with the perforated air-shaft I, tube J, and receiving-box L, of an air-chamber, G, and pipes H S, substantially as herein shown and described, whereby the contents of tube J will be subjected to air-blasts, as set forth.



7. In an amalgamator, the combination, with the pipe D and the plates W, of the distributer U, substantially as herein shown and described, whereby the contents of pipe D will be spread upon the said plates W, as set forth.

8. In an amalgamator, the distributer U, constructed with a face-lining, V, substantially as described, whereby the wearing of the said distributer is prevented, as set forth.

9. The method of transferring the amalgamated gold and sand to the wet amalgamating mechanism, which consists in forcing the said amalgamated gold and sand by means of a blast of compressed air into a stream of water that flows into the wet amalgamating-box, as set forth.



256,734. SINGLE-TREE SLING. JOSEPH H. PORTER, Ottawa, Ill. Filed Feb. 21, 1882. (No model.)

256,734.

Claim.—The combination, with the single-tree A, of the attachment B, provided with hooks C and eyes D, and the rope, wire, or chain E, and pulley-sheave G, adapted to travel upon a suitable rope, wire, or chain and support the single-tree parallel with the line of draft, substantially as and for the purposes specified.

256,735. SULKY HAY-RAKE. WALTER P. PRALL, Colusa, Cal. Filed July 23, 1881. (No model.)

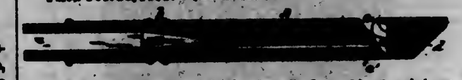
Claim.—1. In a sulky hay-rake, the combination, with the axle B, bars D F, connected by the ends of teeth R, and the teeth E, of the connecting-rods G J L, connecting-lever H, hand-lever K, and foot-lever M, pivoted at N, and the pivoted draw-bar O and single-tree P, whereby when the hinging-point of draw-bar O is brought below foot-lever pivot N the draft operates to raise the rake-teeth and discharge the load, substantially as shown and described.

2. In a sulky hay-rake, the combination, with the axle B, bars D F, placed one above the other, and the teeth R, of the rods G J L, connecting-lever H, hand-lever K, and foot-lever M, whereby the rake is lowered by the combined hand and foot power of the driver, substantially as shown and described.

256,736. CURTAIN-FIXTURE. WENDELL P. PUTNAM, Watertown, Mass. Filed Jan. 23, 1882. (No model.)

Brief.—Under a fast motion the leg attached to the cap throws the pawl attached to the spindle up into engagement with the recessed end cap.

Claim.—2. A spring-actuated curtain-roller carrying an end cap, having one or more recesses in the inner wall of its peripheral flange and a pawl-lifting leg near its center, in combination with a central spindle provided with a pivoted pawl adapted to be lifted by the leg into engagement with the recess in the end cap during a quick upward movement of the shade, for the purpose set forth.



2. The spindle D and the pivoted pawl G, supported thereon, in combination with the spring-actuated roller B, carrying the recessed end cap and the leg I or equivalent devices, for the purposes set forth.

256,737. BOX-FASTENER. GEORGE S. RANDALL, Marshfield, assignor to Howard G. Barnes, Boston, Mass. Filed Mar. 8, 1882. (No model.)

Claim.—In a box-fastener, the combination of the spring part C C and the plate H with the hitch part D d d and catch E, operating together substantially as described, and for the purpose set forth.

256,738. SCRIBNER PENCIL-POINT PROTECTOR, TWINE-CUTTER, AND WHISTLE. JOSEPH ROCKENDORFER and CLARK W. DOMAN, New York, N. Y., assignors to said Rockendorfer. Filed Feb. 20, 1882. (No model.)

Claim.—1. The hereinbefore-described combined point-protector, whistle, and twine-cutter as a new article of manufacture.

2. The tube A, provided with a whistle end and with a slot, *a*, as described, in combination with the cutter *c*, and the plug *d*, constituting the whistle-plug and the cutter-holder, as shown and set forth.

256,739. DRILL-CHUCK. GEORGE REMPFER, Philadelphia, Pa., assignor to himself, John George Rehfuss, and Martin G. Rehfuss, all of same place. Filed Dec. 28, 1881. (No model.)

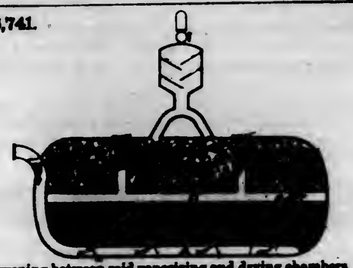
Claim.—1. A chuck in which the body A, having a threaded portion, *c*, and at end near its end a plain cylindrical portion, *y*, is combined with a slotted sleeve and with a nut adapted to the conical portion of the sleeve and to the threaded portion of the body, and constructed to fit snugly on and covering the plain cylindrical portion *y* of the said body, all substantially as set forth.

2. The combination of the threaded body of the chuck and its beveled end *y* with a split sleeve having a beveled shoulder, *p*, adapted to the beveled end of the body, and with the nut H, substantially as set forth.

3. A chuck in which two slotted sleeves, D and G, the cylindrical portion of one fitting into that of the other, and each having a conical termination, are combined with the body A and nut H, substantially as set forth.

4. The combination of the slotted sleeve D, having a conical termination, *d*, and beveled shoulder *n*, the slotted sleeve G, having a beveled end, *n*, adapted to the said beveled shoulder of the sleeve D, the body A, and the nut H, all substantially as specified.

256,740. NECKTIE-FASTENER. PARKER H. RAW, Rochester, N. Y. Filed Sept. 24, 1881. (Model.)

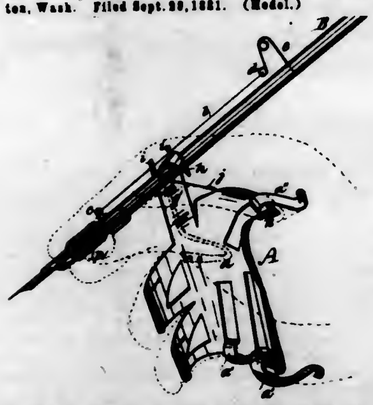


Claim.—1. The combination, with the necktie-bow G, of the wire loop-spring A and the loop or staple E, attached to the bow, substantially as herein shown and described, and for the purpose set forth.

2. The wire loop-spring A, made substantially as herein shown and described, and consisting of a wire bent to form two side loops, B B, and a middle loop, D, the ends C of the wire being crossed diagonally under the loop D, as set forth.

256,741. GAS-GENERATING APPARATUS. EDWARD E. REYNOLDS, New York, N. Y. Filed Dec. 29, 1881. (No model.)

Claim.—1. In a gas-generating cylinder, the combination, substantially as hereinbefore set forth, of the air-inlet pipe, the air-distributing chamber, the vaporizing-chamber above said air-distributing chamber, the intervening perforated division-wall, the upright air-distributing perforated pipes leading from said air-distributing chamber, the drying-chamber, the horizontal chamber



256,741.

intervening between said vaporizing and drying chambers, the perforated division-walls, and the replenishing-pipes leading to said intervening chamber.

2. The combination, substantially as hereinbefore set forth, in a gas-generating cylinder, of the air-distributing chamber, the horizontal vaporizing-chamber above said air-distributing chamber, the horizontal drying-chamber, the intervening perforated division-walls, and the gas-receiving chamber provided with inwardly-projecting deflectors.

256,742. WRITING IMPLEMENT. SAMUEL S. ROGERS, Dayton, Wash. Filed Sept. 29, 1881. (Model.)

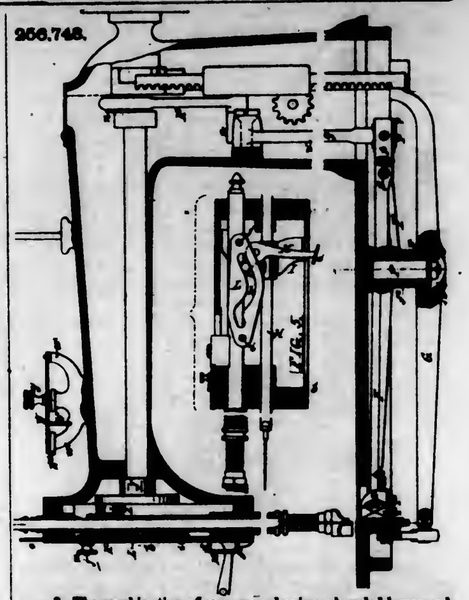
Claim.—1. The pen-holder B, provided with the eyes *e* and *d*, and with the guide-wire *h*, substantially as and for the purposes described.

2. The main frame *a*, formed with the guide *g*, and provided with the wire *j*, in combination with the pen-holder B, provided with the guide-wire *h*, the upper end of the guide *g* being formed with the hook *h*, and the arms *i i*, as and for the purposes set forth.

3. The main palm-supporting frame *a*, formed with the finger-supports *f f*, the guide *g*, and the springs *a'* and *a''*, substantially as and for the purposes set forth.

4. The pen-holder B, provided with the wire *h*, in combination with the guide *g*, formed with the hook *h*, arms *i i*, and the wire *j*, secured to the said guide and to the curved portion *b* of the frame, as and for the purposes set forth.

5. The handle B, provided with the tension-spring *e* and with the eye *e*, in combination with the wire *h*, as and for the purposes set forth.



256,743. SEWING-MACHINE. GUSTAV S. ROSENBERG, Philadelphia, Pa., assignor to the American Buttonhole, Overseaming and Sewing Machine Company, same place. Filed Feb. 13, 1882. (No model.)

Brief.—The invention relates to the shuttle-feed and take-up mechanisms and to the tension device, as indicated by the claims.

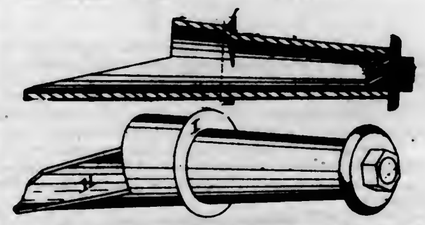
Claim.—1. The combination of the needle-bar or cross-head and its pivoted take-up lever with the adjustable slotted plate L and a device for securing the said plate after adjustment, substantially as described.

2. The combination of the arm *g* and mechanism for vibrating the same with the shuttle-lever F, provided with projections *p p*, having plane inner faces, and the cylindrical block P, adapted to slide and oscillate between the projections and on the lower end of the said arm *g*, substantially as specified.

256,744.

3. The combination of the arm *g*, having a beveled lower end, the cylindrical block P, having an opening, with countersunk ends, the set-screw *i*, having a beveled head and the shuttle-lever having projections *p p*, for embracing the block P, as set forth.

4. The combination of the rod N', actuated by the driving-shaft, and the lever N, pivoted to the frame of the machine, with a connecting-pin, Q, having two portions, *a* and *a'*, the former eccentric in respect to the latter, one portion being adapted to the said rod N' and the other to an arm of the lever N, all substantially as set forth.



5. The combination of the feed-lever G, its recess *h'*, and pivot-pins *o' o'* with the shuttle-lever, its hub *f'*, and ring *s*, extending into the recess, all substantially as set forth.

6. A tension device in which two fixed arms *w w'*, and a spring-plate, W, loosely connected to the arm *w* and acted on by a set-screw, are combined with a plate, W', having a projection fitting in an orifice in the arm *w'*, to which the said projection is loosely connected by a pin, all substantially as described.

7. The combination of the arms *w w'* and the plates W and W', of the tension device and a thread-guiding hook, *y'*, situated at the rear and clear of said plate W', as specified.

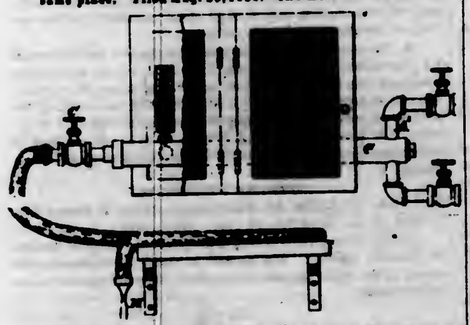
8. The shuttle-driver consisting of two metal plates, T T', conforming substantially with each other and constructed for attachment to the shuttle-lever, as set forth.

256,744. WAGON-AXLE SKEIN. JOSHUA SANDAGE, Carpentersville, Ill. Filed Sept. 11, 1880. (No model.)

Claim.—1. An axle-skein composed of a spindle-section and an angularly enlarged extension or socket back of the former, the whole made from a single piece of plate metal and having but a single longitudinal seam, the meeting edges of which are secured by a weld along their entire length.

2. An axle-skein made from a single piece of plate metal and composed of a spindle-section, an enlarged extension or socket back of the former, a short bevel joining the two sections on the upper side of the skein.

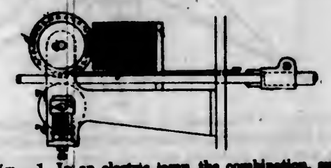
3. An axle-skein blank of a single piece of plate metal, without longitudinal division, having a spindle portion and an enlarged extension in rear thereof, whose edges form an angle with those of the spindle portion at the points of junction.



4. An axle-skein blank of a single piece of plate metal, without longitudinal division, having a spindle portion and an enlarged extension in rear thereof, whose edges form an angle with those of the spindle portion at the points of junction and diverge their own diameter angularly a short distance back of those points for the purpose of forming shoulder or angular enlargements on the upper side of the skein at the junction of the spindle with the extension.

5. A plate-metal axle-skein blank composed of a tapering section and a wider section adjoining the wider end of the former and projecting beyond it on each side thereof.

6. A metal-plate axle-skein blank composed of the tapering section, the enlarged central section projecting at each side beyond the former, and the tapering tail-section.

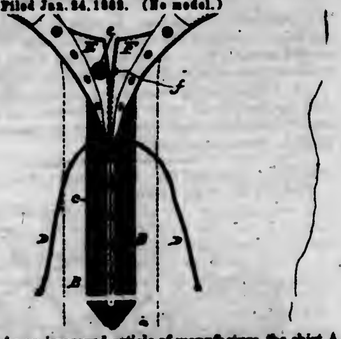


7. A metal-plate axle-skein composed of the spindle portion, an enlarged extension-socket, and a bevel, in combination with the collar fitted at its back edge upon the bevel.

256,745. APPARATUS FOR ADMINISTERING INJECTIONS. PETER V. SCHENCK, St. Louis, Mo., assignor to James W. Allen, same place. Filed Aug. 26, 1881. (No model.)

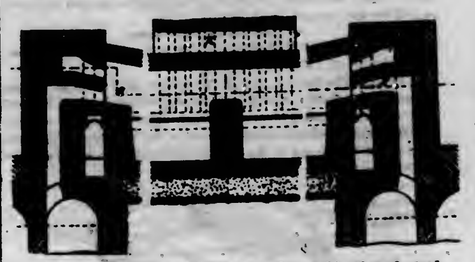
Claim.—In a device for giving injections and like purposes, the combination of the separate hot and cold water pipes with their stop-cocks, the single pipe C, with which they unite, the medicinal reservoir connected with the single pipe, and a hose and eduction-pipe, all substantially as and for the purposes set forth.

256,746. ELECTRIC LAMP. LOUIS SCHAUER, Brooklyn, N. Y. Filed Jan. 19, 1882. (No model.)



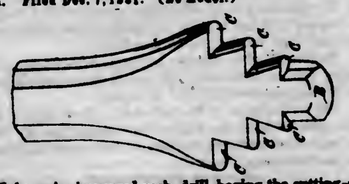
Claim.—1. In an electric lamp, the combination, substantially as herein described, of a supporting-standard, two rotary jaws mounted on arbors arranged in said standard and serving to normally clamp and hold the upper carbon, and by their rotary movement permitting the carbon to descend, a cord attached to the carbon-holder and wound around one of the rotary carbon holding and releasing jaws, a brake-wheel secured to the arbor of the rotary jaw, around which said cord is wound, and an electro-magnet included in the circuit of the carbons, and having a core arranged adjacent to the periphery of the brake-wheel, and by its attraction serving to retain the latter in a fixed position, essentially as and for the purpose described.

2. In an electric lamp, the combination, with a lower carbon and an electro-magnet and armature for vertically adjusting the same, of two rotary jaws mounted on arbors in a supporting-frame, and by their rotary movement permitting the upper carbon to descend, a brake-wheel arranged on the arbor of one of the rotary jaws, and an electro-magnet included in the circuit of the carbons and having a core arranged adjacent to the periphery of the brake-wheel, the current through which magnet causes its core to attract the brake-wheel and prevent the rotation of the carbon holding and releasing jaws, essentially as and for the purposes described.



3. In an electric lamp, the combination, with a vertically-adjustable lower carbon, of two rotary jaws mounted on arbors in a supporting-frame, and serving to clamp and hold the upper carbon and by their rotary movement to permit the descent of the same, a cord connected at one end with the upper carbon and at its other end wound around one of the rotary jaws, an iron brake-wheel mounted on the arbor of one of the rotary jaws, and a stationary electro-magnet included in the circuit of the carbons and having a core arranged adjacent to the periphery of the brake-wheel, the current through said magnet causing its core to attract and hold the brake-wheel until the current decreases, when the latter will be released and the rotary jaws permitted to revolve and feed the carbon downward, essentially as set forth.

256,747. HUNTING-SHIRT. CHARLES H. SUNDAKER, Philadelphia, Pa. Filed Jan. 24, 1882. (No model.)



Claim.—As an improved article of manufacture, the shirt A, provided with flaps E F *e f*, front opening, *a*, the sides, having reinforce strips of braid or other suitable material, provided with metallic eyelets *c* and lacing-cord D, substantially as and for the purpose set forth.

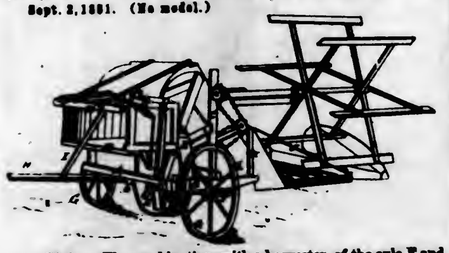
256,748. GLASS-MELTING FURNACE. FREDERICK SIEMENS, Dresden, Germany, assignor to Charles William Siemens, Westminster, England. Filed July 12, 1881. (No model.) Patented in England Nov. 23, 1879.

Claim.—In a regenerative furnace, the combination of a tank for the continuous melting of glass, divided into separate compartments by partitions, which are kept cool by air-flues, with gas and air ports arranged on each side of the tank, as and for the purpose described.

256,749. ROCK-DRILL. WILLIAM H. SILSBY, Orleans Bar, Cal. Filed Dec. 7, 1881. (No model.)

Claim.—An improved rock-drill having the cutting-edge B and the series of side cutters, C, projecting out beyond the one next below it, the side or edges of the drill connecting the said cutters being inclined upward and toward the center longitudinal line of the drill, substantially as herein shown and described.

256,750. PLOW. FERNERT SIMONDS, Grand Island, N. Y. Filed June 1, 1881. (Model.)



Brief.—The mold-board has a base or horizontal flange turned inward; also, a removable heel or shoe. The point is long, and the spread or curve of the share and mold-board is very gentle, as an acute wedge. The handles have an angular brace and slotted adjusting-plates. Rosette-plates connect beam and standard.

Claim.—1. A mold-board provided with an inwardly-extending flange, *b*, at the lower edge, in combination with a shoe, *c'*, secured detachably to the under side of said flange, to extend below the lower edge of the mold-board, as and for the purpose set forth.

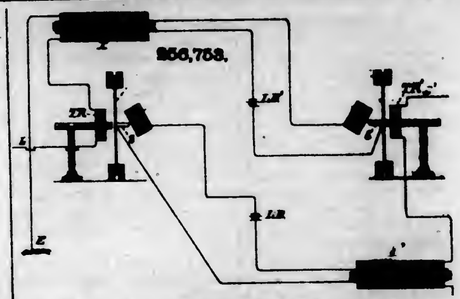
2. A plow having a mold-board and landside, in combination with handles pivoted one to the mold-board and the other to the landside, and with angle-plates I and an intermediate plate, I, bolted to both handles, as set forth.

256,751. HARVESTER. ORIN SIMPSON, Tampico, Ind. Filed Sept. 2, 1881. (No model.)

Claim.—The combination, with a harvester, of the axle F and the wheels G G, arranged substantially as described, the tongue H, attached to the outer side girt of frame A, the brace-bar I, attached at its lower end to the tongue and at its upper end to the binder-frame D, and the chain J, attached to the cutter-bar and reel-post, as and for the purpose specified.

256,752. EARTH-SCRAPER. JOHN W. SKILLEN, Sidney, Ohio. Filed Feb. 18, 1882. (No model.)

Brief.—The body is formed of a single piece of metal having its rear end and sides united by hook-shaped flanges, which interlock. The handles are secured by elastic open rings on the scraper, which fit into circumferential grooves in the handles. The shoes are secured by flanges in the bottom of the scraper, which engage grooves therein.



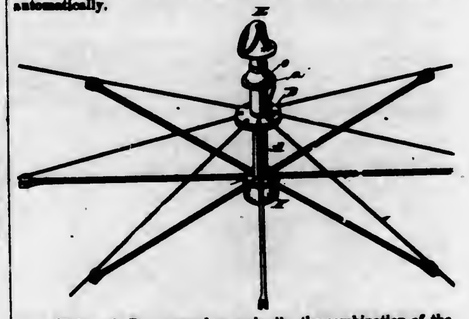
Claim.—1. The body of the scraper, formed of a single piece of metal, and having its rear end and sides united by hook-shaped flanges, as shown and described.

2. The combination of elastic open rings attached to the body of the scraper, with the handles having circumferential grooves to receive said rings, for the purpose specified.

3. The body A of the scraper, having parallel wings or flanges projecting from its under side, and formed in one piece therewith, as and for the purpose shown and described.

4. The combination of the detachable shoes having lengthwise side grooves, with the body of the scraper having wings or flanges bent downward from the bottom thereof and entering said grooves, as shown and described.

256,753. TELEPHONE-REPEATER. JAMES O. SMITH, Hackensack, N. J., assignor of two-thirds to George W. Coy, Milford, Conn., and Charles B. Buell, Washington, D. C. Filed Feb. 28, 1882. (No model.)

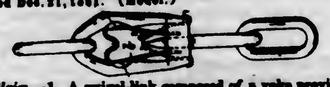


Claim.—1. The combination, substantially as described, with the two line-wires L and L', each grounded through a telephone-receiver and the secondary of an induction-coil, of a telephone-transmitter, one for each line acted upon by the receivers, and local-battery circuits for said transmitters, connected, as described, to the primary of an induction-coil, the local circuit of the transmitter operated by incoming currents from each line and including the primary of the induction-coil, through whose secondary the line-current of the other line runs to earth.

2. The combination, as described, of the two induction-coils I I', the receivers T R T R', the lines L L', circuit-connections from each line through a receiver and the secondary of an induction-coil to earth, local battery I, B' included in the circuit of the primary of induction-coil I, and the transmitter operated by receiver T R' and local battery I, B included in the local circuit of transmitter operated by receiver T R and the primary of induction-coil I'.

256,754. PARASOL OR UMBRELLA. JAMES T. SMITH, New York, N. Y. Filed Feb. 28, 1882. (No model.)

Brief.—To open the parasol the top and the flange of the rim are brought together. The parasol is closed by depressing the spring which holds the runner in place, when the parasol closes automatically.

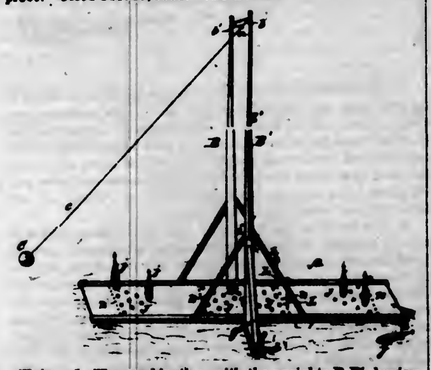


Claim.—1. In a parasol or umbrella, the combination of the runner, holding-spring, and stick, the tube of runner, and the spring and stick extending above the cover, whereby the parasol or umbrella may be opened or closed from the outside, substantially as described.

2. The stretcher-supporting notch riveted or otherwise rigidly secured to the stick, in combination with the upper rib-supporting notch and runner, substantially as described.

3. The runner provided with the stretcher-supporting notch at its lower end and a projecting flange constituting a finger-hold at its upper end, substantially as described.

4. The top E, provided with flange *e*, in combination with the runner C, provided with flange *a*, substantially as and for the purpose described.

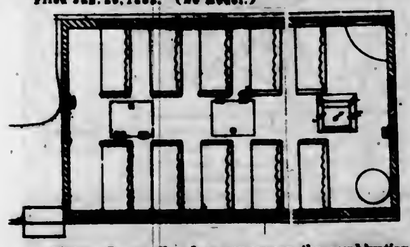


256,755. SWIVEL-LINK. DAVID F. SPANGLER, Dayton, Wash. Filed Dec. 21, 1881. (Model.)

Claim.—1. A swivel-link composed of a yoke provided with a head-piece, through which is formed an elongated opening, a detachable eye having an arrow-head or like construction adapted to be passed up through the elongated opening in the head-piece of yoke, and an independent spring arranged within the yoke and adapted to close against or near to the arrow-head of the detachable eye and prevent the same from turning, substantially as set forth.

2. The combination, with the yoke of a swivel-link, of the U-spring *b*, provided with lips or jaws on its opposite arms, adapted to grasp the sides of the yoke, and having its ends extended to and arranged to close against or near to the arrow-head of the detachable eye, substantially as set forth.

256,756. GAME APPARATUS. GEORGE R. SPEAR, Brooklyn, N. Y., assignor to himself and William J. H. McKillop, same place. Filed Feb. 16, 1882. (No model.)

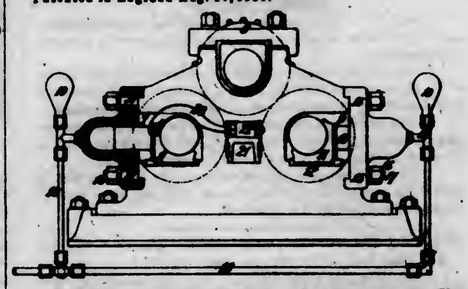


Claim.—1. The combination, with the uprights B B', having the holes *a' a''*, a cleat on the inside and a cleat on the outside, of the cords *b b'*, passing through said holes and secured to said cleats, as described.

2. In a game apparatus, the platform A, having square holes E, in combination with the angle-rods F, balls *c*, and flexibly-suspended ball C, as shown and described.

3. The combination, with the swinging ball C, of a rotary wheel-of-fortune, N, arranged on the platform, as shown and described.

256,757. SAFETY-CAR. ALFRED A. STARR, Westfield, N. J. Filed Jan. 26, 1882. (No model.)



Claim.—In a railroad passenger-car, the combination, with the seats arranged on or along opposite sides of the car, of two or more trap-doors hinged respectively to opposite sides of the sides of the car, and arranged to open inward and to cover escape-openings in said sides, whereby, on whichever side the car may turn or be upset, one or more of said doors will have a tendency to open of their own weight, essentially as herein set forth.

256,758. GROUND-ROLLER. JOHN SCHISLINGER, McVille P. O., Pa. Filed Dec. 5, 1881. (Model.)

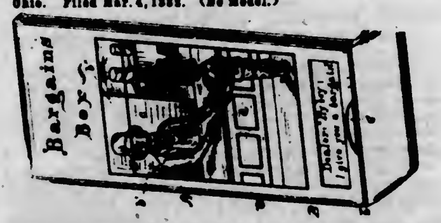
Claim.—The combination of the ground-roller, A, having convex ends and loosely-fitting axles, with the two side bars, B B, curved upward, and having their rear ends connected by the chain C or other suitable flexible connection, all constructed, arranged, and operating substantially as described and shown, for the purpose specified.

256,759. SUGAR-CANE MILL. DUNCAN STEWART, Glasgow, County of Lanark, Scotland. Filed Oct. 27, 1881. (No model.) Patented in England Aug. 17, 1881.

Claim.—1. The combination of the rolls of a sugar-cane mill and movable bearings for one or more of the rolls with hydraulic cylinders, rams acting on said movable bearings, supply-pipes, and air-vessels 19, substantially as and for the purpose set forth.

2. The combination of the bearings and three rolls, one above and between the two others, with bearings, rams, hydraulic cylinders, and rods or long bolts passing through the bearings and connecting the cylinders at opposite parts thereof, all substantially as described.

3. The combination of the rolls of a sugar-cane mill and movable bearings for one of said rolls with a returner and curved links, 28, connecting said returner to said movable bearings, substantially as specified.



256,760. NUT-LOCK. JOHN W. SPRINGSTEEN, New Haven, Ind. Filed Feb. 11, 1882. (No model.)

Claim.—1. The combination of the nut C, having recess D, the latch F, pivoted in said recess and having stud K, and the lever I, pivoted upon said nut and having slot J, fitting over the stud K upon the latch F, as set forth.

2. As an improvement in nut-locks, the combination, with the bolt A, having longitudinal groove B, of the nut C, having recess D, latch F, pivoted in said recess, and having stud K, and the lever I, having slot J, all arranged and operating substantially as and for the purpose set forth.

256,761. TOY OR TOY BOX. WILLIAM STRONG, Cincinnati, Ohio. Filed Mar. 4, 1882. (No model.)

Claim.—A box or toy, A, having the sheath B, with side and end apertures, *b b'*, and with a fragmentary picture, *b''*, in combination with slide C, having two or more fragmentary pictures, *c c'*, which, while both correspond to the fragmentary picture on the sheath, are different in themselves, substantially as set forth.

256,762. CAR-COUPLING. STEPHEN TAPPENDEN and RICHARD S. TAPPENDEN, North Amherst, Ohio. Filed Feb. 8, 1882. (No model.)

256,762.

Claim.—1. A draw-head formed in sections, upper and lower, and with a recess, *a*, and openings *a'* *a²* *a³*, substantially as shown and described.

2. In a draw-head, the clutch B, pivoted in the rear portion of the recess *a*, provided with a pin, *b*, having a slot, *b'*, and notch in its lower side, substantially as and for the purposes set forth.

3. In a draw-head, the cam-lever C, consisting of the cam portion *c*, handle *c'*, and pin *c²*, adapted to pass through the slot *b'* of the pin *b*, substantially as and for the purposes set forth.

4. In a draw-head, the combination of the clutch B and its slotted pin *b* with lever C, beveled as set forth, and draw-head A, substantially as shown and described.

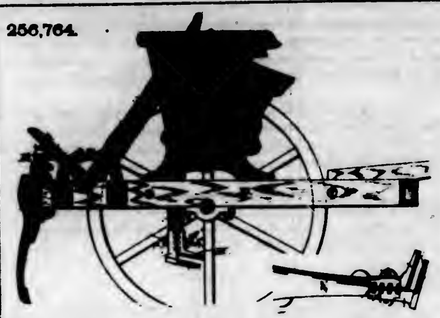
256,763. FORCE-FEED GRAIN-DRILL. MASON P. TENANT, Richmond, Ind. Filed Feb. 18, 1882. (Model.)

Brief.—The feed-cup is composed of two sections, one of which slides within the other. The movable section and the feed-wheel are mounted on a divided thimble that is clasped to the laterally-adjustable shaft, whereby said section and feed-wheel are adjusted to graduate the amount of seed sown.

Claim.—1. The combination, in a seed-cup, of the inner sliding section, B, with the divided thimble passing through said section and fitted upon the rotary shaft, and the feed-wheel locked upon the thimble upon the inner side of the sliding section, the said thimble having a flange fitted against the outer side of the section, substantially as described.

2. The combination, with the two-part seed-cup, of the divided thimble fitted upon the rotary shaft and formed with the gibs K, and the feed-wheel fitted upon the thimble and provided with recesses receiving the said gibs, substantially as described.

3. The combination, in a seed-cup, of the outer section formed with a vertical wall, C, with the rotary rosette located within an annular recess formed in a cap-plate secured to the outer side of said wall, and the fluted feed-wheel fitted in the rosette and locked upon a thimble that is secured upon the shaft and adapted to rotate in one of the sections of the seed-cup, substantially as described.

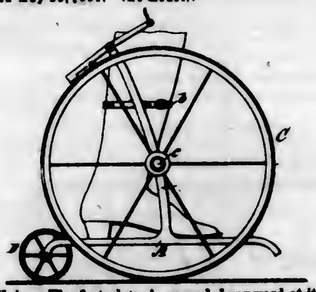


256,764. GRAIN-DRILL. MASON P. TENANT, Richmond, Ind., assignor to GAAR, SCOTT & COMPANY, same place. Filed Feb. 15, 1882. (No model.)

Brief.—The seed-tube has upon it, near its lower end, a series of projections for the reception of teeth on an adjustable two-part scatterer, the under surface of the upper section of which is formed concaved and the upper surface of the lower section convex. The cross-bar, to which the harrow-teeth are secured, is journaled in castings on the side bars and is yieldingly held depressed.

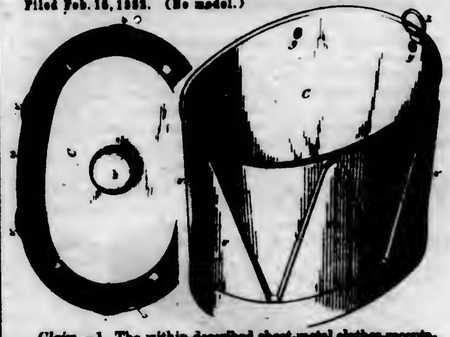
Claim.—1. A scatterer for the seed-tube of a grain-drill, consisting of two independent sections, both adapted to be secured to the seed-tube, and to be adjusted thereon independently of each other, one of said sections being provided with a scattering-plate for the seed to fall upon and the other being provided with a shield adapted to overhang the said scattering-plate, substantially as described.

2. In a two-part scatterer for the seed-tube of a grain-drill, the upper section, H, of the scatterer formed with a shield and adjustably secured to the seed-tube, whereby the shield can be raised or lowered with relation to the scattering-plate upon which the grain falls, substantially as described.



256,764.

3. The combination, with the seed-tube provided at its lower end with teeth and perforated ears, of the two-part scatterer consisting of two sections, G and H, each formed of a semi-cylindrical slotted stem having teeth adapted to mesh with the teeth of the seed-tube, and having a projecting plate at the lower end of the stem, said stem being adapted to be applied to the seed-tube, and said plates being respectively adapted to serve as a shield and as a scattering-plate, substantially as described.

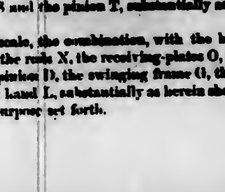


4. The combination, in a grain-drill, of the swinging-bar I, carrying a suitable number of harrow-teeth, the castings K, secured to said bar and pivoted to the side bars of the main frame, the lifting-lever secured to a rock-shaft, P, and provided with a locking-latch, the segment-rack, the rock-shaft provided with a rearwardly-projecting arm, the staple secured to the bar carrying the teeth and receiving the arm of the rock-shaft, and the spring arranged around said staple and interposed between the arm of the rock-shaft and the said bar I, substantially as described.

256,765. PEDICYCLE. ELEAZER THOMPSON, Danbury, Conn. Filed May 26, 1881. (No model.)

Claim.—The foot-plate A, curved downward at its front end and provided with supporting-wheels C and D, all as shown and described, to operate as and for the purpose specified.

256,766. WASH-BOILER. THEODORE F. TIMBY, Alma, Mich. Filed Feb. 16, 1882. (No model.)



Claim.—1. The within-described sheet-metal clothes-receptacle, constructed with continuous flaring sides, having inlet-holes at top, a bottom having a central outlet-trap attached externally, tapering external conduits on all sides formed by sectional jackets attached externally to said sides and an imperforate base-rim attached to the outer walls of said sectional jackets, substantially as shown, for the purposes set forth.

2. The combination, substantially as herein specified, of a wash-boiler having slightly-flaring sides and a clothes-receptacle, forming a removable lining, constructed with a greater flare and provided with inlet-holes at top, tapering external conduits terminating at said inlets, an outlet in its bottom, and an imperforate base-rim inclosing the lower ends of said conduits and meeting with the sides and bottom of the boiler at their intersection, substantially as shown, for the purpose set forth.

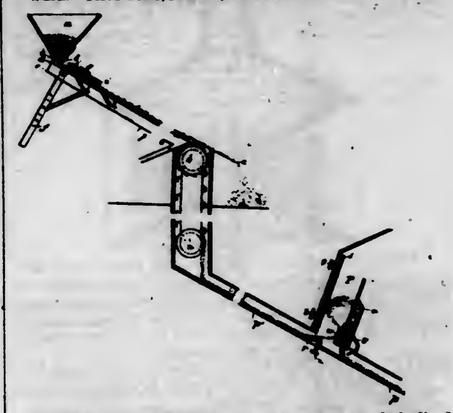
3. The combination, as herein specified, of the clothes-receptacle C, constructed with continuous flaring sides, having inlet-holes therein at top, a bottom provided with a central outlet-trap, tapering external conduits on all sides, and an imperforate base-rim, substantially as shown, a wash-boiler, B, adapted to receive said clothes-receptacle upon its bottom, and a clothes-rack, A, adapted to support the clothes within said clothes-receptacle above the water-level, substantially as described, for the purposes set forth.

256,767. NUT-LOCK. THEODORE F. TIMBY, Alma, Mich. Filed Feb. 11, 1882. (No model.)

Claim.—A nut constructed with an annular recess in its back, an internal collar integral with the body of the nut, and radial indentations dividing said collar, substantially as herein specified, jointly with a washer having a portion adapted to be tightly embraced by the outer wall of said recess and a tapering central orifice adapted to embrace said collar for contracting the latter around the bolt, substantially as herein specified, for the purposes set forth.

256,768. PENDULUM-SCALES. ROSSURO THURAS, Brunswick, Ga. Filed Dec. 20, 1881. (No model.)

Claim.—1. A double weighing-scale made substantially as herein shown and described, consisting of a pair of balanced levers provided at their inner ends with toothed racks that engage the toothed wheel of a swinging sector-rack, the teeth of which latter operate a pointer-wheel that carries a pointer in front of a double-figured dial, whereby when an article to be weighed is placed on one end of the levers the pointer will move correspondingly to indicate on the dial the weight of the article, and if the article is placed on the opposite scale the pointer will move in the opposite direction and indicate the weight, as set forth.



2. In a scale, the combination, with the box or casing B, of the levers A, the racks C, the pinion D, the swinging frame G, the rack H, the pinion J, the hand L, and the dial M, substantially as herein shown and described.

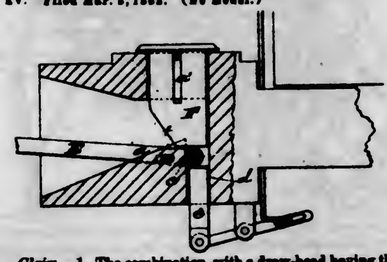
3. In a scale, the combination, with the sector-frame G, of the sliding rack Q and the pinion R, substantially as herein shown and described.

4. In a scale, the combination, with the sector-frame G, of the sliding rack S and the pinion T, substantially as herein shown and described.

5. In a scale, the combination, with the box or casing B, of the levers A, the rods N, the receiving-plates O, the weights P, the racks C, the pinion D, the swinging frame G, the rack H, the pinion J, and the hand L, substantially as herein shown and described, and for the purposes set forth.

256,769. GRAIN-CLEANER. SEWALL TEBAY, Walla Walla, Wash. Filed Oct 6, 1881. (No model.)

Claim.—1. A grain-cleaner consisting of two steeply-inclined chutes connected by a vertical chamber, in combination with an endless belt provided with cups, screens, and ratchets for operating the screens, substantially as shown and described.



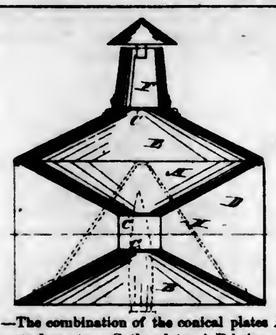
2. A grain-cleaner consisting of an inclined chute or pipe having an adjustable guide in its bottom, and connected to a blast-chamber having a curved iron plate in one side, in combination with a chute having screens, ratchets operating the screens, and a V-shaped distributer, substantially as shown and described.

3. In a grain-cleaner, the chute *p*, having hopper *o*, distributer *i*, screens *s* and *d*, and lever *f*, in combination with the vertical chamber having drum *k*, provided with ratchets, drum *n*, and endless belt *m*, having a series of cups, substantially as shown and described.

4. In a grain-cleaner, the pipe *p'*, having hinged adjustable guide *r*, in combination with pipe or chamber P, having curved iron plate *w*, adjustable board *a*, side opening, *u*, and pipes *v* and *z*, substantially as shown and described.

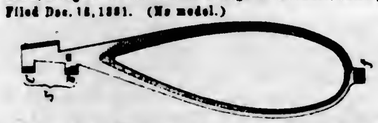
5. The herein-described method of cleaning grain, which consists in permitting the grain to descend through a pipe, and thereby creating a blast of air, deflecting the grain upward through a series of open pipes or chambers, and allowing the blast thus created to carry off the refuse at the top of said chamber, while the grain falls back by force of gravity, substantially as specified.

256,770. CAR-COUPLING. FREDERICK VOEGTLE, Louisville, Ky. Filed Mar. 3, 1882. (No model.)



Claim.—1. The combination, with a draw-head having the interior incline-front hook-lug, D, rising from its base, the top slot, *g*, and the bottom opening, *d*, of the reciprocating uncoupler-bar *c* and the cheek-plate F, having the vertical slot *e'* and the under-beveled front edge, *f*, said cheek-plate extending from the rear wall of the cavity in the draw-bar over the incline of the hook-lug, substantially as specified.

2. The combination, with a draw-head having an interior incline-faced hook-lug rising from its base, and having a groove in its top, of the under-beveled cheek-plate operating through a slot in the top of the draw-head, and the vertically-reciprocating uncoupler-bar working in rear of the hook-lug, the operating-levers, and gravitating connections, substantially as specified.



256,771. INSECT-DESTROYER. WILLIAM L. WARDY, Peytona, Ky. Filed Aug. 4, 1881. (No model.)

256,771.

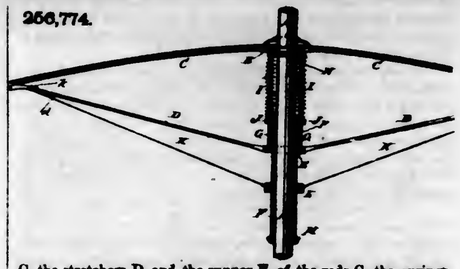
Claim.—The combination of the conical plates A B E, having each a central aperture, C, the plates A B being connected by plates D, with their points turned toward each other, and the plates A E connected at their bases, for the purpose of forming a device adapted to be used with a light, as and for the purpose specified.

256,772. THILL LOOP OR LUG. WESLEY A. WALENTA, Ely, Iowa, assignor of one-half to George W. Devault, same place. Filed Dec. 16, 1881. (No model.)

Claim.—A metallic loop for harness, having a neck or extension, S, formed of side pieces, *a a*, and cross-pieces C, B, and *d*, arranged substantially as herein set forth.

256,773. ADJUSTABLE RECLINING-CHAIR. JACOB F. WARNER, Elkhart, Ind. Filed Nov. 30, 1881. (No model.)

Claim.—1. The combination of the seat-frame having pivoted uprights P P and hinged back-rest frame, the arm-rests Q, pivoted to said uprights and back-rest, and having brackets R, carrying bell-crank levers S, and the pivoted rods T, connecting said levers with ratchet-bars D, pivoted to the sides of the back-rest frame, and engaging brackets E, substantially as set forth.



2. The combination, with the hinged leg-rest frame having lugs Y and studs D′, of the foot-rest having slotted elastic sides, provided with perforations C′, as set forth.

256,774. UMBRELLA. JOHN W. WATSON, New York, N. Y., assignor, by direct and mesne assignments, to William Grant, same place. Filed Oct. 6, 1881. (No model.)

Claim.—1. A self-opening umbrella made, substantially as herein shown and described, with secondary runner, secondary stretchers, and springs carried with the two runners, as set forth.

2. In an umbrella, the combination, with the stick A, the ribs

256,774.

C, the stretchers D, and the runner E, of the rods G, the springs I, the runner L, and the secondary stretchers K, substantially as herein shown and described, whereby the umbrella will be opened automatically when the main runner is released, as set forth.

3. In a self-opening umbrella, the combination of the rods G and springs I with the two runners E L, substantially as herein shown and described, whereby the said runners will be forced apart and the ribs extended by the tension of the said springs, as set forth.

4. In a self-opening umbrella, the combination, with the spring-carrying rods G, of the collar H, substantially as herein shown and described, whereby the upper ends of the said rods are supported from the umbrella-stick and held in place, as set forth.

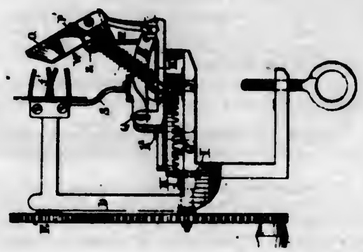
5. In a self-opening umbrella, the combination, with the springs I, the collar H, the rods G, and the runner E, of the lugs J, formed upon the runner-sleeve F, substantially as herein shown and described, whereby the said springs are held against the pull of the said rods, as set forth.

6. In a self-opening umbrella, the combination of the two sets of stretchers D K, with the two runners E L, substantially as herein shown and described, whereby the ribs will be extended by moving the two runners from each other, as set forth.

7. In a self-opening umbrella, the combination, with the stretcher K, provided with the hooks *h*, of the stretcher D, having its outer forked end notched and provided with the longitudinal groove *d*, substantially as and for the purpose set forth.

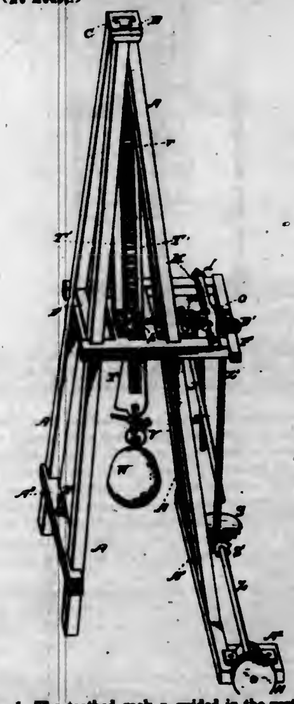
8. In a self-opening umbrella, the stretchers K, made with hooks *h*, and fitted into notches in the forks of the stretchers D at their outer ends, whereby the two sets of stretchers can be readily connected, as set forth.

256,775. BUTTON. GEORGE K. WEBSTER, Attleborough, Mass. Filed Feb. 21, 1882. (No model.)



Claim.—1. A button composed of a head, a post having oppositely-placed sockets, and a shoe, the inner plate of which is slotted and provided with oppositely-placed integral pivots adapted to the said sockets, for the purpose set forth.

2. The described button, consisting of a face-plate, a post having sockets 1 1, and a shoe composed of a cap-plate and a top plate, 2, having integral pivots projecting from opposite sides of a slot therein adapted to the sockets in the post, and a spring, 4, substantially as set forth.



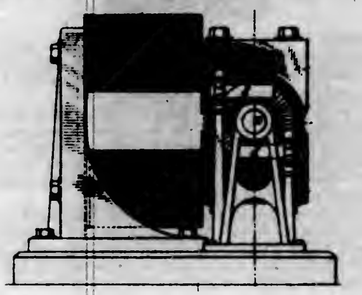
256,776. FRUIT-PARING MACHINE. DANIEL H. WEBBS, Milford, Del., assignor, by direct and mesne assignments, to Robert P. Scott, Newark, N. J. Filed May 23, 1880. (Model.)

Brief.—The novelty consists in the means for oscillating the paring-knife, as set forth in the claim.

Claim.—The combination of the knife W, crank X, link Y, vibrating arm R, pinion S, shaft R, and cog-wheels E′ and C with the holding-fork, substantially as shown and described.

256,777. DROP METAL-BREAKER. ESEC S. WERNICH, Harrisburg, Pa., assignor of two-thirds to Christopher E. Wernich and William E. McBride, both of same place. Filed Feb. 8, 1882. (No model.)

Claim.—1. The toothed rack *r*, guided in the vertical parts T′, in combination with the pinion *p* and the gears O D′ S S′, all arranged and operating substantially as set forth.



2. The rack *r*, provided with the strike T, the uncoupler P′, provided with catches P² R, and the intermittent gear O, provided with the collar *m* thereon, all constructed substantially as and for the purpose set forth.

3. The upright rack *r* T, the uncoupler P′, the intermittent gear *p* O, and the constant forward train of gears D′ S S′ and pulley H, all arranged and operating as and for the purpose set forth.

4. The friction-pulley M on shaft R, in combination with the brake-levers K K′ and wheel O, acting in conjunction with the rack *r* T, as herein set forth.

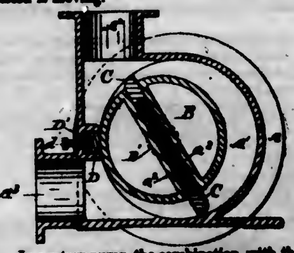
5. The lever L, provided with the grapples A, in combination with the pivot M on brace A², as and for the purpose set forth.

256,778. DYNAMO-ELECTRIC MACHINE. EDWARD WESTON, Newark, N. J. Filed Feb. 21, 1882. (No model.)

Claim.—In a dynamo-electric machine, a rotating armature, the longitudinal conductors of which are connected across the end or ends of the armature by a connecting-piece formed separately from and independently of the said conductors, and to which the ends of the conductors are mechanically attached or united, substantially as hereinbefore set forth.

256,779. APPARATUS FOR DRAWING WIRE. LEWIS WILLIAMS, Bennington, Vt. Filed Oct. 17, 1881. (No model.)

Claim.—As an improvement in wire-drawing apparatus, the combination of the flanged winding-drum B, constructed with the concentric semicircular grooves or channels G G and abutments H H, the annular clutch N N, provided on its opposite sides with lugs for engagement with the corresponding lugs of the driving and driven clutches, respectively, and having elastic cushions or springs interposed between the lugs of the annular and the driven members of the system, with a driving member, I, rigidly connected with the driving-shaft, substantially in the manner described, and for the purposes set forth.



256,780. ADVERTISING-TABLE. WILLIAM WILSON, Brooklyn, N. Y. Filed July 13, 1881. (No model.)

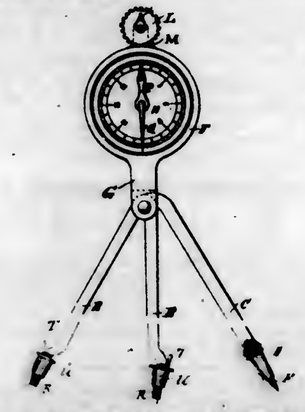
Claim.—In an advertising-table, a top provided at its ends with projecting guide-bars *a a*, arranged parallel to each other, in combination with a transparent plate adapted to be held and to slide longitudinally between said guide-bars, and to retain an advertising-sheet in position to be seen through the plate on the table, as and for the purpose described.

256,781. ROTARY PUMP. THEODORE WIESNER, Chicago, Ill., assignor to August Lockelt, same place. Filed July 22, 1881. (No model.)

Brief.—The piston-plates C may be reversed, so as to bring their beveled faces on the right side, according to the direction in which the piston is moving.

Claim.—In a rotary pump, the combination, with the cylinder A and the piston-hub B, of the packing plate or plates C, the springs *c*′, the rods *c*², the packing-bar D, the bow-shaped spring D′, and the set-screw *d*, all constructed, arranged, and operating as described.

256,782. WOOL-WASHING MACHINE. GEORGE L. WITZIL, Philadelphia, Pa., assignor to Edward C. Edwards, Brooklyn, N. Y. Filed Nov. 19, 1881. (No model.)



Claim.—1. The dasher C and the operating-shaft D, in combination with the beaters G and the heads E, the beaters hanging freely from said heads, whereby the beaters fly out and strike the mass of material at different places and overturn it, substantially as and for the purpose set forth.

2. The beaters G, in combination with the dasher C and inclosing-diaphragms B, said dasher being within the diaphragms and the beaters outside of the same, substantially as and for the purpose set forth.

3. The dasher C, in combination with the heads having connecting bars or shafts F, the swinging beaters G, depending from said shafts, and the operating-shaft D, said shaft D being at the bottom of the heads and the shafts F above the same, substantially as and for the purpose set forth.

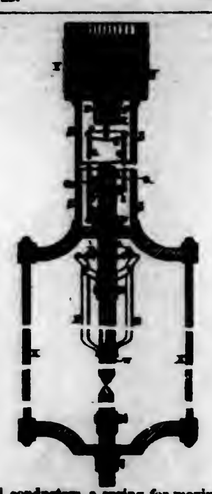
256,783. DIMENSION-MEASURE. RUDOLF WITTMANN, New York, N. Y. Filed July 22, 1881. (No model.)

Brief.—A wheel of known circumference is revolved upon the line to be measured, and each revolution is by differential gear recorded upon the dial. Screw device for adjusting the points of the combination instrument.

Claim.—1. A measuring-instrument having on the piece G a casing, F, provided with the dial H, the pointer Q, and the cog-wheel J, the cog-wheel K, the cog-wheel L, journaled in a pointer carrying outside projection, M, and an inside wheel, O, having one cog less than wheel J, and carrying a pointer, P, as shown and described.

2. In a measuring-instrument, the shanks B, screw-threaded at the lower ends and provided with the tapering longitudinal groove S, in combination with the needle T and screw-sleeve U, as and for the purpose specified.

256,784. ELECTRO-MAGNETIC MOTOR. LEONIDAS G. WOOLLEY, Meadon, Mich. Filed Oct. 24, 1881. (No model.)



Claim.—In an electro-magnetic motor which is adapted to be held in the hand, the magnet A, having its lower portions wrapped with insulated wire for connection with a battery or generator, and having its upper ends turned outward and upward and connected by the non-magnetic piece B, the shaft C, the revolving magnets D, connected thereto, and commutator G, the parts being combined and arranged to operate substantially as shown and described.

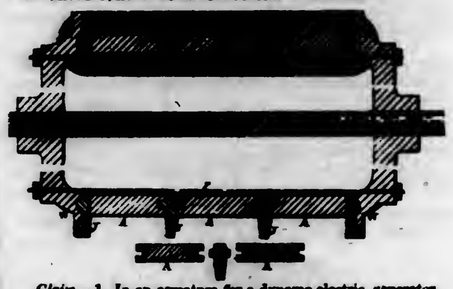
256,785. ELECTRIC LAMP. LEONIDAS G. WOOLLEY, Meadon, Mich. Filed Oct. 28, 1881. (No model.)

Claim.—1. In an electric lamp, the combination of a carbon-clamp and a suitable electrical conductor or conductors, which are pivoted upon the clamp so as to rise and fall with the carbon, to which they are fastened at their lower ends, before the lower half of the upper carbon is consumed, substantially as shown.

2. The combination of a carbon, the carbon-clamp, one or

256,785.

more electrical conductors, a spring for moving the conductor or conductors, and a fusible wire or string by which the lower ends of the conductors are fastened to the carbon, substantially as described.



3. The combination, with a carbon-clamp, 2, of one or more pivoted jaws, B, which have their lower ends fastened to the carbon by a string or wire and a spring, E, which is secured to their upper ends for throwing the lower arm or arms outward when the cord or wire H is destroyed by heat, substantially as set forth.

4. In an electric lamp, the combination of the carbon holder or guide, a lifting mechanism, suitable frames, and two or more dogs pivoted in the said frames and applied upon opposite sides and at different elevations along the sides of the guide, substantially as specified.

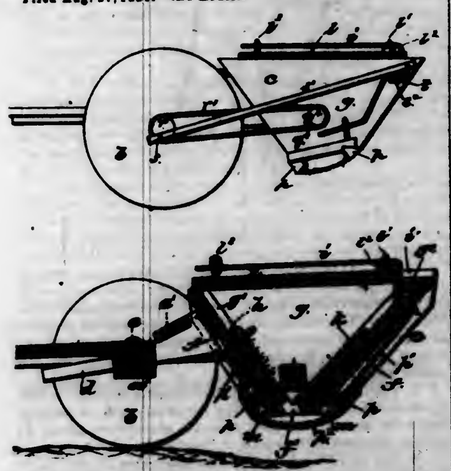
5. In an electric lamp, the combination of the helix, the core, the pivoted rod O, connected to the helix, the two connecting-rods Q, the frames E, the dogs Z, and set-screws V, the dogs being applied at different heights along the sides of the guide A, substantially as specified.

6. In an electric lamp, the combination of the helix Y, core K, pin P, connecting-rods N Q, pivoted lever O, two frames, E, connected together, the two dogs, and the set-screws, substantially as set forth.

256,786. DYNAMO-ELECTRIC MACHINE. LEONIDAS G. WOOLLEY, Meadon, Mich. Filed Nov. 16, 1881. (No model.)

Claim.—1. In an armature for a dynamo-electric generator, the combination of a series of wide flat bands, A, made of magnetic material, with the non-magnetic separating-pieces J, the spiders, and the clamping-rods, substantially as shown.

2. In an armature for a dynamo-electric generator, the combination of a series of wide flat bands, A, made of magnetic material, with the non-magnetic separating-pieces J, the spiders, and the clamping-rods, the pieces J having their outer ends to project outward beyond the surfaces of the bands, so as to act as guides for the different coils, substantially as described.



3. In an armature for a dynamo-electric generator, the combination of a series of wide flat bands, A, made of magnetic material and having grooves made in their edges, with the pieces J, having flanges on their sides to catch in the grooves, substantially as specified.

256,787. HILLSTRIKE-DRIVER. JOAB H. WOODRUM, Strykersville, N. Y. Filed Jan. 13, 1882. (No model.)

Claim.—The combination of the spindle C, of the driver I, having its horns provided with inwardly-enlarged openings e, a bail, D, provided with inwardly-enlarged openings n, and bolts m, having their heads and nuts constructed with bearing-ribs p' q', substantially as set forth.

256,788. SEED-SOWER. JOSHUA S. WRIGHT, Kaheka, Mo. Filed Aug. 27, 1881. (No model.)

Claim.—1. In a seed-sower, the combination, with the cut-off board h, provided with the rod i, of the cover l, having notch f', eye F, and open loop P, substantially as specified.

2. In a seed-sower, the combination, with the seed-box a, having the guides n m, of the slove provided with the side bars p p, the pivotal rods p' p', the boot lever t, pin s', shank s', and pulley r on the wheel of the vehicle, substantially as specified.

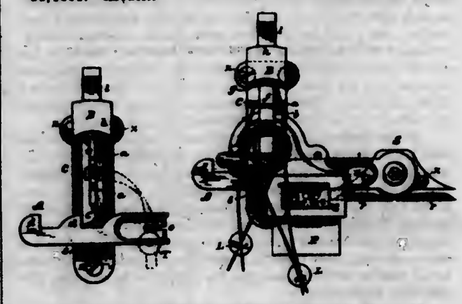
256,789. COMBINED SHEEP RACK AND TROUGH. ANNA E. YOST, Somerset, Ohio. Filed Sept. 16, 1881. (No model.)

Claim.—1. The combination, with the swinging racks d, of the swinging troughs c, pivoted in the outer faces of the corner posts and adapted to perform the double functions of troughs and supports for the racks, substantially as described.

2. The combination of the swinging racks d, pivoted to the inner faces of the opposite corner posts just above the box a, having their lower bars, e, pivoted in the posts b, angular troughs c, pivoted to the posts by arms n, and adapted to serve as troughs and engage with the upper bars of the racks, and buttons p, substantially as described, and for the purpose set forth.

3. The combination, with the box a, removable open rack-bottom s, and racks d, of the swinging end racks, m, and pins j, substantially as described, and for the purpose set forth.

4. The combined rack and trough herein described, consisting of the box a, provided with the posts b and removable open rack-bottom s, swinging racks d m, troughs c, pivoted to the posts by the arms n, buttons p, and pins j, substantially as described, and for the purpose set forth.



256,790. DEVICE FOR CLEARING CYLINDRICAL ROCK-DRILLS. ALBERT BALL, Claremont, N. H., assignor to the Sullivan Machine Company, same place. Filed Dec. 5, 1881. (No model.)

Claim.—1. In a cylindrical drill for boring rock or other material, the combination therewith of a rigid pipe or hollow rod (for the conveyance of water or other power to the hole being bored) provided with a nut or block secured to the lower end thereof, substantially as described, shown, and for the purpose set forth.

2. In a cylindrical drill for boring rock or other material, the combination, with the pipe or hollow rod D, provided on its lower end with nut or block B, substantially as described and shown, of the perforations c and passage b, respectively, for the outlet and passage of water or other power to the hole being bored, substantially as described, shown, and for the purpose set forth.

256,791. SEAL-LOCK. EDWARD J. BROOKS, East Orange, N. J., assignor to E. J. Brooks & Co., New York, N. Y. Filed Feb. 23, 1881. (Model.)

Claim.—1. In a car-door fastening, the combination, with a shackle, A, of a one-part gravitating bolt, B, and a one-part bolt-casing, C, provided with one or more transverse threading-holes and otherwise adapted to be secured by a lead-and-wire seal or a padlock in the manner herein specified, said shackle being adapted to engage with the lower end of said bolt, said bolt constructed with a heavy head at its upper end, and said bolt-casing constructed with a shackle-support near its lower end, and attached to the car by screws at its respective ends, the upper screws secured by said heavy head of the bolt, substantially as shown, for the purpose set forth.

2. A car-door fastening having a vertical gravitating bolt, B, constructed with a beveled lower end, c, to engage automatically with a shackle, A, for the purpose of securing the latter, a casing, C, for said bolt, constructed with a support, e, for said shackle, and one or more transverse threading-holes in said bolt and bolt-casing to receive a lead-and-wire seal or a padlock, substantially as herein specified.

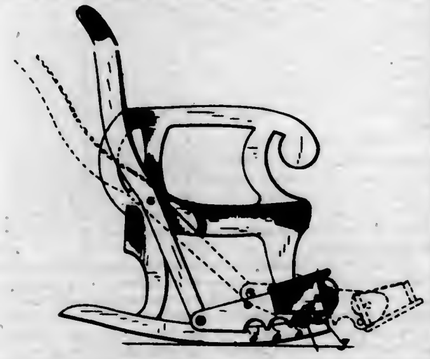
3. A car-door fastening having a vertical gravitating bolt, B, constructed with a lower end, c, beveled on the door side, a shackle, A, provided with beveled catches d on top to engage automatically with said bolt with the door either partly opened or closed, a bolt-casing constructed with a support for said shackle, and one or more transverse threading-holes in said bolt and bolt-casing to receive a lead-and-wire seal or a padlock, substantially as herein specified.

4. A car-door fastening having a sliding bolt, B, adapted to engage with a shackle, A, for securing the latter, and constructed with a longitudinal flange, c, on the front thereof, and a bolt-casing, C, having an internally-grooved face-projection, f, fitted to said flange, with transverse threading-holes a b, extending through said flange and face-projection to receive a lead-and-wire seal or a padlock,

and open grooves in the face of said bolt-casing in line with said threading-holes, substantially as herein specified.

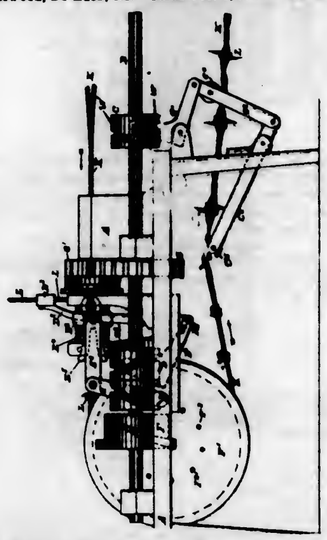
5. In combination with a bolt-casing, C, having a shackle-support, *c*, a vertical gravitating bolt, B, constructed with a lower end, *a*, beveled on the door side, and a shackle, A, having beveled catches *d* on top to engage with said bolt, the shackle-support S, Sheet 1, having a central horizontal pivot-stud, *s*, and a horizontal shackle-rest, *r*, on each side of said pivot-stud, substantially as shown, for the purpose set forth.

256,792. SPINDLE FOR SPINNING-MACHINES AND SUPPORT THEREFOR. WILLIAM T. CARROLL, Worcester, assignor to George Draper & Sons, Hopedale, Mass. Filed Mar. 31, 1881. (No model.)



Brief.—The spindle-bolster is extended below the bolster-rail, and the inner tube is supported in the bolster, so as to rock with the spindle. The step has a horizontal or plane surface, in order that the lower end of the spindle, which rests thereon, may move freely in a lateral direction to find its true center of rotation. The sleeve-whirl is connected with the spindle, very close to the lower end of the latter, whereby the weight of the spindle and its attached revolving parts is brought down as closely as possible to the step or support on which the spindle rests and rotates, thereby enabling the spindle to be run more steadily.

Claim.—1. The bolster-rail and spindle-bolster extended below it, the said bolster having its interior portion supported therein to rock with the spindle, and the step having a horizontal or plane surface, over which the lower end of the spindle may travel freely, combined with the spindle and the whirl connected therewith, the spindle with its load being supported and steadied as described in order that the lower end of the spindle may move freely in a lateral direction to find its true center of rotation without cramping the spindle in its bearings, substantially as described.



2. The bolster-rail and spindle-bolster extended below it, the said bolster having its interior portion supported therein to rock with the spindle, and the step having a horizontal or plane surface, over which the lower end of the spindle may travel freely, combined with the spindle and the sleeve-whirl connected therewith between the said bolster and step, the spindle with its load being supported and steadied as described in order that the lower end of the spindle may move freely in lateral direction to find its true center of rotation without cramping the spindle in its bearings, substantially as described.

256,793. RECLINING-CHAIR. GIACOMO GERLINI, Washington, D. C. Filed Mar. 14, 1882. (No model.)

Claim.—The combination, substantially as shown and described, of the chair-seat frame, a back hinged thereto and extended below the seat, a jointed foot-rest frame provided with notches, the front round of the chair, with which said notched frame engages, a reversible foot-rest in said frame, and stops for the back on the seat-frame, the whole constructed and arranged to operate as specified.

256,794. MACHINE FOR MAKING BARBED FENCE-WIRE. HARRIES CONVERSE and FRANK P. GANT, Cleveland, Ohio, assignors, by direct and mesne assignments, to Washburn & Moen Manufacturing Company, Worcester, Mass., and Isaac L. Ellwood, De Kalb, Ill. Filed Oct. 4, 1880. (No model.)

Claim.—1. In a machine for making barbed fencing, the combination, with means for supporting the strand-wires and preventing them from twisting around each other, and mechanism for inserting barbs between said wires, of a barbing-head for wrapping the barbs around said strand-wires and means for imparting a continuous rotation in the same direction to said barbing-head, substantially as described.

2. The combination, with the barb-bending devices of a barbing-head and means for supporting the strand-wires, of pressing-fingers for pressing the barbs upon the strand-wires during the barbing operation, substantially as described.

3. The combination, with the stationary cam H, of a revolving disk or carrier, M, and levers O and barb-bending device P P', substantially as and for the purposes shown.

4. The combination, with barb-bending finger-bars P, of operating mechanism, as explained, whereby a pressing or pounding action is imparted to said finger-bars, substantially as and for the purposes shown.

5. The combination of a stationary cam, H, and a constantly-revolving barbing-head with the barb bending and pressing fingers carried by said head and arranged to be operated by said cam, substantially as and for the purposes shown.

6. The combination, with mechanism for feeding barb-wire, a barbing-head mounted on an axis at, or approximately at, right angles to the direction in which the barb-wire is fed, and mechanism for revolving said barbing-head continuously in the same direction, of a cutter carried by and revolving with said head and a second cutter co-operating with the revolving cutter to sever the barb-wire, substantially as described.

7. The combination, with the wire barbing and feeding mechanism operating to deliver the barbed wire intermittently, of an automatic take-up between the said mechanism and the spooling mechanism, substantially as and for the purpose described.

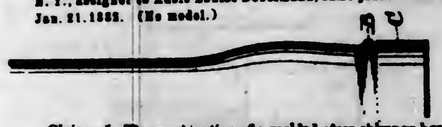
8. In a barb-fence machine, the pinching-fingers carried by a reciprocating head movable lengthwise of the strand-wires, and combined with mechanism for closing and opening said fingers, substantially as described.

9. The combination, with the feed-wheel, its operating-cam, and means for conveying motion from the cam to said wheel, of the take-up lever, its operating-cam, and devices for conveying motion to said lever from said last-named cam, substantially as described.

10. In a fence-wire-barbing machine, the main shaft B, carrying and revolving the cams C, D, E, and F, in combination with the take-up mechanism, the barb-blank-feeding mechanism, the pinching-finger mechanism, and the strand-wire-feeding mechanism, substantially as and for the purposes shown.

11. The combination of the non-rotating holder for the strand-wires, the stationary cam mounted thereon, the rotating barbing-head surrounding said holder, the barb bending and pressing fingers, and the operating-levers carried by and rotating with said head, substantially as described.

256,795. TELEPHONIC RECEIVER. CHARLES CUTTRISS, Duxbury, and GEORGE F. HILLMEN, Boston, Mass., assignors to James Wentworth Brown and Henry B. Hyde, both of Boston, Mass. Filed Aug. 22, 1881. (No model.)

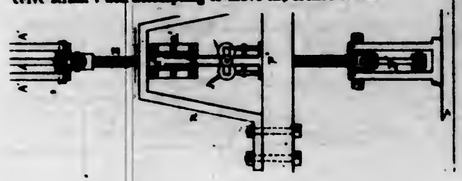


Claim.—1. The combination, substantially as hereinbefore set forth, of a resonant plate, membrane, or body, a device for communicating vibrations to the same by frictional contact therewith, and apparatus for actuating said device by the conversion of electrical undulations or vibrations into mechanical force.

2. The combination, substantially as hereinbefore set forth, of a resonant plate, membrane, or body, one or more wires or rods extending perpendicularly through an aperture formed therein, and in frictional contact therewith, and an electric actuator for imparting longitudinal vibrations to said wires or rods, which vibrations are communicated to said resonant plate.

3. The combination, substantially as hereinbefore set forth, of a resonant plate or membrane, one or more wires or rods extending perpendicularly through an aperture therein, and in frictional contact therewith, a vibratory plate supporting said wires or rods, and an electric actuator for producing vibrations in said wires and plates.

256,796. LAMP-CHIMNEY. JOHN B. DOBELMANN, Brooklyn, N. Y., assignor to Adele Louise Dobelmann, same place. Filed Jan. 21, 1882. (No model.)

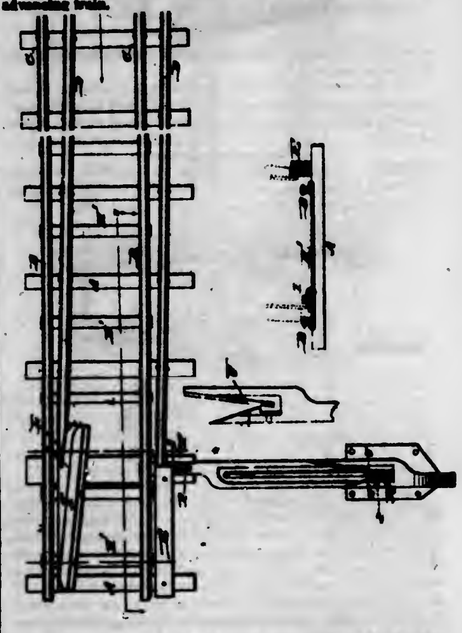


Claim.—1. The combination of a molded glass chimney having its lower edge ground true, as described, and provided with a corrugation, B, and a smooth metallic jacket or band, C, applied to the lower end of the chimney, but unattached thereto, so as to be readily removed and replaced without detaching and attaching fastening devices, the lower end of said jacket or band being bent inward at right angles to the axis of the chimney, and terminating at the inner surface of the vertical wall of the chimney, substantially as and for the purpose set forth.

2. The combination of a molded glass chimney having its lower edge ground true, as described, and provided with a corrugation, B, and a smooth metallic jacket or band, C, arranged loosely on the lower end of the said jacket or band, and having its lower edge bent inward at right angles, and terminating at the inner surface of the vertical wall of the chimney, substantially as and for the purpose described.

256,797. SWITCH AND SIGNAL LOCKING APPARATUS. OSCAR GASSETT, Boston, Mass., assignor to the Union Switch and Signal Company, Pittsburg, Pa. Filed Feb. 18, 1882. (No model.)

Brief.—To prevent the careless shifting of a switch or signal lever while a train is approaching, an armature of an electro-magnet in a closed track-circuit is actuated by short-circuiting to lock said lever-connections until the train has passed off the electrified section. The locking-armature is surrounded by a stirrup to receive strain when attempting to move the locked lever.



Claim.—1. In combination with the connecting-rod of a switch or signal operating mechanism, a stop, *a*, arranged on such rod, an armature-lever arranged to engage with and be disengaged from such stop, an electro-magnet, battery, and track-circuit, substantially as set forth.

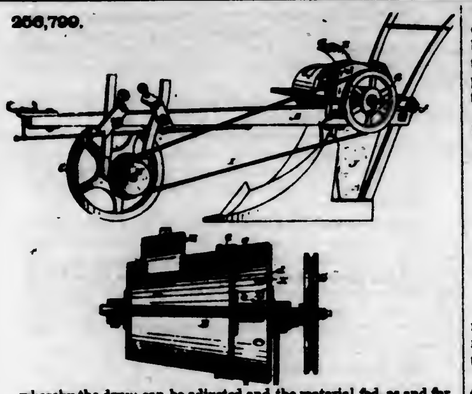
2. The stirrup *a*, in combination with armature-lever *d* and stop *a* on rod B, substantially as set forth.

256,798. RAILROAD-SWITCH. JOSIAH GRAY and WESLEY SELLENBACK, Chicago, Ill., assignors to themselves, Connell B. Sheffer, and Jacob R. Reed, all of same place. Filed Jan. 11, 1882. (No model.)

Brief.—Universal main-track rails capable of lateral spring toward fixed sliding-rails, the end of one of said sliding-rails being an elevated inclined bar to carry the wheel-flanges over the main-line rail, and the end of the other sliding-rail being beveled to fit a notch in a beveled guard-rail which moves with the main-track rails. The lever-catch in the switch-stand is secured by a frangible pin, whereby a misplaced switch may be properly shifted by an advancing train.

Claim.—1. The combination of the fixed sliding-rails, the continuous main-track rails adapted to spring laterally, the guard-rail section I, movable with the main-track rails, the inclined stationary block E, and means for moving the spring-sections of the main-track rails, substantially as described.

2. In combination with the laterally-movable spring-sections of the main-track rails and the fixed sliding-rails, the switch-stand, its lever, the connections between said lever and the said laterally-movable sections, the detent or catch for holding the lever, the frangible pin or bolt *g*, and a spring, U, substantially as described.

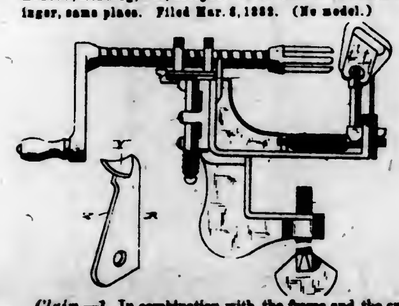


3. In combination with the continuous main-track rails adapted to spring laterally and their operating mechanism, the sliding-rails constructed as described, the outer one terminating in an inclined block and the inner one in a beveled edge, substantially as described.

4. The combination of the main-track rails adapted to spring laterally, the inner sliding-rail beveled as described, the inclined block E, and a switch-stand provided with a bifurcated arm having a beveled catch or detent and a spring, the whole arranged to operate as described.

256,799. FERTILIZER-DISTRIBUTER. JOSEPH H. KNEELAND, Hillsborough, N. J. Filed May 16, 1881. (Model.)

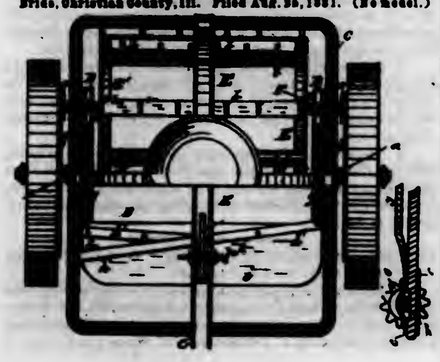
Claim.—1. The conoidal-shaped drum B, supported in a frame adapted to be changed to an agricultural implement, and divided transversely by partition D into apartments *a* and *b*, the apartment *b* having openings *d*, in combination with valves *c* and spout J.



256,799.

whereby the drum can be adjusted and the material fed, as and for the purpose set forth.

2. The revolving drum B, divided by the partition D into apartments *a* and *b*, having openings *d* and lifters Y, in combination with valves *c* and spout J, substantially as and for the purpose set forth.



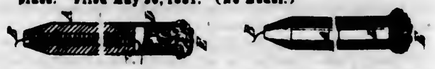
256,800. APPLE PARER, CORER, AND SLICER. CASSIUS HOLTZE, Reading, Pa., assignor of one-half to B. Frank Seltzinger, same place. Filed Mar. 6, 1882. (No model.)

Claim.—1. In combination with the frame and the cutters, the vertical shaft journaled in bearings on the frame and provided with a plate having bearings, in which is journaled the screw fork shaft, the said plate being provided with a flange to engage the edge of the seat upon which it rests, and the seat provided with a lug to engage a cone-shoulder on the shaft, whereby the shaft and its supports are automatically elevated to permit the said shaft to be turned at right angles to its normal position, substantially as specified.

2. The slicing-knife provided with a straight blade, E, having an inclined cutting-edge, Z, and a coring-cutter, Y, extending to each side of the blade, substantially as specified.

256,801. SOIL-PULVERISER. ISAAC HUFFER, Taylorville, assignor of two-thirds to John W. Moore and James O. McBride, Christian County, Ill. Filed Aug. 25, 1881. (No model.)

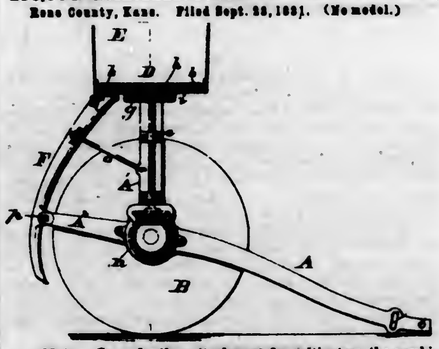
Claim.—In a soil-pulveriser of the character described, the combination of the tubular slides *c* on frame B, the shaft of drum E bearing in said slides, the levers *h h'*, and the rods *g g*, connecting the levers with slides *c c*, all arranged for the purpose of engaging pinions *e* with spur-wheels *f* or disengaging said wheels, substantially as described.



256,802. LEAD AND CRAYON HOLDER. JOSEPH ILLFELDER, Fürth, Bavaria, Germany; Leopold Illfelder Administrator of said Joseph Illfelder, deceased; said Administrator assignor to Bernhard Illfelder, New York, N. Y. Filed June 17, 1880. (No model.) Patented in France Nov. 30, 1880, and in England May 13, 1880.

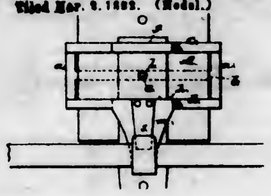
Claim.—1. In a crayon-holder having expansible jaws and a rear controlling-spring, the combination, with said parts, of the ring *d*, rod *e*, plate *g'*, and the interior revolving chamber, substantially as set forth.

2. The tapering compartment-reservoir *a a' a²*, mounted in the sheath A, having the central mouth-piece, C, in combination with the cap *g* and lug *i*, arranged substantially as described, so as to present the leads to the clamping-jaws in the axial line of the holder, as set forth.



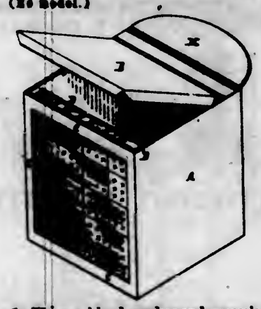
256,803. ELECTRIC-LIGHT CARBON. JOHN B. KING, Brooklyn, N. Y., assignor of one-half to Alphonse Friedrich, same place. Filed May 26, 1881. (No model.)

Claim.—1. The combination of hollow carbon A, containing wire helix C, with holder D and sponge E, substantially as described.



2. The combination, with a tubular carbon, of a hollow cap fitted to its base and forming an air-passage to the interior of the carbon, and a sponge placed in said passage, substantially as described.

256,804. ATTACHMENT FOR PLOWS. WILLIAM D. LIBBESBY, Rene County, Kans. Filed Sept. 26, 1881. (No model.)

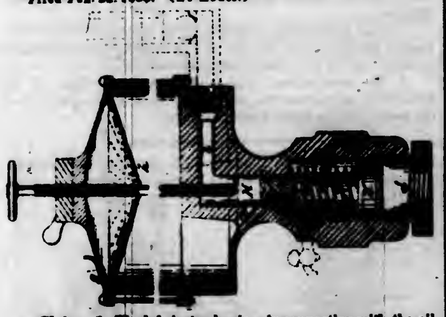


Claim.—In a planting attachment for cultivators, the combination, with the hopper E and side bar, A, having arms A' A², and wheel B, provided with gear *d*, of the perforated box *i*, attached to the lower part of the hopper, receiving disk D, having apertures *b* and gear A, vertical shaft C, having gears *f g*, and the grain-spout F, all substantially as shown and described.

256,805. BACK-BAND BUCKLE. JOSEPH A. LOWE, Gainesville, Tex., assignor of one-fourth to Abner R. Smith, same place. Filed Nov. 9, 1881. (Model.)

Claim.—The back-band triple-bar buckle having the outwardly-projecting stud *c* on its middle bar, the offset-recesses *g h* in the under portions of its upper and lower bars, and the depending lug-hook formed on the lower bar, and having a closing spring-snap, *e*, forming a cross-bearing loop, substantially as specified.

256,806. COMBINED CRACKER AND GROCER'S CAN. CHAS. F. MARELAND, Pittsburg, assignor to himself and Sylvester S. Marvin, Kilbuck Township, Allegheny County, Pa. Filed Nov. 18, 1881. (No model.)



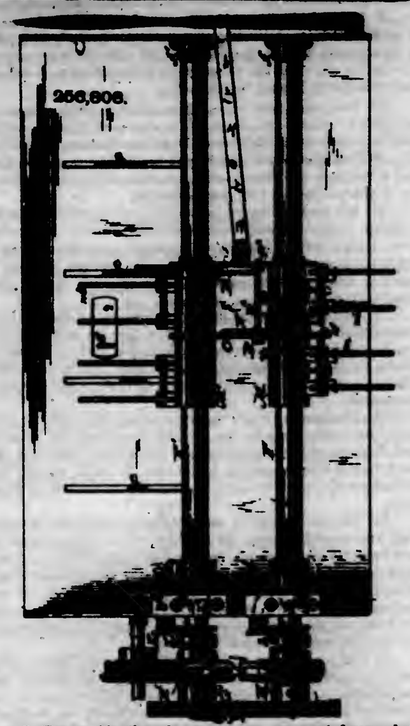
Claim.—1. The combined cracker and grocer's can herein described, provided with a hinged top lid, B, and hinged side lid, M, substantially as and for the purposes set forth.

2. The combined cracker and grocer's can herein described, provided with the hinged top lid, B, the bulged face K, and the hinged side lid, M, substantially as and for the purposes set forth.

3. In a combined cracker and grocer's can having a hinged top lid, B, hinged side lid, M, and open face C, with glass pane *c*, the removable sheet-metal false back D, adapted to be secured in the place of the glass pane *c*, substantially as and for the purposes set forth.

256,807. LUBRICATOR. MARTIN D. MILLER, Springfield, Mo., assignor of one-half to John Neukart, Jr., same place. Filed Feb. 23, 1880. (No model.)

Claim.—1. The lubricator having, in connection with the oil-cylinder and its communicating oil-reservoir, an oil-forcing piston and a screw regulating-stop, adjustable in said oil-cylinder, substantially as specified.



2. In a lubricator, the combination, with the oil-reservoir and its connected oil-cylinder, of the oil-forcing piston made larger at its steam end than its oil end, a spring, and an adjustable regulating device governing the play of the oil-forcing piston, substantially as specified.

3. In a lubricator, the combination, with the oil-reservoir and its communicating oil-cylinder, the steam-chamber, and the oil-forcing piston having a soft-metal oil end, of the spring, the screw regulating-stem extending into said oil-cylinder, and a check-valve, substantially as specified.

256,808. GRAIN-BINDER. NOAH T. RENT, Miamisburg, Ohio, assignor to Abel Hoover and William Gamble, same place. Filed Oct. 28, 1881. (Model.)

Claim.—1. The compressor arm or arms and band-securing mechanism secured to a laterally-sliding frame above the stationary docking or grain-receptacle, combined with a binder-arm sliding laterally upon a shaft beneath said docking, and a common adjusting-lever.

256,806.

2. The combination of compressor-arms mounted upon shafts above the docking or grain-receptacle and opposing each other, band-securing mechanism mounted proximately to the pivots of said compressor-arms, and a binding-arm mounted upon a shaft beneath the docking.

3. The combination of compressor-arms mounted upon shafts above the docking or grain-receptacle and opposing each other, band-securing mechanism mounted proximately to the pivots of said compressor-arms, a binding-arm mounted upon a shaft beneath the docking, and driving-gear whereby the binding-arm is caused to meet one of the compressor-arms as it rises to make a clean division of the gavel from the incoming stream.

4. The combination of the opposing compressor-arms attached to hubs which slide longitudinally upon their shafts, the yokes connecting said hubs to prevent the shafts from springing, the band-securing devices mounted in said yokes, the binder-arm, also attached to a hub which slides upon its shaft, the stationary docking between the compressor and binder arms, and a common lever or equivalent device connected with the hubs to co-ordinately adjust the compressing and binding mechanisms.

5. The combination, in a grain-binder, of a tripping-arm normally in position to receive the pressure of the incoming grain, and arranged to slide laterally upon its shaft, a binder-arm, also arranged to slide laterally upon its shaft, and a common adjusting-lever whereby they may be moved co-ordinately.

6. The combination, in a grain-binder, of an outside compressor-arm arranged to slide laterally upon its shaft, a tripping-arm normally in advance of said compressor-arm and sliding therewith, a binder-arm, also sliding laterally on its shaft, and a common lever whereby said devices may be simultaneously adjusted.

7. The combination, in a grain-binder, of opposing compressors arranged upon a laterally-sliding frame carried by their retaining-shafts, a trip mounted upon said frame and normally in advance of the outside compressor, a binder-arm, also arranged to slide laterally upon its shaft and parallel with the movement of the compressor frame or carriage, and a common lever for co-ordinate adjustment of said devices.

8. In a grain-binder, the combination of the grain-receptacle, a packer, an outside compressor arm or arms normally open, and a tripping-arm normally in advance of the compressor-arm and closing the exit from the receptacle, against which tripping-arm the grain is forced by the packer.

9. In a grain-binder, the combination of the grain-receptacle, a packer, outside and inside compressor-arms normally open, and a tripping-arm normally in advance of the outside compressor and closing the exit from the receptacle in such manner as to receive the grain forced forward by the packer.

10. In a grain-binder, the combination of the grain-receptacle, a packer, an outside compressor arm or arms normally open, a tripping-arm normally in advance of the compressor-arm and closing the exit from the receptacle to receive the grain from the packer, and a binding-arm actuated in common with said compressor-arm by mechanism thrown into gear by the trip.

11. In a grain-binder, the combination of the grain-receptacle, a packer, outside and inside compressor-arms normally open, a tripping-arm normally in advance of the outside compressor and closing the exit from the receptacle, and a binding-arm actuated in common with said compressor-arms by mechanism thrown into gear by the trip.

12. The combination of the outside compressor-arm, the tripping-arm normally in advance thereof to close the grain-receptacle, means whereby the tripping-arm is locked to the compressor-arm as the latter descends and comes alongside, and means releasing it therefrom as said compressor-arm nears the end of its return movement.

13. The combination of the outer compressor-shaft, the tripping-arm carried thereby, the sprocket-wheel running loose on said shaft, the sliding clutch, its yoke and notched dowel-rod, the latch upon the frame, and the tappet upon the shaft, whereby the trip causes the clutch to engage by rocking the shaft in its bearings.

14. The combination of the outer compressor-shaft, the tripping-arm carried thereby, the sprocket-wheel running loose on said shaft, the sliding clutch, its yoke and notched dowel-rod, the latch upon the frame, and the tappet and wing-cam upon the shaft, whereby the trip causes the disengagement of the latch and engagement of the clutch by rocking the shaft in its bearings, and the wing-cam restores the dowel-rod to position and reopens the clutch in the ensuing positive movement.

15. The combination of the two shafts carrying the opposing compressor-arms, the sprocket-wheels running loose thereon, the chain driving said sprocket-wheels constantly in one direction, the intermeshing fixed gear-wheels, and means whereby the shafts are turn by turn clutched to and released from their sprocket-wheels.

16. The combination of the two shafts carrying the opposing compressor-arms, the sprocket-wheels running loose thereon, the chain driving said sprocket-wheels constantly in one direction, the intermeshing fixed gear-wheels, the binder-arm and its crooked shaft, the pitman connecting the binder-arm shaft with a wrist-pin on one of the gear-wheels, and means whereby the compressor-shafts are turn by turn clutched to and released from their sprocket-wheels.

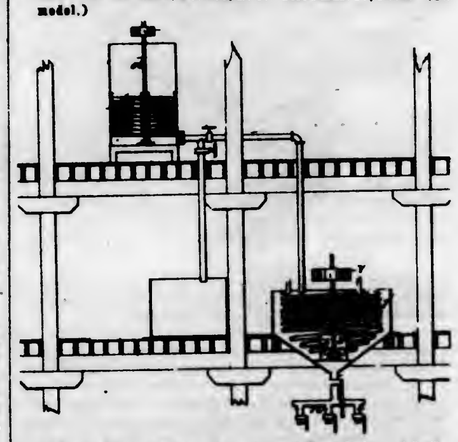
17. The combination, to form a tripping mechanism for grain-binders, of a rock-shaft, a tripping-arm mounted upon said rock-shaft and opposing the incoming grain, a constantly-driven gear or sprocket wheel normally loose upon the shaft, a spring-pressed sliding clutch held out of engagement with said wheel by means of a latch, a tappet upon the shaft in position to be brought against and release the latch as the tripping-arm yields and rolls the shaft, and means for restoring the clutch to its open position after the shaft has been driven the proper distance.

18. The combination, substantially as described, of a gear or sprocket wheel, a spring-pressed sliding clutch engaging therewith, a yoke and notched dowel-rod connected with the sliding clutch, a pivoted latch upon the frame to lock said dowel-rod, a tappet carried by the shaft to release the latch and permit the clutch to engage, and a wing-cam, also carried by the shaft to again retract the dowel-rod and clutch.

19. The combination of the opposing compressing-arms and their respective rock-shafts, the tripping-arm on the outer shaft, the sprocket-wheels running loose on said shafts, the intermeshing gear-wheels fixed to the shafts, the sliding clutches and their yokes and notched dowel-rods, the latches upon the frame, and the tappets and wing-cams carried by the shafts, all relatively arranged as set forth.

20. In combination with the outer compressor-shaft, the adjustable collar carrying the tappet and wing-cam, substantially as and for the purpose described.

21. The combination, with the shaft supported in the yokes which bind the compressor-bolts together and driving the band-uniting mechanism, of the segment upon one of the compressor-shafts for actuating said driving-shaft, as set forth.



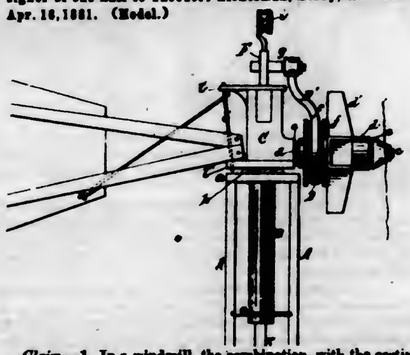
22. The combination, with the binding-arm, of the separator-arm pivoted thereto and guided as to the path in which it moves by the slot in the docking through which the binding-arm passes.

23. The tripping-arm mounted upon the shaft F, combined with the coiled spring, the brake, and the notched rim, substantially as and for the purpose set forth.

24. The combination of the tripping-arm, its coiled spring and brake, the rim a^2 and its shoulder a^3, the compressor-arm, and the stop a^4 on the frame, as and for the purpose described.

25. The combination, with the outside vibrating compressing-arm, of the pivoted dog and its stop to form a gavel-ejector, as set forth.

256,809. APPARATUS FOR CRYSTALLIZING GRAPE-SUGAR. HOWIE ROAF, Buffalo, N. Y. Filed Mar. 17, 1881. (No model.)

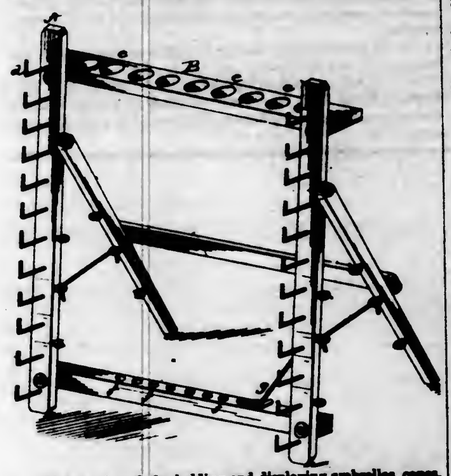


Claim.—1. The combination, substantially as before set forth, of the mixer and the crystallizer, whereby the emulsion may be conveniently supplied to the crystallizer.

2. The combination, substantially as before set forth, of the tank, the screw-bladed agitator, and the drum surrounding said agitator.

3. The combination, substantially as before set forth, of the tank of the crystallizer, the coil of pipe therein, the screw-bladed agitator, and the drum surrounding said agitator.

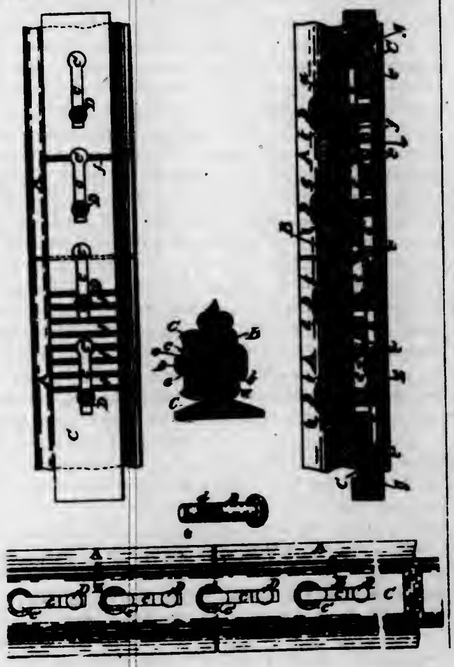
4. The combination, substantially as before set forth, of the tank of the crystallizer, the coil of pipes therein, the agitator, and the discharge-pipe divided into branches.



256,810. WINDMILL. EMANUEL H. SOUNDER, Nebraska, assignor of one-half to Theodore Bickerman, Henry, Ill. Filed Apr. 16, 1881. (Model.)

Claim.—1. In a windmill, the combination, with the casting C, carrying the shaft *c*, with a sleeve, *d*, having the wheel-spider *d'* and the eccentric or cam *f*, of the collar D, having the pitman *D'*, and the piston-rod E, substantially as and for the purpose set forth.

2. In a windmill, the combination, with the casting C, having the tubular shaft B and supported upon bearing anti-frictional rolls *h*, the shaft *c*, with its sleeve *d*, fitted with frictional rolls *e*, and having the spider *d'*, cam *f*, with anti-frictional bearing-rolls *f'*, collar D, having pitman *D'*, and guide-standards F, of the piston-rod E, having the pin *g* and interposed between the anti-frictional rolls *h h*, substantially as and for the purpose set forth.



256,811. FOLDING DISPLAY-RACK. JAMES T. SMITH, New York, N. Y. Filed Feb. 24, 1882. (No model.)

Claim.—A rack for holding and displaying umbrellas, canes, or other articles, consisting of the front supports provided with hooks or pegs, the upper and lower cross-pieces provided with holes and recesses, as described, and the back braces, all pivoted to each other to permit of sliding and folding the parts together, substantially as described.

256,812. RAIL-JOINT FASTENING. HAZLOISE THIBAULT, Ottawa, Ontario, Canada, assignor of one-half to Maxime Hélanger and John Sweetland, both of same place. Filed Dec. 12, 1881. (No model.)

Brief.—Two tapered slotted plates having longitudinal slots enlarged at one end and provided with notches, in which may be inserted locking-pins, are secured to the rails by means of recked bolts.

Claim.—1. The joint-fastening consisting of the plate B, recked bolts D, the two tapered slotted plates C, provided with notches *f*, and the pin E, as shown.

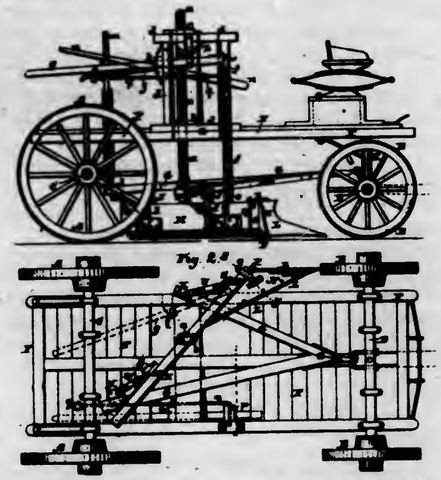
2. As a new article of manufacture, a flat tapered plate provided with longitudinal slots enlarged at one end and with transverse grooves in one face.

3. The tapered slotted plate C, provided with the grooves *f*, for a fastening-pin, and the notch *g*, to facilitate their removal.

REISSUES.

10,088. ROAD SCRAPER AND GRADER. ALONZO H. KIMBALL and CHARLES H. KIMBALL, Littleton, Mass. Filed June 2, 1881. Original No. 231,589, dated Aug. 24, 1880.

Brief.—A plow is detachably secured to the end of the scraper by means of a bar at the bottom connected to lugs on the plow, passing under the scraper, and connected at its rear with a bar passing over the top of the scraper and bolted to the plow. The scraper is suspended by looped straps to the rear of a triangular frame, loosely jointed at its front end to the front axle of a wagon-frame. The scraper is connected with the frame by extension-braces having ball-and-socket joints. The rear of the triangular frame has a vertical bar passing up through slots in the cross-bars of a frame on the wagon-body. The ends of the scraper have vertical bars adjusted by means of levers and racks and pawls.



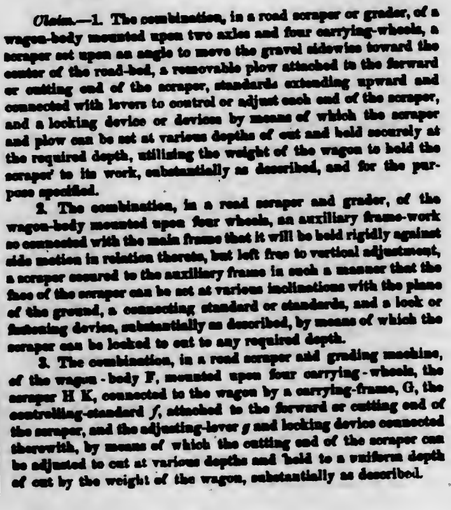


Fig. 2.

Claim.—1. The combination, in a road scraper or grader, of a wagon-body mounted upon two axles and four carrying-wheels, a scraper set upon an angle to move the gravel sidewise toward the center of the road-bed, a removable plow attached to the forward or cutting end of the scraper, standards extending upward and connected with levers to control or adjust each end of the scraper, and a locking device or devices by means of which the scraper and plow can be set at various depths of cut and held securely at the required depth, utilizing the weight of the wagon to hold the scraper to its work, substantially as described, and for the purpose specified.

2. The combination, in a road scraper and grader, of the wagon-body mounted upon four wheels, an auxiliary frame-work so connected with the main frame that it will be held rigidly against side motion in relation thereto, but left free to vertical adjustment, a scraper secured to the auxiliary frame in such a manner that the face of the scraper can be set at various inclinations with the plane of the ground, a connecting standard or standards, and a lock or fastening device, substantially as described, by means of which the scraper can be locked to cut to any required depth.

3. The combination, in a road scraper and grading machine, of the wagon-body F, mounted upon four carrying-wheels, the scraper H K, connected to the wagon by a carrying-frame, G, the controlling-standard *f*, attached to the forward or cutting end of the scraper, and the adjusting-lever *g* and locking device connected therewith, by means of which the cutting end of the scraper can be adjusted to cut at various depths and held to a uniform depth of cut by the weight of the wagon, substantially as described.

4. The combination, in a road scraper and grading machine, of the main wagon-body, mounted upon four wheels, the auxiliary frame G, connected with the main wagon-body in such a manner that it carries the scraper and holds it against the side draft, the standards *f* and *m*, for adjusting the cut of the scraper, the levers *g* and *n*, for raising and lowering the scraper, the segment *h* and catch *j*, for locking the cutting end of the scraper to the required depth of cut, and the pin *g*, used to hold the lever *n* and the rear end of the scraper at the required height or depth, substantially as described, and for the purpose set forth.

5. The combination, with the scraper H K, of the removable plow L, by means of the bar P, passing beneath the scraper-blade, the bar R, passing over the scraper, both connected with lugs or projections on the rear surface of the plow, and bolt Q, all combined and operating substantially as described, and for the purpose specified.

6. In a road scraper and grader, the combination, with the scraper H K and the frame G, of the extension-braces U V, provided with ball-and-socket bearings W X and T S at their ends, substantially as herein shown and described, to give the braces a firm support at whatever pitch the scraper may be adjusted, as set forth.

STEEL ELIOTYPE PRINTING CO BOSTON

DECISIONS

OF THE

COMMISSIONER OF PATENTS

AND OF

UNITED STATES COURTS IN PATENT CASES.

OPINION OF SECRETARY OF THE INTERIOR.

1. SECTION 4887 OF THE REVISED STATUTES CONSTRUED.
   Under section 4887 of the Revised Statutes the Commissioner of Patents should limit the duration of patents issued by him to the term of foreign patents previously issued for same invention.
2. RULE 39 OF PRACTICE IN THE UNITED STATES PATENT OFFICE.
   To this end he may require of the applicant, under oath, all his knowledge upon the subject.

DEPARTMENT OF THE INTERIOR,
Washington, April 10, 1882.

SIR: I acknowledge the receipt of your letters of the 4th of January last and the 9th ultimo relative to the execution by the Patent Office of the provision of section 4887 of the Revised Statutes, which directs that every patent granted for an invention which has been previously patented in a foreign country shall be so limited as to expire at the same time with the foreign patent, or, if there be more than one, with the one having the shortest time to run, provided that in no case shall a patent be enforced more than seventeen years.

It is the policy of the law to have patents granted in this country for inventions previously patented in foreign countries expire in this country at the time at which they expire in the countries in which they have the shortest term to run. It is the duty of the Department to give effect to this policy so far as it can so do.

It has been suggested that the Patent Office has not sufficient means of learning whether in fact inventions for which patents are claimed, have been patented abroad. That is doubtless true; but still the Patent Office should use what means it has to that end. Now, it can search the conscience of the applicant and require from him all his knowledge on the subject. It is true he may falsify, but so may all witnesses, and yet we must in all controversies rely on sworn testimony. The testimony of the applicant here and the transcripts of patents in foreign countries filed in the Patent Office are, perhaps, the only means by which the Commissioner of Patents can learn the existence of a foreign patent and the date at which it was granted, and it does not seem wise to have the Office reject either of the modes of ascertaining the fact.

It is claimed in the case appealed that the applicant has made oath that he has procured a patent for an invention in one foreign country, and has been required to state in addition whether he has obtained a patent for the same invention in any other foreign country. He protests against such requirement. It seems to me a statement of this proposition carries with it its sufficient answer. The object is to get not only the truth, but the whole truth.

The applicant surely cannot complain if his patent here be limited by his own sworn statement concerning the issue of a foreign patent. He knows what the law intends to give him. If he states truly he gets all that and should not want more. If he states untruly he runs the risk of taking nothing by his falsity, if discovered, and also the risk of prosecution for perjury.

It is also suggested that if the patent issued here refers to the law limiting the life of the patent issued here to the life of a foreign patent issued for the same invention that will be effective and sufficient. That may be so in law and not in fact. If the applicant states truly all he knows (and he knows all there is to know) his patent here under the present practice gives a clue which will enable those interested to determine the facts as to the expiration of the patent. If no data as to particular foreign patents be given on the face of the patent the public may be kept in ignorance of the foreign patent and royalty may be collected on an expired patent.

I am, therefore, of opinion that the Commissioner of Patents should insert in patents issued by him the limitation shown by the facts in his possession touching the existence and date of foreign patents for the same invention so far as developed, and should also refer to the law limiting domestic patents to the life of foreign patents for the same invention.

Very respectfully,

S. J. KIRKWOOD,
Secretary.

The Commissioner of Patents.

DECISIONS OF THE U. S. COURTS.

Supreme Court of the United States.

AGER *et al. v.* MURRAY.

Decided March 6, 1882.

1. PATENT RIGHTS LIABLE FOR DEBTS OF PATENTEES.
   A patent right may be subjected by bill in equity to the payment of a judgment debt of the patentee.
2. SALE BY ORDER OF COURT—TRUSTEE TO ASSIGN.
   The decree below, appointing a trustee to execute an assignment, if the patentee should not himself execute one, being clearly within the chancery powers of the court, affirmed.

APPEAL from the Supreme Court of the District of Columbia.

Mr. T. T. Crittenden for the appellants.
Mr. L. G. Hine and *Mr. S. T. Thomas* for the appellee.

Mr. Justice GRAY delivered the opinion of the Court.

This is a bill in equity by a judgment creditor to subject to the payment of his debt the interest of his debtor

in patent rights. The case was heard in the Supreme Court of the District of Columbia upon bill and answers, by which it appears to be as follows:

On the 10th of April, 1876, Talbot C. Murray, in an action at law upon a promissory note, recovered judgment against Wilson Ager for the sum of $2,164.66, with interest and costs. Upon that judgment a writ of *fieri facias* was issued and returned *nulla bona*. Wilson Ager had no real or personal property in the District subject to execution at law, but was the owner of sundry letters patent issued to him by the United States for useful inventions, which, if sold, would produce more than enough money to satisfy that judgment. On the 26th of September, 1876, he conveyed all his right and interest in these letters patent to the other defendant, Elisha C. Ager, who owned an equitable interest of one-third therein, and who, on the 8th of October, 1877, reconveyed the patent rights to Wilson by an assignment, which was not recorded in the Patent Office. Wilson Ager resides in the District of Columbia and the other defendant resides in the State of California, and both have appeared in the cause and answered to the merits of the bill.

The bill prays for an injunction against further assignment pending the suit, and that the patents be sold under the direction of the court, and the proceeds of the sale applied to the payment of the judgment debt, and the defendant, Wilson Ager, be required to execute such assignment as may be necessary to vest title in the purchaser or purchasers, in conformity with the patent laws, and for further relief. The decree is that, in default of his paying by a certain day the judgment mentioned in the bill, with interest and costs, and the costs of this suits, the patent rights be sold and an assignment thereof executed by him, as prayed for, and that, in default of his executing such assignment, some suitable person be appointed trustee to execute the same. From that decree the original defendants have appealed to this Court, and the single question argued before us is, whether a patent right may be ordered by a court of eqnity to be sold and the proceeds applied to the payment of a judgment debt of the patentee.

A patent or a copyright, which vests the sole and exclusive right of making, using, and vending the invention, or of publishing and selling the book, in the person to whom it has been granted by the Government, as against all persons not deriving title through him, is property capable of being assigned by him at his pleasure, although his assignment, unless recorded in the proper office, is void against subsequent purchasers or mortgagees for a valuable consideration without notice. (Rev. Stats., secs. 4884, 4898, 4952, 4955.) And the provisions of the patent and copyright acts, securing a sole and exclusive right to the patentee, do not exonerate the right and property thereby acquired by him, of which he receives the profits and has the absolute title and power of disposal, from liability to be subjected by suitable judicial proceedings to the payment of his debts.

In England it has long been held that a patent right would pass by an assignment in bankruptcy, even without express words to that effect in the bankrupt act. (*Hesse* v. *Stevenson*, 3 Bos. & Pul., 565; *S. C.* Davies Pat. Cas., 263; *Longman* v. *Tripp*, 2 New Rep., 67; *Bloxam* v. *Elsee*, 1 Car. & P., 558; *S. C.*, Ry. & Mood., 187; 6 B. & C., 169; 9 D. & R., 215; *Mawman* v. *Tegg*, 2 Russ., 385; *Edelsten* v. *Vick*, 11 Hare, 78; *Hudson* v. *Osborne*, 39 Law Journal, N. S., chap., 79.)

In *Hesse* v. *Stevenson* Mr. Justice Chambre, in the course of the argument, said: "The right to the patent is made assignable; why, then, may it not be assigned under a commission of bankrupt?" (3 Bos. & Pul., 571.) And Lord Alvanley, delivering the unanimous judgment of the court, after observing that it was contended "that the nature of the property in this patent was such that it did not pass under the assignment," and "that although by the assignment every right and interest and every right of action, as well as right of possession and possibility of interest, is taken out of the bankrupt and vested in the assignee, yet that the fruits of a man's own invention do not pass," said:

It is true that the schemes which a man may have in his own head before he obtains his certificate, or the fruits which he may make of such schemes, do not pass, nor could the assignee require him to assign them over, provided he does not carry his schemes into effect until after he has obtained his certificate. But if he avail himself of his knowledge and skill, and thereby acquire a beneficial interest, which may be the subject of assignment, I cannot frame to myself an argument why that interest should not pass in the same manner as any other property acquired by his personal industry. (3 Bos. & Pul., 577, 578.)

The recent bankrupt act of the United States, in defining what property should vest in the asignee in bankruptcy, expressly enumerated "all rights in equity, choses in action, patent rights, and copyrights," and required the assignee to sell all the property of the bankrupt for the benefit of his creditors. (Rev. Stats., secs. 5046, 5062, 5064.) The only difference is that in England all such rights pass that become vested in the bankrupt before he obtains a certificate of discharge, whereas here only those rights pass which belong to him at the time of the assignment.

It has been said by an English text-writer that "a patent right may be seized and sold in execution by the sheriff under a *fieri facias*, being in the nature of a personal chattel." (Webster on Patents, 23.) We are not aware of any instance in which such a course has been judicially approved. But it is within the general jurisdiction of a court of chancery to assist a judgment creditor to reach and apply to the payment of his debt any property of the judgment debtor which, by reason of its nature only, and not by reason of any positive rule exempting it from liability for debt, cannot be taken on execution at law, as in the case of trust property, in which the judgment debtor has the entire beneficial interest of shares in a corporation, or of choses in action. (*M'Dermutt* v. *Strong*, 4 Johns., chap., 687; *Spader* v. *Hadden*, 5 Johns., chap., 280, and 20 Johns., 554; *Edmeston* v. *Lyde*, 1 Paige, 637; *Wiggin* v. *Heywood*, 118 Mass., 514; *Sparhawk* v. *Cloon*, 125 Mass., 263; *Daniels* v. *Eldredge*, 125 Mass., 356; *Drake* v. *Rice*, 130 Mass., 410.)

In *Stephens* v. *Cady*, (14 How., 528,) and again in *Stevens* v. *Gladding*, (17 How., 447,) the point decided was that by a sale of the copper-plate engraving of a map on execution from a State court against the owner of the copyright the purchaser acquired no right to strike off and sell copies of the map.

Mr. Justice Nelson, in delivering judgment in *Stephens* v. *Cady*, said:

The copper-plate engraving, like any other tangible personal property, is the subject of seizure and sale on execution, and the title passes to the purchaser the same as if made at a private sale; but the incorporeal right secured by the statute to the author to multiply copies of the map by the use of the plate being intangible and resting altogether in grant, is not the subject of seizure or sale by means of this process—certainly not at common law. No doubt the property may be reached by a creditor's bill and be applied to the payment of the debts of the author, the same as stock of the debtor is reached and applied, the court compelling a transfer and sale of the stock for the benefit of creditors.

He then cited the cases in Johnson's and Paige's Reports above referred to, and added:

But in case of such remedy we suppose it would be necessary for the court to compel a transfer to the purchaser in conformity with the requirements of the copyright act, in order to vest him with a complete title to the property. (14 How., 531.)

In *Stevens* v. *Gladding* Mr. Justice Curtis said:

There would certainly be great difficulty in assenting to the proposition that patent and copyrights held under the laws of the United States are subject to seizure and sale on execution. Not to repeat what is said on this subject in 14 Howard, 531, it may be added that these incorporeal rights do not exist in any particular State or district. They are coextensive with the United States. There is nothing in any act of Congress or in the nature of the rights themselves to give them locality anywhere, so as to subject them to the process of courts having jurisdiction limited by the lines of States and districts. That an execution ont of the Court of Common Pleas for the County of Bristol, in the State of Massachusetts, can be levied on an incorporeal right subsisting in Rhode Island or New York will hardly be pretended. That by the levy of such an execution the entire right could be divided and so much of it as might be exercised within the county of Bristol sold would be a position subject to much difficulty. These are important questions, on which we do not find it necessary to express an opinion, because in this case neither the copyright, as such, nor any part of it, was attempted to be sold. (17 How., 451.)

The difficulties of which the learned justice here speaks are of seizing and selling a patent or copyright upon an execution at law which is ordinarily levied only upon property, or the rents and profits of property, that has itself a visible and tangible existence within the jurisdiction of the court and the precinct of the officer, and do not attend decrees of a court of equity, which are *in personam*, and may be enforced in all cases where the person is within its jurisdiction. (*Massie* v. *Watts*, 6 Cranch, 148.) And the terms in which he refers to the statement of Mr. Justice Nelson show that there was no intention to criticise or qualify that statement.

There are, indeed, decisions in the circuit courts that an assignee in insolvency, or a receiver of all the property of a debtor appointed under the laws of a State, does not, by virtue of the general assignment or appointment merely, without any conveyance made by the debtor or specifically ordered by the court, acquire a title in patent rights. (*Ashcroft* v. *Walworth*, 1 Holmes C. C., 152; *Gordon* v. *Anthony*, 16 Blatchf. C. C., 234.) But in *Ashcroft* v. *Walworth* Judge Shepley clearly intimated that the courts of the State might have compelled the debtor to execute such a conveyance; and the highest courts of New York and California have affirmed the power upon a creditor's bill to order the assignment and sale of a patent right for the payment of the patentee's judgment debts. (*Gillette* v. *Bate*, 86 N. Y.; *Pacific Bank* v. *Robinson*, 57 California.)

In *Carver* v. *Peck* (131 Mass., 291) the court reserved the expression of any opinion upon that question, because unnecessary to the decision, and the assumption in *Cooper* v. *Gunn* (4 B. Monroe, 594) that an author could not be deprived against his will and in favor of any of his creditors of any of the rights secured to him by the copyright acts was merely *obiter dictum*, unsupported by reasoning or authority.

In the case at bar the bill is filed by a judgment creditor of the patentee in a court of the United States of appropriate jurisdiction against the patentee, residing within the District and holding the entire legal title and two thirds of the equitable interest in the patent rights, and against the owner of an equitable interest in the remaining third, who is properly made a party to the bill. Both defendants are before the Court and have filed answers. The debtor's interest in the patent rights is property assignable by him, and which cannot be taken on execution at law. The case is thus brought directly within the opinion delivered by Mr. Justice Nelson in *Stephens* v. *Cady*, of the soundness of which we entertain no doubt.

The clause of the decree below, appointing a trustee to execute an assignment, if the patentee should not himself execute one, as directed by the decree, has not been objected to in argument, and was clearly within the chancery powers of the court as defined in the statute of Maryland of 1785, which is in force in the District of Columbia. (Maryland Stats. 1785, chap. 72, secs. 7, 13, 25, 2 Kilty's Laws; Laws of District of Columbia, edition 1868, pages 326, 328, 333, 336.)

Decree affirmed.

U. S. Circuit Court—Eastern District of Pennsylvania.

HAMMERSCHLAG *v.* GARRETT *et al.*

Decided January 23, 1882.

1. MOTION FOR ATTACHMENT—PROCESS—OMISSION OF STEP.
   Motion for attachment for contempt dismissed, it appearing that defendants omitted in their method the first step in the plaintiff's process.
2. PROCESS CLAIM—CHANGE OF MACHINERY—OMISSION OF STEPS.
   The position that the process claim of the patent in question covers all methods of making waxed paper by machinery, whether by complainant's method or by a new mode devised by themselves, and which dispenses with some of the steps used by the plaintiff in his particular mode, cannot be adopted.
3. SAME—INFRINGEMENT.
   Construing the claim in question as for a process, every successive step enumerated must be regarded as an essential part, and must be employed by defendants to render them liable for infringement.

MOTION FOR ATTACHMENT FOR CONTEMPT.

Messrs. Frost & Coe and *Mr. J. K. Valentine* for the complainant.

Messrs. Collier & Bell for the defendants.

BUTLER, *J.*, MCKENNAN, *C. J.*, concurring.

Subsequently to the injunction in this case the defendants constructed a machine corresponding to a section of the old Anderson machine, the patent for which has expired, and continued the manufacture of waxed paper by this means. The plaintiff, charging that the process thus employed infringes his as described in the fifth claim of his patent, asks for an attachment to prevent its further use and to punish the alleged disregard of his injunction. It is not charged that the machine is similar to the plaintiff's and infringes the claims of his patent in this respect, but simply that the process is employed in violation of the claim for this.

In passing upon the validity of the plaintiff's patent and the construction of its several claims, we adopted the judgment of the Circuit Court of the Southern District of New York in *Hammerschlag* v. *Seamoni*, (involving the same patent,) for the sake of consistency and uniformity, without critical examination of the reasons on which the judgement was based. Whether the fifth claim under consideration is for a process or simply for the combination of machinery previously described and claimed in separate parts is a debatable question, which we did not, for the reasons stated, esteem it proper to enter upon. In the case cited it was decided to be for a process consisting of successive steps, four in number, as follows: first, moving the paper over and in contact with a heated cylinder, which acts to spread the wax on the surface of the paper; second, heating the unwaxed surface to spread and fuse the wax into the fabric of the paper; third, removing the surplus wax; and, fourth, remelting and polishing the wax upon the surface, these several steps being performed substantially as set forth in the specifications. The plaintiff's present position—that this process covers all methods of making waxed paper by machinery, "and, therefore, whether or not the defendants carry on the making of waxed paper by machinery by the complainant's particular method or by a new mode devised by themselves, and which dispenses with some of the steps used by the plaintiff in his particular mode, makes no difference whatever as regards infringement"—cannot be adopted. It is clearly unsound. His invention, as described by himself and in his own language, is for an improvement relating to a "means for heating the wax, applying it to the paper, * * * removing surplus wax, and then polishing the surface," which improved means are particularly described in the specifications and embraced in the claims, the fifth of which reads as follows:

The method herein set forth of waxing paper, consisting in spreading the wax upon the surface, heating the paper from the opposite side, to spread and fuse the wax into the fabric of the paper, removing the surplus wax, and remelting and polishing the wax upon the paper, substantially as set forth.

Construing this claim to be one for a process, as has been done, every successive step enumerated must be regarded as an essential part, and must be employed by the defendants to render them liable to the charge of infringement. The first (spreading the wax upon the surface of the paper, substantially as set forth) certainly is not employed by the defendants. The paper is not moved over and in connection with the heated cylinder, which acts to spread the wax upon it, nor is the wax spread upon it by any similar or equivalent means. It is not, indeed, in the sense here contemplated, spread upon it at all. The paper is simply dipped into the wax and as much of this substance taken up as will adhere, not upon one side simply, but upon both. This omission of the first step in the plaintiff's process plainly distinguishes the defendants' from it. That such an omission would have such an effect seemed to be fully conceded on the argument for injunction by the plaintiff's expert and his counsel.

In speaking of the Anderson patent, then set up in anticipation, this witness said:

The mode of operation there is different, being that of submerging the fabric or a portion thereof in the liquid on its way through the machine. The Anderson machine does not contain the same subject-matter of the first claim, because it has no heated cylinder revolving within the trough containing wax and acting to heat the same and apply it to the paper. For the same reason it does not contain the method specified in the second claim, the first step of which consists in transferring the melted wax from the trough to the paper by a roller or cylinder. For the same reason it does not contain the combination specified in the third claim, and for the additional reason that it contains no means after the wax has been applied to one surface of the paper for heating it at the other surface to draw the wax in. Finally, it does not contain, for the same reason, the method claimed in the fifth claim.

That this witness may now express a different opinion is not important.

The plaintiff's counsel, in distinguishing the Anderson machine from the plaintiff's, adopted and enforced this view. That it was also adopted by the distinguished judge whose leading we followed in granting the injunction is rendered clear by what he said in disposing of the motion for attachment against Scamoni on September 27, 1881. We quote his language:

In regard to the Van Skelline machine, there is not in it any such heated cylinder as the cylinder *a* of claim 1 of No. 8,460 or as the cylinder C of the defendant. It does not anticipate claim 2 of No. 8,460, because not only is there not in it a roller which transfers the melted wax from the trough to the paper, but there is no scraper between the roller and the paper. It does not meet claim 3 of No. 8,460, because it has no heated cylinder like the heated cylinder *a*; nor does it meet claim 5 of No. 8,460. The operation of spreading the wax upon the surface of the paper substantially as set forth in the description of No. 8,460 involves spreading it by means of a uniform layer of wax on the spreading-cylinder, produced by a scraper applied to such cylinder between the trough and the place of contact with the paper, which removes from the cylinder the surplus wax taken up by it from the trough. In Van Skelline's machine the paper is dipped into the bath of wax and takes up all the wax it will, and then the scraper is applied to the paper. The defendant's process imitates the plaintiff's and not Van Skelline's.

As respects the question before us, the operation of the defendant's machine and his process are precisely similar to Van Skelline's. This view is also fully sustained by the testimony of the several experts called by the defendants, some of whom are men of very great experience and unusual intelligence respecting the matters of which they speak.

It is unnecessary to inquire whether the defendants employ or imitate other steps of the plaintiff's process. What we have said is sufficient to indicate our reasons for holding that they do not employ the process protected by his patent.

The motion must, therefore, be refused.

U. S. Circuit Court—Eastern District of Pennsylvania.

THE BIGELOW CARPET COMPANY *v.* DOBSON. SAME *v.* SAME. THE HARTFORD CARPET COMPANY *v.* SAME.

Decided January 27, 1882.

1. INFRINGEMENT—ASCERTAINMENT OF DAMAGES.

In cases of wilful infringement respondents ought to be held to the most rigid accountability, and no intendment ought to be made in their favor founded upon the alleged inconclusiveness of the complainant's proof of loss. Such proof ought to be interpreted most liberally in favor of complainants within the limit of an approximately accurate ascertainment of their damages.

2. SAME.

Where in a suit for infringement of a patent for a carpet design the evidence showed the quantity of complainants' carpet sold during the season of its first introduction, its cost, the profit upon it, the quantity of the infringing carpet sold by respondents during the following season, and that there was a decline in complainants' sales, the measure of damages is the profits which would have accrued to complainants upon the quantity of carpets sold by respondents. This latter quantity must under the circumstances be presumed to have displaced an equal quantity of complainants' carpets.

Mr. A. v. Briesen for the complainants.

Mr. George E. Buckley for the defendants.

McKENNAN, *C. J.*:

These were all suits for infringement by the respondents of designs for carpets patented to the complainants. The infringing designs are exact counterparts of the patented ones, and carpets embodying them were put upon the market by the respondents some time after the date of the patents and the introduction of carpets containing the designs described in them by the complainants. No defense was made by the respondents, and they therefore occupy the attitude of willful infringers. Under these circumstances the respondents ought to be held to the most rigid accountability, and no intendment ought to be made in their favor founded upon the alleged inconclusiveness of the complainants' proof of loss. On the other hand, such proof ought to be considered and interpreted most liberally in favor of the complainants within the limit of an approximately accurate ascertainment of their damages. The master has not so dealt with the evidence presented to him, and has therefore fallen into error in his conclusion. He has found nominal damages only in favor of the complainants, although they furnished proof by which the damages claimed by them might, to some extent at least, be legally measured. In this category is the evidence of the number of pieces and yards of the complainants' carpets during the season of its first introduction upon the market, the cost per yard of their manufacture, and the prices at which they were sold in the market, the number of pieces and yards of infringing carpets made and sold by the respondents in the following season, and the very large decline in the complainants' sales during this period. It furnishes the means of accurate compntation of the complainants' profits and of the extent to which the market was occupied by the respondents. All that is left for presumption is that the infringing carpets displaced in the market the complainants' carpets, and hence that the profits which would have accrued to them upon the quantity of carpets wrongfully pnt upon the market is the measure of their damages. This presumption, as against a wrong-doer, is not unreasonable, and it has the sanction of numerous decisions. (*Putnam* v. *Lomax*, 9 Fed. Reps., 448; *American Saw Company* v. *Emerson*, 8 Fed. Reps., 886; *McCaub* v. *Brodie*, 2 O. G., 117; *Westlake* v. *Cartter*, 4 O. G., 636.) Upon this basis there is no difficulty in stating an account against the respondents, and this is the only one upon which, under the evidence, the complainants' damages can be computed. It is enough for us to say that the losses claimed for the entire decline in the complainants' sales and on looms are too remotely connected with the defendant's acts as their supposed cause, and hence are too speculative in their character to entitle them to allowance.

It sufficiently appears that the respondents made and sold twenty pieces of fifty-five yards each—eleven hundred yards in all—of carpets containing the design described in No. 30 of April term, 1879, and that the complainants' profit upon carpets of that design was sixty-seven cents per yard. They lost therefore this sum upon eleven hundred yards, and their damages amount to $737, for which a final decree must be rendered in their favor.

In No. 34, April term, 1879, which is founded upon the patent for what is popularly called the "Pagoda" pattern, the respondents made twenty pieces of fifty yards each, in all one thousand yards, the profits of complainants for like carpet being seventy-five cents per yard. The defendants have not disclosed what became of the carpets thus made by them, and they are therefore held accountable for them as if put upon the market. The complainants' damages in this case are, then, seventy-five cents upon one thousand yards, equal to $750, for which a final decree will be entered in their favor.

In No. 35, April term, 1879, the respondents made fifty-three pieces of the "Chinese lantern" patent of fifty yards each, but sold only thirty-five pieces, the rest having been sealed up by the marshal.

The complainants' damages in this case are therefore seventy-five cents upon one thousand seven hundred and fifty yards, equal to $1,312.50, for which a final decree will be entered in their favor.

DESIGNS.

12,901.—CARPET.—*Frank Allen*, Worcester, Mass., assignor to *Matthew J. Whittall*, same place. Application filed March 9, 1882. Term of patent 3½ years.

12,902.—PERFUMERY-BOTTLE.—*Alfred P. Babcock*, New York, N. Y., assignor to *Jesse Oakley*, *John A. Oakley*, and *E. Benedict Oakley*, all of same place. Application filed March 13, 1882. Term of patent 3½ years.

12,903.—WOVEN FRINGE.—*George F. Hetzel*, Philadelphia, Pa. Application filed March 13, 1882. Term of patent 7 years.

12,904.—LOCKET.—*Charles E. Millin*, Providence, R. I. Application filed March 10, 1882. Term of patent 7 years.

12,905.—ORNAMENTAL OR ADVERTISING EASEL.—*Ethanan L. Meedie*, New York, N. Y., assignor of one-half to *Charles H. Gillespie*, same place. Application filed March 4, 1882. Term of patent 3½ years.

12,906.—VASE.—*William T. Murphy*, New York, N. Y. Application filed March 10, 1882. Term of patent 7 years.

12,907.—WALL-PAPER.—*Emil Popcke*, New York, N. Y., assignor to *Warren, Fuller & Co.*, same place. Application filed February 13, 1882. Term of patent 3½ years.

12,908.—SPICE-BOTTLE.—*John McC. Watson*, Pittsburg, Pa. Application filed March 20, 1882. Term of patent 3½ years.

TRADE-MARKS.

[Certificates of registration of Trade-Marks numbered 8,191 and upward are registered under the act of March 3, 1881.]

9,306.—FLOUR.—*Atlantic Milling Company*, St. Louis, Mo. Application filed March 20, 1882.

"The word 'TROPICAL.'"

9,307.—FLOUR.—*Atlantic Milling Company*, St. Louis, Mo. Application filed March 20, 1882.

"The word 'CHAMPION.'"

9,308.—SHEETS, PLATES, BARS, AND RODS OF IRON AND STEEL.—*William Barrows & Sons*, Tipton, county of Stafford, England. Application filed July 18, 1881.
"The letters 'B. B. H.' surmounted by a crown."

9,309.—PALE ALE, STRONG ALE, AND STOUT OR PORTER.—*Base, Ratcliff & Gretton*, (Limited,) Burton-on-Trent, county of Stafford, England. Application filed March 31, 1882.
"The arbitrary symbol 'Bass & Co.'s.'"

9,310.—COOKING-STOVES.—*James Beakey & Co.*, St. Louis, Mo. Application filed March 28, 1882.
"The words 'DINNER BELL.'"

9,311.—CIGARS.—*Juan Cueto y Co.*, New York, N. Y. Application filed March 28, 1882.
"DON QUIJOTE DE LA MANCHA."

9,312.—CIGARS.—*Estanillo y Co.*, New York, N. Y. Application filed March 28, 1882.
"FLOR DEL FUMAR."

9,313.—OIL AND POLISH FOR LEATHER.—*Estep & Calkins*, Chicago, Ill. Application filed November 28, 1881.
"The representation of a boat sailing, upon which are people trailing their boots and shoes in the water."

9,314.—LIQUID PROPRIETARY MEDICINE.—*Griggs & Co.*, Ottawa, Ill. Application filed February 3, 1882.
"The words 'RED CLOVER' and the representation of a clover-leaf."

9,315.—FLOUR.—*J. F. Imbs & Co.*, St. Louis, Mo. Application filed December 19, 1881.
"The registrants' monogram in connection with the shield and the wheat at opposite sides of said shield."

9,316.—LIQUID SOAP.—*Ezra L. Post*, New York, N. Y. Application filed March 20, 1882.
"The five posts, each bearing one of the letters 'P O S T'S.'"

9,317.—PICKLES, PRESERVES, AND SAUCES.—*Shilton, Foote & Co.*, Somerville, Mass. Application filed July 11, 1881.
"The words 'BUNKER HILL,' together with the pictorial device."

9,318.—COMPOUND POWDER OF DRUGS.—*B. Williams*, Chagrin Falls, Ohio. Application filed February 18, 1882.
"The arbitrarily-selected word 'DOVERINA.'"

9,319.—CIGARS.—*Ramon Allones*, New York, N. Y. Application April 3, 1882.
"The word 'MARGARITA.'"

9,320.—CIGARS.—*Ramon Allones*, New York, N. Y. Application filed April 3, 1882.
"The word 'HERNANI.'"

9,321.—CIGARS.—*Ramon Allones*, New York, N. Y. Application filed April 3, 1882.
"The words 'LA EMINENCIA.'"

9,322.—CIGARS.—*Ramon Allones*, New York, N. Y. Application filed April 3, 1882.
"The words 'EL DESIGNIO.'"

9,323.—CERTAIN MEDICINAL PREPARATION FOR THE SKIN.—*James W. Hinckley*, Minneapolis, Minn. Application filed January 26, 1882.
"The word 'BALSAMINE.'"

9,324.—FIRE-BRICKS, FIRE-SLABS, AND CLUMPS.—*Henry Lamplough*, London, England. Application filed December 17, 1881.
"The word 'ABERNANT.'"

9,325.—CIGARS.—*Perfecto F. Lopez*, New York, N. Y. Application filed April 3, 1882.
"The words 'KATHERINE AND PETRUCHIO.'"

9,326.—FLOUR-SIFTERS.—*Brainerd T. Smith*, Covington, Ky. Application filed March 28, 1882.
"The word 'AVALANCHE.'"

9,327.—CIGARS.—*Yelverton P. Stone*, Baltimore, Md. Application filed January 19, 1882.
"The fanciful term 'THREE SPANIARDS.'"

9,328.—ROASTED COFFEE.—*A. H. Stump & Sons*, Baltimore, Md. Application filed April 1, 1882.
"The words 'TOR-FUNE.'"

9,329.—LEAD-PENCILS.—*The Eagle Pencil Company*, New York, N. Y. Application filed February 20, 1882.
"The words 'CRAYON AMERICAIN,' in conjunction with the representation of an eagle."

LABELS.

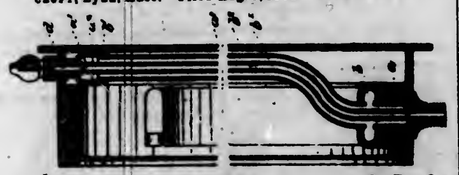
2,670.—Title: "DR. CADY'S CONDITION POWDERS FOR HORSES AND CATTLE."—*Chamberlain & Co.*, Des Moines, Iowa. Application filed March 28, 1882.

2,671.—Title: "EASTBURN'S PINE TAR CORDIAL."—*Robert Eastburn*, New Brunswick, N. J. Application filed December 31, 1881.

2,672.—Title: "HINRICHS' AMERICAN CORN CURE."—*Robinson & Hinrichs*, Manitowoc, Wis. Application filed March 31, 1882.

PATENTS

GRANTED APRIL 25, 1882.

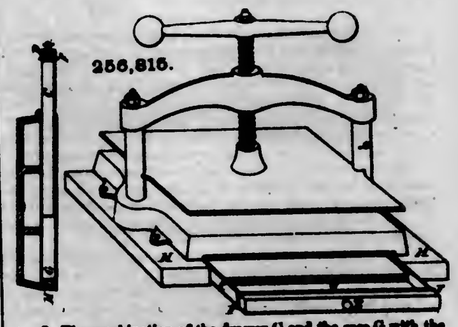


256,813. ADJUSTING MECHANISM FOR HARVESTER-FRAMES. HENRY A. ADAMS, Sandwich, Ill. Filed Aug. 10, 1881. (No model.)

Claim.—1. The main frame, in combination with circular racks attached thereto, the main axle provided with pinions engaging with the racks, a sprocket-wheel on the axle, a sprocket-pinion on the main frame, having its journal at, or very nearly at, the center of the circle of which the racks are area, and a continuous chain running around the sprocket-wheel and sprocket-pinion, substantially as described.

2. The curved guide-racks on the main frame, in combination with pinions D and sprocket-wheel F, both on the main axle, the sprocket-pinion G, arranged at, or nearly at, the center of the curve upon which the guide-racks are described, the endless chain H, independent pawl K, and independent operating-lever M, substantially as described.

256,814. MERCURY PRESSURE-GAGE. EDWARD H. ASHCROFT, Lynn, Mass. Filed Aug. 8, 1881. (No model.)

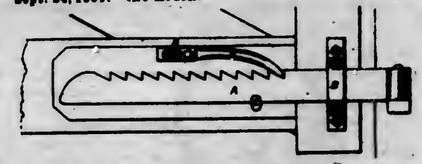


Claim.—1. The combination, in a steam-gage, of a Bourdon spring, a steam-chamber, a^2, a steam supply pipe or tube, a^1, entering said chamber, and a passage, b^2, connecting the chamber with the passage or passages in the Bourdon spring, filled with mercury, all substantially as and for the purposes described.

2. The combination of a Bourdon spring, the tube b^2, connected with the passages or chambers in the Bourdon spring, and with the steam-chamber a^2, the tube a^3 within said tube b^2, and the said chamber a^2, all substantially as and for the purposes described.

3. In a steam-gage, the combination of the steam supply-pipe, a pipe or passage connecting it with the passages of a Bourdon spring and adapted to contain mercury or other pressure-transmitting medium, and upon which the steam is brought in direct contact, and a passage communicating with the outer air extending from the end of the steam-passage, having a suitable cock or valve for opening and closing the same, all substantially as and for the purposes described.

256,815. COPYING-PRESS. LEONARD BAILEY, Hartford, Conn. Filed Sept. 14, 1881. (No model.)

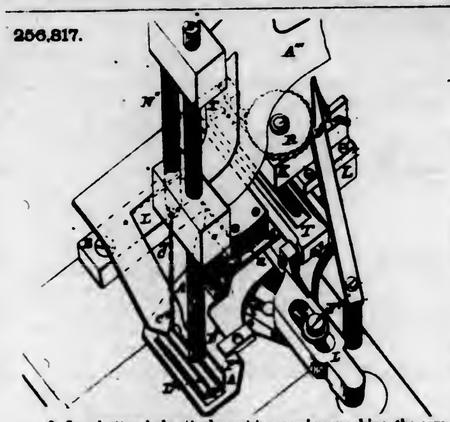


Claim.—1. In a copying-press, the combination of the rubber packing F, inserted between the drawer C and the face D, with the drawer C and the case G, substantially as described.

2. The combination of the drawer C and the case G with the base-plate B of a copying-press, substantially as described.

3. The combination of the frame H, containing the case G and the drawer C, with a copying-press, substantially as described.

256,816. HINGE. JOHN O. ROE, Meehanicsburg, Ill. Filed Sept. 24, 1881. (No model.)



Claim.—The combination of the ratchet-plate A, guide-plate B, with pawl C, stay-plate D, and guide-pin E, all constructed and arranged substantially as and for the purpose herein represented and described.

256,817. BUTTON-HOLE ATTACHMENT FOR SEWING-MACHINES. WILLIAM H. GARR, Lansingburg, assignor to Freeland W. Ostrom, Troy, N. Y. Filed Oct. 28, 1880. (Model.)

Brief.—An angular lever, on which the cloth-clamp is mounted in suitable slides, is vibrated by a cross-grooved cam on the driving-shaft of the machine, to which the attachment is applied for the purpose of producing the overcasting or button-hole stitches. The movements of the cloth-clamp on the angular lever, required to traverse the cloth under the needle, so that the opposite sides and ends of the button-hole may be properly worked, are produced by a crank-pin carried by an endless chain intermittingly moved around a flat blade-drum by a spur-wheel carried by a shaft mounted in vertical bearings on the vibrating angular lever, said shaft being rotated by a ratchet-wheel secured thereto and operated by a pawl pivoted to the stationary bed-plate of the machine.

Claim.—1. In a button-hole attachment for a sewing-machine, the combination of a ratchet-wheel, a vertical shaft to which the latter is connected, a spur-wheel on said shaft and attached thereto, a pawl for imparting rotary movement to said ratchet-wheel, an endless chain having a crank-pin or journal firmly secured thereto, and a blade-drum around which said chain is adapted to be moved by said spur-wheel, substantially as herein described, and for the purposes set forth.

256,817.

2. In a button-hole attachment to a sewing-machine, the combination of a ratchet-wheel having a vertical shaft, a spur-wheel upon and constructed to move with the latter, a pawl for imparting motion to said ratchet-wheel, an endless chain having a crank pin or journal firmly secured thereto, a flat blade-drum around which said chain is adapted to be moved by said spur-wheel, a cloth-carrying mechanism connected to move with said journal, and the bar T, constructed to operate as herein shown and described.

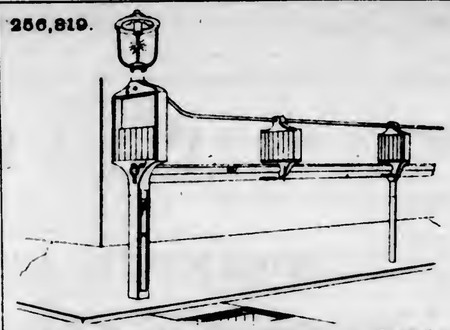
3. In a button-hole attachment to a sewing-machine, the combination of an endless chain, M, its attached journal or pin, the blade-drum *e*, the cloth-carrying mechanism A, and the spur-wheel Y, with the latter constructed to move the chain, as and for the purposes herein described.

4. In a button-hole attachment to a sewing-machine, the combination of the endless chain M, its attached journal or pin J, the flat blade-drum *e*, bar T, cloth-carrier A, and the spur-wheel Y, with the latter constructed to actuate the chain, as shown and described.

5. In a button-hole attachment to a sewing-machine, the combination of the presser-foot P‴, the chain C‴, the latter being constructed to hook to or be unhooked from the presser-foot, the pivoted lever F‴, and the presser-bar N‴, arranged to operate as shown and described.

256,818. FRUIT-PICKER. EDWIN CASE, East Toledo, Ohio. Filed Jan. 31, 1881. (No model.)

Claim.—In a device for gathering fruit, the concavo-convex frame A, having aperture B and radial slots *a'* formed in the curve of the frame between the sides and top, and having handle-socket C, constructed and adapted to serve in relation to a sack secured to the edges of the said frame and a pole, as set forth.



256,819. APPARATUS FOR SUSTAINING TELEGRAPH-WIRES. HENRY A. CHASE, Lynn, Mass. Filed June 17, 1881. (No model.)

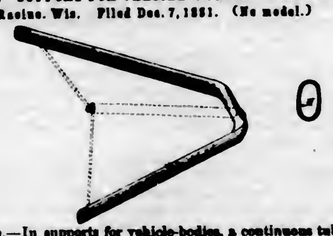
Brief.—A hollow girder containing wires for lighting and working purposes is sustained on a line of posts. On this girder are placed at intervals a series of supporting-frames for telegraph and telephone wires. These frames contain each a series of vertically-removable notched sections. A railing and platform are provided.

Claim.—1. The herein-described apparatus for suporting electric conductors, consisting of a girder and supporting-posts therefor, combined with a series of carrier-supporting heads mounted upon the said girder and movable wire-carriers thereon, substantially as described.

2. The girder provided with a tubular portion to receive electric conductors and supporting-posts therefor, combined with a series of wire-carriers upon the said girder, whereby conductors for currents of dangerous intensity may be kept separate from those used for ordinary purposes of communication, substantially as described.

256,819.

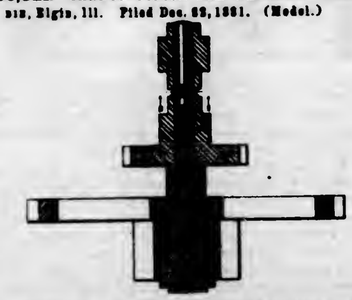
3. The girder having its compression member made tubular and provided with a longitudinal opening to receive electric conductors within it, combined with a continuous series of removable covers to close the said opening, substantially as described.



4. The girder and supports therefor and wire-carriers mounted thereon, combined with the socketed caps for the said carriers and the railing extended longitudinally between them, substantially as and for the purpose described.

5. The girder and wire-carriers thereon, combined with the brackets or platforms fixed upon the said girder, substantially as and for the purpose set forth.

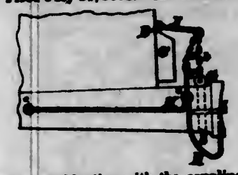
6. The electric-light-supporting posts and frame-like opening therein, combined with the girder supported upon the said post below the said opening and wire-carriers in the said opening and upon the said girder, substantially as described.



7. The dovetail-shaped carrier guide-bars and carrier-pieces provided with dovetail grooves to engage and slide longitudinally upon the said bars, substantially as described.

256,820. SUPPORT FOR VEHICLE-BODIES. CHARLES OSMSTOCK, Racine, Wis. Filed Dec. 7, 1881. (No model.)

Claim.—In supports for vehicle-bodies, a continuous tubular iron frame bent into the required shape and elliptical or oblong in cross-section.

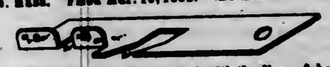


256,821. CANNON-PINION FOR WATCHES. ANTOINE CORBIN, Elgin, Ill. Filed Dec. 22, 1881. (Model.)

Claim.—1. A cannon-pinion having its cannon or barrel reduced in thickness so as to give it the elasticity of a spring, in combination with an arbor having a groove or tapering neck, the cannon-pinion and arbor being held together by the reduced portion of the cannon being indented into the groove or neck of the arbor, substantially as set forth.

2. A cannon-pinion the barrel or cannon of which has a continuous periphery and is reduced in thickness till it has the elasticity of a spring and is adapted to be indented, as and for the purpose specified.

256,822. CAR-COUPLING. CHARLES E. GORDENT, Bellefontaine, Ohio. Filed July 28, 1881. (No model.)



Claim.—1. In combination with the coupling apparatus of cars, the lever B, chains *b d*, swing F, notched pin G, elevating-lever H, and toggle K, as and for purpose specified.

2. In combination with the coupling apparatus of cars, the lever B, chains *b d*, swing F, and notched pin G, as and for purpose specified.

3. In combination with the coupling apparatus of cars, the lever B, chains *b d*, toggle K, and notched pin G.

256,823. BOX-FASTENER. GEORGE H. CRANE, East Somerville, Mass. Filed Mar. 10, 1882. (No model.)

Claim.—1. The hasp D, provided with the lips *c c'*, having the openings *b b* and slots *d d*, substantially as described.

2. The combination of a tub provided with a staple, a cover, and a hinged bar with a hasp provided with a tongue having a wedge-shaped end, which, when forced through the staple, will draw the cover down upon the tub, substantially as described.

3. The combination of the tub A, having the staple *f*, fixed into its side some distance from the upper edge, and the projection *l* above the staple, with the bar C, cover B, and the hasp D, provided with the tongue *f*, which has the projecting lip *e*, substantially as described.

256,824. ADJUSTABLE PIGEON-HOLE FOR DESKS, &c. FRED H. OSTLER, Buffalo, N. Y. Filed Aug. 3, 1881. (No model.)

Claim.—A removable pigeon-hole having upon its upper surface spring-pieces secured upon alternate sides, and having their free ends projecting slightly above the upper surface of the pigeon-hole, substantially as and for the purpose set forth.

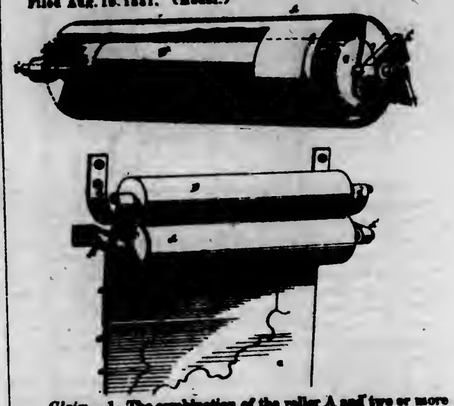
256,825. LAMP-SHADE. WILLIAM DAY, Brooklyn, N. Y. Filed Feb. 25, 1882. (No model.)

Claim.—1. A lamp-shade of the character herein specified, having one or more movable screens located upon the interior of the body of the shade, adapted and arranged to be pushed upward within the shade or pulled below the edge thereof, substantially as shown and described.

2. In an adjustable shade of the character herein specified, the combination, with the body A of the shade, of a movable screen, B, secured to the interior thereof, and adapted and arranged to be raised or lowered therein, substantially as shown and described.

3. In an adjustable shade, the body A, screen B, having curve *b* and turned edge D, and strip C, attached to the interior of the shade and pressing against said screen B, the whole combined and arranged to operate substantially as shown and described.

256,826. COMBINED STEAM AND COMPRESSED-AIR ENGINE. EZEKIAH B. DUFF, Sedalia, Mo. Filed Jan. 24, 1882. (No model.)



256,826.

Claim.—1. In combination with a steam-boiler, A, and steam-engine D, an air-compressor, B, and reservoir C, said parts being provided with pipes *a b' c d'*, and said pipes having suitable regulating-cock, substantially as and for the purpose described.

2. In combination with a steam-boiler, A, and steam-engine D, an air-compressor B, reservoir C, pipes *a, b', b', b', c, d'*, and *e*, and with cocks or valves *a' b' d' e' f*, substantially as and for the purpose described.

256,827. DEVICE FOR DISPLAYING MAPS, CHARTS, AND ILLUSTRATIONS. ALEXANDER DOE, Mount Healthy, Ohio. Filed Aug. 10, 1881. (Model.)

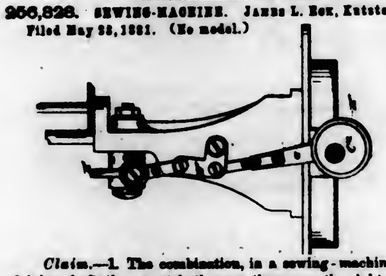
Claim.—1. The combination of the roller A and two or more sheets of maps, display-cards, charts, or illustrations hung thereon, the sheet being so arranged that the lower end of each sheet is below the one immediately behind it, and the roller B' located within the main roller A, and actuated by a spring for rotating the main roller and winding up the sheets, substantially as and for the purpose specified.

2. The combination of the roller A and two or more sheets of maps, display-cards, charts, or illustrations hung thereon, the sheets being so arranged that the lower end of each sheet is below the one immediately behind it, and a roller, B', located within the main roller A, and actuated by a spring for rotating the main roller and winding up the sheets, and the pawl O' and ratchet C, substantially as and for the purpose specified.

3. The combination of the roller A and two or more sheets of maps, display-cards, charts, or illustrations hung thereon, the sheets being so arranged that the lower end of each sheet is below the one immediately behind it, and a roller, B', located within the roller A, and actuated by a spring for rotating the main roller, and auxiliary roller D, substantially as and for the purpose specified.

4. The combination of roller A and two or more sheets of maps, display-cards, charts, or illustrations hung thereon, the sheets being so arranged that the lower end of each sheet shall hang below the one immediately behind it, and the roller B' located within the roller A, and actuated by a spring for rotating the main roller, and auxiliary roller D, and pawl O' and ratchet C, substantially as and for the purpose specified.

5. The combination of the roller A, provided with spring-pawl O', and interior spring-roller, B', provided with ratchet C, said rollers rotating on shaft *b*, provided with square extremity *b'*, to prevent the shaft from turning in the brackets or supports A', and the sheets of maps, charts, display-cards, or illustrations *a a' a' a'*, substantially as and for the purpose specified.

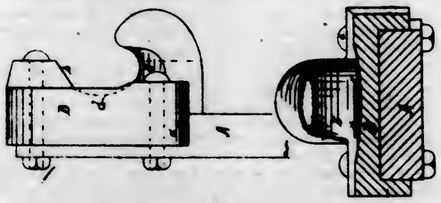


6. The combination of the roller A, provided with spring-pawl O', and interior spring-roller, B', provided with ratchet C, said rollers rotating on shaft *b*, provided with square extremity *b'*, to prevent the shaft from turning in the brackets A', and the sheets of

maps, charts, display-cards, or illustrations *a a' a² a³*, attached to roller A, and supplemental roller D, caused to bear against the roller A by the spring *d*, substantially as and for the purposes specified.

7. The combination of the roller A and two or more sheets of maps, charts, display-cards, or illustrations suspended therefrom, each sheet being attached to the one immediately behind it, the last one being suspended from the roller, the sheets being so arranged that the lower end of each one is below the one immediately behind it, substantially as and for the purposes specified.

8. The combination of the rollers A and B' and two or more sheets of maps, charts, display-cards, or illustrations suspended from roller A, the sheets being so arranged that the lower end of each sheet is below the one immediately behind it, the rollers being provided with mechanism for compelling the outer roller to move with the inner roller in one direction and permitting the outer roller to rotate in the opposite direction, independently of the inner roller, substantially as and for the purposes specified.

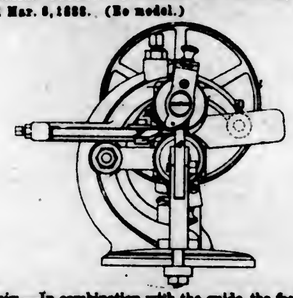


256,828. SEWING-MACHINE. JAMES L. BOX, Kutztown, Pa. Filed May 28, 1881. (No model.)

Claim.—1. The combination, in a sewing-machine, of the driving-shaft, the eccentric thereon, the arm *c*, the right-angle elbow-lever F, pivoted by one arm to the goose-neck E, and to which the arm *c* is pivoted, and the link G, connected to the needle-arm E and pivoted to the other arm of the elbow-lever, the relation of the parts being such that the distance from the needle-arm to its pivot on the elbow-lever and the distance from that pivot to the pivot of the elbow-lever on the goose-neck are equal, whereby the needle-arm and its bar are held substantially at rest for a moment when they are in their lowest positions, substantially as and for the purpose set forth.

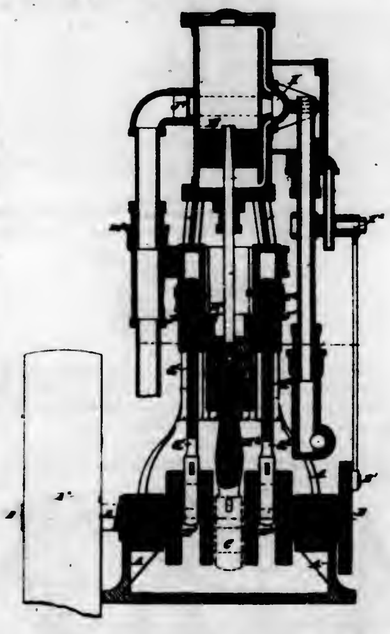
2. The combination, in a sewing-machine, of the shuttle-race H, cut away to form the enlargement N, in order to provide space for the loop, and also to admit of the removal of the shuttle without detaching its carrier, with the rotary shuttle-carrier I, formed with a beveled recess, and the shuttle M, adapted to fit into and be retained in the said beveled recess of the shuttle-carrier, substantially as described.

256,829. LEVER FOR STARTING AND MOVING CARS. ROBERT K. EVANS, Dover, Minn., assignor to himself and Richard Evans, Jr., same place. Filed Mar. 11, 1881. (No model.)



Claim.—1. The car-moving lever provided with a clutch on its end having rounded bearing-surfaces adapted to fit on the flange of the car-wheel, so that said clutch will slide freely thereon, except when force is applied to the end of the lever, substantially as specified.

2. The car-moving lever provided with clutch B, made in one piece and having bearing-point *b* and lip *b'*, made inclined toward each other at their base, as shown, to adapt the clutch to fit car-wheel flanges of different sizes, substantially as specified.



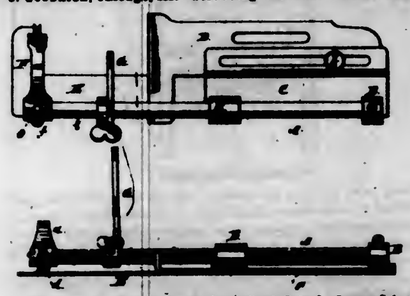
3. The car-moving lever A, provided with a clutch, B, having rounded bearing-surfaces *b* and *b'*, adapted to fit on the flange of the car-wheel, and having its plate or flat part extended, as shown at C, to prevent the lever turning or twisting, substantially as specified.

256,830. MACHINE FOR MAKING SHOE-HEEL BANDS. GREENLIEF FARNHAM and JAMES T. FARWELL, Lynn, Mass. Filed Mar. 8, 1882. (No model.)

Claim.—In combination with the guide, the feed-rollers, and the oblique splitting knife, the two edge beveling knives, as arranged to operate therewith, substantially in manner and for the purpose as explained.

256,831. STEAM-ENGINE. THOMAS F. FLINN, Flatbush, N. Y. Filed July 29, 1881. (No model.)

Claim.—1. In a steam-engine, the reciprocating cylinder J and links *G' G²*, made thin and light, in combination with the reciprocating piston E, made thick and solid, and with the heavy cross-head E' and heavy connecting-rod E², and with the triply-cranked shaft B C D' D², arranged to balance each other, as herein specified.



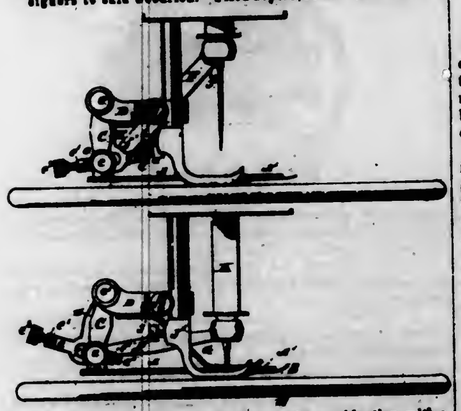
2. In an engine having a reciprocating piston working in a reciprocating cylinder, the pipe K' and its connections, arranged to perform the double functions of communicating the valve motion and forming a passage for the steam, as herein specified.

256,832. MANUFACTURE OF BAKING-POWDER. ADOLPH GIESECKE, Buffalo, N. Y. Filed Feb. 16, 1882. (No specimens.)

Claim.—1. The combination, substantially as specified, of phosphate of soda and muriatic acid, whereby a dry acid salt is produced, for the purposes described.

2. The combination of said acid salt with the usual or proper proportion of bicarbonate of soda, as and for the purposes specified.

256,833. TUCK-MARKER FOR SEWING-MACHINES. HARRY C. GOODRICH, Chicago, Ill. Filed Aug. 15, 1881. (No model.)



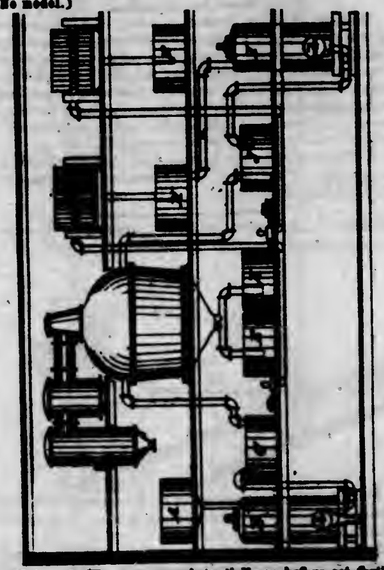
Claim.—1. In a tuck-marker adapted to be secured to the bed-plate of a sewing-machine, the combination of a rocking bar, a swinging or oscillating arm or lever attached thereto, an arched or curved spring connected with said rocking bar, a creasing-wheel carried by the free end of the spring, and a plate provided with a creasing-blade, said combination being and acting substantially as and for the purpose described.

2. In a tuck-marking device, the combination of the rocking bar, the swinging or oscillating arm or lever attached thereto, an arched or curved spring adjustably secured to the rocking bar, a creasing-wheel journaled at the outer or free end of said spring, and a plate provided with a creasing-blade, substantially as and for the purpose described.

3. In a tuck-marker, the combination of the rocking bar A, the arched or curved spring *a*, carrying a creasing-wheel at its outer end, and provided at its other end with a socket having a slot, *c*, the socket being secured to the rocking bar by a set-screw passing through said slot for adjusting the elevation of the creasing-roller, the plate C, provided with bearings B, supporting the rocking shaft, the arm or lever secured to the latter, and the plate R, provided with an arm, F, carrying a creasing-blade, *e*, substantially as described.

256,834. RUFFLING ATTACHMENT FOR SEWING-MACHINES. HARRY C. GOODRICH and RUSSEL S. DARROW, Chicago, Ill., assignors to said Goodrich. Filed Sept. 1, 1881. (Model.)

Claim.—1. In a ruffling attachment, the combination, with a support adapted to be attached to the presser-bar of a sewing-machine, of a reciprocating plate carrying a ruffling-blade, a suspended link connecting said reciprocating plate with said support, and devices connecting said link with the needle-bar, said devices being so constructed that the ruffle will be formed at the latter part of the descent of the said needle-bar, whereby a ruffle will be formed while the previously-formed ruffle is being sewed, substantially as described.



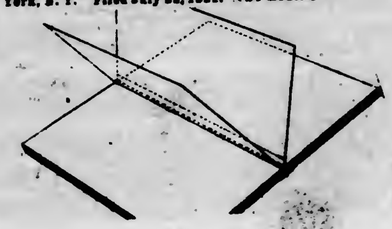
2. A reciprocating plate carrying a ruffling-blade, suspending-link C, and support D, in combination with the vibrating link E and arm or link F, for giving the plate a reciprocating movement to advance and return the blade, substantially as specified.

3. A reciprocating blade, A, carrying a ruffling-blade, and a suspending-link, C, and a support, D, in combination with the oscillating link E, set-screws *c'* and *c²*, and link or arm F, for reciprocating the plate A and adjusting its movements, substantially as specified.

4. A support, D, provided with a notch or recess, *d*, and a set-screw, *d'*, to receive the presser-foot bar and clamp the support thereon, in combination with the reciprocating plate A, carrying a ruffling-blade, links C and E, suspended from the support, and a link or arm, F, substantially as and for the purposes specified.

5. A reciprocating plate, A, carrying a ruffling-blade, B, and a guide-arm engaging the plate A, in combination with a link, C, the support D, link E, and arm or link F, substantially as specified.

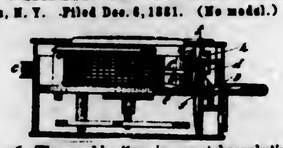
256,835. PROCESS OF AND MEANS FOR PURIFYING GLUCOSE. HARRY HAMLIN, Buffalo, N. Y. Filed Mar. 17, 1882. (No model.)



Claim.—1. The process, substantially as before set forth, of concentrating and purifying glucose, consisting of the concentration of the glucose liquor at two stages with both an intervening mechanical filtration and an intervening filtration through bone-black of the partly-concentrated liquor previous to the second stage of concentration.

2. The process, substantially as before set forth, of concentrating and purifying glucose, consisting of the concentration of the glucose liquor at two stages with an intervening mechanical filtration of the partly-concentrated liquor and an intervening filtration of it through bone-black, and with a mechanical filtration of the sirup after the second stage of concentration.

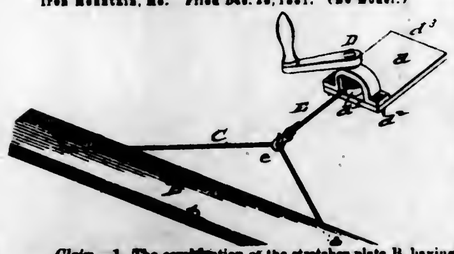
3. The combination, substantially as before set forth, of the vacuum-pan, the intervening mechanical filter, and the intervening bone-black filter, the whole constituting an apparatus for the concentration and purification of glucose liquor.



4. The combination, substantially as before set forth, of the vacuum-pan, the intervening mechanical filter, the intervening bone-black filter, and the terminal mechanical filter, the whole constituting an apparatus for the concentration and purification of glucose liquor.

256,836. WRITING-TABLET. FREDERICK S. HASBROUCK, New York, N. Y. Filed July 22, 1881. (No model.)

Claim.—A writing-tablet composed of detachable sheets of paper arranged in a number of sections which are hinged together, so that either of them may be used independently, and a blotter or blotters arranged between said sections and capable of being applied thereto, substantially as specified.

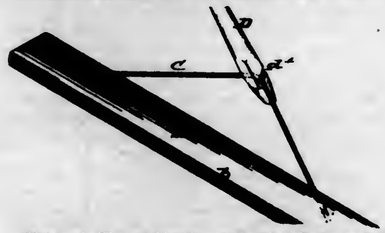


256,837. WATCHMAN'S TIME-DETECTOR. OTTO HAUSSNER, Brooklyn, N. Y. Filed Dec. 6, 1881. (No model.)

Claim.—1. The combination, in a watchman's time-detector, with a drum or carrier having a time-movement, a strip or piece of paper or other suitable material surrounding or facing the same, and a case the body of which is provided with a lock and the lid of which is provided with a hasp, of a perforating or marking device arranged within the body of the case adjacent to the lock, and adapted to be operated by said hasp in opening or closing the lid, substantially as and for the purpose specified.

2. The combination, in a watchman's time-detector, with the case and cover, of the spring *f*, pin *g*, and hasp *d*, substantially as and for the purpose specified.

256,838. CARPET-STRETCHER. WILLIAM E. HENDERSON, Iron Mountain, Mo. Filed Dec. 28, 1881. (No model.)



Claim.—1. The combination of the stretcher-plate B, having the teeth *b'*, the cord C, the crab D, and the cord E, substantially as described.

2. The combination of the plate B, teeth *b' b²*, the cords C E, and the crab D, substantially as described.

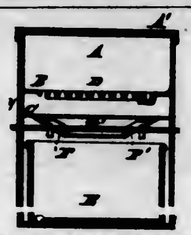
3. The combination of the plate B, teeth *b' b²*, the cords C E, and the crab D, having the teeth *d²* and the extended plate *d*, substantially as described.

256,839. CARPET-STRETCHER. WILLIAM E. HENDERSON, Iron Mountain, Mo. Filed Dec. 28, 1881. (No model.)

Claim.—1. The combination of the plate B, the teeth *b'*, the cord C, and the lever D, substantially as described.

2. The combination of the plate B, the teeth *b'* and *b²*, the cord C, and the lever D, substantially as described.

256,840. ASH SIFTER AND RECEPTACLE. JOHN HEDRICH and GEORGE SCHAEFER, Buffalo, N. Y. Filed Mar. 16, 1882. (No model.)



Claim.—1. In stoves, ranges, &c., having an ash-sifting device, an auxiliary-bottom for the ash-receptacle, substantially as and for the object specified.

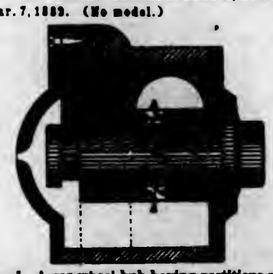
2. In stoves, ranges, &c., having an ash-sifting device, a drop-bottom for the ash-receptacle, substantially as stated.

3. A drop-bottom for an ash-receptacle, consisting of folding wings actuated by mechanism substantially as mentioned.

4. An ash-sifter having a suitable grating for separating the

256,840.

coarser from the finer particles, a drop-bottom below said grating actuated by mechanism substantially as described, and a receptacle for said separated particles below said drop-bottom, the whole being constructed for operation substantially as and for the object specified.



5. In ash-sifters, a drop-bottom constructed of wings forming a spout when in an unfolded position, as stated.

6. The combination, with the receptacle A, having the vibratory and oscillating grating D, of a drop-bottom for retaining the separated particles, said bottom being composed of four wings, F F G G', respectively, having curved ends matched together, as stated, and a device, substantially as specified, for holding the wings in a manner as and for the purpose stated.

7. In ash-sifters, the folding wings F F' G G', having curved ends *f g*, as stated, in combination with the rock-shaft H, having cams I, and a device, substantially as specified, for upholding said wings in a folded position, as mentioned.

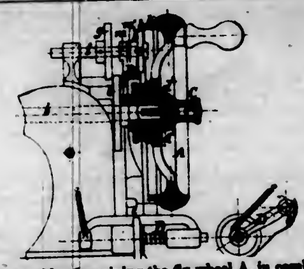
8. As an improved article of manufacture, an ash-sifter consisting essentially of a box-shaped receptacle, A, having inwardly projecting flanges B C, a vibratory or other proper separator, D an auxiliary bottom below said separator, consisting of folding wings, actuated and retained in position by devices substantially as specified, and a receptacle below said auxiliary drop-bottom for the reception of the separated particles, the whole being constructed and arranged for operation and use, as and for the purpose specified.

256,841. CAR-WHEEL. THOMAS E. KNAUSS, Holcomville, Ohio. Filed Mar. 7, 1882. (No model.)

Claim.—1. A car-wheel hub having partitions which extend lengthwise of the bearing and from the latter to the shell, and are provided with passages for the lubricant, and also having apertures between such partitions, all as set forth.

2. In a car-wheel hub provided with a lubricating-chamber, the apertures *b*, having their passage-way *l* smaller than their tops and bottoms, as set forth.

3. The hub having the offset and partitions, in combination with the plate having the lugs and the notch, and the axle having the groove, all as set forth.



256,842. DRIVING-GEAR FOR SEWING-MACHINES. FRANZ LEHMANN, Berlin, Germany. Filed Sept. 15, 1881. (No model.) Patented in Germany Nov. 19, 1880.

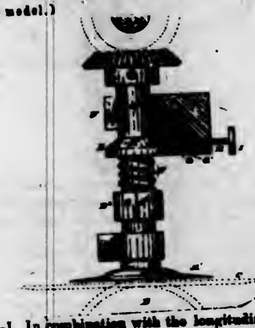
Claim.—1. In a sewing-machine, the fly-wheel A, mounted concentrically with the main shaft *b* on a bushing, *a*, fixed to a rigid part of the frame, in combination with said main shaft and said bushing, and with a clutch, C, carried on an extension of the main shaft and capable of being engaged with and disengaged from the pulley A, substantially as herein specified.

2. As a sewing-machine, the fly-wheel A, mounted concentrically with the main shaft *b*, but capable of turning independently thereof, in combination with said main shaft, with oscillating gearing between the two, means for engaging and disengaging such gearing, and with a clutch, C, substantially as and for the purposes herein specified.

3. As a sewing-machine attachment, the standard B, having

256,842.

a bushing, *a*, capable of receiving the fly-wheel A, in combination with the clutch C *a*, for connecting the fly-wheel and main shaft of the machine, substantially as herein specified.



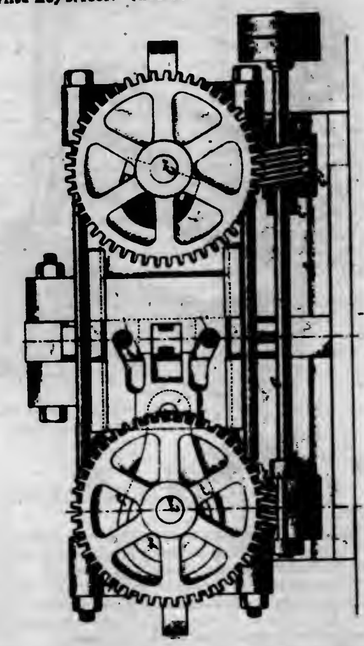
4. As a sewing-machine attachment, the standard B, having the bushing *a*, and a suitable bearing or bearings for a longitudinally-movable shaft carrying accelerating gearing, in combination with such shaft and gearing, and with a toothed circle, *h*, revolved by the fly-wheel, the gear-wheel *i*, and the clutch C, all arranged to serve relatively to each other and to the main shaft *b* of the machine, substantially as and for the purposes herein specified.

256,843. SPOON-BAIT FOR FISHING. WILLIAM T. J. LOWE, Buffalo, N. Y. Filed Feb. 28, 1882. (No model.) Patented in Canada Jan. 28, 1882.

Claim.—The combination, with the rod *a* and the spoon *d*, provided with the eye *d'*, of the spring *c*, having the spiral turn or turns *c'*, and the eye *c²*, the spring *c* being located near the top of the spoon and being rigidly attached to the spoon at one end, and working loosely upon the rod *a* at the other end, substantially as shown and described.

256,844. ADJUSTING DEVICE FOR LEATHER-SKIVING MACHINES. GEORGE H. LOCKLOW, Chicago, Ill. Filed Jan. 27, 1882. (No model.)

Claim.—1. In combination with the longitudinally-movable rotating cutter-shaft A in the machine described, a spring, F, arranged to raise the shaft, and a screw, H, suitably supported and arranged to bear downward thereon, substantially as and for the purposes set forth.



2. In a leather-skiving machine, the combination, with the shaft A, provided with a collar, E, and with the shaft-bearings D' D², of the spring F, interposed between the lower bearing and the collar, and an adjusting-screw fitted into a part of the upper bearing and arranged to bear downward upon said collar, substantially as described, and for the purposes set forth.

3. In combination with the longitudinally-movable cutter-shaft A, bearing a fixed collar, E, a part, *d'*, recessed at G', and provided with the sliding block G, and adjusting-screw H, arranged and operating substantially as described.

4. In combination with the vertically-movable shaft A, provided with the beveled collar E, and with a spring, F, to raise the shaft, a part, *d'*, provided with a beveled sliding block, G, and screw I, arranged and operating substantially as shown, and for the purpose set forth.

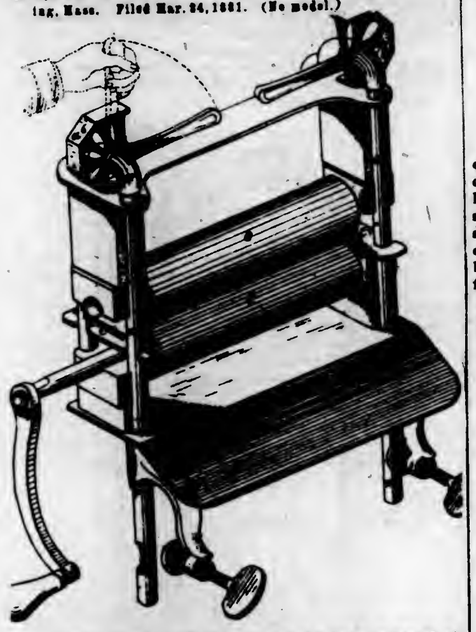
5. In the adjusting mechanism described for the cutter-shaft A, the screw H, provided with a notched thumb-wheel, I, combined with the spring J, arranged to engage the notches of said wheel, substantially as described.

256,845. NUT-MACHINE. JAMES P. MASON, Philadelphia, Pa., assignor of one-half to Thomas H. Moore, same place. Filed May 2, 1881. (Model.)

Claim.—1. In a nut-machine, a multiple shearing and punching device consisting of two series of dies arranged in separate die-cases, each of said series being composed of alternate cutting-off and punching dies placed side by side in said cases, and mechanism to actuate said series of dies reciprocally toward and from one another, substantially as set forth.

2. In a nut-machine, the combination of a series of alternate shearing and punching dies, a case or die-box, a backing-plate, and a clamping cap or cover, substantially as set forth.

3. In a nut-machine, the combination of a movable series of alternate shearing and punching dies and a stationary series of strippers for discharging the cut and punched nuts, said strippers being arranged in pairs on each side of and parallel to each of the punching-dies, substantially as set forth.



4. In a nut-machine, the combination of a frame, a head or carrier fitted to guides therein, a die-box secured removably in said head and carrying a series of alternate shearing and punching dies, and a driving-shaft by which reciprocating movement is imparted to the head or carrier, substantially as set forth.

5. In a nut-machine, the combination of a pair of heads or carriers, each provided with a series of alternate shearing and punching dies, a pair of grippers or clamping-jaws intermediate between the heads or carriers, and a pair of sliding frames having inclined slots receiving pins on the ends of the clamping-jaws, substantially as set forth.

6. In a nut-machine, the combination of a pair of reciprocating grippers or clamping-jaws and a discharger traversing intermittently over the face of one of said grippers, substantially as set forth.

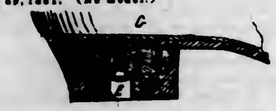
7. In a nut-machine, the combination, with a pair of heads or carriers, each provided with a removable die-case having secured within it a series of alternate shearing and punching dies, of mechanism by which said die-cases are actuated reciprocally toward and from one another, stationary stripper-plates for relieving the punching-dies, and a pair of grippers or clamping-jaws reciprocated between the heads and at right angles to their line of traverse, these members being combined for joint operation substantially in the manner and for the purposes set forth.

256,846. WRINGING-MACHINE. THOMAS J. MAYALL, Reading, Mass. Filed Mar. 24, 1881. (No model.)

Claim.—1. In a wringing-machine, the frame composed of two continuous tubular arches, between and by which all the parts of the machine are supported, substantially as described.

2. The combination of the tubular frame, movable top plate, through perforations in which pass the side pieces of said frame, cam-levers acting on said top plate, elastic blocks supported in said frame, and pressure-rolls, substantially as described.

3. In a wringing-machine, the combination, with the supporting-frame composed of two tubular arches, of a movable top plate, through holes in which pass the uprights of said frame, and by which the two portions of said frame are united, as set forth.

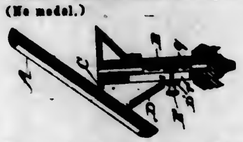


4. The tubular frame-pieces supporting between them the bearings for the rolls, and connected at the top by carved pieces which carry adjusting devices, substantially as described.

5. A wringing-machine comprising the following elements in combination: a tubular frame, a movable top plate, cam-levers supported by said frame and acting upon said plate, pressure-rolls, elastic blocks supported in said frame below said plate, and guards operating in connection with said rolls, all substantially as described.

256,847. SALVE. JOHN HAYES, Holly Springs, Miss. Filed Dec. 19, 1881. (No specimens.)

Claim.—The herein-described compositions of ingredients, consisting of red-oak bark, tobacco, lard, and beeswax, combined with rosin, in the proportions specified.



256,848. BOOT OR SHOE HEEL. EBI S. HOULTON, Chelsea, Mass., assignor to himself and JOHN B. TIERNAN, same place. Filed Aug. 29, 1881. (No model.)

Claim.—1. A boot or shoe heel composed of the inner part, C, adapted to be permanently secured to the sole, and the outer part, D, recessed to receive the inner part and entirely surround the sides and bottom of the same, substantially as described.

2. The combination, with the boot or shoe sole, of the heel composed of the inner part, C, permanently secured to the sole, the outer part, D, formed with a recess which receives the said inner part, the outer part fitting and inclosing the sides and bottom of the inner part and being secured by a screw, G, substantially as described.

256,849. TABLE. OLOF HILSTON, Chicago, Ill. Filed Oct. 31, 1881. (No model.)

Claim.—The combination of the pedestal B, having a slot, *r*, expanded toward its inner end, bar *q* within the expanded portion of the slot, and adapted to slide up and down therein, table-top A, hinged to the pedestal B on the same side as the slot *r*, jointed support D D′, hinged to the under side of the table-top on the same side as the slot *r*, and set-screw E, passing through the lower end of said support and also into the slot *r* and through the sliding bar *q*, whereby the table-top may be adjusted to any angle and firmly secured there, substantially as described.

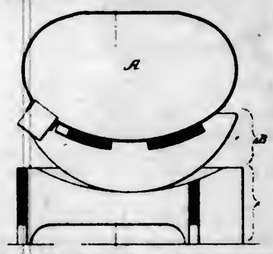
256,850. DENTAL MALLET. JOHN B. ODELL, Chicago, Ill. Filed Dec. 13, 1881. (No model.)

Claim.—1. The combination, with an electro-magnet having hollow cores arranged axially with each other, of the mallet-stem mounted in said hollow cores and the bent armature secured to said mallet-stem for actuating the same, substantially as specified.

2. The combination, with an electro-magnet having fixed hollow cores arranged axially with each other and connected by a heel-plate, of a movable non-magnetic mallet-stem mounted in said hollow cores and an armature secured to said mallet-stem for actuating the same, substantially as specified.

3. The combination, with an electro-magnet having fixed cores arranged axially with each other, of a bent reciprocating armature secured to a reciprocating mallet-stem, substantially as specified.

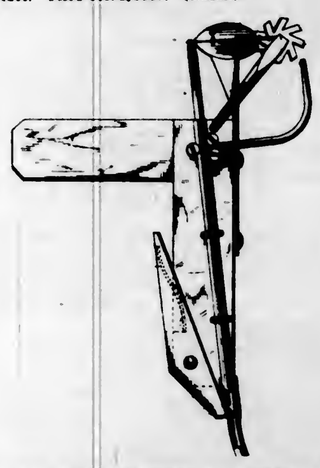
4. The combination of the mallet and mallet-stem, spring for retracting the same, an electro-magnet having hollow cores arranged axially with each other, shell inclosing said magnet, coil-heads, spring-contact, circuit-breaker provided with stop and adjustable collar, and an arm secured to the armature for actuating the circuit-breaker, substantially as specified.



5. The combination, with an electro-magnet, of the mallet and mallet-stem, spring for retracting the same, adjustable stop to limit its upward motion, spring-contact, and circuit-breaker provided with stop and adjustable collar, and arm secured to the armature for actuating said circuit-breaker, substantially as specified.

6. The combination, with the handle K, provided with rough-ened exterior surface, of the finger-rest mounted on an adjustable conical split threaded sleeve and conical threaded nut for securing said sleeve in position on the handle K, substantially as specified.

7. The combination of handle K, provided with bent slot *f*, hollow head H, ferrule J, provided with pin *f*′, and mallet provided with slot *j*, substantially as specified.



8. The combination of shell A and the handle K, provided with an adjustable finger-rest, with the mallet-stem and spring for retracting the same, an electro-magnet having cores arranged axially with each other inclosed within said shell A, mechanism for breaking the circuit by movement of the mallet-stem, and a sliding ferrule, J, mounted on said handle K and connected with the mallet-stem, whereby the circuit may be broken at the will of the operator, substantially as specified.

256,851. OVEN. BENJAMIN H. OVERMEYER, Orwell, Vt. Filed Nov. 16, 1880. (No model.)

Claim.—The combination of the vessel A, free from internal agitating devices, and having a rounded bottom and curved ends of less radius than the bottom, with rockers B, and a base having ways made on a curve less abrupt than the curve of the rockers, as set forth.

256,852. PAINT-DISTRIBUTER. ARNER PERLEE, Fort Dodge, Iowa, assignor to Liberty Walkup and Charles Walkup, same place. Filed Oct. 4, 1881. (Model.)

Claim.—1. The combination, with a reciprocating needle arranged and adapted to feed a quantity of liquid pigment to its point at every stroke, of devices for projecting a jet of air against the needle and atomizing the liquid pigment, substantially as set forth.

2. The combination, with a reciprocating needle and a grooved or trough-shaped liquid-pigment receptacle, of devices for projecting a jet of air against the point of the needle and atomizing the liquid pigment, substantially as set forth.

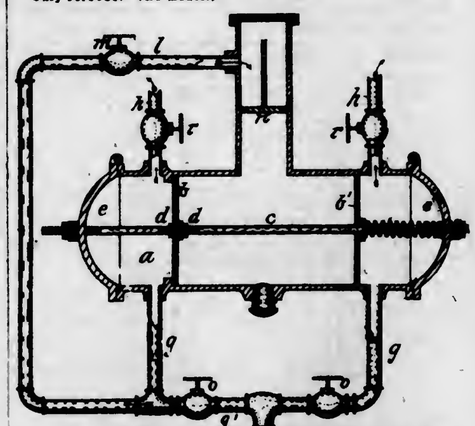
3. The combination, with a reciprocating needle and a liquid-pigment receptacle, of an air-jet tube arranged at right angles to the point of the needle, and apparatus for projecting a jet of air against the needle-point, substantially as set forth.

4. The combination, with a liquid-pigment receptacle, of a fan and a needle connected with the fan and adapted to be reciprocated thereby, substantially as set forth.

5. The combination, with a liquid-pigment receptacle, a fan, and a needle connected therewith, of devices to project a jet of air both upon the fan and upon the needle, substantially as set forth.

6. The combination, with a liquid-pigment receptacle, of a fan, a needle adapted to be reciprocated in the receptacle by attachment to the fan at a point near the axis thereof, and devices to project a jet of air both upon the point of the needle and upon the periphery of the fan, substantially as set forth.

The combination, with a reciprocating needle, a pigment-receptacle, and a fan, of a supply-pipe branching at its upper end into two pipes, respectively, adapted to project a jet of air upon the fan and the point of the needle, substantially as set forth.



8. The combination, with a reciprocating needle, a pigment-receptacle, and a fan, of a supply-pipe adapted to convey jets of air upon the fan and needle, and a valve adapted to regulate the passage of air through the supply-pipe, substantially as set forth.

9. The combination, with a reciprocating needle, a pigment-receptacle, and a fan, of a supply-pipe for carrying air-jets to the fan and needle, a flexible pipe attached to the lower end of the supply-pipe and communicating therewith through an aperture in the side thereof, and a spring-pressed plate adapted to compress the flexible pipe, substantially as set forth.

10. The combination, with a reciprocating needle, a pigment-receptacle, and a fan, of a supply-pipe adapted to convey compressed air to the fan and needle, and an air-pump in connection with said supply-pipe, substantially as set forth.

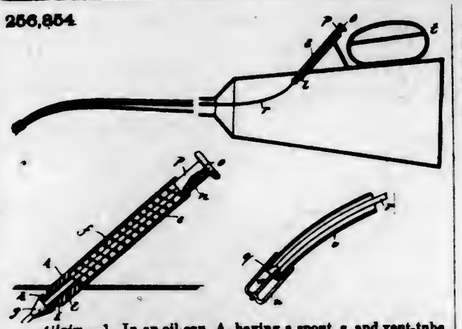
11. The combination, with a reciprocating needle, a pigment-receptacle, and a fan, of a supply-pipe adapted to convey compressed air to the fan and needle, an air-chamber connected with said pipe, and an air-pump for forcing air into the said chamber, substantially as set forth.

256,853. FILTER. WILLIAM A. PITT, New York, N. Y. Filed July 16, 1881. (No model.)

Claim.—1. The combination, with a filtering-vessel, of automatically-operating devices for compressing the filtering material laterally and vertically, substantially in the manner and for the purpose set forth.

2. The combination, with the filtering-chamber of a filter, of a pipe connected with such chamber and a loose plunger arranged therein and operated by means of a head of water, substantially as and for the purpose specified.

3. The combination of the filter *a*, stand-pipe *k*, provided with the hand-hole *e*, plunger *n*, pipe *l*, and valve *m*, all arranged and operating in the manner and for the purpose set forth.

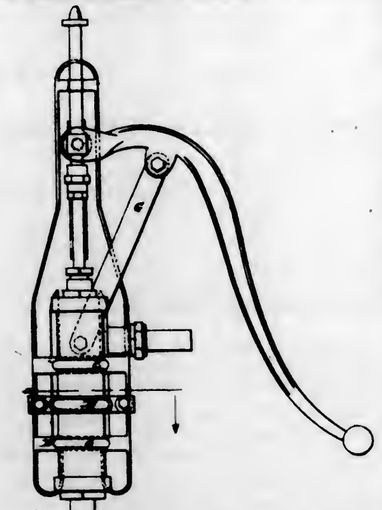


4. The combination of the vessel *a*, rod *c*, adjustable diaphragm *b*′, and spring *j*, arranged on said rod, and operating in the manner set forth.

5. The combination, with the vessel *a*, provided with covers *e e*, rod *c*, and diaphragms *b b*′, of the supply-pipes *g g* and discharge-pipes *h h*, arranged in the side of the vessel and between the said diaphragms and covers, substantially as and for the purpose set forth.

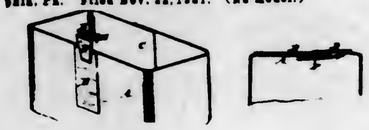
6. The combination, with a filter, of an automatic-working pressure-plate and plunger, whereby both a lateral and vertical compression of the filtering material is effected, substantially as set forth.

256,854. OIL-CAN. ARTHUR W. PLUMB, Chicago, Ill. Filed July 14, 1881. (No model.)



256,854

Claim.—1. In an oil-can, A, having a spout, *c*, and vent-tube *e*, as shown, a rod, *r*, passing through said spout and vent-tube, and provided with two valves, one having for its seat the end of the spout and the other the inner end of the vent-tube, and provided also with a knob, *o*, at the outer end of the vent-tube, in combination with a spring, *f*, acting in opposition to pressure exerted on the knob, substantially as described.



2. The combination of the can A, having the spout *c* and handle *t*, vent-tube *e*, passing through said can on the same side as the handle and extending upward and backward, rod *r*, passing through said spout and vent-tube *e*, and provided with the valve *q* at the end of the spout, valve *h* at the inner end of the vent-tube, and cylinder *p*, having the knob *o* and groove *n*, and the spring *f*, surrounding said rod in the interior of the tube and confined between said cylinder *p* and a shoulder, *g*, near the lower end of said tube, substantially as described.

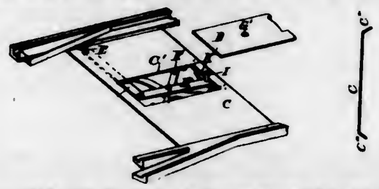
256,855. PUMP-FRAME. JAMES PRESTON, New York, N. Y., assignor of one-half to Samuel A. Burns and C. A Cook, same place. Filed June 20, 1881. (No model.)

Claim.—The handle fulcrum-rod G, pivoted at its lower end in the axial line of a turning pump-cylinder, and pivoted detachably to the pump-handle at the other end, whereby it will be in its true relative position to the handle, no matter to what extent the cylinder is turned.

256,856. BAG-FASTENER. WILLIAM B. PURVIS, Philadelphia, Pa. Filed Nov. 22, 1881. (No model.)

Claim.—The combination, with the bag A, provided with its seam C, of the paper or cloth slip B, secured on the edge of the bag and opposite the seam, and the metallic piece D, provided on its end with prongs, said piece being secured to the bag through the slip B, substantially as and for the purpose specified.

256,857. STOPPER FOR JARS, &c, HENRY W. PUTNAM, Bennington, Vt. Filed Feb. 10, 1882. (Model.)



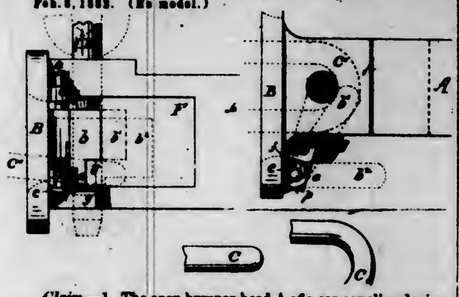
Claim.—1. The combination of the jar A, having shoulder *a*, with the neckband D, and with the sheet-metal ears F, that are doubled around and below the neckband, bent or curved inward against the body of the jar, and perforated below the neckband through its two thicknesses to receive the actuating-lever of the jar or bottle closing apparatus and the upward strain thereof, and that bear against the shoulder *a*, substantially as specified.

2. The combination, with a jar, of a fastening consisting of the eccentric lever E, straddling the jar and forming a handle at the side thereof, combined with the bail or yoke G, that is pivoted to it, and with horizontal supporting and suspending devices on the jar A, and with the cover, that is disconnected from said bail or yoke and from said pivoted lever, the proportions and arrangement of said elements being such that when the lever is raised against the vessel the yoke will hold the cover loosely in position, and when depressed will hold it tightly in position, substantially as herein shown and described.

3. The combination of a jar and its cover B, having recess or groove *g* on the raised part *h* of its top, with the springing bail or yoke and eccentric lever pivoted to the jar, all arranged and proportioned so as to allow the bail to hold the cover loosely when the lever is raised against the jar, and the cover to be taken off when said lever is so raised by springing the bail out of the groove or recess *g*, substantially as herein shown and described.

256,858. SWITCH FOR RAILWAYS. ORRIN A. REYNOLDS and JAMES A. SUPPENDORSON, Covington, Ky. Filed Feb. 16, 1882. (No model.)

Brief.—The coping for the switch-operating devices has its exposed side flanges turned down, and upon its under side is secured a spider, to which is pivoted a lever one end of which is actuated by a laterally-adjustable treadle upon the passing car, the other end being pivoted to a rod, to which is secured the switch-tongue.



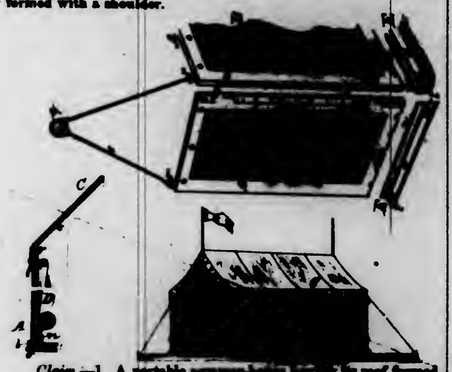
Claim.—1. In switches for street-railways, the coping C, extending from track to track, having a central opening, C', and lid D, and provided beneath said opening with the spider F, in combination with the laterally-vibrating lever H, having at one end an upwardly-projecting lug, I, and at the opposite end a connecting-rod attached to the shifting end of a rail, substantially as and for the purpose set forth.

2. In switches for street-railways, the coping having on its exposed sides the downwardly-turned flanges C', substantially as and for the purpose set forth.

3. In street-railways, the coping having the spider F, provided with the laterally-vibrating lever H, connected with the switching-rail B, the forward end of said lever having a lug projecting up through the coping, in combination with a car having a vertical shaft, O, as shown, provided with a forwardly-projecting arm, substantially as herein shown.

256,859. CAR-COUPLING. ALTAN BIRD, Rochester, N. Y., assignor of one-half to Stephen Wheeler, same place. Filed Feb. 8, 1882. (No model.)

Claim.—1. The open bumper-head A of a car-coupling device, provided with a projecting bumper-ring, B, and a gate, *b*, hung to said bumper-ring at the rear side thereof, and in such a manner that it may be swung into the opening F of the bumper-head, substantially as and for the purpose set forth.



2. The open bumper-head A of a car-coupling device, provided with a projecting bumper-ring, B, and a gate, *b*, hung at the rear side of said bumper-ring and in such a manner that it may be swung into the opening F of the bumper-head, as set forth, said gate when swung within the bumper-head being adapted to the double purpose of holding in position either the coupling-link or coupling-pin, as may be required.

3. In combination with the bumper-head A, having an opening, F, a link, C, and pin D, a gate, *b*, hung at one side of the head and so as to be swung into or out of the opening F, and capable of being moved vertically up or down upon its bearing or hinge, substantially as described, and for the purpose set forth.

4. In a car-coupling device, the gate *b*, provided with the downward-projecting part *c*, and hung to the rear side of the bumper-ring B, so as to be swung into the opening F of the bumper-head, said bumper-head being provided with the ledge *g*, projecting laterally from the lower plate thereof, and in position for the said part *c* of the gate to ride upon while the latter is being swung, as and for the purpose set forth, the said ledge *g* also forming, with the part *c*, a stop for the gate when the latter is swung out of the bumper-head, to prevent it being swung therein again until needed.

256,860. PORTABLE SUMMER-HOUSE. NEETA G. ROOT, Evanston, assignor of one-half to Charles F. Ward, Chicago, Ill. Filed Feb. 20, 1882. (No model.)

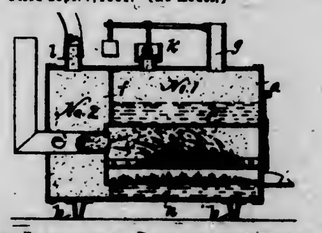
Brief.—The walls are formed of wire-screen sections removably connected together. A roof-covering is placed over rods connected together at their upper ends and to the screen-sections at their lower ends. Curtains winding upon rollers are placed inside the sections. The sections rest on beveled water-shedding bases formed with a shoulder.

Claim.—1. A portable summer-house having a roof formed of material adapted to exclude rain and its walls of sections of wire screening set in frames, provided with means for detachably connecting them together, substantially as described.

2. In a portable summer-house, the combination of the wire-screening A in frames B, said frames having devices at their edges for separably connecting them together to form the walls, a roof-frame formed of rods connected together at their upper ends and to the upper edges of the frames B at their lower ends, and a roof-covering, C, substantially as described.

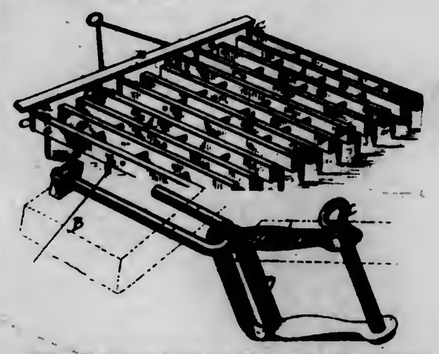
3. In a portable summer-house, the combination with the separable wire-screen wall-sections A B, of the curtains D, one upon each section, and adapted to be closed by drawing upward, substantially as described.

4. In a portable summer-house, the combination, with the separable wire-screen wall-sections A B, of the water-shedding bases E, each formed of the beveled horizontal side *e* and vertical strip *n*, substantially as described.



256,861. EYEGLASS-FRAME. FRIEDRICH A. BONORN, Elizabeth N. J. Filed Oct. 8, 1881. (No model.)

Claim.—1. As an improved article of manufacture, an eyeglass-frame made, substantially as herein shown and described, of hard rubber or some analogous material, and having its lens-frames and bow-spring adapted to press the lens-frames against the sides of the nose, made integral and of the same material, as set forth.

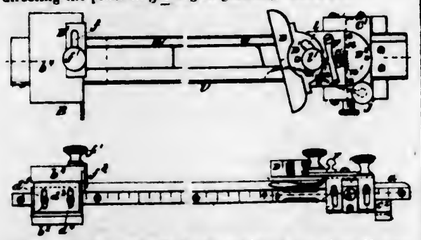


2. In an eyeglass, the combination, with the lens-frames A, made of some composition of matter—such as hard rubber or pyroxyline—of the bow-spring B, adapted to press the lens-frames against the sides of the nose, made integral with the frames and of the same material, substantially as herein shown and described, and for the purpose set forth.

256,862. STEAM-GENERATOR AND FEED-COOKER. WILLIAM W. SCOTT, Dakota, assignor of three-fourths to John H. Burgit, John Byrne, and A. B. Chauvet, Humboldt County, Iowa. Filed Sept. 7, 1881. (No model.)

Claim.—In a steam-generator, the reservoir No. 1, the superheating-chamber No. 2, the fire-chamber *c*, having a flue, *c'*, the perforated partition *f*, the water induction and ebullition tubes *g* and *h*, and the steam-eduction tube *l*, arranged and constructed substantially as shown and described, for the purpose specified.

256,863. HARROW. GEORGE SUPPERT, Moline, Ill. Filed Feb. 7, 1882. (No model.)



Claim.—1. The combination, with the independent harrow-frames arranged side by side, the transverse draft-bar arranged in advance of said frame, and the vertically-slotted couplings applied two between each harrow and the draft-bar.

2. In combination with the harrow-frame and draft-bar, the vertically-slotted clevis and the hook-shaped bolt having its rear end seated and covered, as shown, whereby the disengagement of the clevis is prevented.

3. The combination of the transverse draft-bar B, the harrow-frame A, connected thereto by two vertically-slotted couplings, each constructed substantially as shown, to permit motion between the parts in a vertical direction only.

256,864. ADJUSTABLE GAGE FOR PLANING. WILLIAM H. STINSON, Scandia, Kans. Filed Jan. 7, 1882. (No model.)

Brief.—Clamps having hinged top pieces capable of vertical adjustment hold the board to be gained upon the graduated base-piece. Upon one of these clamps is an angularly-adjustable guide for directing the plane in gaining or grooving the board.

Claim.—1. The guide B, having a hinged top piece, *b'*, provided with a hinge-plate capable of vertical adjustment, in combination with the base-piece A, substantially as and for the purpose set forth.

2. The guide B, combined with the base-piece A *a*, and having the adjustable clamp B', provided with a downward-projecting arm, *f*, substantially as and for the purpose set forth.

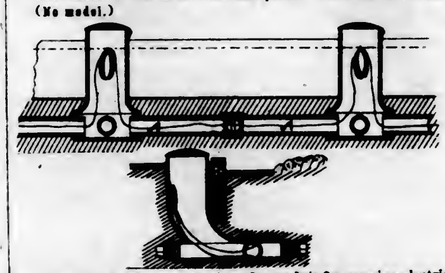
3. The guide having the adjustable clamp provided with a downward-projecting arm, and combined with a base-piece having the stop *a* at its rear side, substantially as described.

4. The sliding gage C, combined with a base-piece, A, and having the vertically-adjustable top piece, C', and an adjustable plane-guide, substantially as and for the purpose set forth.

5. The combination of the angularly-adjustable guide D, having its segmental plate D', provided in its convexity with a slot, with the toothed lever F, the adjustable and graduated leaf E, and graduated plate D^2, substantially as and for the purpose set forth.

6. The guide having the adjustable clamp provided with a vertical arm, the hinged top, the vertically-adjustable plates, one having a hook or catch, the gravity-locking latch or lever, and the plate having the downward-projecting flange, combined with a base-piece having a stop at its rear edge, substantially as and for the purpose set forth.

7. The sliding gage having the flanges resting upon its support, the holding-screw, the pointer or index, the clamp, the graduated and adjustable leaf, and graduated adjoining plate, the toothed lever, and the angularly-adjustable guide provided with a slotted plate, combined with the base-piece having a stop at its rear edge, and graduated face-plate, substantially as and for the purpose set forth.

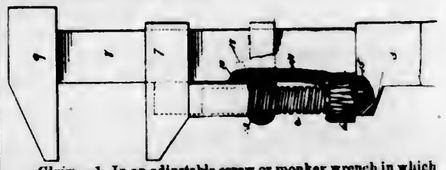


256,865. BLANKET-FASTENER. OSCAR SWEET, Boston, N. Y. Filed Mar. 3, 1882. (No model.)

Claim.—1. The combination, with a blanket, of a fastening device consisting essentially of a gravity-bolt supported in a bearing fastened to one edge of the blanket, the shank of said bolt being greater in width than in thickness, and a hook attached to the other edge of the blanket, said hook being provided with a transverse opening and having a narrow slot leading thereto, adapted to receive the shank of the bolt when presented edgewise and allow the bolt to enter the opening, substantially as set forth.

2. A fastening device for blankets, consisting essentially of a rotary bolt provided with a weighted arm, a bearing for supporting one end of the bolt, the said bolt being provided with a shank made flattened in cross-section and of greater width than thickness, and a hook provided with a narrow slot leading to a transverse opening, and adapted to receive and secure the flattened shank of the gravity-bolt, substantially as and for the purpose set forth.

256,866. DEVICE FOR UNDERGROUND ELECTRIC COMMUNICATION. H. FRANK TEAL, Philadelphia, Pa., assignor of two-thirds to Jno. E. Gowan, same place. Filed Jan. 27, 1882. (No model.)



Claim.—1. The combination of a conduit for carrying electric wires (said conduits being provided with service-nipples, as described) with working or access chambers extending to one side and upward, as described, whereby the conduit may be laid in the street and the openings of the working or access chambers be located in the sidewalk of the street, all as set forth.

2. The combination, with a conduit for carrying electric wires, of working or access chambers extending to one side and upward, as described, whereby the conduit may be laid in the street and the openings of the working or access chambers be located in the side walk of the street, as set forth.

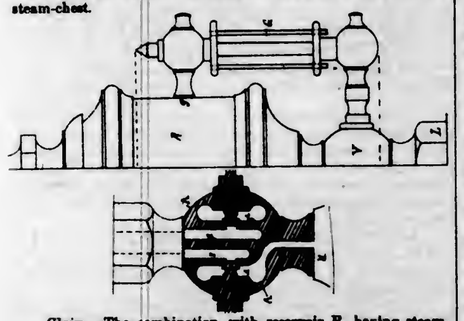
3. In combination with conduits for carrying electric wires, provided with service-nipples and working or access chambers, as described, permanent cords extending through the pipe from chamber to chamber, substantially as and for the purpose set forth.

256,867. WRENCH. JOHN THOMSEN, Brooklyn, N. Y. Filed Mar. 15, 1882. (No model.)

Claim.—1. In an adjustable screw or monkey wrench in which the movement of the sliding jaw is effected without changing the position of the hand during the rotation of the operating-screw, the combination of the semicircular nut, as 13, screw, as 6, slotted end bearing, as 15, and spring, as 11, for the purpose of permitting the depression and detachment of said screw from the movable jaw, whereby said jaw may be quickly slid or allowed to gravitate to any position on the shank, the screw being afterward used to lock the jaw, as in the ordinary manner.

2. In an adjustable screw or monkey wrench in which the movement of the sliding jaw is effected without changing the position of the hand during the rotation of the operating-screw, the combination, with the rigid jaw, as 9, shank, as 8, sliding jaw, as 7, semicircular nut, as 13, screw, as 6, and slotted end bearing, as 15, of a spring, as 11, for the purpose specified.

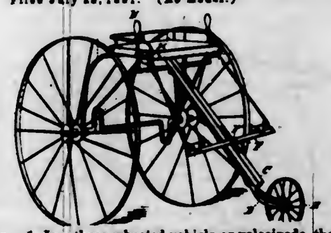
256,868. COMBINED FAUCET AND AUTOMATIC TOY. FORTUNATO C. HARETTI, Bryan, Tex. Filed Feb. 23, 1882. (No model.)



Claim.—1. A faucet constructed, as herein described, with a trough or gutter, in combination with an automatic figure operated by a paddle-wheel adapted to be actuated by the fluid passing through said trough or gutter, as set forth.

2. The combination, with the faucet A, having trough C, of the funnel or spout K, having flange L, as set forth.

3. The combination of the faucet A, having trough C, the bracket E, paddle-wheel H, shaft G, automaton I, and the funnel or spout K, having flange L, substantially as and for the purpose set forth.

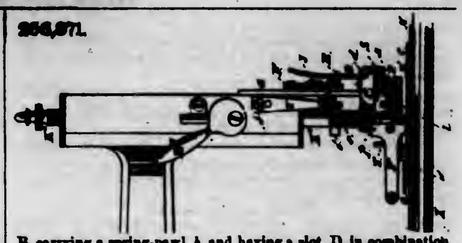


256,869. LUBRICATOR. LUTHER B. BAILEY, London, Ontario, Canada. Filed Aug. 10, 1881. (No model.)

Brief.—By opening the valve O' the steam enters and forces the lubricant out of the cup at side down through glass tube into the valve-chamber and delivers the lubricant at the back of the valve O, which regulates the supply of lubricant passing into the steam-chest.

Claim.—The combination, with reservoir E, having steam-passage *r* at bottom and oil-outlet *g* at top, of valve-chamber V, having communication with said reservoir at bottom through the valve-passage *r s* and at top through the outlet *g*, glass tube G, and valved passage *r' s'*, as set forth.

256,870. VELOCIPEDE. WALTER O. BECKWITH, Norwalk, Ohio. Filed July 28, 1881. (No model.)



Claim.—1. In a three-wheeled vehicle or velocipede, the combination, with a double-crank axle and the leg connecting the front or caster wheel and the seat, of an adjustable oscillating foot-rest and straps, or equivalent means, connecting the cranks and the outer ends of said foot-rest, substantially as set forth.

2. In a velocipede, the combination, with the leg C, of the centrally-pivoted rest F, constructed and arranged substantially as described, to be vertically adjusted, substantially as set forth.

3. In a three-wheeled velocipede, the combination of a caster-wheel, E, having its shank pivoted to the leg C, the crank D', and suitable mechanism for moving said crank, substantially as and for the purposes shown.

4. In a velocipede adapted to be driven by the feet, the combination, with a leg supported by a caster-wheel, of a bar adjustably attached to the leg, substantially as and for the purposes shown.

256,871. UPPER-FEED AND BUTTON-HOLE ATTACHMENT FOR SEWING-MACHINES. JOHN W. BLODGETT, Chicago, Ill. Filed Mar. 18, 1880. (Model.)

Claim.—1. The feed-wheel A, having ratchet-teeth *a* and lever B, carrying the pawl *b*, in combination with the swinging plate F, operated by the needle-bar for oscillating the lever or arm B, substantially as and for the purposes specified.

2. The feed-wheel A, having ratchet-teeth *a*, and lever or arm B, carrying a spring-pawl, *b*, and having a slot, D, in combination with the swinging plate F, carrying a pin, E, and operated from the needle-bar, substantially as and for the purposes specified.

3. The feed-wheel A, having ratchet-teeth *a*, and lever or arm B, carrying a spring-pawl, *b*, and having a slot, D, in combination with the swinging plate F, carrying a pin, E, and a projecting arm, J, substantially as and for the purposes specified.

4. The feed-wheel A, having ratchet-teeth *a*, and lever or arm B, carrying the spring-pawl *b*, and having a slot, D, in combination with the swinging plate F, carrying the pin E, and having an arm or lever, J, to engage the needle-bar, and a pin or arm, H, to engage a return spring, substantially as and for the purposes specified.

5. The feed-wheel A, having ratchet-teeth *a*, and arm or lever B, carrying a spring-pawl, *b*, and having a slot, D, in combination with the plate F, pin E, arm or lever J, pin or arm H, and spring I, substantially as and for the purposes specified.

6. The feed-wheel A, having ratchet-teeth *a*, and lever or arm B, carrying a spring-pawl, *b*, and having a slot, D, in combination with the spring-stop *d e*, plate F, pin E, arm or lever J, pin or arm H, and spring I, substantially as and for the purposes specified.

7. The support C, secured to the presser-bar, and having a spindle, A, carrying the feed-wheel and its actuating-lever, in combination with the bar G, for steadying the support, substantially as specified.

8. The feed-wheel A and a mechanism for driving the same from the needle-bar, in combination with the cogged wheel S, cogged segment R, and plates O P, for giving the plates a half-revolution, substantially as and for the purposes specified.

9. The feed-wheel A and a mechanism for driving the same from the needle-bar, in combination with the pinion *m* and racks *n* and plates O P, for giving the plates a direct travel, substantially as and for the purposes specified.

10. The feed-wheel A and a mechanism for driving the same from the needle-bar, in combination with the cog-wheel S, cog-segment R, pinion *m*, racks *n*, and plates O P, for automatically operating the plates to work the button-holes, substantially as specified.

11. The combination, with the needle and the presser bars, of the ratchet feed-wheel supported by an attachment to the presser-bar and adapted to be raised and lowered by the same, the slotted vibratory lever carrying a spring-pawl arranged to engage the feed-wheel, and the pivoted oscillatory plate adapted to operate the slotted lever, and provided with an arm independent of the needle-bar, but arranged to be acted upon at a certain moment by a device upon the said needle-bar, substantially as described.

12. In a button-hole attachment consisting of a bed-plate, N, carrying-plate O, and clamping-plate P, the handle P', having notches or teeth *c*, for holding the material, substantially as specified.

13. The combination, with bed-plate N, of the carrying-plate O, the clamping-plate P, secured at one end to the carrying-plate, the spring arranged upon a rod secured to the carrying-plate and passing up through the free end of the clamping-plate, and the lever P'', adapted to raise the free end of the clamping-plate against spring-pressure, substantially as described.

14. The combination, in a button-hole attachment, of the carrying-plate with the bed-plate having the guard-bar Q, adapted to hold the carrying-plate down upon the said bed-plate, and to constitute at each of its ends a stop that will limit the revolution of the carrying-plate, the said carrying-plate being provided with parallel slots which, in connection with stops formed by the bar Q, serve to govern the movements of the carrying-plate in a right line to the extent required in stitching a button-hole, substantially in the manner shown and described.

15. The combination, with the bed-plate N and the circular carrying-plate formed with two parallel slots, *w*, of the guard-bar Q, secured to said bed-plate and adapted to hold down the carrying-plate, the ends of said bar forming stops *w'*, to limit the right-line movement of said carrying-plate, substantially as herein shown, and for the purpose specified.

256,872. METHOD OF TREATING PULP AND THE RESULTANT MATERIAL. FRANCIS BOSTON, Plymouth, assignor to H. D. Harter, Mansfield, Ohio. Filed Dec. 12, 1881. (No specimens.)

Claim.—1. Pulp made from wood or other suitable material and saturated with oil, for the purpose and substantially as described.

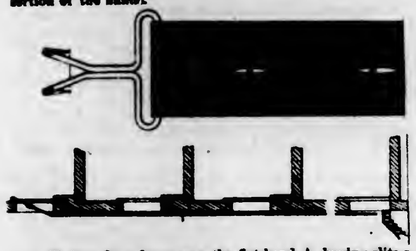
2. A material composed of pulp made from wood or other suitable material saturated with a drying-oil, and rolled, pressed, or molded into the desired form for use.

3. A material for roofing, paneling, and other purposes, composed of pulp saturated with oil, in combination with coloring material for giving any desired color or shade to said material when reduced to the required form for use.

256,873. FAUCET. ULRICH BORRER, New York, N. Y. Filed July 28, 1881. (No model.)

Claim.—1. The combination, in a faucet, of the wooden barrel, the tapering metal seat screwed into the wood, and an elastic valve closing against the seat, substantially as set forth.

2. The combination, in a faucet, of a wooden barrel and a metal delivery-tube, *c*, screwed into the wood and the inner end spread outwardly, substantially as set forth.

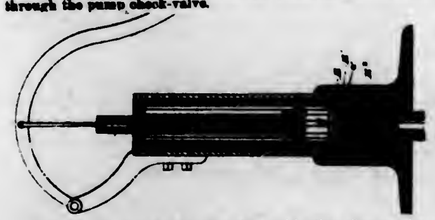


3. The combination, in a faucet, of a wooden barrel, a tapering metal plug having a tinned surface, and a handle, a washer, *o*, and attaching screws to connect the washer to the plug, substantially as set forth.

4. The combination, in a faucet, of a wooden barrel, a tapering metal plug and handle, a disk, *o*, an elastic valve, a valve-stem, and a screw connecting the disk and plug, substantially as set forth.

5. In a faucet, the combination of a wooden barrel, a tapering metal valve-seat screwed into the wooden barrel, a metal plug and handle, an elastic valve, a metal valve-stem, and an eccentric connection between the valve-stem and plug, substantially as set forth.

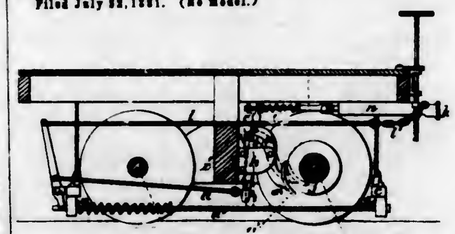
256,874. FIRE-ESCAPE. NICHOLAS H. BOROFSKY, New York, N. Y. Filed Jan. 25, 1882. (No model.)



Brief.—Slits are formed in the flat webbing-band for the insertion of the hands.

Claim.—In a fire-escape, the flat band A, having slits *a*, substantially as and for the purpose herein shown and described.

256,875. CHECK-VALVE. ADELBERT H. BRAINARD, Chicago, Ill. Filed Oct. 5, 1881. (No model.)



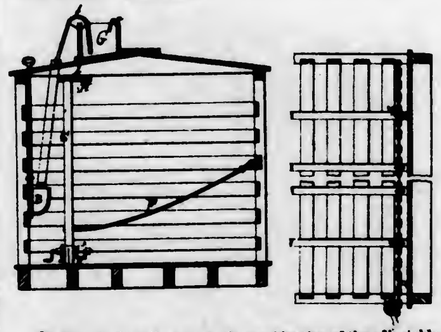
Brief.—The valve is intended for air-pumps, and the improvement is designed better to prevent the escape or passage of air through the pump check-valve.

Claim.—1. In a check-valve, the combination of an apertured seating-plate, E, a flexible flap, E', and a spring, E², together arranged to bear around the aperture, and operating substantially as described, and for the purposes set forth.

2. In a check-valve, the combination of a seating-plate, E, having its aperture *e* surrounded with a boss, *e'*, a flexible flap, E', and a spring, E², arranged to bear all around the boss, substantially as and for the purposes set forth.

256,876. CAR-BRAKE. JESSE H. BURKE, Los Angeles, Cal. Filed July 22, 1881. (No model.)

Claim.—1. The upright lever *i*, connected at its upper end with the draw-head and at its lower end with the brake-lever Y, and at some convenient point hung or pivoted to the short lever *a*.



2. The short lever *a*, hung in the bearing A, with its upper end attached to the lever *i* and its lower end provided with a brake-shoe to operate against a wheel or cylinder on the axle, for the purpose set forth.

3. The hollow wheel *j*, provided on its inner surface with teeth or cogs, together with the toothed quadrant-arms f^2 f^3, the spiral springs a^2, and the sleeve a', arranged on the axle of a car and operating together, for the purpose set forth.

4. A wheel or cylinder moving upon the axle of a car in the direction of its length by means of centrifugal force acting on arms f^2 f^3, said cylinder furnishing when the car is in motion a bearing for the shoe of a brake-lever; a^2.

5. The combination of the brake-lever *i*, the auxiliary lever *a* and the wheel *j*, for the purpose set forth.

256,877. STOCK-CAR. JAMES B. CALKINS, Pacific, Mo. Filed Nov. 2, 1881. (No model.)

Claim.—1. In railway-cars, the combination of the adjustable cattle-fastenings C, provided with hooks *c*, bolts *d*, the plank H, having mortises *e*, the chain D, and the ropes F, arranged to secure and separate the cattle in the manner set forth.

2. In a railway-car arranged for transporting cattle, the food and water receiving tub G, placed upon the top of car, in combination with the siphon-tube *f*, long flexible hose *g*, and trough B, arranged to supply the cattle in the manner set forth.

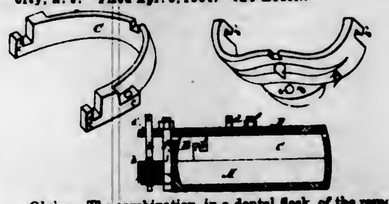
256,878. FEED MECHANISM FOR ROLLER-MILLS. CHARLES B. CAMPBELL, Buffalo, N. Y., assignor to John T. Noye Manufacturing Company, same place. Filed Feb. 20, 1882. (No model.)

Claim.—1. The combination, with the feed-slide C, of a pivot, *f*, a spring, *i*, connected with the pivot, and means whereby the tension of the spring can be regulated, substantially as set forth.

2. The combination, with the feed-slide C and its pivot *f*, of a sleeve, H, spring *i*, cap J, and means whereby the cap J can be secured in different positions on the sleeve H to regulate the tension of the spring, substantially as set forth.

3. The combination, with the feed-slide C and its pivot *f*, of

256,878.



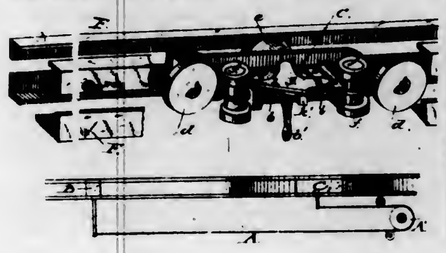
the spring *i*, sleeve H, provided with teeth *h*, and cap J, provided with teeth *l*, substantially as set forth.

4. The combination, with the feed-slide C and its pivot *f*, of the sleeve H, cap J, spring *i*, bolt *m*, and head L, substantially as set forth.

5. The combination, with the feed-hopper A and feed-roller B, of the feed-slide C, provided with suitable pivots, a spring, *i*, surrounding one of the pivots and attached with its ends, respectively, to the pivot and to a stationary part of the machine, and mechanism whereby the feed-slide is opened against the pressure of the spring, substantially as set forth.

256,879. DENTAL FLASK. MARVIN H. CARPENTER, Jersey City, N. J. Filed Apr. 8, 1881. (No model.)

Claim.—The combination, in a dental flask, of the removable front piece, B, with section C, both in conjunction with section A, the cap D, and the screw-rods *d d d*, the whole substantially as set forth, and for the purpose specified.



256,880. BARBED FENCE-WIRE. GEORGE CASE, De Kalb, Ill., assignor to Lolile E. Sunderland, same place. Filed Jan. 3, 1882. (No model.)

Claim.—The combination and arrangement, substantially as shown and described, of the upright perforated plate D, barb C, and fence-wire B, as and for the purpose set forth.

256,881. UNDERGROUND CABLE-WAY. HENRY CARROLL, San Francisco, Cal. Filed Jan. 17, 1882. (No model.)

Brief.—A conducting-carriage travels within the tunnel on angle-iron ways supported by brackets, consisting of double and single curved bars. The carriage is provided with rollers and a downwardly-projecting arm, to which is secured a rope, by which it is connected to a supplemental carriage. The first-named carriage has a pivoted latch, which automatically engages and disengages with a socket in the grip. The supplemental carriage consists of a vertical body provided with a gravity-latch to engage and disengage with the grip, and at its ends with V-shaped angle-irons, and is adapted to travel in V-shaped angle-iron ways secured to yokes placed at suitable distances apart in the tunnel.

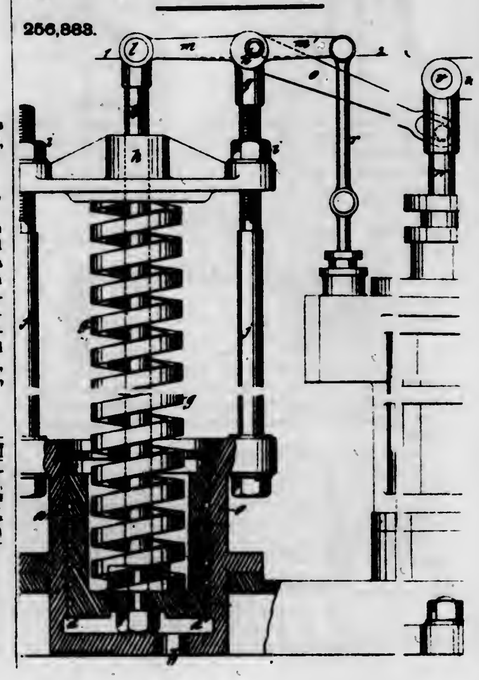
Claim.—1. In a device for turning curves of endless cable-ways, the combination, in one tunnel, of a main grip-conveying carriage, a supplemental returning-carriage, and a connecting-rope, substantially as and for the purpose described.

2. The carriage C, provided with the rollers *d*, *d*, *e*, and *f*, and a spring-latch carrying a diagonal bar or rod, *l*, in combination with the angle-iron ways F and stud *m*, substantially as and for the purpose set forth.

3. The latch *g*, made from a flat blank, with its engaging end struck down at *h'*, and provided with trunnions or pivots *i i*, in combination with the plate G of the carriage and spring *h'*, all constructed and arranged as described.

4. In combination with the carriage-ways F, the bracket consisting of the double-curved bars D and the single intervening curved bar D', for the purpose specified.

5. The supplemental or returning carriage consisting of the body *k*, provided at its ends with V-shaped angle-iron sockets and the latch O near its center, in combination with the bars P and the V-shaped angle-iron ways R R, for the purpose set forth.



6. The gravity-latch O, made of a metal plate, having projections bent downward at o^1 o^2 and pivoted to the carriage, for the purpose specified.

256,882. HEATING-DRUM. CHARLES H. CHAPMAN, Joplin, Mo. Filed Sept. 15, 1881. (No model.)

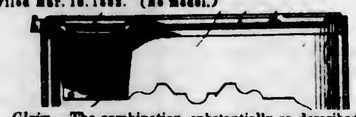
Claim.—The heating-drum herein shown and described, the same consisting of the exterior cylinder or casing, E, having flanges F, inside drum, D, cone I, having flange J, central pipe, L, and tangential fines K and H, connecting the annular chamber between casing E and drum D with, respectively, pipe L and cone I, the whole constructed and combined as specified, for the purpose set forth.

256,883.

256,883. SAFETY-VALVE APPARATUS FOR STEAM-BOILERS. JAMES DIXON CHURCHILL, Upper Holloway, County of Middlesex, England. Filed Feb. 14, 1881. (Model.) Patented in England July 1, 1880.

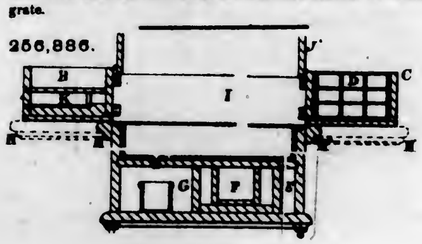
Claim.—1. In safety-valve apparatus for steam-boilers wherein the safety-valve is connected to and controlled by a piston working in a cylinder, admission and emission of actuating-fluid to and from which are regulated by a slide or valve, the combination, with such slide or valve, of a piston or its equivalent in direct communication with the interior of the boiler, said piston or its equivalent being loaded by an adjustable spring adjusted by the nuts *i i*, or their equivalents, and connected to said slide or valve, substantially as herein specified.

2. In safety-valve apparatus for steam-boilers wherein the safety-valve is connected to and controlled by a piston working in a cylinder, admission and emission of actuating-fluid to and from which are regulated by a slide or valve operated through a lever, *m m'*, by a piston or its equivalent actuated by the pressure in the boiler, the combination, with said lever *m m'*, of an arm or lever, *o*, and a pin or projection, *n*, fixed to said arm or lever *o* in a position eccentric to its own fulcrum, said pin or projection *n* serving as the fulcrum of the lever *m m'*, substantially as hereinbefore described, and for the purposes specified.



3. In a safety-valve apparatus for steam-boilers, the combination of a cylinder, *t*, containing a piston whose rod *r* is connected to the lever *u* of the safety-valve, a slide or valve working in steam-chest *v*, a rod, *r*, a lever, *m m'*, to which said rod *r* is connected, an arm or lever, *o*, connected to piston-rod *w*, an eccentric fulcrum pin or projection, *n*, on which said lever *m m'* is mounted, a rod, *k*, connected to said lever *m m'*, and a piston, *e*, working in a cylinder, *a*, and loaded by a spring, *g*, adjustable by a cross-head, *h*, nuts *i*, and rods *j*, all substantially as and for the purposes hereinbefore described.

256,884. FENCE-POST. WILLIAM CLINE, Plainfield, Ind. Filed Feb. 4, 1882. (No model.)



Claim.—A fence-post consisting of the side pieces, A B, cut away at their upper ends, as shown at *c*, and joined together, the cross-braces *a b* and upright C, connected together as described, said upright extending below the ends of the side pieces, and the shoulders *d* and end of the upright projecting above the cross-brace *a*, substantially as and for the purpose set forth.

256,885. RANGE. JAMES H. CODDING, North Dighton, Mass. Filed Mar. 16, 1882. (No model.)

Claim.—The combination, substantially as described, of the cabinet-base of a range, the detachable plate or frame supported thereby and carrying the sifting-grate, and the independent ash-box attached to the base within the same and beneath the sifting-grate.

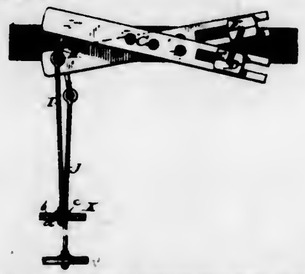
256,886.

256,886. CABINET BATHING-TUB. EUGENE F. COLLINS, Auburn, Me. Filed July 27, 1881. (Model.)

Claim.—The cabinet bathing-tub herein described, in combination with the removable wash-stand B, with shelf K, removable box C, with its cover J', the removable basket D, the compartments E F G, the supports H H', all arranged and constructed as herein set forth.

256,887. SHIRT. FREDERICK A. DIETRICH, Freeport, Ill. Filed Oct. 7, 1881. (No model.)

Claim.—The shirt A, in combination with an attached strap, B, and removable loop C, located on the top of the shoulder, all constructed and arranged to operate substantially as and for the purpose set forth.



256,888. COMBINED CORSET AND ABDOMINAL AND SKIRT SUPPORTER. FREDERICK A. DIETRICH, Freeport, Ill. Filed Oct. 7, 1881. (No model.)

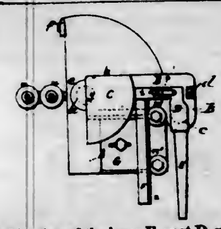
Claim.—In combination with the corset A, having the busks *a a*, the roll C, buckle E, webbing D, plate B, and elastic strap F, all constructed substantially as and for the purpose set forth.

256,889. PUMP. ALONZO JOSLYN EDWARDS, Dayton, Wis. Filed Dec. 1, 1881. (No model.)

Brief.—A wind-wheel may be attached to G. The fulcrum-pin C may be shifted.

Claim.—1. The pump attachment for windmills, consisting of the two slotted levers, the double-crank shaft operating directly upon said levers, and the two pump-rods provided with pistons, one rod passing through the piston of the other rod, as shown.

2. The combination of the two pump rods and pistons, as described, the levers, the double-crank shaft, and the lever-fulcrums adjustable lengthwise with regard to the levers, substantially as shown, whereby the stroke of the pistons may be varied and the attachment adapted for mills of different powers.



3. The combination, with the double-crank shaft and the slotted levers operated thereby, of the two piston-rods and their respective pistons, one rod being passed eccentrically through the piston of the other rod, as described and shown.

4. In combination with the piston K, consisting of the parts *a b c*, the piston-rod I, inserted through and secured to the same, and the piston-rod J, passed through said parts and closely encircled by the leather *b*, as described and shown.

256,890. MACHINE FOR BENDING PIPE. JAMES H. EVARTS, New Haven, Conn., assignor to the National Pipe Bending Company, same place. Filed Nov. 8, 1881. (No model.)

Claim.—1. The lever E, part D, pivoted to the part B, and bar *i*, in combination with the part B, provided with the stud *a* and shoulder *c*, and with the former C, having the lug *g* and ribs *m*, as set forth.

256,890.

2. The combination of the lever E, part D, pivoted to the part B, bar *i*, part B, provided with the stud *a* and shoulder *c*, and former C, having the lug *g* and ribs *m*, with the bar F, having a groove and tongue, as described, and with the adjustable pulleys *n'*, having the rectangular grooves, as set forth.

3. In a machine for bending pipe into coils, the adjustable pulleys *n*, arranged and adapted to hold the bent pipe in their semicircular grooves and give direction to the same, as set forth.

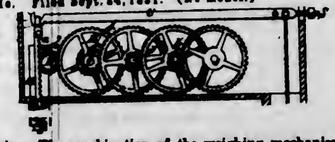
4. In a machine for bending pipes into coils, the combination of the bed A, having pulleys *o o'*, the slotted and shouldered arm B, pivoted to said bed, the segmental former C, adapted to be supported on the pivoted arm, the bars F and *i*, arranged at a right angle, and the lever D E, having a latch-connection with the bar *i*, substantially as and for the purpose described.

256,891. PRINTING-PRESS. WILLIAM H. GOLDING, Chelsea, Mass. Filed Mar. 28, 1880. (Model.)

Claim.—1. In combination with the platen, the main shaft, and the crank, a connecting-rod with intermediate connecting devices, substantially as described, for uniting the connecting-rod to the platen, substantially as described, the pivot of the upper end of the connecting-rod being during a portion of its movement nearly coincident with the center of the main shaft, substantially as and for the purpose set forth.

2. In combination with the bar f^{10} and the blocks f^9, for adjusting the cams, the movable bar f^{11}, as set forth.

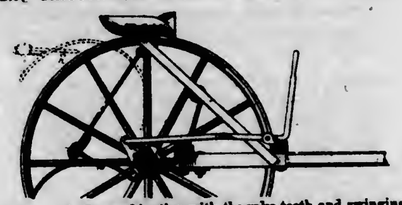
3. In combination with the base-plate and face-plate of the platen, the ledges f^7 f^8, wedge-blocks f^9, springs f^{11}, and bars f^{10} f^{11}.



4. In combination with the hook-rods h^{10} and the springs h^{11}, the hollow studs h^9, having slots for guiding the rods, as described.

5. In combination with the hook-rod having the springs h^{11}, the bar h^{12}, and spring h^{13}, as described.

6. In combination with the rod J, the ink-distributor *j*, adapted to swing upon the pivotal rod J, as described, and the inking-rollers, the combination being such that the former receives a vibration by the upward movement of the latter, as described.

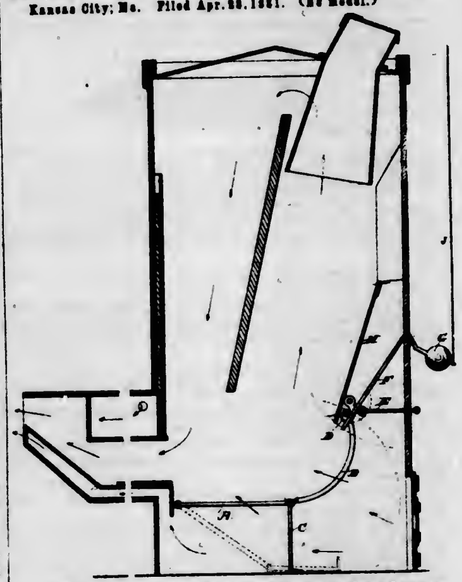


7. In combination with a pivoted ink-distributor located below the bed, mechanism, substantially as described, for giving it a lateral vibration, and inking-rollers, substantially as described, for giving a swinging movement.

256,892. WEIGHING-SCALES. JAMES P. HAGERTY, New Castle, Me. Filed Sept. 24, 1881. (No model.)

Claim.—The combination of the weighing mechanism of a platform-scale, a registering mechanism therefor, a vertical bar composed of a rack which engages an actuating-pinion of the registering mechanism, and a straight shank continuous therewith projecting through a slot in the horizontal arm of the scale-frame, said bar being provided at one end with an adjusting-nut and at the other end with a loop adapted to hook over the outer end of the scale-beam, and a spring interposed between the nut and the said arm of the frame, substantially as described.

256,893. HORSE HAY-RAKE. WILLIAM H. HALL, Tiffin, Ohio. Filed Feb. 25, 1882. (No model.)



Claim.—1. In combination with the rake-teeth and swinging cleaner-bar, shoes or runners attached to the cleaner-bar and elongated in the plane of the individual teeth upon which they travel at substantially right angles to the cleaner-teeth.

2. In combination with the rake-teeth and swinging cleaner-bar, means for lifting said cleaner-bar out of contact with the rake-teeth at each end of its traverse to entirely withdraw the cleaner-teeth from beneath the rake-teeth.

3. In combination with the rake-teeth and swinging cleaner-bar, shoes or runners attached to the cleaner-bar and elongated both above and below it in the plane of the individual rake-teeth upon which they travel at substantially right angles to the cleaner-teeth.

256,894. GRATE AND SHAKER. CHRISTOPHER C. HARN, Kansas City, Mo. Filed Apr. 28, 1881. (No model.)

Claim.—1. A grate consisting of the two independent portions A B, each hinged at back and provided at front with mechanism for holding them in their normal or closed position.

2. A weighted shaking-lever, in combination with a grate having a motion perpendicular to its own plane.

3. In combination with a weighted lever for clearing the fire, a cord or wire connected thereto and enabling the operation of the lever at a distance from the stove or furnace, substantially as set forth.

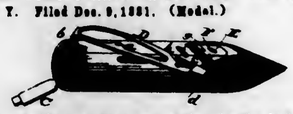
4. In combination with a grate held from downward motion by suitable stops, and having free upward motion, a bent shaking-lever pivoted in the wall of the furnace at its bent portion, weighted at its outer end, and engaging under the grate at its inner end, the whole being arranged, as described, so that when the weighted end of the lever is dropped its inner end will impinge against the under side of the grate, raise it from its supports, and allow it to drop again into place thereon, substantially as set forth.

5. In combination with a hinged grate, the shaking-lever F, having weight G, for the purposes set forth.

6. In a magazine-stove, the combination of hinged reservoir-wall H, a hinged grate, and a pivoted shaker for shaking and al-

tornately compressing and releasing the coal, substantially as described.

7. The combination of hinged grate B, having catch D, shaking-lever F, having weight G, and the hinged magazine-wall H, substantially as and for the purposes set forth.



256,895. DEVICE FOR AND METHOD OF FORMING BRAID TRIMMING. DAVID HENIUS, New York, N. Y., assignor of one-half to Samuel Hernstein, same place. Filed Jan. 3, 1881. (No model.)

Claim.—1. The method of forming braid trimmings herein shown and described, which consists in laying cords together, one above the other, feeding said cords through a grooved guide, which keeps them accurately together, and sewing centrally through the said cords, substantially as herein specified.

2. A guide, C, adapted to be applied as a presser-foot to a sewing-machine, provided with a groove, *b*, of the proper width to hold one thickness of cord, and of a depth sufficient to hold two or more cords, as required, and to allow one cord to project below the same, so that the feed device may act on it and move the cords along, and with a vertical hole which admits the needle through the middle of the several cords, substantially as and for the purpose herein specified.

256,896. SEWING-MACHINE SHUTTLE. JOHN HOEFLER, Ilion, N. Y. Filed Dec. 9, 1881. (Model.)

Claim.—1. The combination of the shuttle-body and its swinging latch, the spring pivoted to the body and engaging with the latch, and the detent engaging with and holding the spring.

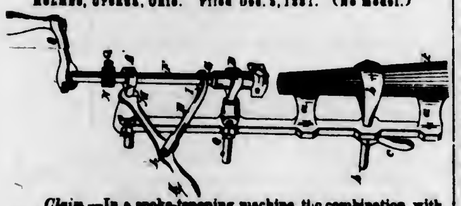
2. In combination with the shuttle-body and the hinged latch or cap at its base, the centrally-pivoted spring engaging at one end with the latch and at the opposite end with a retaining-lip or detent.

3. The combination of the shuttle-body A, latch C, pivoted spring D, and detent E.

4. In combination with the shuttle-body, the swinging tension-spring D and the adjustable detent E, serving the twofold purpose of retaining the spring in position and regulating the pressure upon the thread.

5. In combination with the swinging spring, the spring-supported detent E and adjusting-screw F.

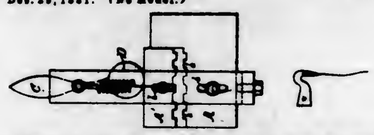
6. In a shuttle, the latch or detent E, having the spring-arms formed in one piece therewith.



7. In combination with the shuttle-body, the tension-spring provided with the inwardly-turned lip A, substantially as shown and described.

8. In a shuttle, the tension-spring provided with the V-shaped slit or opening therein to receive the thread.

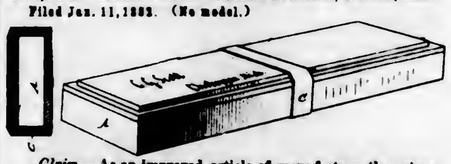
9. The shuttle-body provided with the external transverse groove, in combination with the latch, the hinge-pin for the latch, seated in the groove, and the soft metal inserted, as shown, to secure the pin in place.



10. In a shuttle, the latch-sustaining pin secured in an external groove in the body.

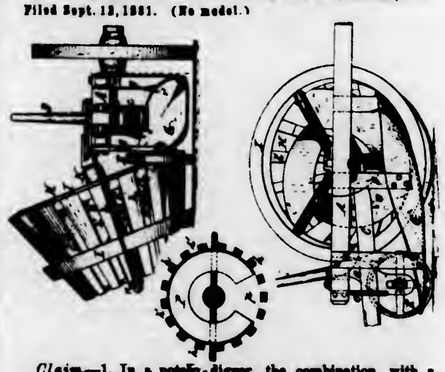
256,897. SPOKE-TENONING MACHINE. CHRISTIAN B. HOLMES, Urbana, Ohio. Filed Dec. 8, 1881. (No model.)

Claim.—In a spoke-tenoning machine, the combination, with the bed A, having integral spoke-rests *a* and clamps *b* D D', of the hollow auger shaft F and compound adjusting-levers H K, adjustable feed-gage N, and crank-arm O, substantially as shown and described, and for the purpose set forth.



256,898. APPARATUS FOR SHAPING AND HOLDING METAL WHILE BEING TEMPERED. JOHN JACOBS, Sandusky, Ohio, assignor of one-half to Henry Jacobs, same place. Filed Dec. 29, 1881. (No model.)

Claim.—1. The combination, with the adjustable stationary nodulated die A, of the movable nodulated upper die, A', the eccentric roller D, provided with a handle and arranged to force said upper die toward the lower die, and the springs arranged to retract said upper die, substantially as described.



2. The combination of the upper and lower nodulated dies, the straps or standards B B', provided with the slots *b* and inwardly-projecting lower ends, the bolts F, securing the lower die, the screws E E', for supporting and adjusting the same, the bolts F', moving loosely in the upper slots and secured to the upper die, the eccentric roller D, bearing upon the upper die and provided with means for operating the same, and the springs G G', for retracting said upper die, substantially as described.

256,899. MAILING-BOX. GEORGE JOHNSTON, Detroit, Mich. Filed Jan. 11, 1882. (No model.)

Claim.—As an improved article of manufacture, the return mailing-case herein described, consisting of the box-body A, having the elastic securing-band C permanently attached thereto, and of a reversible cover provided around the periphery of each side with a rabbet, the vertical wall of each rabbet, when underneath, being seated within the box, and the horizontal wall seated on the box, as herein shown and described.

256,900. POTATO-DIGGER. LEWIS S. KELSEY, Marilla, N. Y. Filed Sept. 13, 1881. (No model.)

Claim.—1. In a potato-digger, the combination, with a wheeled frame, A, of the downwardly-inclined axle *m*, projecting laterally from the wheeled frame, a cage, H, having the form of a truncated cone, mounted on said axle and running with its lower side upon the ground, a plow, G, which delivers the potatoes and earth into the inner end of the cage, and a discharge-opening formed in the outer end of the cage H, through which the potatoes freed from the earth are delivered upon the surface of the ground, substantially as set forth.

2. In a potato-digger, the combination, with the cage H, of a stop-flange, P, and a discharge-opening, *p*, arranged at its discharge end, whereby the potatoes are temporarily retained in the cage and discharged therefrom at intervals, substantially as set forth.

3. In a potato-digger, the combination, with the cage H, of a stop-flange, P, and a discharge-opening, *p*, arranged at its discharge end, whereby the potatoes are discharged at intervals, and screw-blades *o*, whereby the material is propelled toward the discharge-opening, substantially as set forth.

256,901. HARVESTER REEL AND RAKE. JOHN KEYS, Beloit, Kans., assignor of one-half to George W. Port, same place. Filed Mar. 2, 1882. (No model.)

Claim.—1. In combination with the platform having an upward inclination to the rear, the endless belts or chains having the rake-head hinged thereto, substantially as shown.

2. The combined rake and reel consisting of the endless belts or chains provided with the fixed reel-blades, and the rake-bar attached thereto by hinged arms, substantially as shown.

3. In combination with the platform having an upward inclination to the rear, the endless reel belts or chains provided with the fixed and the hinged blades or bars, and arranged to approach the surface of the platform as they travel from its front to its rear, whereby the slain are caused to assist in retaining the moving grain in position.

4. The combination of the inclined platform, the endless belts or chains, the rake-head connected to the belts by hinged arms, the tripping-arm attached to the hinged arms, and the stud to act upon the tripping-arm and elevate the rake-head at the completion of its action, substantially as shown.

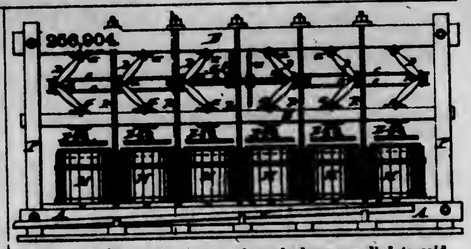
5. In combination with the traveling rake-head, the hinged presser-bar arranged to travel in advance thereof, the sustaining-arms upon said presser-bar, and the stationary tracks or cams to carry the sustaining-arms while the compressor-bar is pressing upon the grain.

6. The combination of the endless chains, the rake-head attached thereto by hinged arms, the presser-bar hinged to and in advance of the rake-head, and means, substantially as described, to sustain the presser-bar until it has passed over the butts of the grain.

7. In combination with the reel, the fixed posts, the notched hinge-post, and means, substantially as described, for securing the hinged posts in position.

256,902. PADLOCK-COVER. GEORGE E. KIRK, Washington D. C. Filed Sept. 14, 1881. (No model.)

Claim.—A weather-proof padlock-cover consisting of a cap, A, hinging to a plate, B, provided with the staple-slot *c*, as and for the purposes herein specified.



256,903. MANUFACTURE OF LOCKET-RIMS. GUSTAVUS R. W. KURTUS, Providence, R. I. Filed Dec. 9, 1880. (No model.)

Claim.—The described process for forming a locket-rim and field-piece in one piece of stock, with a joint groove in the edge of the field-piece, which consists, first, in striking up the disk to a cup form, (shown in Fig. 3;) second, in striking up the beveled rim of the field-piece and the groove for the joint at one operation, as shown in Fig. 4; third, in cutting out the central portion of the bottom of the cup and removing the surplus exterior flange of the rim, as shown in Fig. 5; fourth, in bending the raised rim inward, as shown in Fig. 6, and thus completing the locket-rim.

256,904. SAND-PRESS. EMIL LAAGE, Goddee, N. Y. Filed Feb. 13, 1882. (No model.)

Claim.—1. The combination, with a press-frame and its vertically-movable pressing-beam, of toggle-levers applied to said pressing-beam at intervals, mechanism arranged to operate said toggle-levers synchronously and in unison, and a series of plungers arranged under the pressing-beam, as set forth.

2. The combination, with a prolonged upright press-frame adapted to sustain a number of cheese-hoops in an upright position side by side, of toggle-levers arranged over the respective cheese-hoops and connected with one another, a series of plungers interposed between the toggle-levers and cheese-hoops, and a screw arranged to operate the toggle-levers simultaneously, as set forth.

3. The combination, with the prolonged upright press-frame A P P B and prolonged pressing-beam C, of two series of toggle-levers, D D, distributed over the pressing-beam and arranged conversely in relation to each other, the tie-rods *c*, connecting the respective toggle-levers of each series with one another, the nuts *n'*, connected in the first of each series of toggle-levers, the right-and-left screw *s*, a lever or other mechanical power connected to said screw, and a series of plungers connected to the pressing-beam, all as shown and described.

4. The combination, with a prolonged press-frame, of a series of plungers arranged to yield and conform to the unevenness in the heights of the several cheeses to be pressed, substantially as set forth.

5. The combination, with the prolonged pressing-beam C, of the plungers E E, composed respectively of two parts, *b b*, and an intermediate spring, *d*, as described and shown.

6. In an upright gang-press, the combination, with a prolonged press-bed and a prolonged press-head, of tie-rods connecting said members intermediately of their length, as shown and set forth.

7. In an upright gang-press, the combination, with a prolonged press-bed and a prolonged press-head, of tie-rods connecting said members intermediately of their length, and a pressing-beam moving between and guided by said tie-rods, as described and shown.

256,905. PICK FOR MILL AND OTHER STONES. LAWRENCE LAFAYETTE, Suncook, N. H. Filed Nov. 10, 1881. (No model.)

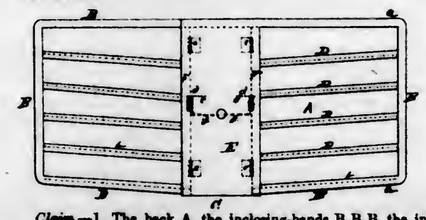
Claim.—As an improved article of manufacture, a pick composed of a stock provided with recesses to receive and inclose the shanks of the blades on all sides, of a series of blades, *b*, having their shanks fitted into the said recesses in the stock, and of a single pin for each series of blades, the said pins being extended through the said blades and screwed into the stock, substantially as described.

256,906. RECEIVER FOR TELEPHONES. ROBERT M. LOCKWOOD, New York, N. Y., assignor to the Molecular Telephone Company, same place. Filed Sept. 10, 1881. (No model.)

Claim.—1. In a telephone-receiver, a diaphragm composed of cork or equivalent non-resonant and non-magnetic material and provided with a central perforation, in combination with a disk or plate of glass covering said perforation, substantially as described

2. The diaphragm of cork, provided with a central perforation, in combination with disks or plates of glass arranged on opposite sides of said diaphragm, covering the perforation therein and forming a sound-chamber between them.

3. The diaphragm of cork, made in two parts, consisting of a central perforated disk and a ring surrounding said disk, in combination with a plate or plates of glass covering the perforation in said central disk.



256,907. RECEIVER FOR TELEPHONES. ROBERT M. LOCKWOOD, New York, N. Y., assignor to the Molecular Telephone Company, same place. Filed Sept. 10, 1881. (No model.)

Brief.—A reduced flexible extension of the magnet-core is in contact with a piece of carbon attached to the center of a diaphragm made of cork. The molecular vibrations of the magnet are communicated to the carbon and through the same to the diaphragm.

Claim.—In a telephone-receiver, a diaphragm of cork, provided with a central button of carbon or its equivalent, applied thereto substantially as specified, in combination with the magnet having the reduced elastic extension resting in contact with said button, substantially as and for the purpose described.

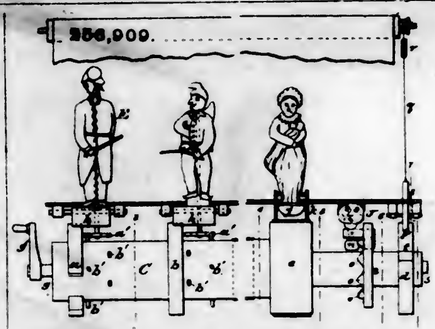
256,908. POOL-BALL HOLDER. WILLIAM H. MARSHALL and CHARLES H. ANDERSON, Bridgeport, Conn. Filed Jan. 7, 1882. (No model.)

Claim.—1. The back A, the inclosing-bands B B B, the inclined plates D D D, cover E, stops F F', and discharge C, when combined substantially as described.

2. The combination of the cover, hinged stops F, the springs *d d*, and the pull *g*, when arranged and operated as described and set forth.

256,909. TOY THEATER OR PUNCH-AND-JUDY SHOW. NEWMAN R. HARSHMAN, New York, N. Y. Filed Jan. 11, 1882. (No model.)

Claim.—1. In a toy, the combination, with a revolving roller having a recess and shoulder, of a figure pivoted over said roller on a block and arranged to be thrown up to an erect position by the engagement of the shoulder with said block, substantially as set forth.

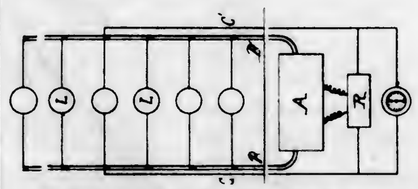


2. In a toy, the combination with a roller provided with a recessed flange, *a*, and pins *b'*, of a figure, E, mounted on a block, *h*, pivoted over the roller, the head of the figure being arranged to be moved independently by means of a stem acted upon by the pins *b'* in the roller as the latter turns, all arranged substantially as and for the purposes set forth.

3. The combination, in a toy, of a roller, an endless band or apron, an idler-pulley for the band to pass over, and a figure or figures pivotally mounted on said band and weighted at the bottom to maintain them in an erect position, substantially as and for the purpose set forth.

4. In a toy, the combination, with a figure arranged to be thrown up to an erect position by means of a shoulder on a roller, and the said shouldered roller provided with projecting pins, of a star-wheel, *a'*, fixed on the lower end of the stem which bears the head of the figure, substantially as set forth.

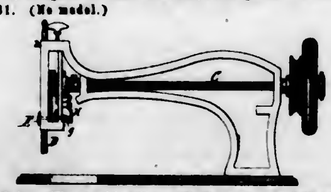
5. In a toy theater wherein figures appear and move on the stage, the combination, with the roller which actuates the figures, of a belt or apron bearing legends or inscriptions, the said roller and apron being arranged to exhibit said inscriptions at the proper times in order to illustrate the acts or purposes of the figures on the stage, substantially as set forth.



256,909.

6. The combination, in a toy, of an actuating-roller, C, provided with a cam, *c*, a head, J, a stem, *s*, a lever, *m*, on which the head is pivoted, and projections *o* on the sides of the cam *c*, said projections being arranged to impinge against the stem *s* as the cam rotates and raises the head into view, substantially as set forth.

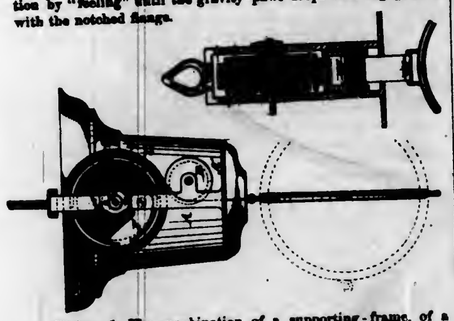
7. In a toy theater wherein a stage is employed, the combination, with an actuating-roller, C, for imparting movements to the actors or figures, of a curtain, K, curtain-roller *p*, cord *q*, lever *s*, provided with a short arm, *s'*, and a notched flange, *d*, on the roller C, arranged to actuate the lever *s* and raise the curtain, substantially as set forth.



256,910. SYSTEM OF ELECTRICAL GENERATION AND DISTRIBUTION. HIRAM S. MAXIM, Brooklyn, assignor to the United States Electric Lighting Company, New York, N. Y. Filed Apr. 21, 1881. (No model.)

Claim.—1. The combination, with a main circuit and a group of branch or multiple-arc circuits containing devices for utilizing and converting the current, of a branch circuit taken off from the main conductors at or near the center of the group of branch circuits and containing devices for regulating the amount of current supplied to the main circuit, substantially as set forth.

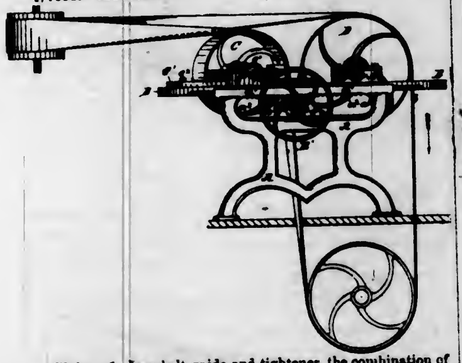
2. The combination, in a system for generating and distributing electric currents, of one or more generators, A, main conductors B B, and two or more cross-circuits containing the devices for converting the current, with circuit C C', taken from the main wires at or near the center of the group of cross-circuits and brought back to operate the regulator R, connected with the generators, as and for the purpose set forth.



256,911. SEWING-MACHINE. NICHOLAS HEYNES, Buffalo, N. Y., assignor to John H. Fair, same place. Filed June 8, 1881. (No model.)

Claim.—The combination, with the motor-shaft C, of an actuating-cam, I, secured thereto, a disk, E, located near the lower end of the head of the machine, adapted to clamp the needle-thread between itself and the head of the machine, and attached to a stem, *f*, a spring, *g*, applied to the stem *f* and tending to press the disk E against the needle-thread, and a lever, H, operating the stem *f* from the cam I, the parts being so combined that the disk E is held away from the needle-thread by the lever H bearing against the stem *f*, except during the downward movement of the needle-bar before the needle enters the cloth, when the stem *f* is automatically released by the lever H and the disk E pressed against the needle-thread by the spring *g*, thereby preventing the formation of loops before the needle enters the cloth, substantially as set forth.

256,912. SPRING-BALANCE FOR LAMPS. CHARLES G. MILLER, Bridgeport, Conn. Filed Dec. 24, 1881. (No model.)



Brief.—When it is desired to raise the fixture the same is pulled down slightly against the stress of a spring to take the gravity-pawl F out of engagement with the notched flange C, when the stress of the spring and the power applied below will carry up the fixture. The fixture is secured at any desired elevation by "feeling" until the gravity-pawl drops into engagement with the notched flange.

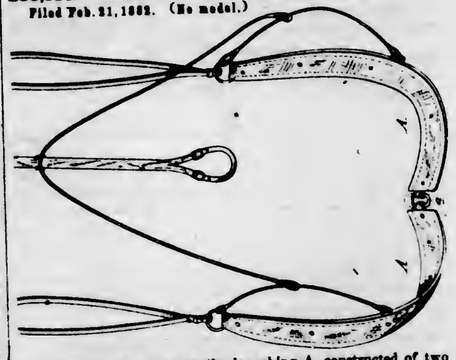
Claim.—1. The combination of a supporting-frame, of a spring-actuated drum, and of a metallic suspension band or tape applied to the drum, with one or more gravity-pawls applied to a stationary end plate and adapted to engage notches in the flanged circumference of the same, substantially as set forth.

2. The combination of the following parts: a supporting-frame having a centrally-perforated bottom plate and top hook or eye, a fixed transverse spindle, a spring-actuated drum, a metallic suspension-tape applied to the drum, one or more gravity-pawls pivoted to a stationary end plate and adapted to engage notches in the flanged circumference of the spring-drum, and a guide-roller below the drum and at one side of the bottom opening of the frame, substantially as set forth.

256,913. BELT GUIDE AND TIGHTENER. JONATHAN MILLS, Chicago, Ill., assignor of three-fourths to Samuel S. Chisholm and Wellington P. Chisholm, both of same place. Filed Jan. 4, 1882. (No model.)

Claim.—1. In a belt guide and tightener, the combination of the frame A, adapted to be secured to the floor, the pulley-frame B, arranged to slide horizontally upon the frame A, and the pulleys C and D, mounted on the frame B, together with means for adjusting and securing said frame B, all for the purpose of deflecting a belt from one shaft to another, when located in the relative positions shown, substantially as described.

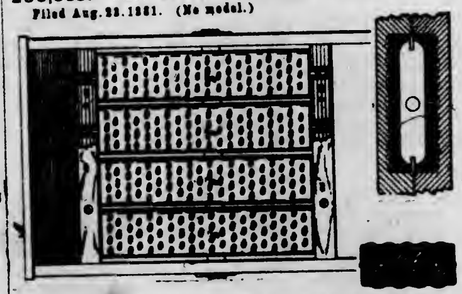
2. The combination, in a belt-guide, of the frame A, provided with the loose pulleys C and D, arranged as shown, the former being smaller than the latter, and set, or adapted to be set, at an angle with the former, substantially as and for the purpose set forth.



3. In a belt guide and tightener, the combination of the frame A, provided with a rack, *a'*, the pulley-frame B, fitted to slide in the frame A, the shaft E, provided with a pinion fitted to the rack *a'*, and the ratchet *c'* and pawl *c²*, arranged and operating substantially as described.

4. In a belt-guide, the combination, with the pulley D, of the pulley C, having its shaft-bearings adjustable, whereby the angle of its inclination may be varied at will, substantially as described.

5. In a belt-guide, the combination, with the pulley D, of the pulley C, having its shaft-bearings connected by the frame-piece C', adapted to be adjustably secured in place, substantially as described.



6. In a belt guide and tightener, the combination, with the separate frame-piece C', carrying the pulley C, of the sliding frame B, provided with slots *b'*, and carrying the relatively-fixed pulley D, substantially as described.

256,914. HARNESS. DAVID MORSE, Mount Pleasant, Mich. Filed Feb. 21, 1882. (No model.)

Claim.—In a harness, the breeching A, constructed of two sections of spring-steel or other suitable metal, provided with a protective covering, and secured together at their inner ends by a flexible joint, substantially as herein set forth.

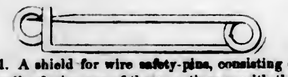
256,915. WASH-BOARD. JOHN MYERS, Philadelphia, Pa. Filed Aug. 23, 1881. (No model.)

Claim.—1. A wash-board consisting in a frame having a series of vertically-pivoted slats which are held in a common plane by springs and adapted to be oscillated under pressure, substantially as shown and described.

2. A wash-board consisting of a frame having a series of vertically-pivoted slats, which are strung upon a rubber band, substantially as shown and described, and for the purpose set forth.

3. In a wash-board, the combination, with a suitable frame, of a series of vertically-pivoted slats and a rubber band or cord which is secured to the frame, and upon which the slats are strung, substantially as shown and described.

4. In a wash-board, the combination of frame A, having its top and bottom cross-pieces, *a a*, provided with bearings for the spindles of the sections, the strips *a' a'*, for holding the spindles in said bearings, the sections *b*, consisting of wooden slats having spindles at their ends and a longitudinal groove in each lateral edge and openings *d*, and which are covered with strips of corrugated metal struck up to fit the slats on opposite sides thereof, and the rubber band which passes through the sections and is secured to opposite sides of the frame, substantially as shown and described.



256,916. ART OF STAINING OR ENAMELING GLASS, &c. SYDNEY J. NEWNHAM, New York, N. Y., assignor of one-half to Francis T. Sargent, same place. Filed Oct. 1, 1880. Renewed Dec. 23, 1881. (No specimens.)

Claim.—1. The improvement in the art of decorating glass or similar material with designs in stains or enamels, consisting in covering the ground with a protective ink or equivalent material, leaving the lines to be decorated exposed, filling in said exposed parts with the stain or enamel, and fusing the same with the protective ground surrounding and confining the enamel, substantially as herein set forth.

2. The herein-described improvement in the art of enameling or staining embossed or etched articles—viz., leaving the protective ground intact after the embossing or etching, then applying the enamel or stain, and baking or fusing the same, with the protective ground surrounding and confining the enamel or stain—substantially as and for the purpose herein set forth.

3. In the art of enameling or staining glass or similar material, the step of covering the protective ground with a coating of an absorbent fire-proof paint previous to the baking or fusing operation, substantially as and for the purpose herein set forth.

256,917. SAFETY-PIN. HENRY H. PAINE, Newark, N. J., assignor to F. S. Peshine, same place. Filed Apr. 11, 1881. (No model.)

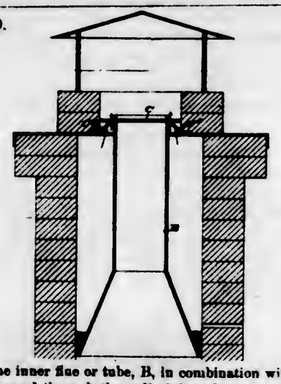
Claim.—1. A shield for wire safety-pins, consisting of two nearly parallel coils of wire, one of them continuous with the body of the pin, the said coils being separated sufficiently to admit the point of the pin between them, and being combined with a lock or loop of the wire forming the pin, substantially as and for the purpose set forth.

2. The safety-pin provided with the shield formed of two coils of wire separated to receive the point between them, and provided with a lock or open loop bent out of the same piece of wire as the pin and the shield and adapted to guide the point of the pin into the space between the coils, substantially as herein set forth.

256,918. NEEDLE-CASE. JOHN J. PARSONS, New York, N. Y. Filed Jan. 31, 1882. (No model.)

Claim.—1. A needle-case comprising a foundation-card, a band or strip, B, stretched across the front of the same and attached at the sides, and a soft material, C, arranged between the band B and the card, the said parts being connected together on vertical lines to form parallel bottomless pockets, substantially as set forth.

2. A needle-case comprising a foundation-card, a band, B, to form the front of the pockets, a soft filling material, C, and wire staples *g*, arranged to form partitions or divisions between the pockets, substantially as and for the purposes set forth.



3. The combination, to form a series of bottomless pockets or keepers for the needles in a needle-case, of the foundation-card, the band B, secured thereto, the woolen strip C, interposed between the band B and the card, and the wires *g*, arranged to divide the whole up into pockets, whereby the needles are secured independently in the pockets and are prevented from rusting, substantially as set forth.

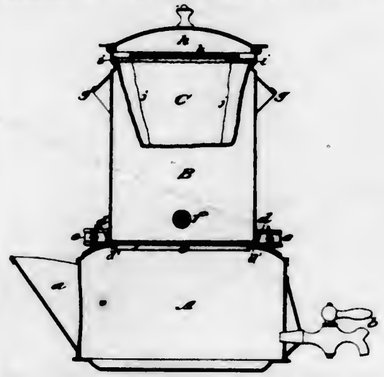
256,919. CHIMNEY. JACOB M. PATTERSON, Woodbury, N. J. Filed Dec. 28, 1881. (No model.)

Brief.—The tube B is suspended within the chimney from the top thereof by means of the rod C. The opening *d* in the wall of the chimney is to admit a draft to assist in expelling the heated air.

Claim.—1. The inner flue or tube, B, in combination with the top plate, C', and the deflector C'', the latter being supported on said plate, and the tube projecting through openings in the plate and deflector and suspended within the chimney from said deflector, substantially as and for the purpose set forth.

256,919.

2. The inner flue or tube, B, in combination with the rod C, which is passed through the wall of the tube and sustained on the top of the chimney, substantially as and for the purpose set forth.



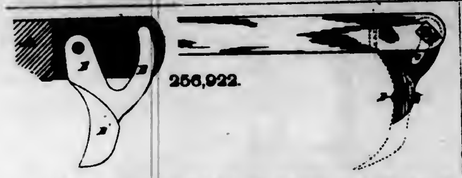
3. The chimney, in combination with the inner flue or tube, B, rod C, deflector C'', and top plate, C', substantially as and for the purpose set forth.

256,920. FRICTION-MATCH. WILLIAM H. PITT, Buffalo, N. Y. Filed Nov. 12, 1881. (No model.)

Claim.—A friction-match composed of a wooden splint having one end provided with a friction compound and the opposite end rendered incombustible, and with an intermediate portion capable of combustion, whereby the flame is confined to the combustible portion of the splint and prevented from extending to the non-combustible portion, which is held between the fingers.

256,921. COMBINED KETTLE AND URN. HENRY C. RICH, Louisiana, Mo. Filed Mar. 30, 1880. (No model.)

Claim.—1. The combination, with a pot or urn provided with a lip or dam and with a bead or ledge directly below said dam, of a flexible filtering bag or strainer provided with a ring to expand its mouth and arranged to be suspended from the bead below the dam, substantially as shown.



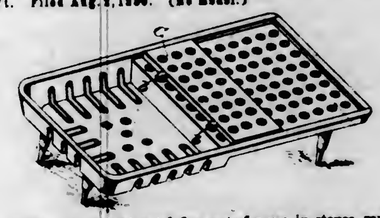
2. The combination, with the urn or pot B, provided with the dam *h* and flexible strainer C, of the kettle A, provided with the opening *e*, the marginal ledge *d'*, and the rim *d*, all substantially as set forth.

256,922. SEEDER OR CULTIVATOR TOOTH. JNO. S. ROWELL, Beaver Dam, Wis. Filed Oct. 13, 1881. (No model.)

Claim.—1. The double-pointed reversible seeder-tooth described, having its opposite ends similarly shaped and its intermediate portion or shank bent to the form shown, said tooth being struck from a single piece of sheet metal, substantially as described.

2. In combination with the beam and with a plate having a slipping connection therewith, a double-pointed tooth consisting of a shank having a blade at each end, and being, as a whole, detachably and reversibly secured to the slipping plate, the elevated

256,922.



unused point being arranged beneath and near the beam, so as to be guarded thereby, substantially as described.

3. In combination with the beam having an open vertical slot at its rear end, the slipping plate B, connected to slip in said slot, and provided with an extension on its lower margin, a double-pointed tooth, and a means, substantially as described, for securing the tooth directly to and beneath the lower projection of the slipping plate, substantially as and for the purposes set forth.

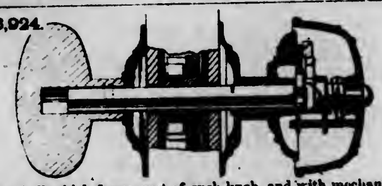
4. Combined with the beam and with the bent sheet-metal double-pointed tooth described, a slipping plate having a projection thereon shaped to fit the rear concave face of the tooth, and a bolt, D, or its equivalent, for securing the tooth to said projection, substantially as described.

256,923. GRATE FOR STOVES. LAUREN S. SCOTT, Bristol, Vt. Filed Aug. 2, 1880. (No model.)

Claim.—1. A horizontal fire-grate for use in stoves, ranges, and heaters, having a section of its fuel-supporting area constructed in a plane lower than the general plane of such area, so as to constitute a basin or receiver for embers or partially-consumed fuel, the bottom of which basin is perforated with a much less number of draft-apertures than the adjacent portions of the grate, as a means for conserving fuel when the fire is dying out, substantially as specified.

2. A horizontal perforated fire-grate adapted to be used in the combustion-chambers of stoves, ranges, and heaters, in combination with a detachable partition-plate, substantially as herein described, armed with hinge-lugs adapted to articulate with the perforations in the fire-grate, whereby such partition-plate may be hinged to the fire-grate, substantially as described, and for the purposes set forth.

3. A horizontal fire-grate for use in stoves, ranges, and heaters, provided on its upper surface with a hinged perforated rolling partition-plate connected and adjusted as described, so that when erected it shall divide the fire-box into two compartments, between which draft circulation can be maintained through the perforations in said partition, and when recumbent such perforations shall coincide with the openings in the grate itself as a means for admission of air and escape of ashes, substantially as described and set forth.



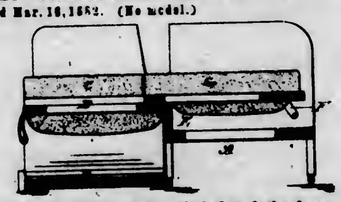
4. The specific means shown for articulating the rolling partition-plate with the grate, consisting of the crank-shaped lug *b*, projecting from the edge of the rolling plate C, constructed with the stop-facets *e* and *f*, arranged at right angles with each other, or so that when the plate is erected, one pair, *e e*, will prevent its further rotation away from the recumbent position, and when the plate is recumbent the other pair, *f f*, will so hold it locked down in such position that it cannot be displaced, substantially as specified.

5. A horizontal perforated fire-grate for use in the fire-boxes of stoves, ranges, and heaters, provided with a detachable falling partition-plate armed with hinge-lugs, the perforations of the grate and the hinge-lugs of the partition-plate being so adapted to each other that the position of the partition-plate may be reversed so as to fall in opposite directions in the manner described, and for the purposes set forth.

256,924. DOOR-KNOB ALARM. JOHN SIMON, New York, N. Y. Filed Jan. 16, 1882. (Model.)

Claim.—1. As an improvement in door-knob alarms, the combination of an alarm mechanism contained within the inner knob

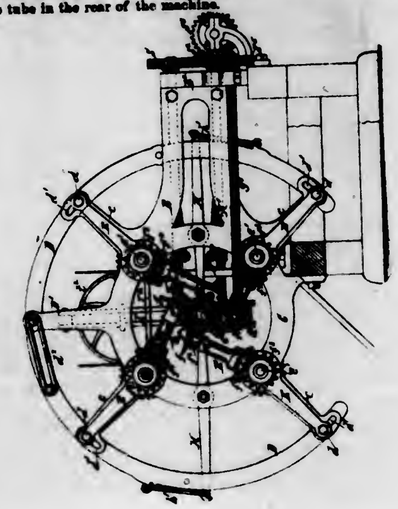
256,924.



with a bell which forms part of such knob, and with mechanism whereby the alarm is thrown out of contact with the ringing device when the inner knob is turned for opening the door, substantially as and for the purpose set forth.

2. The combination of a knob-spindle, an inner knob composed of a disk connected to the door and a bell loose on the knob-spindle, a pawl-frame sliding on the knob-spindle and having wings or ears and pawls pivoted thereto, with striking mechanism, and a cam-sleeve having a perforated cam or ear, to which the bell is connected by a fixed pin, whereby the cam-sleeve is adapted to engage the pawl-frame and slide it forward clear of the striking mechanism, substantially as set forth.

3. The combination of the fixed disk, the bell, the striking mechanism, an eccentrically-pivoted cam on said disk, adapted to engage a pin of the hammer-tongue, and means for turning said cam from the outside of the knob, whereby the striking mechanism may be thrown out of gear at will, substantially as described.



256,925. SOFA-BEDSTEAD. THOMAS SOBEL, New York, N. Y. Filed Mar. 16, 1882. (No model.)

Claim.—In a convertible sofa-bedstead, the frame A, provided with the hinged back E and brace F, in combination with the reversible front portion, B C D, substantially as and for the purpose set forth.

256,926. MACHINE FOR CUTTING GREEN CORN OFF THE COB. WELCOME SPRAGUE, Farnham, N. Y. Filed Jan. 12, 1882. (Model.)

Brief.—The corn is fed to a series of self-adjusting feed-wheels by means of an endless feed-belt. The ear is then forced forward between the self-adjusting cutters, one set of which is arranged horizontally and the other vertically. Thence it passes between two sets of feed-wheels and scrapers, and is discharged through the tube in the rear of the machine.

Claim.—1. In a machine for cutting green corn from the cob, the combination, with self-adjusting cutters, of an endless feed belt, *g*, and feed-wheels *f*, arranged between the feed-belt and the cutting mechanism, substantially as set forth.

2. In a machine for cutting green corn from the cob, the combination, with self-adjusting cutters and scrapers, of a feed-trough, G, and endless feed-belt *g*, arranged in said trough, with its upper portion exposed to receive the ears of corn, substantially as set forth.

3. The combination, with the self-adjustable cutters *h*, of self-adjustable feed-wheels *f*, mounted on swinging arms E, substantially as set forth.

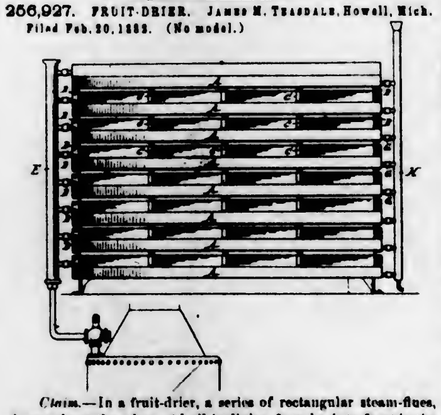
4. The combination, with the cutters *h i* and scrapers L M, arranged in rear of the cutters, of feed-wheels arranged between the several sets of cutters and scrapers, substantially as set forth.

5. In a machine for cutting green corn, the combination, with the cutting mechanism, of a feed-belt and feed-wheels, whereby the ears are fed between the cutters, and of feed-wheels and scrapers arranged in rear of the cutters, substantially as set forth.

6. The combination, with the stationary ring C and movable ring D, of the arms E, pivoted to the ring C and attached with their outer ends to the ring D, and guide-plates *e* and feed-wheels *f*, mounted on the inner ends of the arms E, substantially as set forth.

7. The combination, with the stationary ring C and movable ring D, of guide-plates *e* and feed-wheels *f*, mounted on adjustable arms E, and cutters *h*, mounted on adjustable arms H, substantially as set forth.

8. The combination, with the stationary ring C and movable ring D, of guide-plates *e* and feed-wheels *f*, mounted on arms E, cutters *h*, mounted on arms H, and springs *h'* and shoulders h^2, whereby the arms H are connected with the ring D, substantially as set forth.



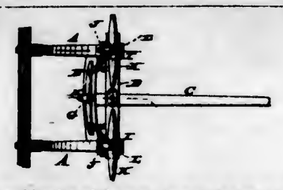
9. The combination, with the arms E, of the shafts *e'*, on which said arms turn, shafts *f'*, supported in the arms E, feed-wheels *f*, secured to the inner ends of the shafts *f'*, and gear-wheels f^3 f^4, whereby the shafts *e'* *f'* are connected, substantially as set forth.

10. The combination, with the feed-wheels *f*, of guide-plates *e*, provided with slots f^5, through which the feed-wheels project, substantially as set forth.

11. The combination, with the cutting and scraping mechanism, of feed-wheels *N* N N' N', made self-adjusting toward and from each other, substantially as set forth.

12. The combination, with the ring C, of the sleeve R, secured thereto, shafts *e'*, whereby the feed-wheels *f* are driven, and a gear-wheel, T, turning on the sleeve R and meshing with wheels *t*, mounted on the rear ends of the shafts *e'*, substantially as set forth.

256,927. FRUIT-DRIER. JAMES M. TEASDALE, Howell, Mich. Filed Feb. 20, 1882. (No model.)



Claim.—In a fruit-drier, a series of rectangular steam-flues, A, one above the other, and all inclining from back to front in the same direction, in combination with the steam-inlet E and exhaust H, and separate connections between each flue and the inlet and exhaust pipes, said exhaust-pipe connections being made at the lowest end of the flues, substantially as shown and described.

256,928. POLE AND SHAFT FOR VEHICLES. DIODEMUS B. TERRELL, Wytheville, Va. Filed Feb. 11, 1882. (Model.)

Claim.—1. The combination of the arms A, cross-brace B, having recess F, pole C, having cross-bar D and strap E, sockets I, having brackets J, single-trees K, and suitable connecting-bolts, substantially as set forth.

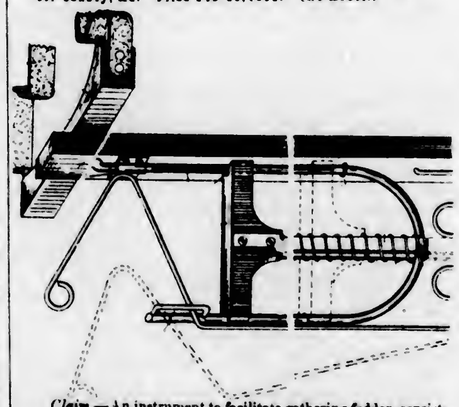
256,928.

2. The combination of the arms A, cross bar or brace B, pole C, having cross-bar D, sockets I, having brackets or clips J and suitable connecting-bolts, and braces M, connecting said bolts with the cross-bar B, substantially as set forth.

256,929. DOOR-HANGER. LE GRAND TERRY, Dundee, N. Y. Filed July 18, 1881. (No model.)

Claim.—1. The hanger C, having a hinge-joint between the door and rail, and having the roller *a* at its upper end and holes for the pivot D, all as above specified.

2. The part F, having the downward projection, in combination with a hanger having a horizontal wheel and vertical roller attached to a right-angled piece integral with the hanger-strap, as herein shown and described.



256,930. LAMP. THOS. C. J. THOMAS, 54, 55, and 56 Minories, County of Middlesex, England. Filed Oct. 3, 1881. (No model.) Patented in England June 26, 1880, in France Dec. 22, 1880, and in Belgium Dec. 24, 1880.

Claim.—1. The chimney G, having the openings H formed at suitable positions around the chimney, being independent of each other, in combination with the parabolic or other suitably-tapering formed chambers, mounted with their small ends in the openings H and their expanded ends bearing against the side of the lantern, whereby both the chimney and the reflectors are held in place, substantially as set forth.

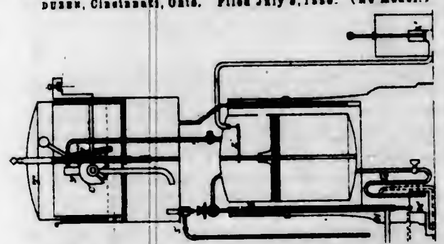
2. In a lamp, the combination of the chimney G, provided with the holes H, and supported by the ends of the chambers J J entering said holes H, with said chambers J, and with the burner C set diagonally in relation to the chambers, substantially as set forth, and for the purpose specified.

256,931. FODDER-HOLDER. WILLIAM S. TILGHMAN, Worcester County, Md. Filed Feb 25, 1882. (No model.)

Claim.—An instrument to facilitate gathering fodder, consisting of a holder having two straight parallel sides, a spring-actuated follower moving in the said two sides and constituting the bottom of the holder, a spring-actuated device to close the top of the holder above the follower, and means, substantially as described, for attachment to the human body, as set forth.

256,932. BEE-HIVE. FRANK DELLA TORRE, Baltimore, Md. Filed Feb. 25, 1882. (No model.)

Claim.—1. A bee-hive provided with bags or cushions containing quicklime or lime partly slaked, substantially as and for the purposes set forth.



2. A bee-hive provided with quicklime or lime partly slaked, located in its interior, substantially as and for the purposes set forth.

256,933. EXTENSION-GUARD FOR REAPERS. HENRY E. TRUMBLE, Kalamazoo, and FREDERICK A. KETCHUM, Three Rivers, assignors of one-third to Frederick Motop, Kalamazoo, Mich. Filed Dec. 19, 1881. (No model.)

Claim.—In a reaper, the combination, with a sickle-guard, of an extension guard or finger curving downward and outward from said guard, and having the shoulder with the mortise in which the point of the sickle-guard is located, and the elongated slot adapting it to the varying types of reaper-guards, all substantially as set forth.

256,934. AUTOMATIC GAS APPARATUS. BENJAMIN C. VANDUSEN, Cincinnati, Ohio. Filed July 8, 1880. (No model.)

Claim.—1. In an automatic gas apparatus, a gasoline-tank, in combination with generating-pipes connected with the tank at the top and bottom, in which the gasoline is vaporized by heat, whereby the gasoline is fed from the bottom of the tank to be vaporized in the pipes and the hot vapor from the pipes discharged in the tank above the gasoline, substantially as described.

2. In an automatic gas apparatus, a gasoline-tank, in combination with generating-pipes connected with the tank at the top and bottom and containing a float, so that when gasoline is introduced into the tank and heat applied to the pipes the compartment under the float shall supply the gasoline to the pipes, to be therein vaporized, and the pipes shall conduct the vapor into the tank above the float, substantially as described.

3. The generating-pipes, combined with the double bent supply-pipe at the bottom of the gasoline-tank and a single pipe at the top of the tank, substantially as described.

4. The hot-water boiler and its connections with the hot-water tank, arranged to direct the greatest heat from the water against the lower ends of the generator-pipes for vaporizing the gasoline at the lowest point, substantially as described.

5. The combination of the water-leg and connecting-pipe with the hot-water boiler, the hot-water tank, and the generating-pipes, substantially as described.

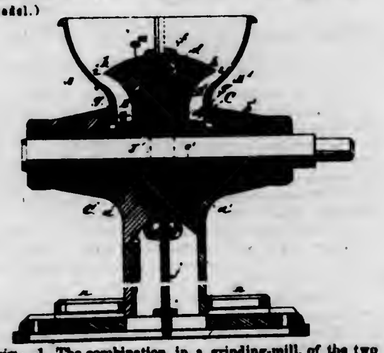
6. The combination of the vapor-and-gasoline tank containing the float, the generating-pipes, the inclosing hot-water tank separated from the gasoline-tank by an air-space, and the hot-water boiler connected with the bottom of the water-tank, substantially as described.

7. The float, of a diameter nearly equal to that of the gasoline-tank, and composed of two sheet-metal disks, with a filling of cork between them, substantially as described.

8. The governor for regulating the flow of the hydrocarbon vapor into the gasoline-tank, in combination with said tank and the generating-pipes, and actuated automatically by the pressure of the vapor in said tank to cut off the vapor at the desired pressure in said tank and to open for continuing the supply when the pressure is reduced, substantially as described.

9. The governor or regulator consisting of two elastic metal disks secured together at their edges, a shell upon which the disks are secured, and the valve-stem attached to the upper disk and extending through the lower disk and shell to seat the valve against the under side of the shell, in combination with the gas-holder and vapor-and-gasoline tank, substantially as described.

10. The gasometer, combined with the vapor-and-gasoline tank and the regulator-valve in the generating-pipes, substantially as described.



11. The combination of the cam, the angular tripping-lever and notched disk, and long pivoted link with the vapor-supply valve and inverted cylinder of the gasometer, substantially as described.

12. The combination, with the gasometer and hot-water tank, of the vapor-pipe, whereby the liquid of condensation of the gasometer is vaporized and returned to the gasometer, substantially as described.

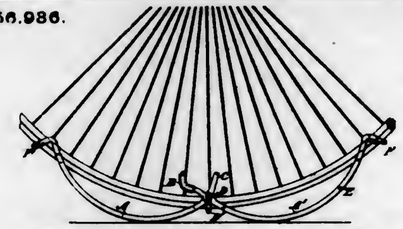
13. The valve between the gasometer and pipe for supplying oxygenated vapor to heat the water-boiler, in combination with the regulator or governor valve in the generating-pipes, for the purpose of regulating the heat under the boiler in proportion to the varying pressure of the vapor in the generators, substantially as described.

14. The combination of the stand-pipe E' with the gasometer and the seat for the valve through which vapor is supplied to heat the water-boiler, substantially as described.

256,935. GRINDING-MILL. ANDREW S. WEAVER, Jay, N. Y., assignor to Charles H. Morse, Chicago, Ill. Filed Apr. 8, 1880. (No model.)

Claim.—1. The combination, in a grinding-mill, of the two parts A A', composing the casing, with the outer stationary grinding-rings, B B', respectively, connected with said two parts of the casing, and formed with hubs having grinding-faces and the inner rotary grinder, C, composed of two parts, each formed with a hub having a grinding-surface, substantially as described.

2. The combination, in a grinding-mill, of the rotary shaft with the grinder C, having a circumferential groove, *d*, and provided with scrapers *r*, the ring *f*, having a flange, d^3, received into said groove, the partition *j*, dividing the delivering-passage, and the grinding-rings B B', said members being constructed and organized substantially as and for the purpose described.



3. The combination, in a grinding-mill, of the two-part casing A A', having the wings A, arranged within the hopper substantially as set forth, with the stationary grinding-rings B B', having hubs *a a'* and openings *g*, and the rotary grinder C, all constructed and arranged substantially as and for the purpose specified.

256,936. STAND FOR BICYCLES. CHARLES WICKSTEED, Kettering, County of Northampton, England. Filed Mar. 8, 1882. (No model.) Patented in England Mar. 8, 1880.

Claim.—1. A bicycle-stand composed essentially of two frames hinged together for folding one over the other, and provided with means for holding a bicycle upright off the ground when said frames are unfolded, as described.

2. A bicycle-stand composed essentially of two frames hinged together for folding one over the other, and provided with means for holding a bicycle in an inverted position off the ground when so folded, as and for the purpose specified.

256,936.

3. The curved frames A A', jointed together by the cross-rod D, and having their ends prolonged beyond said joint and forming respectively the hooks B and legs C, substantially as set forth and shown.

4. The combination of the frame A, having extensions or legs C, with and connected to the frame A', having extensions or hooks B, and capable of being folded over upon frame A, the combined frames then forming a stand suitable for holding a bicycle in an inverted position, substantially as set forth and shown.

5. The combination of the jointed frames A A', having recesses F at their extremities, with the centrally-cranked rod D, whereby the wheel may be run onto the stand and cause said stand to grip its periphery in the said recesses F by reason of the weight of the wheel depressing the central rod, substantially as set forth.

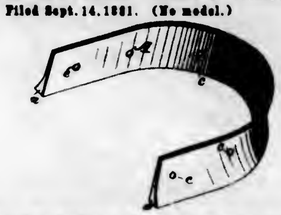
6. The frames A A', hinged together for folding one over the other, and having the recesses F, bearings B, and legs C C, in combination with the stops or lugs E E, substantially as and for the purposes specified.

256,937. RAZOR-STROP. CHARLES H. WILCOX, Detroit, Mich. Filed Mar. 15, 1882. (No model.)

Claim.—1. A razor-strop provided with a recess, the neck of which is interiorly threaded, in combination with a brush having a threaded portion to engage with said threaded strop, substantially as described.

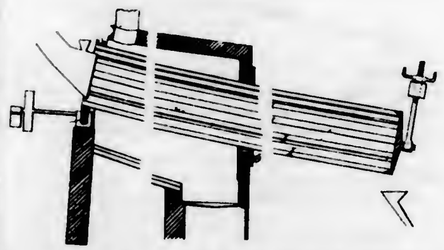
2. A razor-strop provided with a recess, the neck of which is interiorly threaded, in combination with a brush having a threaded portion to engage with said threaded strop, the handle of the brush being adapted to also form the handle of the strop.

3. The combination, with a strop provided with a recess to receive a razor and with a recess to receive a brush, of a brush having a threaded ferrule to screw into the brush-recess, substantially as specified.



4. A razor-strop provided with a recess to receive a brush, said recess being interiorly threaded, in combination with a brush having a threaded ferrule and means, as described, for ventilating said recess when the brush is in place, substantially as and for the purposes set forth.

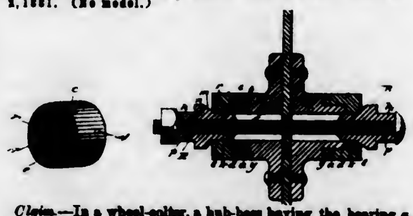
256,938. MECHANISM FOR REGULATING CLOCK-PENDULUMS. JOHN W. WILLIAMS, New York, N. Y. Filed Feb. 4, 1882. (No model.)



Claim.—As an improvement in clocks, the combination, with the center arbor, of an axially-turning pinion or toothed segment having a fixed pointer-arm bent over the dial, with a vertically sliding and guided rack carrying a split movable stud, and with a pendulum-rod suspended from a fixed stud above the movable stud, substantially as set forth.

256,939. HEEL-PLATE. MORRIS D. WILLIAMS, Syracuse, N. Y. Filed Sept. 14, 1881. (No model.)

Claim.—The heel-plate A, of U-shape form, and adapted to pass around the outer surface of the heel, said plate at its lower edge having a flaring or wide bearing-surface, *a*, and decreasing in thickness therefrom to its upper edge, and provided with holes *c*, for connecting it to the heel, substantially as and for the purpose set forth.



256,940. MACHINE FOR DRYING AND COOLING GRAIN AND OTHER SUBSTANCES. STANLEY E. WORRELL, Hannibal, Mo. Filed Nov. 4, 1881. (No model.)

Claim.—1. In a drying and cooling device, the combination of the inclined revolving metal cylinder or case containing cups or troughs and partly inclosed or surrounded by a furnace or heating-chamber, with the means of producing a current of air, and appliances for varying the inclination of said cylinder and rotating it, substantially as described.

2. In a drying and cooling device, the combination of the inclined revolving metal cylinder or case containing cups or troughs and partly inclosed or surrounded by a furnace or heating-chamber, and appliances for varying the inclination of said cylinder and rotating it, substantially as described.

256,941. WHEEL-COLTER. WILLIAM B. YOUNG, Alton, Ill., assignor to Hapgood Plow Company, same place. Filed Dec. 2, 1881. (No model.)

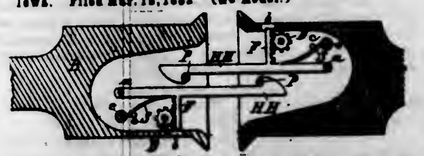
Claim.—In a wheel-colter, a hub-bem having the bearing *a*, shoulder *y*, and clutch *b*, in combination with the cap-bush A, having the recess *d*, with slit *e*, shoulder *r*, and bearing *c*, and with the plug-bush B, having the bearing *h*, oblique shoulder *m*, and extension *k*, all arranged and operating substantially as and for the purpose set forth.

256,942. FOLDING BEDSTEAD. CHARLES F. YOUNGBERG, Salt Lake City, Utah. Filed Mar. 18, 1882. (No model.)

Claim.—1. A folding cot constructed substantially as described, and provided with elastic strips I, for holding the canvas in position when folded, substantially as set forth.

2. In a folding cot, a head-rest provided with ratchet bars or props H, working in suitable notches K at the ends of the rails A, and secured by hoopers *h* and springs L, substantially as and for the purpose herein described.

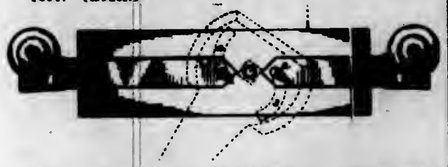
3. In a folding cot, the combination, with the canvas bottom having its edges corded, of cleats E, secured to the rails A and provided with a rabbet for holding said corded edges, substantially as herein described.



4. In a folding cot, the braces C, provided with studs *c*, for insertion in corresponding sockets in the rails A, substantially as and for the purpose herein described.

5. A folding cot having legs B, provided with lateral lugs *m*, for allowing them to be pivoted at exactly opposite points on the rails A, substantially as and for the purpose herein described.

6. In a folding cot, a hinge consisting of a staple, *f''*, and a right-angled strip or leaf, *f*, in combination with the bar F and prop H, substantially as herein described.

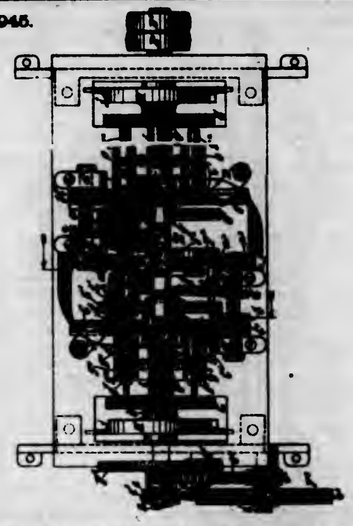


256,943. CAR-COUPLING. CARL G. A. ALEXANDER, Alden, Iowa. Filed Mar. 16, 1882. (No model.)

Claim.—1. The combination, with a draw-head, B, provided with a central opening, and a side opening, *b*, of the pivoted hook H H, rack-bar F, secured thereto, pinion D, spring S, and coupling-pin P, substantially as described, and for the purpose set forth.

2. The combination of the draw-head B, pivoted hook H H, rack-bar F, secured to said hook, shaft K, provided with the pinion D, ratchet-wheel R, and hand-wheel C, pawl A, spring S, stops *c*, and coupling-pins and stops P, substantially as described, and for the purpose set forth.

256,944. MACHINE FOR UPSETTING AND STRETCHING TIRES. ROBERT B. ALEXANDER, Niagara, Pa. Filed Nov. 16, 1881. (Model.)



Claim.—In combination with the sliding bars and operating-lever, the tire-holders pivoted to said sliding bars, and having the fixed jaw, the movable jaw, the threaded shank, and the screw grip or handle, all substantially as described.

256,945. MACHINE FOR TURNING SPOOLS. ERWIN ALLEN and JOHN H. HOGARSON, Norwich, Conn., assignors to the Allen Spool and Printing Company, same place. Filed June 16, 1881. (No model.)

Brief.—The spool-blank is taken from a hopper (which has an adjustable throat) by oscillating pairs of spindles. The spindles are moved lengthwise in their oscillating supports by stationary spring-pressed cams, and thus caused to approach each other. Two pairs of spindles are provided, which move alternately from the hopper to revolving cutters on each side, the bottom of the hopper being closed meanwhile by interlocking tongues extending from the spindle-supports. The points on the spindles which enter the central hole of the blank are made yielding. Spring-hook cams retract the spindles at the proper time.

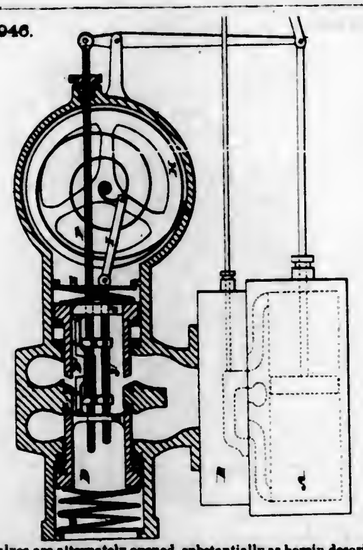
Claim.—1. In a spool-turning machine, the combination of a feeding-throat, a cutter or cutters, a pair of spindles movable toward and from each other, and having separately-yielding centers therein, which are adapted to enter the holes in the spool-blanks, a vibrating or reciprocating carrier in which said spindles are fitted, and which carries said spindles from said feeding-throat to said cutter or cutters for presenting spool-blanks to said cutter or cutters, and cams between which said spindles are carried, and which force the spindles toward each other to clamp a spool-blank between them, the centers of the spindles yielding when a spool blank which has not been bored is fed between the spindles, substantially as specified.

2. In a spool-turning machine, the combination of a feeding-throat, a cutter or cutters, a pair of spindles movable toward and from each other, a vibrating or reciprocating carrier in which said spindles are fitted, and which carries said spindles from said feeding-throat to said cutter or cutters, and spring-actuated pushers, which serve as cams, between which said spindles are carried, and which force said spindles toward each other to clamp a spool-blank between them, substantially as specified.

3. In a spool-turning machine, the combination of a central throat through which spool-blanks are delivered into the machine, a pair of pivoted carriers having their upper ends extending inward toward each other below said throat to form a support for the spool-blanks therein, and pairs of rotary spindles carried by said carriers, and which are alternately brought below said throat, substantially as specified.

4. In a spool-turning machine, the combination of a central throat, and two pivoted carriers, each having in it a pair of rotary spindles, which are alternately moved below said throat, and having their upper portions extending under said throat and provided with steps or depressions between the spindles of each pair, substantially as specified.

5. In a spool-turning machine, the combination of a central throat for spool-blanks, and two carriers having in them pairs of spindles which are alternately brought under said throat, and having their upper portions extending toward and past each other beneath said throat, so as to form a permanent support for the spool-blanks in said throat, substantially as specified.



6. In a spool-turning machine, the combination of a central feeding-throat, carriers, each provided with a pair of spindles, and which are brought alternately under said throat to receive a spool-blank between said spindles, and hinged guards, which form the opposite sides of said throat at its lower end, and which are adapted to be swung outward by the spool-blanks as the carriers and spindles holding said blanks are moved outward, but which cannot swing inward, and therefore serve to remove the spools from between the spindles as the carriers and spindles are moved inward past said guards, substantially as specified.

7. The combination of the throat *c*, the carriers B B', provided with arms *d d'*, the shaft F', the rods *d*² *d*³, and the shaft F, provided with cams F' F², for operating said rods to move said carriers in one direction, and the springs *d*⁴, for moving said carriers in the other direction, substantially as specified.

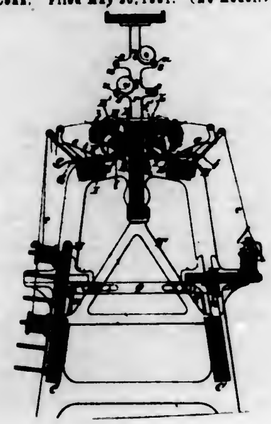
256,946. STEAM-ENGINE GOVERNOR. LEE W. ANDREWS, Live Oak, Cal. Filed Dec. 19, 1881. (No model.)

Claim.—1. The valves D D', reciprocating within a case and caused to close against central seats by springs E, in combination with the valve-stem F, having the central collar, *c*, the hinged pawls *i*, acting against the ends of this collar, and the arms K, whereby

256,946.

the valves are alternately opened, substantially as herein described.

2. The valves D D′, reciprocating in a case and having the pawls *i* resting against the ends of the collar *e* upon the reciprocating valve-stem F, and spring E, in combination with the arms K, secured to the rod J, which is reciprocated by the action of the balance-wheel H, said arms tripping the pawls and allowing the valves to close, substantially as herein described.



3. The valves D D′, reciprocated in a case, A, by the valve-stem F, and collar *e*, pawls *i*, and springs E, and having the seats *a*, said valves having flanges *b*, to inclose an air-cushion between themselves and the shoulder *c* of the cylinder, substantially as herein described.

4. In a governor for engines, a releasing mechanism constructed substantially as shown and described, and adapted to be operated by the isochronal vibrations of the pendulum or balance-wheel H, substantially as herein described.

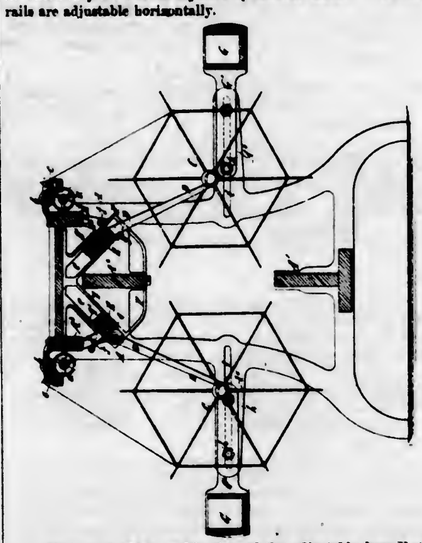
256,947. PROCESS OF TREATING FRUIT-TREES. JOHN M. ASKIN, Oshtemo, Mich. Filed Nov. 21, 1881. (No specimens.)

Claim.—The process of treating diseased fruit-trees, which consists in cutting awa the diseased branches, varnishing the trunk and branches with soap, burying under the roots cast-iron covered with a compound of condensed lye, lime, and sulphur, wetting the same, and in scattering over the ground sulphur and salt, in substantially the proportions specified.

256,948. MACHINE FOR DOUBLING AND WINDING SILK AND OTHER FIBROUS MATERIALS. JOHN E. ATWOOD, Stonington, Conn. Filed May 20, 1881. (No model.)

Claim.—1. The combination, with a winding-bobbin having a ratchet spindle-head and a friction-wheel for driving said bobbin, of drop-wires and a drop lever or pawl having its fulcrum arranged as described, whereby when the said lever or pawl is brought into operation by the breakage or giving out of a thread the said lever or pawl, by its action on the ratchet, produces not only the stoppage of the bobbin, but also raises the spindle out of contact with the driving-wheel, substantially as herein described.

2. The combination, with the elbow drop lever or pawl and the rail or support for the same, of an adjustable stand carrying said lever and an adjusting-screw for adjusting the stand upon said rail or support, substantially as and for the purpose herein set forth.



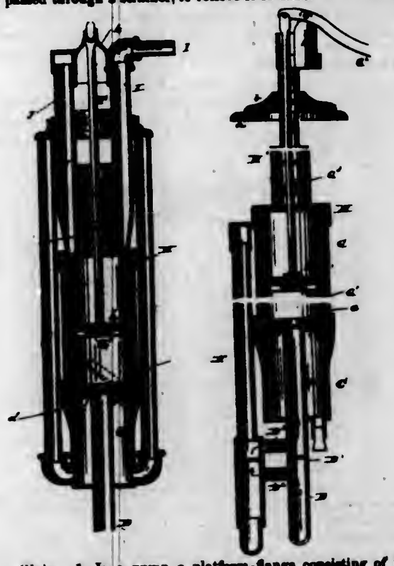
3. The combination, with a winding-bobbin spindle and means of driving the same and a stop-lever serving to stop the said spindle, of a sector-faced lever to be actuated by the friction of the material wound on the bobbin, and serving to bring the said stop-lever into operation on the spindle, substantially as specified.

4. The combination, with a winding-bobbin and a spindle therefor having ratchet-teeth on its head, and means for driving the said spindle, of the drop-lever G, which operates on said ratchet to stop the said spindle and the sector-faced lever L, actuated by the material on the bobbin and acting through the drop-lever to stop the spindle when sufficient material is on the bobbin, substantially as herein specified.

5. The combination, with the frame provided with cross-slotted or cross-grooved pocket-pieces, and the removable and convertible bobbin-boards or jack-boards fitted to said pocket-pieces, of supporting-braces Q, adjustable to be adapted either to bobbin-boards or jack-boards, substantially as specified.

256,949. MACHINE FOR WINDING SILK. JOHN E. ATWOOD, Stonington, Conn. Filed May 20, 1881. (No model.)

Brief.—The reels are supported in hangers attached to bars, which are supported transversely the machine in brackets or receivers formed with inclined slots converging upward toward the center of the frame. When different-sized reels are employed their height and also distance from the center of the frame may be varied by changing the position of the bars in the slots of the bracket in which they are held as adjusted by suitable means. The knee-rails are adjustable horizontally.



Claim.—1. The combination of the adjustable bars E, the hangers D, attached thereto, the supports or receivers F, constructed with upwardly-converging slideways or slots *e*, and means for holding said bars after adjustment, substantially as specified.

2. The combination, in a winding-machine, of the adjustable bars E, hangers D, attached thereto, the supports or receivers F, constructed with upwardly-converging slideways *e*, means for holding said bars after adjustment, and the knee-rails G, adjustable inward and outward, substantially as specified.

256,950. PUMP. JOHN BEAN and ROSCOE BEAN, Springfield, Ohio. Filed Dec. 17, 1881. (Model.)

Brief.—The platform or flange A is composed of two parts, *a b*, so arranged that the working parts of the pump may be withdrawn from the well and the stationary part remain fixed. J is an air-pipe and I the discharge. Water is drawn through D by piston G′ and delivered through L. Any water remaining above piston G′ will pass down through valve *h* when at rest and through *d* into chamber *c*, compressing the air in B B. When the pump is started this water will be forced out into the main stream and discharged. The water in rising in D is turned into pipe E, where it is passed through a strainer, to relieve it of sand.

Claim.—1. In a pump, a platform-flange consisting of the part *a* and the part *b*, substantially as described.

2. The combination of a two-part vertically and horizontally divided platform, a pump-section which is adapted to be fixed in a well, and a pump-section which is adapted to be removed from the section left in the well, substantially as described.

3. The combination of a vertically and horizontally divided platform, a pump-stock arranged above the same, and a pump-cylinder and its attachments arranged below the platform, substantially as described.

4. The stationary section of the pump, consisting of the flange *a*, the rods depending therefrom, the cylinder C, attached to said rods and adapted to receive the pump-cylinder G, and the suction-pipe D, substantially as shown.

5. The stationary section of the pump, consisting of a flange which sustains the lower cylinder, C, and the suction-pipe, substantially as described.

6. The stationary section of the pump, consisting of a flange, the suspension rods or tubes, the cylinder C, the suction-pipe, a tube communicating with the suction-pipe, and means for allowing the escape of sand from the cylinder, substantially as described.

7. The stationary section of the pump, consisting of a flange, the suspension rods or tubes, the cylinder C, the suction-pipe, tubes communicating therewith, a sand-box, and a suitable outlet from said box, substantially as described.

8. The stationary section of the pump, consisting of a flange, the cylinder C, and the suspension rods or tubes, forming air or vacuum tubes, and communicating with said cylinder below the bucket A, substantially as described.

9. The stationary section of the pump, consisting of a flange, the suspension rods or tubes, the cylinder C, the sand-box, a valve or gate at the lower end of the same, and a rod or handle extending to the top of the well, substantially as described.

10. The stationary section of the pump, consisting of the flange, the suspension rods or tubes closed at their upper ends and communicating with the cylinder C, and means for withdrawing the sand, &c., from said cap, substantially as described.

11. The combination of a flange, the suspension rods or tubes depending therefrom and communicating with the cylinder C, the suction-pipe extending upward in said cylinder and forming a valve-seat for the check-valve, and a pump-cylinder, G, detachable from said cylinder C, substantially as described.

12. The combination of the cylinder C, the suction-pipe therein, the flange *a*, leaving a space between it and the upper end of the suction-pipe, and the check-valve seated on flange *a*, substantially as described.

13. The combination of the cylinder C, the suction-pipe, and the flange *a*, perforated at *d*, having a space between them and affording seats for the check-valve, for the purpose described.

14. In a pump, the combination of the cap C, the flange *a*, provided with a perforation, *d*, and means for withdrawing the sand from the said cap, substantially as described.

15. The combination of the cylinder C, the suction-pipe therein, the diaphragm D′, water-passages D² D³, and an air-chamber, F, communicating with the said suction-pipe, substantially as described.

16. The combination of the cylinder C, the discharge-pipe therein, a sand-box communicating therewith, and an air-chamber above the sand-box, substantially as described.

17. For a pump, the combination of a sand-box, a strainer therein, and a tubular air-chamber extending above the same, substantially as described.

18. In a pump, a divided platform-flange constructed to allow the removal from the well of the working mechanism of the pump, substantially as described.

19. In a pump, a two-part vertically and horizontally divided platform-flange arranged to suspend a section of the lower part of the pump in the well after the working mechanism has been removed, substantially as described.

20. In a pump, the combination of a pump-cylinder, C, a discharge-pipe, I, a platform-flange, *a*, and a tubular air-chamber, J, independent of the discharge-pipe, adapted to allow of the withdrawal of the said parts G, I, and J from the well, substantially as described.

21. The combination, with a platform-flange, of a suspended cylinder, C, and the pump-cylinders G and H′, supported thereby, the said flange being constructed to allow of the withdrawal of the cylinders G and H′, substantially as shown.

22. In a pump, the combination of a divided or two-part flange-platform, a cylinder, C, its suspension rods or tubes, the pump-cylinder G, the suspending and holding-down discharge-pipe, and the air-chamber, substantially as described.

23. In a pump, the combination of a handle-standard and an air-chamber and discharge-pipe fixed to but removable from a non-chambered platform, said pipes communicating independently with the pump-cylinder between two pistons, for the purpose set forth.

24. In a pump, the combination of a stationary but removable discharge-pipe and a stationary and removable air-chamber when both communicate with the pump-cylinder through the head thereof and between two pistons, substantially as described.

25. In a pump, the combination of a two-part vertically and horizontally divided platform-flange and discharge-pipe, removable from part *a* of said flange, and connected to the handle-standard and communicating with the pump-cylinder between two pistons, for the purpose set forth.

26. In a pump, the combination of a cylinder, G, its removable top, cap, or head H, and a discharge-pipe and air-chamber connected to said cap H and communicating with the pump-cylinder below the cap, substantially as described.

27. In a pump, the combination of the removable cap H, the piston-cylinder G, flange A, and the suspending-tubes I J, substantially as described.

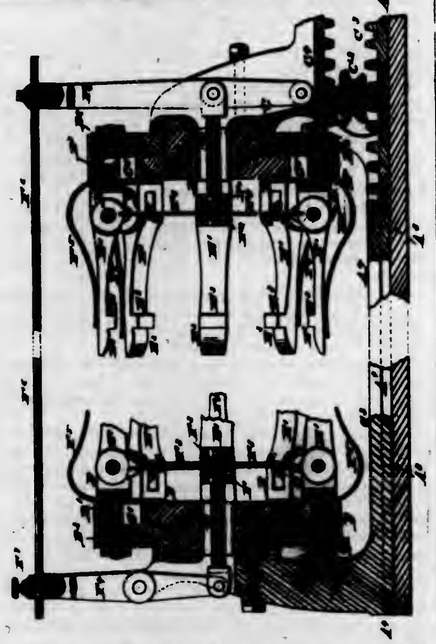
28. In a pump, the combination of the lower cylinder, C, the side supports thereof, and the divided platform to which these supports are secured, substantially as described.

29. The combination, in a pump, of the lower cylinder, C and its tubular side supports communicating with the pump-cylinder G above the check-valve, substantially as described.

30. The combination of the lower cylinder, C, provided with a chamber, a tube, and a water-passage, substantially as and for the purposes set forth.

31. The combination, in a pump, of the lower cylinder, C, provided with a valve, *e*, a seat for this valve, and a leak-hole, *d*, the suction-pipe D, forming part of said valve-seat, and means for drawing off sand, &c., from said cylinder, substantially as described.

32. In a pump, the combination of the lower cylinder, C, and one or more vacuum-pipes connecting said cylinder to the platform, and a discharge-pipe whereby the water is drawn out of the latter pipe when the pump is at rest, to prevent freezing, substantially as described.



33. In a pump, an air or vacuum chamber communicating with the pump-cylinder below the piston and above the check-valve through holes *d*, for the purpose specified.

34. In a pump, a frame which is intended to be fixed in the well, having at its upper end a flange-bearing to be sustained on

the curb, and pendants connected at their lower ends by a horizontal piece, and adapted to sustain the working parts of the pump, and to allow the same to be removed or replaced at pleasure, substantially as specified.

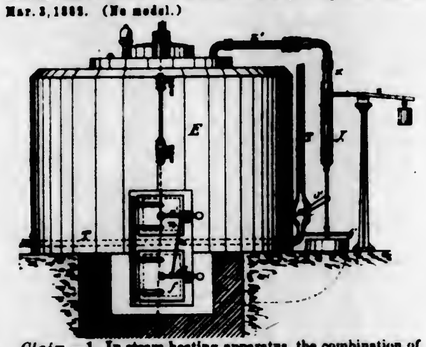
256,951. MACHINE FOR DRIVING HOOPS UPON CASKS. MARIA E. BRADLEY, Philadelphia, Pa., assignor of one-half to William Robert Thompson, same place. Filed Nov. 26, 1881. (No model.)

Brief.—The hoop-driving arms are pivoted to jaws radially adjustable in heads, which move toward and from each other simultaneously to any required distance. The arms are moved in and out radially by means of push-rods at the center of each head, which are simultaneously moved longitudinally, and which are connected to the driving-arms by elastic arms thereon.

Claim.—1. In a machine for driving hoops upon casks, the combination of radially-adjustable jaws D and arms E, hinged thereto, having claws F', with the pair of heads C and C', and arranged to reciprocate through varying distances in opposite directions by means of gearing propelled by a reversible driving mechanism, substantially as and for the purpose set forth.

2. In a machine for hooping casks, the trunk A, having V-shaped bearings A', adjustable thereon in height, and adapted to hold casks of different diameters centrally between the driving-heads C and C', in combination with said driving-heads, provided with arms E' and jaws D, radially adjustable thereon and arranged to reciprocate simultaneously in opposite directions, as and for the purpose set forth.

3. The combination of the rigid arms E', springs F', spring arms or levers F', operated by the rods F, having collars F' and F' thereon, and moved by the levers F', connected adjustably at F' by the rod F', for the purpose of adapting the machine to casks of different lengths, substantially as described and shown.



4. In a machine for driving hoops on casks, the combination of the rigid arms E', provided with shoulders E' and E', adapted to drive on or retract hoops from casks, with the elastic actuating-arm F', connected by the collars F' and F' on the rods F, for applying and releasing the shoulders E' and E' to and from hoops upon casks of imperfect circular form, as and for the purpose set forth.

5. In a machine for driving hoops on casks, the double series of arms E', having shoulders E' and E', adapted to drive on or draw off the hoops of casks, in combination with the rods F and the spring-levers F', and a driving mechanism adapted to move the pair of heads bearing both series of arms simultaneously in opposite directions, substantially as and for the purpose set forth.

6. In a machine for hooping casks, the combination of reciprocating heads C and C', operated by mechanism moving them variable distances simultaneously in opposite directions, and bearing rigid arms E, pressed inwardly by the springs F', with the elastic arms F', for the purpose of opening the arms E' and applying the shoulders of the several arms E to irregularities in the shape of the hoops, and driving the hoops on or drawing the hoops off from a cask, substantially as set forth and described.

7. The combination of the double series of arms E', connected elastically by the spring-arms F' and rods F to a single opening and closing mechanism, and hinged to the jaws D, with the pair of heads C and C', rigidly secured to said jaws D and arranged to move simultaneously in opposite directions, substantially as and for the purpose set forth.

256,952. APPARATUS FOR HEATING BUILDINGS. JULIUS ADOLPH BRUHN, Hagen, Westphalia, Germany, assignor of one-half to Carl Johann Diedrich Wilhelm Post, same place. Filed Mar. 3, 1882. (No model.)

Claim.—1. In steam-heating apparatus, the combination of the coupled doors *a* and *f*, for closing and opening simultaneously the stoke-hole N and ash-hole F, the air-conduit H, regulator J, and steam-pipe *s'*, for the purpose of maintaining a uniform pressure of steam within the boiler A, substantially as herein set forth.

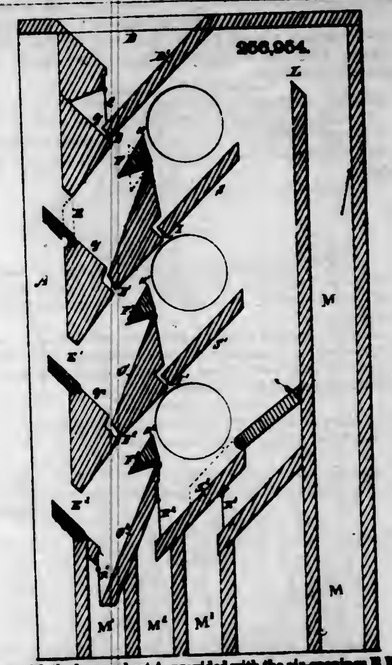
2. In combination, the coupled doors *f* and *a*, air-conduit H, regulator J, steam-pipe *s'*, fire-tube D, and intermediate space, L, arranged between the boiler A and the wall E, provided with air-cone F', as set forth.

3. The combination, with the boiler of a steam heating device, of the regulator J and the high-pressure steam-conduit T, having the valve G, connected by the lever *o'* to the regulator J, substantially as and for the purpose specified.

256,953. CAR-COUPLING. MICHAEL BERGAN, Mona Township, Ford County, Ill. Filed July 1, 1881. (No model.)

Claim.—1. The combination, with a draw-head, of a pivoted locking-latch longitudinally movable in the draw-head, and means, substantially as described, for moving said latch forward in the draw-head.

2. In a car-coupling, the combination, with the rigid draw-head pin, of a pivoted latch having a slotted bearing, substantially as described.

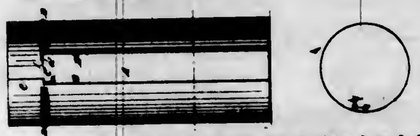


3. In a car-coupling, the pivoted and slotted gravitating latch, in combination with an expansion-spring forming a cushion for said latch, substantially as described.

4. The rigid draw-head pin and the pivoted and longitudinal movable locking-latch, in combination with a slotted arm rigid upon the latch, substantially as described.

5. The pivoted and longitudinal locking-latch, and the oscillating crank-shaft connected with said latch, in combination with the S-arm rigid upon the shaft, and a vertical lever pivoted to said arm, all arranged substantially as described.

256,954. APPARATUS FOR CLEANING GRITS. ARTUR BRAUN, Vienna, Austria-Hungary. Filed Nov. 16, 1881. (No model.) Patented in Austria Aug. 31, 1881, and in Hungary Aug. 31, 1881.

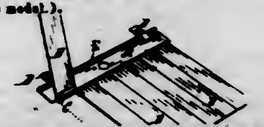


Claim.—1. In an apparatus for cleaning grits, the combination, with the box or chest A, provided with the air-openings E E' F' and the adjustable hinged gates E' E' F', of the inclined partitions O O' S S' and the pieces having their lower faces, Y Y' Y', arranged on the same inclined planes and arranged to leave between them the angular slots D' D' I' I', the upper parts of said slots being parallel with and the lower parts perpendicular to the lower faces of the said partitions and inclined planes, substantially as and for the purpose set forth.

2. In an apparatus for cleaning grits, the combination of the box or chest A, the pieces presenting the inclined planes Y Y' Y', the inclined partitions O O' O', having their lower faces arranged on the same inclined planes as those of said pieces, and arranged to leave angular slots at their points of nearest approach thereto, and the adjustable triangular prisms F F' F', hinged to the upper edge of the inclined partitions O O' O', directly facing the said slots, substantially as and for the purpose set forth.

3. In an apparatus for cleaning grits, the combination, with the box or chest A, provided with a series of air-openings and adjustable gates thereto, the hopper B, formed with slot D, and the inclined partitions O O' O' S S' F, and the pieces presenting on their lower faces the inclined planes Y Y' Y', arranged substantially in the same inclined planes as those of partitions O O' S S', of the adjustable triangular prisms F F' F', hinged to the upper edge of one series of inclined partitions, the vertical partition L, and the chutes M M' M' M', substantially as and for the purpose set forth.

256,955. SHEET-METAL PIPE. LEWIS F. BEEVE, Norton, Pa. Filed Sept. 13, 1881. (Model.)



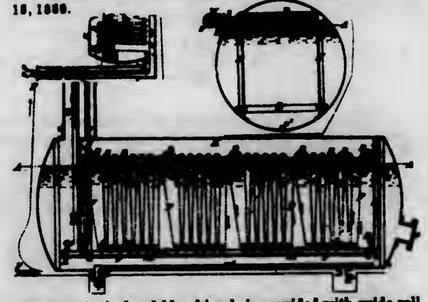
Claim.—1. A self-clasping sheet-metal pipe-joint formed of a single piece of metal having a tongue formed by bending one of the transversal edges of the metal in a radial direction to the body of the pipe, and a radial hook formed by the other transversal edge thereof, in combination with the portions O O' upon one extremity of the pipe, overlapping in a contrary direction to said tongue and hook, substantially as shown and described.

2. In a self-clasping sheet-metal pipe of the character herein specified, the combination, with the flat portions of the transversal edges O O', overlapping each other, of the tongue formed by bending one of the transversal edges below said portion O O' in a radial direction to the body of the pipe, the other corresponding edge being bent outward and inward, forming a hook projecting radially to the body of the pipe, substantially as and for the ends and purposes shown and described.

3. In a self-clasping sheet-metal pipe of the character herein specified, the combination, with the overlapping portions O O' of the transversal edges of the metal, of a radial hook formed by bending the remaining portion of one of the transversal edges from the body of the pipe and inwardly, and the radial tongue formed by bending the remaining portion of the other transversal edge of the metal outwardly from the body of the pipe, said radial tongue being cut away for a short distance below the overlapping portion O, substantially as and for the ends and purposes shown and described.

4. A self-clasping sheet-metal pipe-joint of the character herein specified, formed of a single piece of metal, A, having a radial hook, B', formed upon a part of one of its transversal edges, a radial tongue, B, upon a part of the other transversal edge, said tongue being cut away or beveled at *b*, and the overlapping portions of the transversal edges O O', the whole combined and arranged to operate substantially as shown and described.

256,956. RULER OR GUIDE FOR CUTTING FURS OR FUR TRIMMINGS. GABRIEL L. BROW, New York, N. Y. Filed Mar. 7, 1882. (No model.)



Claim.—1. The combination, in a fur-cutting ruler or guide, of a frame, A, fitted and provided with movable or lifting guides B, to secure a fixed back for the cutting-knife in each strip, substantially as described, for the purposes specified.

2. In a fur-cutting ruler or guide, the combination of a frame, A, with lifting-guides secured by hinges, movable independently of each other, and placed in a continuous line along the face or length of the frame A, all substantially as set forth.

3. The clamps D, having a hollow or mouth on one of their sides, which, in combination with the projection or rod E on the frame A, rigidly hold the frame A, substantially as shown, and for the purposes specified.

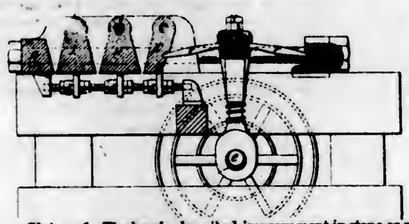
256,957. APPARATUS FOR BLEACHING WOVEN FABRICS, &c. WILLIAM BIRON, Salford, County of Lancaster, England. Filed Feb. 6, 1882. (No model.) Patented in England Nov. 18, 1880.

Claim.—1. A closed bleaching-keir provided with guide-rollers and a tube forming a seal-joint, arranged for the passage of the fabric or material to be treated to and from the keir through said tube, which has suitable feed and guide rollers, substantially as described.

2. A closed bleaching-keir provided with guide-rollers and a tube forming a seal-joint and containing a mid-feather, *m*, and arranged for the passage of the fabric or material to and from the keir on opposite sides of the feather through said tube, which has suitable feed and guide rollers, substantially as described.

256,958. WRITING-PEN. HOWARD D. BLACKWELL, Hemptonier, Vt. Filed Dec. 28, 1881. (Model.)

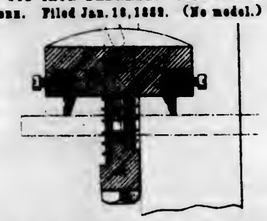
Claim.—1. An improved pen having a wall or partition extending entirely across and rigidly attached to the inner concave side of its body, substantially as shown and described, whereby the



256,958.

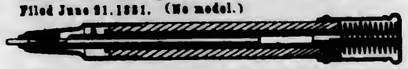
ink is prevented from flowing back and soiling the fingers of the writer and the pen strengthened and prevented from splitting, as set forth.

2. A pen having the hollow or concave inner side of its body provided with a cross wall or partition of hollow form on its face and set inclining or shelving toward the point of the pen from the interior of the body of the latter, whereby a bucket-shaped guard is formed within said body to catch and hold any ink running back within it, substantially as herein set forth.



256,959. STONE-CRUSHER. THEODORE A. BLAKE, New Haven, Conn. Filed Aug. 13, 1881. (No model.)

Claim.—1. The herein-described improvement in stone or ore crushers, consisting in a stationary and a movable jaw, combined with one or more jaws arranged intermediate between said movable and stationary jaws, and adapted to receive crushing movement from said movable jaw, substantially as described.



2. The herein-described improvement in stone or ore crushers, consisting in a stationary and a movable jaw, combined with one or more jaws arranged intermediate between said movable and stationary jaws, and adapted to receive crushing movement from said movable jaw, and mechanism, substantially such as described, to adjust the position of the said jaws relatively to the stationary jaw, substantially as described.

256,960. PIG-IRON BREAKER. THEODORE A. BLAKE, New Haven, Conn. Filed Jan. 16, 1882. (No model.)

Claim.—In a pig-iron breaker, the breaking block or blocks provided with a rubber spring to receive the transverse strain produced in breaking the pig, substantially as described.

256,961. LEAD AND CRAYON HOLDER. CLARE W. ROMAN, New York, N. Y., assignor to Joseph Reckendorfer, same place. Filed June 21, 1881. (No model.)

Claim.—1. The combination of the lead-tube with the grasping-jaw and the pin or contrivance for causing the jaw to grasp the lead when the tube is moved longitudinally with reference to the pin, the whole being constructed and capable of operating in combination, substantially as set forth.

2. The combination of the lead-tube with the grasping-jaw and the pin and the case and nozzle, substantially in the manner and for the purposes set forth.

256,962. WAGON-SEAT LOCK. EBENEZER H. BOOTH, West Cedarville, N. Y. Filed Feb. 21, 1882. (No model.)

Claim.—In a safety-lock, the combination, with the base-plate and its bearings *g*, *h*, and *u*, of the grooved clamp-hook and the cap-plate having the marginal bearing *s* and the cam-rib *x*, substantially as specified.

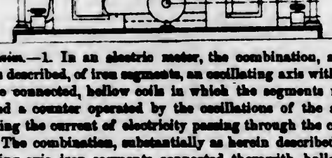
256,963. VENTILATOR FOR GRAIN, FRUIT, &c. LAFAYETTE T. BOW, Burkesville, Ky. Filed Jan. 21, 1882. (No model.)

Brief.—Perforated tubes A have detachable penetrating-points B, to facilitate their passage into the hay, &c., to be ventilated.

Claim.—1. In a ventilator for grain, hay, &c., the combination of a perforated pipe, the detachable conical penetrating-point, and a screw-coupling, or its equivalent therefor, substantially as described.

2. The combination of the spiral penetrating-point, the screw-thread coupling, and a ventilating-tube which is thickly perforated and to which said point is removably secured, substantially in the manner and for the purpose described.

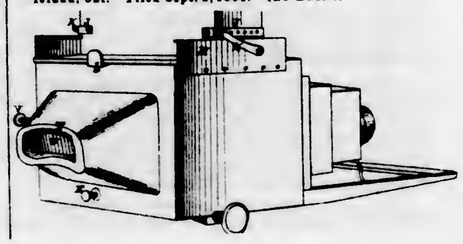
256,964. TUYERE. FREDERICK BOWER, Barnhart's Mills, Pa. Filed Nov. 15, 1881. (No model.)



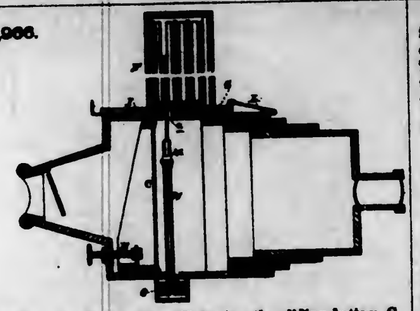
Claim.—1. A tuyere made, substantially as herein shown and described, of two or more coiled pipes, as set forth.

2. A tuyere made of the pipes B and C, coiled parallel with each other, substantially as herein shown and described, and for the purposes set forth.

3. In a tuyere, the combination, with the coiled pipes B and C, of the band D, surrounding the tuyere and holding the pipes together, substantially as herein shown and described, and for the purpose set forth.



256,965. ELECTRIC METER. CHARLES V. BOYS, Wing, near Oakham, County of Rutland, England. Filed Feb. 2, 1882. (No model.) Patented in England Oct. 15, 1881.



Claim.—1. In an electric meter, the combination, substantially as described, of iron segments, an oscillating axis with which they are connected, hollow coils in which the segments reciprocate, and a counter operated by the oscillations of the axis for measuring the current of electricity passing through the coils.

2. The combination, substantially as herein described, of an oscillating axis, iron segments connected therewith, hollow coils in which the segments reciprocate, a counter operated by the oscillations of the axis, and additional coils and a contact maker and breaker, essentially as and for the purposes set forth.

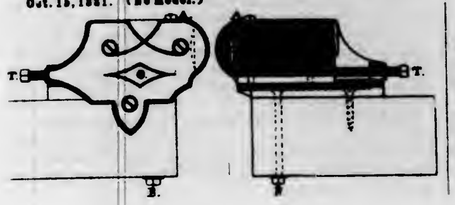
256,966. CAMERA ATTACHMENT. WILFRED L. BROWN, Mare Island, Cal. Filed Sept. 8, 1881. (No model.)

256,966.

Claim.—1. The plate-box F, having the sliding bottom G, made adjustable between guides H upon the top of the camera, as shown, in combination with the false bottom I, secured to the top of the camera and corresponding in thickness with G, the slot *a*, and the plate-elevator M, substantially as and for the purpose herein described.

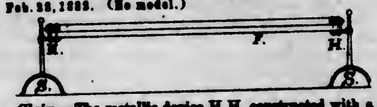
2. In a photographic camera, the plate-elevator consisting of the horizontal bar M, having the spring R fixed beneath it, and having the bars N hinged to it at each end, while their opposite ends have nuts O loosely hinged to them, so as to traverse the screws P, together with the gears and crank, substantially as herein described.

256,967. CHURN. ORANGE L. BRUNER and WHITZEL LEWIS, Malta Road, Mo. Filed Jan. 23, 1882. (No model.)



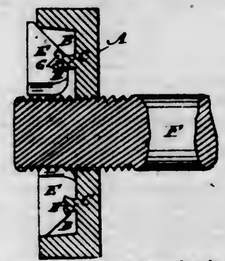
Claim.—In a reciprocating churn, the combination of the two uprights D, connected together by the cross-piece F, with the slotted guide P, which is secured upon the top of the cross-piece F, and which is provided with the projections R, to catch over the edge of the cross-piece, the slots in the guide being formed outside of the edge of the cross-piece, so as to be in a direct line with the dasher-rod, substantially as shown and described.

256,968. WEIGHT FOR EXTENSION-LAMPS. EDSON L. BRYANT, Ansonia, Conn., assignor of one-half to Wallace & Sons, same place. Filed Mar. 5, 1882. (No model.)



Claim.—The herein-described weight for lamp-fixtures, consisting of the cast-metal body A, constructed with annular groove or grooves *a*, combined with the sheet-metal covering B, spun into the annular groove or grooves, substantially as described.

256,969. BED. HIRAM BUCKINGHAM, Hartford, Conn. Filed Oct. 15, 1881. (No model.)

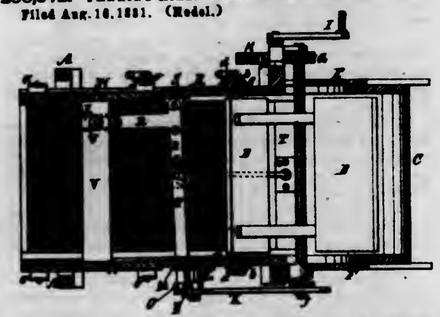


Claim.—In combination with a bed-frame, the device consisting of a dovetail slide, D, secured to the end rail by bolt A, the dovetail slide-cast B, secured to the side rail by bolt B and screw T, all constructed as described, and for the purpose of adjusting the tension of the fabric of which the bed is constituted, whether of woven wire or other material.

256,970. BED. HIRAM BUCKINGHAM, Hartford, Conn. Filed Feb. 28, 1882. (No model.)

Claim.—The metallic device H H, constructed with a notch or slot, N, to fit on the cross-bars of standards S S, combined with the bed-frame F F, and secured to the same by bolts B B, as described, and for the purposes set forth.

256,971. NUT-LOCK. JOSEPH H. BURROWS, Boise City, Idaho, assignor of one-half to Barnet E. Light. Filed Dec. 30, 1881. (No model.)



Claim.—1. A nut made, substantially as herein shown and described, with one or more recesses in its face, which recesses are provided on their bottom with a transverse ridge or projection, as set forth.

2. The combination, with the screw-bolt F, of the nut A, provided with one or more recesses, B, provided on the bottom with a projection, C, and of the keys E, provided in the bottom edge with two diverging recesses, G, forming a nose, H, between them, substantially as herein shown and described, and for the purpose set forth.

3. In a nut-lock, the wedge E, having one end sharpened and the other end beveled inwardly from the top to the bottom, and provided with the diverging recesses G, forming a nose, H, between them, substantially as herein shown and described, and for the purpose set forth.

256,972. FANNING-MILL. JONATHAN D. BUSH, Lebanon, Mo. Filed Aug. 16, 1881. (Model.)

Claim.—1. In a fan-mill, the combination, with the fan-shaft B, the upper shoe, W, and the lower shoe, T, of the crank J, the pivoted bent lever K, the lever P, the angle-bar H, the lug-plate Y, and the rod Z, substantially as herein shown and described, whereby the upper shoe will be vibrated laterally and the lower shoe longitudinally from the said fan-shaft, as set forth.

2. In a fan-mill, the combination, with the casing B, the crank J, fan-shaft B, and the vibrating lever P, provided with pin N, of the bent lever K, having its ends slotted and pivoted at its bend to the said casing, substantially as and for the purpose set forth.

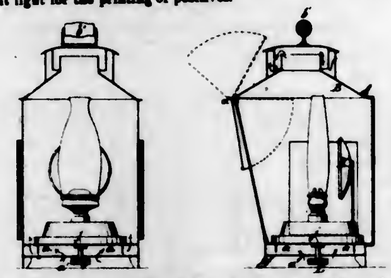
3. In a fan-mill, the combination, with the slotted lower end

of the bent lever K, having flange or foot Q, and the end of the lever P, of the band O, having pin N, substantially as herein shown and described, whereby the wear and friction are lessened, as set forth.

4. In a fan-mill, the combination, with the cross-bar V of the upper shoe, W, and the lever P, of the slotted angle-bar R, the cross-plate X, having center thimble and end holes, and the pin U, substantially as herein shown and described, whereby the movement of the said shoe can be regulated, as set forth.

5. In a fanning-mill, the combination, with the casing B, the fan-shaft E, crank J, the bent lever K, and the upper shoe, W, of the lever P, and the angle-bar R, pivoted to the side of the said casing, and having the arm operating the shoe slotted, substantially as and for the purpose set forth.

6. In a fan-mill, the combination, with the casing B, the fan-shaft E, the crank J, the bent lever K, the upper shoe, W, and the lower shoe, T, provided with socket-plate *a*, of the lever P, the angle-bar R, the lug-plate Y, and the rod Z, substantially as and for the purpose set forth.



256,973. KEY FOR MUSICAL INSTRUMENTS. AUGUST CAESAR, New York, N. Y., assignor to Caesar Bros., same place. Filed Feb. 20, 1882. (No model.)

Claim.—As a new article of manufacture, a key for musical instruments the body of which is covered by an enameled plate of copper or other metal, substantially as and for the purpose set forth.

256,974. PHOTOGRAPHIC LANTERN. JOHN CARBUTT, Philadelphia, Pa. Filed Mar. 8, 1882. (No model.)

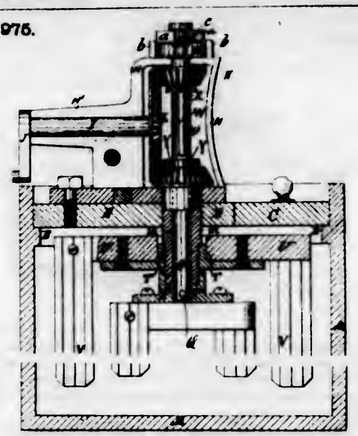
Brief.—The light can be used to furnish non-actinic rays for the coating, manipulation, and development of the plates, or a white diffused light for examining the condition of the plates, or a clear bright light for the printing of positives.

Claim.—1. A photographic lantern having on one side a window of colored glass or other material and on another side a window of semi-transparent material with a movable shutter.

2. A photographic lantern having on one side a window of colored glass or other material and on another side a window of semi-transparent material with a movable shutter, and containing a light and reflector adapted to be turned to throw the light through either window.

3. A photographic lantern containing a movable light and reflector, and having three windows, one with colored glass or other material, another semi-transparent, and a third of clear glass or open, the latter two windows being provided with shutters, all substantially as described.

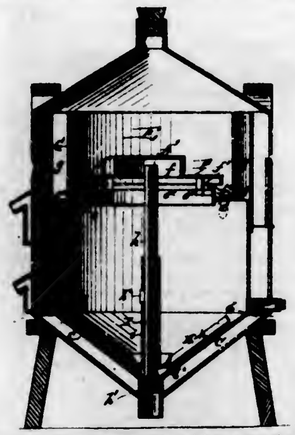
4. A photographic lantern having windows on three sides, two provided with shutters, and a lamp and reflector on the inside mounted on a pivot in the base of the lantern, and means for turning the lamp on its pivot.



5. A photographic lantern having two or more windows and shutters for one or more of the windows, with a lamp and reflector mounted on a pivot, and a device on the exterior of the lantern for turning the lamp and reflector.

6. A photographic lantern having a window and a hinged deflector, D, with wings *d'*, substantially as described.

256,975. CHURN. JOHN COCHRAN, Jr., Millwood, Mo. Filed Sept. 8, 1881. (No model.)



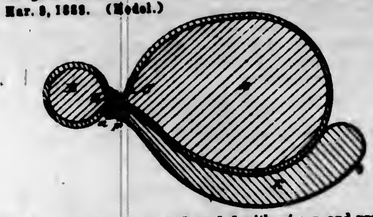
Claim.—1. In a churn, the combination, with the gear-wheels L N, provided with the recesses X Y, and the shaft O, provided with the tongues W, of the ring-flange Z, provided with recesses *c*, and the cross-head *a*, provided with arms projecting from opposite sides, substantially as and for the purpose set forth.

256,976.

2. In a churn, the combination, with the casing H, the shaft O, and the ring-flange Z, provided with recesses *b*, of the cross-head *a*, provided with arms projecting from its opposite sides, substantially as and for the purpose set forth.

256,976. MILK-COOLER. CHARLES COLBY and EDWARD BRAHMALL, Benton Harbor, Mich. Filed Sept. 27, 1881. (No model.)

Claim.—1. In an apparatus for raising cream, the cooling-pan adapted to fit upon the milk-reservoir and provided with an annular air-passage for the descent of cold air into the milk-reservoir, and also provided with vertical side passages for the ascent of the warm air, substantially as shown and described.



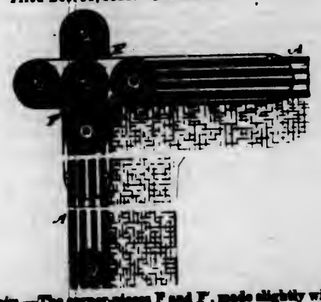
2. In an apparatus for raising cream, the cooling-pan E, provided with the flange *e'* around a central opening in its bottom, the elevated disk F, with annular cold-air passage *f''*, and the vertical side passages, *g*, for warm air, substantially as described.

3. In an apparatus for raising cream, the wiper consisting of a rod, *h*, with the slotted tube arranged to slide longitudinally thereon, the funnel-shaped disk fitted upon the tube, and the arm extending out from the disk and carrying material suitable for wiping the bottom of the milk-reservoir when the wiper is turned about its axis, substantially as described.

4. The combination, in an apparatus for raising cream, of the milk-reservoir having a funnel-shaped bottom, with the wiper H and the cooling-pan E, having an opening through which access can be had to the wiper, and a cap for closing the said opening, substantially as described.

5. The combination, in an apparatus for raising cream, of the milk-reservoir with the wiper consisting of the rod *h*, the tube I, arranged to slide upon said rod and carrying a disk, and the arm extending out from said disk and adapted to hold the wiper-cloth, substantially as described.

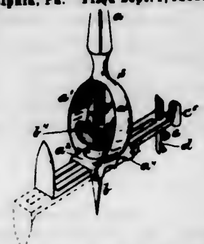
256,977. HORSE-COLLAR. GEORGE P. COLE, Johnstown, N. Y., assignor of one-fourth to Potter Hadden, same place. Filed Mar. 8, 1882. (Model.)



Claim.—1. The sweat-pad corded with wire *a*, and provided with wire staples G, as means for attaching the pad to the collar, substantially as specified.

2. The combination, with the sweat-pad and collar, of the wire *a*, bound in the edge of the sweat-pad, and having an eye-extension, *f*, at the lower end and a point-extension, *g*, at the upper end for connection with said collar, substantially as specified.

3. The combination of wire *a*, clips *d*, rivets *e*, pad E, staples G, and collar A B C, substantially as specified.

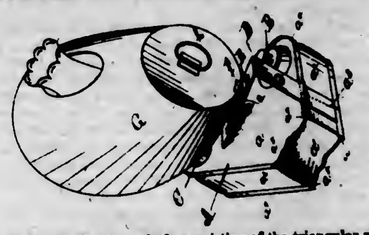


4. The sweat-pad constructed with the wire at its edge and for attachment to the collar, substantially as specified.

256,978. CARPET-FASTENER. JAMES A. COLE, Northville, N. Y. Filed Dec. 30, 1881. (No model.)

Claim.—The corner-pieces F and F', made slightly wider than the strips A, and provided at one end with diagonal or longitudinal corrugations and at the opposite end with two or more bosses, substantially as and for the purpose described.

256,979. EXTENSION-BIT AND WASHER-CUTTER. JOHN W. COOPER, Philadelphia, Pa. Filed Sept. 1, 1881. (No model.)



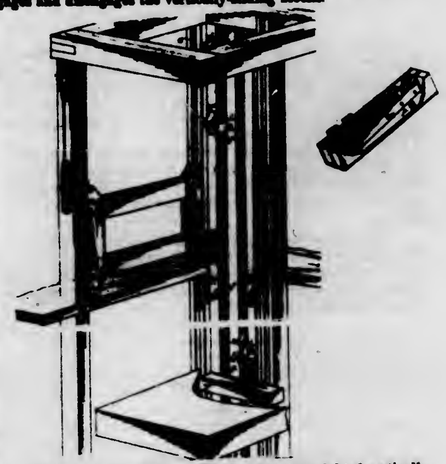
Claim.—1. In a device for cutting washers, the combination, substantially as hereinbefore set forth, of the bit-shank *a*, the lateral arms *a' a'*, extended from the lower end of the bit-shank and curved, as shown, the head *a²*, formed between the lower ends of the curved arms, and having formed through it the vertical opening to receive the centering-pin, and provided on its under side with groove to receive the cutter-bars and the centering-pin, and adapted to receive and hold the cutter-bars, as set forth.

2. The combination, with the frame S, constructed with the lateral arms *a' a'*, curved as shown, and having the head *a²*, provided with a vertical opening, *a³*, the centering-pin *b*, and nut *b'*, of the pendent screw-shank *b²*, arranged as shown and described, and for the purpose set forth.

3. The combination, with the bar *c*, constructed with the enlargement *c'* and opening *c²*, of the cutter *d*, the gage *e*, and the set-screw *c³*, substantially as set forth.

256,980. LAMP AND REFLECTOR FOR GAME. PATRICK H. COTTER, Dallas, Tex. Filed Feb. 8, 1882. (No model.)

Claim.—1. The lamp-body consisting of the triangular plates *a a'*, the beaded band *a²*, seamed at *a³*, and provided with the suspension and reflector-supporting strap D and at one corner with the filling-opening and at the corner opposite the seam *a³*, with the burner C, substantially as shown and described.



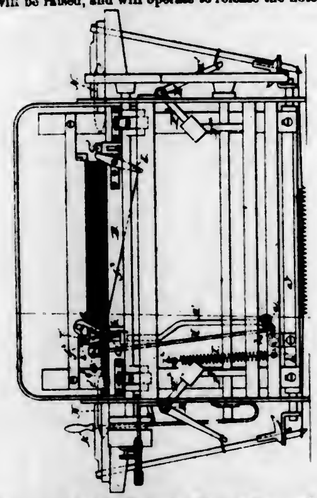
2. The strap D, provided with the clip E, having its edges turned inward, in combination with the tongue F, secured to the reflector G, substantially as shown and described.

3. The combination of the reflector-supporting strap D, slanted as shown, with the reflector G, consisting of a frustum of a cone, the lower shorter side of which terminates below and beneath the burner, and the upper longer side of which projects beyond the chimney and is perforated for the passage therethrough of the chimney, substantially as shown and described.

4. The reflector G, consisting of a frustum of a cone, the top of which is closed by a concavo-convex disk provided with a handle and with a tongue, F, the upper side of which extends beyond and is perforated for the passage of the chimney, the lower side of which extends and terminates beneath the burner, in combination with a lamp-body provided with a slanted strap, D, having a clip, E, thereon, substantially as shown and described.

256,981. AUTOMATIC GATE FOR ELEVATORS. JAMES CHERING, Dubuque, Iowa. Filed Nov. 15, 1881. (No model.)

Brief.—A counterweighted vertically-moving gate provided at its corners with friction-rollers is connected by endless cords passing over pulleys with vertically-moving blocks in the side of the elevator-shaft. A system of levers in the side of the elevator is operated by a series of inclines in the side of the shaft and engages and disengages the vertically-sliding blocks.

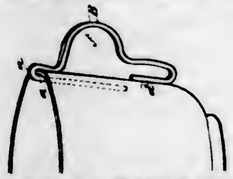


Claim.—1. In an elevator-shaft, a counterweighted vertically-moving gate provided at its corners with friction-rollers and connected by endless cords with vertically-moving blocks, said cords passing over pulleys, substantially as described, and for the purpose set forth.

2. In an elevator-shaft provided with a series of inclines, the vertically-moving blocks, as described in combination with a system of levers placed in the adjacent side of the elevator, said blocks being connected by endless cords with a vertically-moving counterweighted gate, all the parts arranged and operating as shown and described.

256,982. LOOM STOP-MOTION. JAMES W. T. DAVIDSON, Brownville, Ala., and DOUGLASS GREEN, Columbus, Ga. Filed June 16, 1881. (Model.)

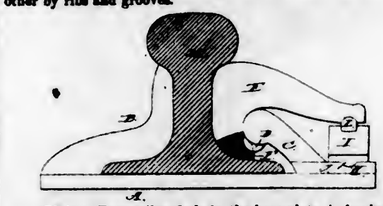
Brief.—When the weft or filling breaks the head or weighted end of a lever mounted in the shuttle drops into position to engage either of two flirts or levers pivoted upon the opposite ends of the lathe. A small shaft mounted on the lathe and connected to the levers which unship the shipper-handle has connected to it a notched rod, that engages the heel of one of the flirts. When the latter is turned by contact with the lever carried in the shuttle its heel is disengaged from the notched rod, and the shaft is thus permitted to turn and effect the release of the shipper-handle. The flirt at the other end of the lathe is connected by a lever and wire with the one just referred to, in order that contact of the weighted lever with either flirt may operate to stop the loom. A bar resting upon the warps and pivoted upon the reed-cap has one of its arms connected by an intermediate lever with the first-named flirt, whereby when the shuttle flies upward out of its path the bar will be raised, and will operate to release the notched rod.



Claim.—1. A shuttle, N, having the groove *n* and slanting notch *n'*, and provided with the pivoted weighted lever P, having the tail *p'*, and the loop *p²*, in combination with the pivoted flirt C, the bent rod A', provided with the notch *f''*, the shaft *a'*, the rod H, spring I, angle-lever G, pivoted lever K, and shipper-handle *k'*, substantially as specified.

2. The combination, with the lathe and the flirts C and C', pivoted to opposite ends of the lathe, of the lever L, and wire *f'*, connecting said flirts, the bent rod A', rod H, spring I, shaft *a'*, angle-lever G, lever K, and the shipper-handle *k'*, substantially as specified.

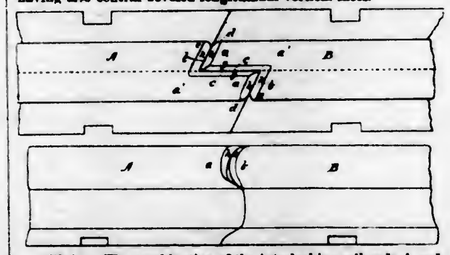
3. The lathe and reed and the bar R, having the arms *r*, the lever S, having arms *s s'*, the flirts C C', and the wire *f²* and lever L, in combination with the bent rod A', having shoulder *f''*, the rod H, spring I, shaft *a'*, angle-lever G, lever K, and shipper-handle *k'*, substantially as specified.



256,983. DETACHABLE HANDLE FOR TEA-CUPS, &c. JOHN W. DAVIS, Marion, S. C. Filed Feb. 24, 1882. (No model.)

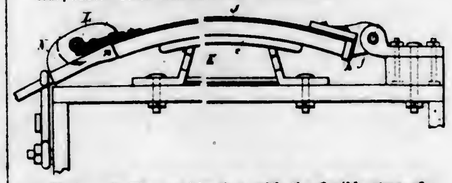
Claim.—As an article of manufacture, the removable handle for cups and similar vessels, made substantially as herein shown and described, consisting of the spring-metal handle B, bent to form the prongs *e*, the fold *d*, and the grasp *f*, as set forth.

256,984. RAILROAD-CHAIR. WILLIAM W. DAWLEY, Mount Holly, Vt. Filed Oct. 1, 1881. (No model.)



Brief.—The base-plate has a cheek for one side of the rail and an abutment serving as a fulcrum on the other side for a lever cheek-piece, which is strained in position by a wedge between it and the base-plate. The parts are kept in proper relation to each other by ribs and grooves.

Claim.—In a railroad-chair, the base-plate A, having cheek-piece B, groove H, provided with transverse recesses K, the abutment C, having stud D, in combination with the grooved removable cam-piece E, having recess F, and the spring-key I, having guides L and J and the rabbeted end, substantially as and for the purposes set forth.

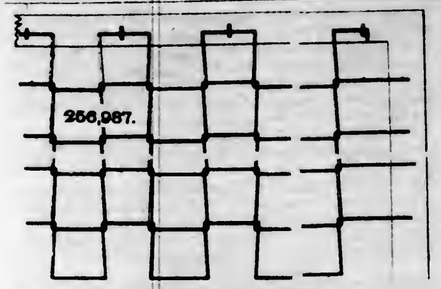


256,985. RAILWAY-RAIL. WILLIAM W. DAWLEY, Mount Holly, Vt. Filed Oct. 8, 1881. (No model.)

Brief.—The interlocking rail ends have acute-angular beveled projections and shoulders extending to the rail center, and having also central beveled longitudinal vertical faces.

Claim.—The combination of the interlocking rail ends A and B, having the acute-angular projections *a* and acute-angular shoulders *b*, beveled respectively at *b* and *b* and extending to the rail center, and the central vertical faces *c* in the direction of the length of the rail, provided with the bevels *g g*, substantially as and for the purposes specified.

256,986. STAVE-BENDING MACHINE. HENRY DE RUE, Riverside, Ohio. Filed Jan. 21, 1882. (No model.)



Claim.—1. The combination, with the flexible strap of a wood-bending machine, of the end lever hinged thereto by a plate, N, which takes a bearing on the strap and serves to slightly lift the lever, as set forth.

2. In a stave-bending apparatus, the combination of the former E *e*, strap J, pivoted abutments *h n*, and the pivot-bearing L, attached to and at or nearly in line with the strap, substantially as set forth.

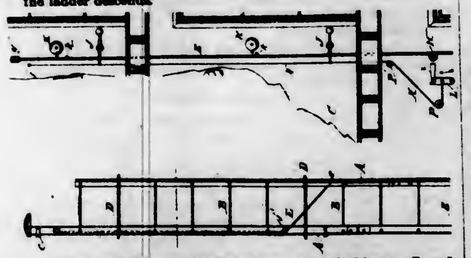
256,987. COAL-SCREEN. WILLIAM F. DODDS, Wilkes-Barré, and THOMAS M. RICHTER, Sandy Run, Pa. Filed Dec. 16, 1881. (No model.)

Claim.—1. The screen-netting formed of crenelated or looped wires interlocked, substantially as shown and described.

2. A screen having its meshes or interspaces formed by interlocked loops of wires extending from one side to the opposite side of the frame, substantially as shown and described.

256,988. GUIDE FOR SEWING HARNESS. WILLIAM C. DUFFEY, Calhoun, Ga. Filed Sept. 19, 1881. (Model.)

Claim.—A slotted and apertured plate-spring, B, arched to carry the top guide, twice bentat one end where it is to be attached to the bed A, carrying the channeling-knives on opposite sides, the pressure-roll suspended from the arch, and the side rolls arranged on each side of the arch, said knives and the holders of the rolls being adjustable by screws, whereby there is formed an attachment which may be used in connection with a sewing-machine, as and for the purpose specified.

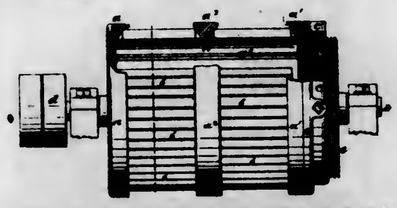


256,989. SPOON. AMELIA C. FELSENBERG, Newark, N.J. Filed Mar. 2, 1882. (No model.)

Claim.—A spoon, A, provided with the lip B, when the same extends farther upon one side of the spoon-bowl than the other, substantially as shown and described.

256,990. FIRE-ESCAPE. FRANK P. FISH, New York, N. Y. Filed Feb. 21, 1882. (No model.)

Brief.—The crank-arm of the shaft which holds the weighted cable is held from turning by a notched button, which is connected to a controlling-rope, that may be released from any story of the building. Projections on the weighted cable strike alarm-bells as the ladder descends.

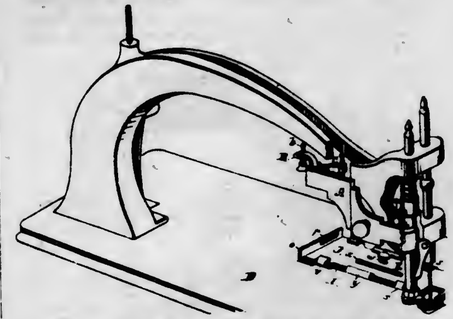


Claim.—1. The combination of an end-notched button, L, and a shaft, H, having a crank-arm, *i*, adapted to lock in the notch of said button and to hold the movable upright A' in folded position, as described.

2. The combination, with a wall, C, having pulleys P P' and pin *j*, of the cable N and button L, whereby the upright A' may be unlocked from any story of the building and allowed to drop into position for immediate use, as described.

3. The combination, with a dropping upright, A', of a weighted cable, E, having the projections *k k* and one or more bells, K, whereby the dropping of the upright causes a fire-alarm to be sounded, as described.

256,991. LATHE FOR TURNING POLYGONAL BODIES. JOHN H. FISHER and CASSIUS C. PECK, New York, N. Y.; said Fisher assignor to said Peck. Filed Jan. 3, 1881. (No model.)



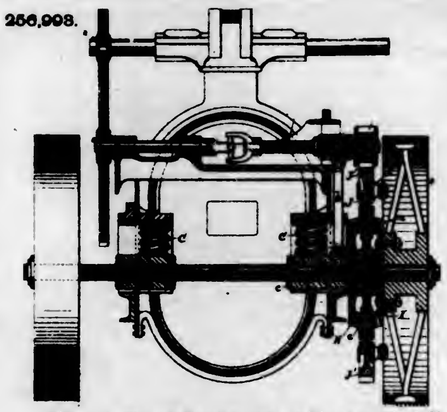
Claim.—1. In combination with the cylinder A, fixed flange *a*, and one or more intermediate adjustable flanges, *a' a²*, the tightening device consisting essentially of the nut *c*, engaging with the cylinder, for forcing said movable flanges toward the fixed shoulder *a*, for the purpose and substantially in the manner specified.

2. In combination with the cylinder A, the flanges formed with a series of annular shoulders, *a'*, for the reception of the ends of the blanks, and the inclined bearing-surfaces *a²*, for the purpose and substantially in the manner set forth.

3. In combination with the cylinder A, the flanges formed with the series of annular shoulders *a'*, for the reception of the ends of the blanks, substantially in the manner and for the purpose described.

4. In combination with the cylinder A, provided with a fixed flange, *a*, and an adjustable flange, *a'*, adapted to receive the thrust of the tightening device, the intermediate sliding flange, *a²*, provided with bearing-surfaces on both sides for engaging the adjacent ends of two series of blanks, substantially in the manner and for the purpose described.

256,992. SEWING-MACHINE ATTACHMENT. ALFRED A. FISHER and ALBERT HART, San Francisco, Cal. Filed June 14, 1881. (No model.)



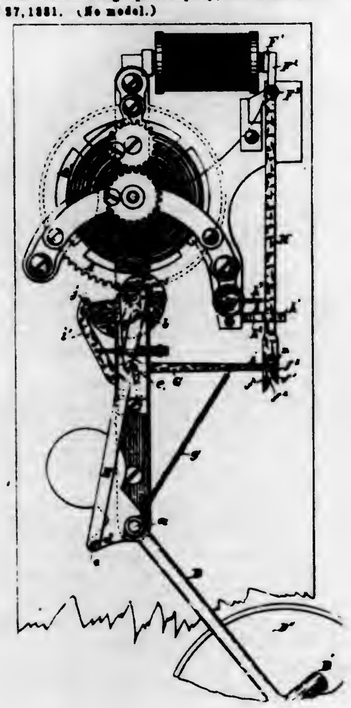
Claim.—1. A sewing-machine attachment consisting of the plate I, with its shoulders *u*, side flange-guides, *s*, wide end *t*, and slots *q* and *r*, and the plate J, with its side flanges, *v*, down-turned end *b'*, hole *w*, and slot *x*, arranged and used substantially as and for the purpose herein described.

2. In a sewing-machine having an adjustable presser-foot and fixed arm and an oscillating or vibrating needle-arm, the strip A, pivoted to the presser-arm, as shown, one end fitting under a screw or projection, *c*, on the pressure-shaft and its other end provided with points B and C, having set-screws *b* and *c*, fitting under the presser-arm and needle-arm, respectively, substantially as and for the purpose herein described.

3. In a sewing-machine having an adjustable presser-foot and fixed arm and an oscillating or vibrating needle-arm, the combination of the strip A, with its points B and C and screws *b* and *c*, and pivoted to the presser-arm, as shown, whereby its function is that of a lever acting upon the presser-foot at each stroke of the needle-arm, and the attachment consisting of the plate I, with its guide and slots, as shown, and the adjustable plate J, with its slots, as shown, and its down-turned end *b'*, arranged substantially as and for the uses and purposes herein described.

256,993. TRACTION-ENGINE. ABRAHAM O. FRICK, Waynesborough, Pa. Filed Mar. 7, 1882. (No model.)

256,993.

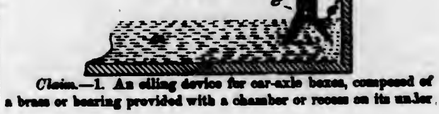


Claim.—1. The combination, with a driving gear-wheel, K, and the axle, of a compound wheel arranged upon the axle and having a laterally-flexible toothed rim and draft-connection between said toothed rim and the inner or web portion, substantially as shown and described.

2. The combination, with the body of the engine and the axle having springs interposed between the same, of a counter-shaft located above the axle and having a universal joint in the same, with a pinion, K, a movable bearing for the counter-shaft connected to the axle by a link, and a compound wheel located on the axle and provided with a laterally-flexible toothed rim, substantially as shown and described.

3. The combination, with the compensating-gears H I J *c*, of a laterally-flexible toothed rim and draft-connections between the rim and its web portion J, as described.

256,994. ELECTRO-MAGNETIC ESCAPEMENT MECHANISM. JAMES H. GARDINER, Hackensack, N. J., assignor to the Gamewell Fire Alarm Telegraph Company, New York, N. Y. Filed June 27, 1881. (No model.)

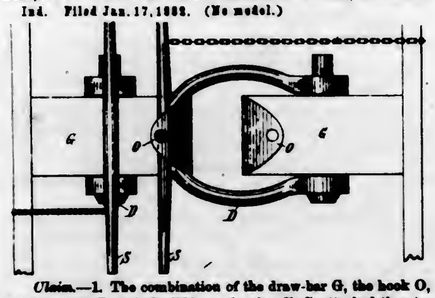


Claim.—1. The duplex electro-magnetic and mechanical escapement consisting of the magnet F, with its pivoted armature and swinging arm H, provided with escapement devices consisting of the forked ends *f* and *f'* of said lever, provided with notches *f*² and *f*³ on inner edges thereof, and the lever G, having pin *n*, and constructed and arranged to engage the arm H and to actuate a stop device, as and for the purpose described.

2. The combination of the magnet and armature, the arm H, lever G, stop *d'*, crank-arm C, cam I, and spring *g*, as and for the purpose described.

3. The combination, with the hammer D and gong D', the revolving crank-arm C and link-bar E, of the escapement mechanism described, consisting of the magnet F, with its pivoted armature F', arm H, lever G, stop *d'*, cam I, and springs *g* and *h*', all constructed to operate as and for the purpose described.

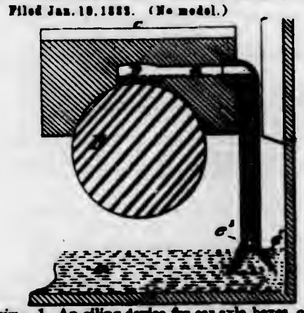
256,995. BLUING-PACKAGE. ROBERT W. GILLETT, Chicago, Ill. Filed Feb. 13, 1882. (No model.)



Claim.—1. A holder for laundry-bluing, consisting of a hollow reticulated and open-ended receptacle provided with a removable stopple and with an extension, substantially as described, whereby the receptacle may be manipulated, as set forth.

2. A holder for laundry-bluing, consisting of a hollow reticulated and open-ended receptacle having a removable stopple, which forms therewith a drip-cup, said receptacle being provided with an extension, substantially as described, to manipulate the same, as set forth.

3. As an article of manufacture, a hollow reticulated open-ended receptacle in which a mass of laundry-bluing is sustained, substantially as described, said receptacle being provided with an extension or handle to manipulate the same, and adapted as well for use as a tool, substantially as set forth.



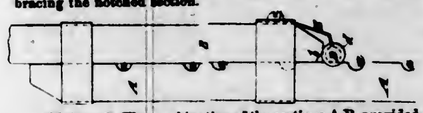
256,996. CAR-COUPLING. NEWTON J. GLOVER, Waveland, Ind. Filed Jan. 17, 1882. (No model.)

Claim.—1. The combination of the draw-bar G, the hook O, and the clevis D with the lifting rod or handle S, attached thereto, substantially as described.

2. The draw-bar G, hook O, and clevis D, with handle S, in combination with the lever N, sliding in the eye of arm J, substantially as shown and described.

256,997. CAR-AXLE BOX. GEORGE F. GOBLE, Philadelphia, Pa. Filed Jan. 19, 1882. (No model.)

Claim.—1. An oiling device for car-axle boxes, composed of a brass or bearing provided with a chamber or recess on its under



side, a pump or oil-lifting device, and a passage between said chamber and lifting device, said pump or lifting device being constructed substantially as shown and described, and caused to operate by the vibratory motion of a moving car, as set forth.

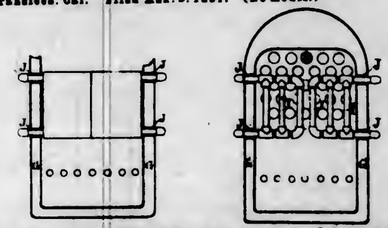
2. In combination with a car-axle box, a brass or bearing provided with a chamber or recess on its lower or the side next the axle, a pump or lifting device, and a passage-way between said chamber and pump, whereby when said pump is operated by the vertical vibratory motion of the axle-box to lift oil to said chamber such oil will be further assisted to rise thereto by the partial vacuum created in said chamber by the revolution of the axle, substantially as set forth.

3. In a car-axle box, the combination, with a brass or axle-bearing provided with chamber D, of a tube, *c*, carrying valve *c'*, piston F, spring *f*, and valve *f'*, substantially as shown and described.

256,998. EXTENSION-LEG FOR SCAFFOLD-SUPPORTS. JOSEPH GORMAN, Elizabeth, N. J. Filed Feb. 18, 1882. (No model.)

Brief.—Consists of two sections, one provided with a series of notches and the other with a notch at its lower end, and a leaf-spring with a dog engaging the notches, and having flanges embracing the notched section.

Claim.—1. The combination of the sections A B, provided one with a series of notches and the other with a dog or catch, D, and the leaf or flap spring E, substantially as and for the purpose specified.

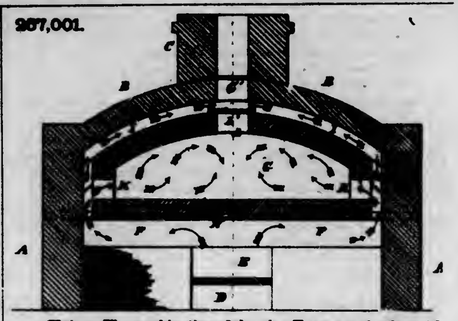


2. The combination of the sections A B, provided one with a series of notches, *a*, and the other with a notch, *b*, the dog or catch D, provided with flanges *d*, and the leaf or flap spring E, substantially as and for the purpose specified.

256,999. FASTENING FOR LACES. THOMAS GREEN, Northampton, County of Northampton, England. Filed Aug. 11, 1881. (No model.) Patented in England May 27, 1881.

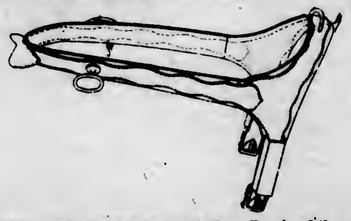
Claim.—A lacing-grip consisting of the metal base-plate A formed with the outer folded portion, *d*, the wall *c*, and the inner folded portion, *e*, having its free extremity extended in close proximity to the wall *c*, to prevent the lacing inserted between the base-plate and the portion *e* from gaining access to the space behind the latter, as and for the purpose described.

257,000. STEAM-BOILER FURNACE. CONRAD I. HALL, San Francisco, Cal. Filed Aug. 5, 1881. (No model.)



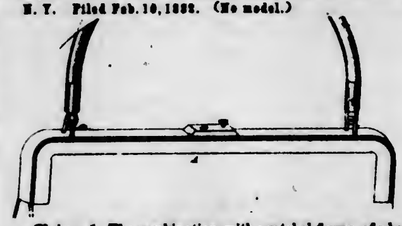
Claim.—1. In a steam-boiler furnace, the circulating-pipes I or water-back, Figs. 5 and 6, when connected with said furnace in four places by continuing all four ends of the pipes, or the ends of pipes correspondingly projected from water-back through the tubes J, set in water-walls G of furnace, when said pipes connect above and below in the water-space of boiler, so as to maintain a water-circulation between each side of furnace and the pipes I or water-back, as the case may be, substantially as and for the purpose herein described.

2. In a steam-boiler furnace, the circulating-pipes I or water-back, Fig. 5, when divided in two parts, each part being connected with the next adjacent water-wall G of furnace, as and for the purpose described.



257,001. INSIDE OVEN. SAMUEL HALL, Chicago, Ill. Filed Mar. 8, 1882. (No model.)

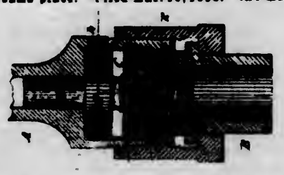
257,001.



Claim.—The combination of chamber F, communicating with the fire-box, baking-chamber G, chamber J, flue C, ducts I and K, opening L, dampers L' and C', and outer wall, A B, all made substantially as and for the purpose set forth.

257,002. HORSE-COLLAR. WILLIAM H. HALL, New York, N. Y. Filed Feb. 9, 1882. (No model.)

Claim.—The combination, with the collar A, of the separate breast-band B, inclined downwardly to the front from the points of attachment to ends of the collar, and provided at its lower rear ends with loops and buckles, whereby the collar and breast-band will set on a horse, as shown, and for the purpose specified.

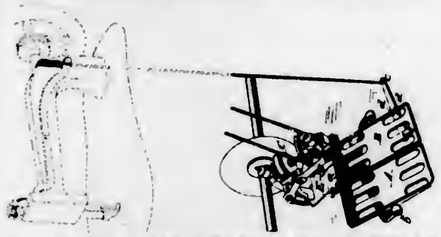


257,003. BAG OR SATCHEL. ROBERT HARRIS, Peekskill, N. Y. Filed Feb. 10, 1882. (No model.)

Claim.—1. The combination, with a satchel-frame, of a handle which is connected at one end to a staple in the frame in the usual manner and provided at the other end with a padlock, the loop of which is adapted to be fastened to or separated from a second staple in the frame by means of a suitable key, as and for the purpose specified.

2. A bag or satchel having one end of its handle connected with the satchel-frame by a padlock and staple, for the purpose specified.

257,004. ADJUSTABLE PITMAN. WESTEL E. HAWKINS, Wallingford, Conn., assignor of one-half to Walter J. Leavenworth, same place. Filed Mar. 13, 1882. (No model.)

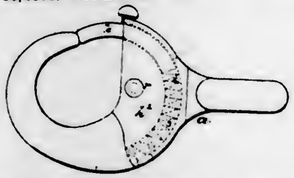


Claim.—1. The combination, in an adjustable pitman, of the two parts A B, the one part arranged to move longitudinally in a

recess in the other part, with a spindle taking a bearing on one part and screw-threaded into the other part, with a locking-sleeve to bind the two parts together, substantially as described.

2. The combination, in an adjustable pitman, of the two parts A B, the one part arranged to move longitudinally in a recess in the other part, with a spindle taking a bearing on one part and screw-threaded into the other part, with a locking-sleeve to bind the two parts together, the said spindle provided with a collar, G, with an opening, h, through the part in which it is arranged, and means, substantially such as described, for rotating the said spindle through said opening, substantially as described.

257,005. TREADLE FOR SEWING-MACHINE MOTORS. GEO. A. HEATH, Warren, Wis. Filed Mar. 15, 1882. (No model.)



Claim.—1. A treadle for use in connection with a motor, substantially such as referred to, consisting of the section A, having the arm *a* connected with the shifting-lever of the motor, and the section B, overlapping arm *a* and connected with the presser-foot lever of a sewing-machine, as set forth.

2. The herein-described treadle, consisting of sections A B, connected respectively with the shifting or clutching lever of a motor and with the presser-foot lever of a sewing-machine, and adapted, substantially as described, to be operated both independently and in unison, as and for the purpose explained.

3. In combination with the treadle A, having arm *a*, the treadle B, overlapping said arm, and provided with the detachable arm *c* and screw or fastening *f*, as and for the purpose set forth.

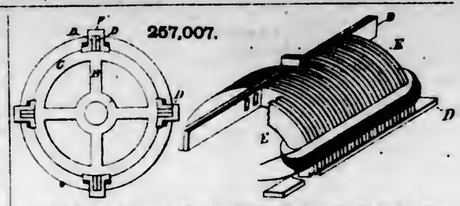
4. In combination with the treadle B, the arm *c*, provided with lugs or hooks *d*, and the fastening-screw *e*, as and for the purpose set forth.

257,006. SNAP-HOOK. ALFRED S. HERR, New Haven, Conn. Filed Feb. 24, 1882. (No model.)

Claim.—A bolt snap-hook consisting of the circularly-grooved body portion *a* and the complemental circularly-grooved cap-plate *b*, riveted thereto, and forming therewith a circular recess to receive the curved bolt and spring, substantially as specified.

257,007. DYNAMO-ELECTRIC MACHINE. WILLIAM HOCHHAUSEN, New York, N. Y. Filed Feb. 17, 1882. (No model.)

Brief.—The armature-cores in the form of gratings are secured to supporting-disks slotted to receive them by clamps. Clamps are also placed centrally to prevent bulging of the segments by centrifugal force.



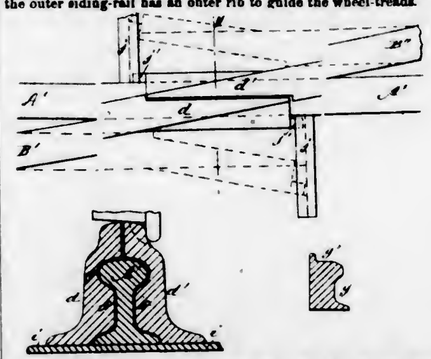
Claim.—1. The combination of the notched spider-frame, the armature-sections having longitudinal projecting bars or rods D, and the clamps F, secured to the spider-frame.

2. The combination, with the notched spider-frame, of the detachable armature-sections, each consisting of the longitudinal bars D, connected by a series of parallel bars or rods, E.

3. The combination, substantially as described, of the armature-sections having the longitudinal projecting bars or rods, the notched spider-frames, and the clamps seated in the notched spider-frames and embracing the ends of the bars or rods.

4. The combination, substantially as described, with two adjoining detachable armature-sections, each having a longitudinal bar or rod, of a clip, H, embracing the abutting bars so as to prevent bulging at the middle.

257,007.



5. An armature-carrier provided with slots distributed and arranged in the manner shown, so that each slot extends only part way circumferentially and only sufficiently far to overlap some other slot in the same section.

6. The combination, substantially as described, of the bars D and their connecting-segments, the notched spider-frames, and the clamps F, embracing and clamping the ends of the abutting bars in two adjoining sections.

257,008. RAILROAD-SWITCH. JOHN H. HORTMAN, Hopewell, N. J. Filed Jan. 21, 1882. (No model.)

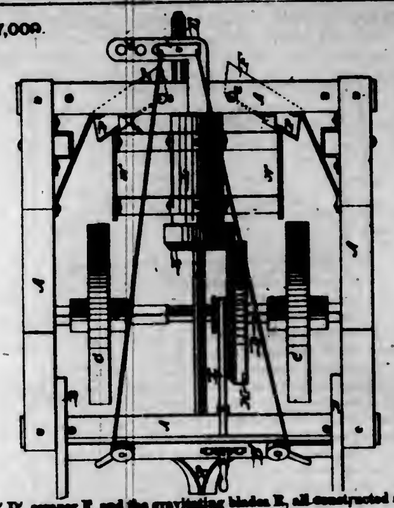
Brief.—The meeting ends of the siding-rails, where they bridge the main-track rail, are diagonally scarfed, and are formed to correspond to the configuration of said main-track rail, the ends of said siding-rails moving under guide-plates. The forward end of the outer siding-rail has an outer rib to guide the wheel-treads.

Claim.—1. In a railway-switch, the rails B′ B″, having their ends diagonally scarfed and provided with the swells or enlargements *f* to fit the sides of one of the main rails, and with recesses *g*, for inclosing the tread of the same, substantially as and for the purpose set forth.

2. In a railway-switch, the rails B′ B″, having their ends diagonally scarfed and of a thickness equal to the depth of the flanges of the wheels of the car, and provided with the swells or enlargements *f* to fit the sides of one of the main rails, and with recesses *g*, for inclosing the tread of the same, substantially as and for the purpose set forth.

3. In a railway-switch, the combination, with the main rail A′ and the guides *j*, of the rails B′ B″, having the diagonally-scarfed ends *d d*, and provided with the swells or enlargements *f*, the recesses *g*, and the projections *j*, substantially as and for the purpose set forth.

4. In a railway-switch, the switch-rail B, provided with the tapering side extension, *g*, having the upwardly-projecting flange *g′*, substantially as and for the purpose set forth.



5. In a railway-switch, the rail B, provided with the tapering side extension, *g*, having upwardly-projecting flange *g′*, and the rails B′ B″, having the diagonally-scarfed ends *d d*, and provided with the swells or enlargements *f* and the recesses *g*, the rail B′ having tapering and inclined ends *b*, in combination with rails of the main track and the means for operating the said switch-rails, substantially as and for the purpose set forth.

257,009. COTTON-CULTIVATOR. JOSIAH R. HOWARD, Clinton, N. C. Filed Feb. 23, 1882. (No model.)

Brief.—In this machine are combined scrapers, choppers, center plows, and gravitating hillers. The guide-wheel is swiveled and turned by ropes attached to a cross-head. A loose gear-wheel for clutch device. Draft and guide wheel to one side of center.

Claim.—1. The combination of the adjustable draft-frame A, pinion K, revolving chopper N, guide-wheel E, supporting-wheels

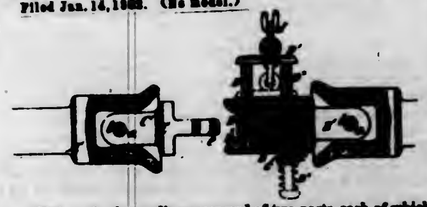
257,009.

D′ D′, scraper F, and the gravitating blades E, all constructed and arranged to operate substantially as set forth.

2. The combination, with the draft-frame and its supporting-wheels, of rotary choppers, adjustable scrapers, furrow-plows, and gravitating earthing-up blades, substantially as and for the purpose described.

3. In a cotton-chopper, the pivoted gravitating earthing-up blades E E, formed as shown, in combination with the heads *i* and slots *j*, substantially as described.

257,010. CASE FOR PRESERVING FOOD. JONATHAN J. HOYT, Chelmsford, Mass. Filed Sept. 1, 1881. (No model.)



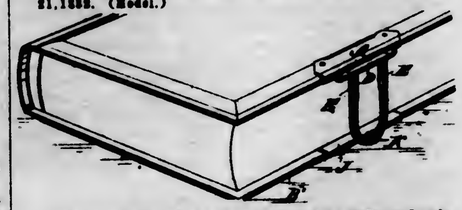
Claim.—1. The combination of the glass case D E, the protectors B B′, the ring-clamps A A′, and screw-bolts F, as and for the purpose specified.

2. The combination of the glass case D E, provided with notched flanges C′ C′, the ring-clamps A A′, and screw-bolts F, as and for the purpose specified.

3. In combination with a glass case, D E, provided with notched flanges C′ C′, as herein described, the ring-clamps A A′, provided with vertical annular flanges, and the screw-bolts F, as and for the purpose specified.

257,011. CAR-COUPLING. DAVID T. HUBBELL, Bethel, Conn. Filed Jan. 14, 1882. (No model.)

Claim.—1. A coupling compound of two parts, each of which is provided with a tongue or shank adapted to enter an ordinary draw-head and be secured therein by the ordinary coupling-pin, one of said parts being provided with a vertical bar or yoke and the other with jaws, between which said bar or yoke is received, and a transversely-movable locking pin or bolt adapted to engage with said bar or yoke, substantially as herein described.



2. In a coupling, the combination of the part C, provided with the tongue or shank C′, which is arranged out of the center vertically, so as to adapt the coupling for cars having draw-heads at different heights, and also provided with the bar or yoke *c*, the part B, provided with the shank or tongue B′, and the vertical slot or opening B″, forming jaws, and the transversely-movable locking pin or bolt D, all constructed and operating substantially as and for the purpose specified.

3. The combination of the part B, the locking pin or bolt D, its attached guide-rod D′, the spring *e*, the tripping-lever E, and the part C, having a bar or yoke, *c*, substantially as specified.

4. The combination of the part B and its transverse pin or bolt D, the part C and its bar or yoke *c*, the lever G, and the lever *i*, connected with said lever G, substantially as specified.

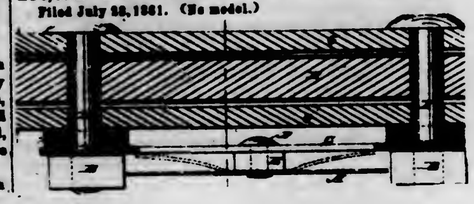
5. The combination of the part B and its transverse locking pin or bolt D, the part C and its bar or yoke *c*, the lever G, and the lever *j*, connected with said lever G, substantially as specified.

257,012. ALBUM-CLASP. PHILIP NEUBLAND, New York, N. Y., assignor to E. & H. T. Anthony & Co., same place. Filed Jan. 21, 1882. (Model.)

Claim.—1. An album-clasp made substantially as herein shown and described, and consisting of a loop or bow of coiled elastic wire adapted to be held at its ends to the edge of a book or album cover, as set forth.

2. In an album-clasp, the combination, with the swinging sockets E, of a bow or loop made of coiled wire, the ends of the bow being secured in the sockets, substantially as herein shown and described, and for the purpose set forth.

3. In an album-clasp, the combination, with the swinging sockets E, of a bow or loop made of coiled wire, having its ends secured in these sockets, and of a U-shaped loop or stiffening-wire, F, contained within the bow formed by the coiled wire, substantially as herein shown and described, and for the purpose set forth.



4. In an album-clasp, the combination, with the plate A, provided with swinging sockets E, of a bow or loop made of coiled wire, surrounding a U-shaped loop, F, and of the plate J, provided with a headed stud or catch, K, substantially as herein shown and described, and for the purpose set forth.

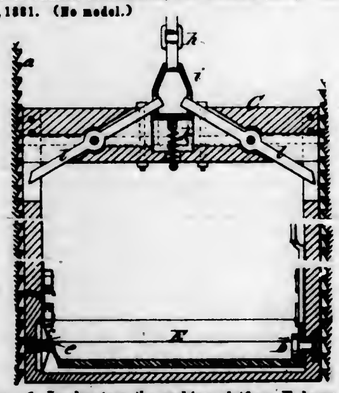
257,013. FENCE. HENRIE B. JOHNSON, Paducah, Ky. Filed Mar. 8, 1882. (Model.)

Claim.—The fence having uprights secured together at their upper and lower ends by means of stringers, and braced together at their centers and bottoms upon opposite sides by strips or braces which have their ends secured in place by means of the braces C and I, substantially as shown and described.

257,014. NUT-LOCK. WALTER B. JOHNSON, Waterloo, Ind. Filed July 28, 1881. (No model.)

Claim.—The elastic plate A, made shorter than the distance between the nuts B B, and at the middle rigidly connected with the washer-plate C, which connects the bolts F F, whereby the ends of said plate may be bent down to allow the nuts to be screwed on or off, but otherwise will resist and prevent the nuts from turning around on the screws, as described.

257,015. CLOTHES-LINE FASTENER. WILLIAM H. JOSSELYN, Bridgeport, Conn. Filed Aug. 16, 1881. (No model.)



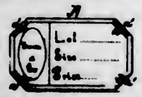
Claim.—1. A fastener, A, for a rope or cord, formed in substantially one piece, with a body portion, F, to receive the bight of the rope, a cross-recess, *d*, above said body portion, to receive the slack end portion of the rope, and a longitudinal recess, *e*, in front of said cross-recess, to receive the taut portion of rope, whereby the latter is caused to draw down upon and confine the transverse end portion, substantially as set forth.

2. A rope or cord fastener formed in substantially one piece, with a body portion, F, sockets *a* and *b* on opposite sides thereof, a transverse recess, *d*, above the socket *a*, and a longitudinal recess, *e*, in front of said transverse recess, substantially as set forth.

3. A rope or cord fastener formed in substantially one piece, with a body portion, F, sockets *a* and *b* on opposite sides thereof, a transverse recess, *d*, above the socket *a*, a longitudinal recess, *e*, in front of the recess *d*, and a circumferential groove, *g*, around the portion F, substantially as set forth.

257,016. PLATFORM-ELEVATOR. THOMAS KEITH, New York, assignor to Charles E. Hesserole, New Rochelle, N. Y. Filed Nov. 25, 1881. (No model.)

Claim.—1. In elevators, the rocking platform E, hung by pivots *b*, combined with the elevator-frame and provided with latching devices, substantially as shown and described.



2. In elevators, the latch-piece *e* and tripping-dog *f*, in combination with the pivoted platform E, substantially as shown and described, for operation as set forth.

3. In elevators, a tilting platform retained normally in place by a latch, and tripping devices placed to release and tip the platform, combined for operation substantially as shown and described.

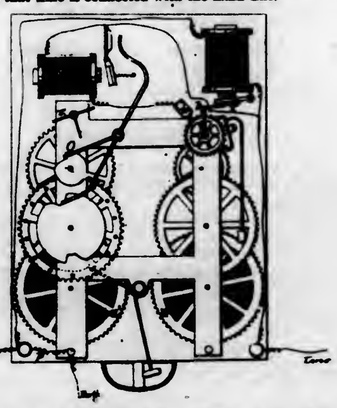
4. In elevators, the combination, with a double-inclined platform pivoted at its mid-length, of spring *g* and latch *e*, substantially as shown, for the purposes set forth.

5. The combination, with an elevator, of the stopping and starting chain *n*, having thereon a two-holed block, *n*, the standard-arm O, having end eye, *o'*, and the pin *p*, all arranged as shown and described.

257,017. GARMENT TAG OR TICKET. JOHN KELLER, New York, N. Y. Filed Jan. 11, 1882. (No model.)

Claim.—As an improved article of manufacture, the ticket A, having the indentations or openings *a* along its edges, as and for the purpose specified.

257,018. OVEN. THOMAS A. KELLETT, Laporte City, Iowa. Filed Nov. 3, 1881. (No model.)



Claim.—1. A slide for ovens, consisting of two V-shaped surfaces which have a suitable opening between them for the escape of the heated air, substantially as shown.

2. In a bake-oven, the combination of the base B, having suitable openings through it, and provided with the projections C, with a sheet-iron plate that is placed upon the projections, and a grate which is provided with a second plate for the article being baked to rest upon, substantially as described.

3. In a bake-oven, the combination of the perforated base having a sheet-metal base placed above it, a grate provided with a second plate, a slide having its surface formed into two or more V shapes, and suitable fines for carrying off the hot air from the oven, substantially as set forth.

257,019. TELEPHONE-ALARM. JAMES F. KETTELL, Worcester, Mass. Filed Sept. 3, 1881. (No model.)

Brief.—At each station a branch or ground circuit normally disconnected from the main line contains a magnet, which controls a mechanically-operated bell. At the several stations, *exclusive*, this branch is connected with the main line by a clock-work which moves synchronously with a transmitting-clock at the central office. The transmitter at starting sends an impulse to line, starting all the clock-trains, and then at any desired point in its revolution it sends a second impulse, thereby calling up the station which at that time is connected with the main line.

Claim.—1. A clock mechanism normally at rest, an electro-magnet and armature arranged in the main-line circuit for controlling said clock mechanism, a main circuit, a branch or grounding circuit, two electrodes, one of which is a revolving arm and the other a stationary spring or point, an alarm mechanism consisting of a spring-impelled train of gears, as described, and an electro-magnet and armature arranged in said branch or grounding circuit for releasing the self-impelled alarm mechanism, all constructed to act in combination in the manner and for the purposes herein set forth.

2. A number of stations in a single electric circuit, each comprising a clock mechanism normally at rest, an electro-magnet and armature arranged in said circuit for controlling said clock mechanism, a branch or grounding circuit, two electrodes, one of which is a revolving arm and the other a stationary spring or point, an alarm mechanism consisting of a spring-impelled train of gears, as described, and an electro-magnet and armature arranged in said

branch or grounding circuit for releasing said alarm mechanism, the revolving arm-electrode of each station being also normally at rest, so that when said electrodes are released by their respective electro-magnets by a single impulse generated upon the main line, they will each rotate synchronously for one revolution, during which they will close the circuit through their respective branch or ground wire, each at a different period of the revolution, thereby releasing their self-impelled alarms through the electro-magnet and armature in the said branch circuit.

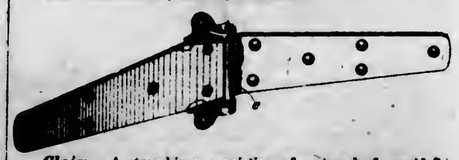
3. A clock mechanism at the central station normally at rest, a revolving electrode carried thereby, another electrode adjustable by hand and arranged to contact the revolving electrode, as described, and a catch for holding said clock-work normally at rest, operated by hand, and carrying a contact-point, whereby the battery-current will be thrown upon the line momentarily when the catch is operated, in combination with an out station or stations, each comprising a clock mechanism, an electro-magnet and armature arranged in the main circuit for controlling said clock-work, a branch or grounding circuit, two electrodes, one of which is a revolving arm and the other a stationary spring or point, an alarm mechanism consisting of a spring-impelled train of gears, as described, and an electro-magnet and armature arranged in said branch or grounding circuit for releasing said alarm, the revolving arm-electrodes of all the stations upon being released (the central station by its catch, and the out stations through their electro-magnets and armature in the main line) by a single impulse generated upon the main line, they will each rotate synchronously for one revolution, during which that out station, and that only, whose stationary electrode lies in the same direction as that to which the adjustable electrode of the central station has been set will have its branch or ground-wire circuit closed and the armature and magnet therein attracted, thereby releasing the spring-impelled alarm.

4. A clock mechanism, a single revolving electrode carried thereby, a catch for holding said clock-work normally at rest, operated by hand, an electrode carried by said catch, another electrode connected with a battery, and suitable wires arranged in an open circuit, all constructed to act in combination, whereby the clock-work will be mechanically released, so that the revolving electrode will make one revolution and a single contact, and the other two electrodes electrically contacted, so as to send a single impulse through the line upon the catch being operated, substantially as set forth.

5. A clock mechanism, a revolving electrode carried thereby, another electrode adjustable by hand, and arranged to contact the revolving electrode, as described, a catch for holding said clock-work normally at rest, operated by hand, an electrode carried by said catch, another electrode connected with the battery, and suitable wires arranged in an open circuit, all constructed to act in combination, whereby the clock-work will be mechanically released and the two last-named electrodes first electrically contacted, so as to send a single impulse through the line upon the catch being operated, and then the revolving and adjustable electrodes contacted, so as to send a second impulse through the line, for the purposes described.

257,020. HAY-CARRIER. GEORGE W. KISS, Marion, Ohio. Filed Feb. 15, 1882. (No model.)

Claim.—1. In combination with the beam A, adapted to be suspended from the rafters of a barn, the traveling carriage D, mounted on friction-rollers F, the pulley G, journaled in said carriage, the rope H, passing over said pulley and secured to the carriage, the frame N, provided with hook R and connection P, the guide S, the pulley M, and the swiveled hook W, and the shoulders on the traveling carriage, with which the hooks R and W are adapted to engage, respectively, substantially as specified.



2. In combination with the beam or track upon which the carriage is adapted to travel, the plate secured thereto provided with a central boss and terminal lugs, and the swiveled lever adapted to be turned in either direction, as desired substantially as specified.

257,021. WICK-TUBE. CHARLES A. KIMBEY, Meriden, Conn., assignor to Edw. Miller & Co., same place. Filed Mar 17, 1882. (No model.)

Claim.—The wick-tube cap A, constructed with the tongues *a b*, extending vertically one on each side the slot in the cap, combined with the tube B, introduced into the slot between the said tongues and interlocked with the cap, substantially as described.

257,022. STRAP-HINGE. WILLIAM H. KURTZ, Columbus, Ohio. Filed June 3, 1881. (No model.)

Claim.—A strap-hinge consisting of a strap-leaf provided with upturned side ears or flanges, and separate and independent re-enforcing blocks external to said ears, in combination with a strap-leaf formed with a tubular knuckle received between the two ears of the other leaf, and a pintle which passes through said knuckle, ears, and external re-enforcing blocks, under the arrangement and for operation as hereinbefore shown and described.

257,023. FINGER, SCARF, AND OTHER JEWELRY RINGS. ROBERT J. LA GRANGE, Philadelphia, Pa. Filed Feb. 13, 1882. (No model.)

Brief.—The ring is adapted to have different heads applied to it. The ring is also adjustable in size, the adjustable portion being concealed by the head of the ring.

Claim.—1. The ring having a socket and a head removably fitted to said socket, whereby the head may be removed and different heads substituted therefor, substantially as and for the purpose set forth.

2. A ring having an adjustable bow and a fastening therefor concealed by the head of the ring, substantially as and for the purpose set forth.

3. A ring formed of a head and an adjustable bow, the movable section or portion whereof is formed with openings, and a fastening-pin on the head of the ring engaging with either of said openings, substantially as and for the purpose set forth.

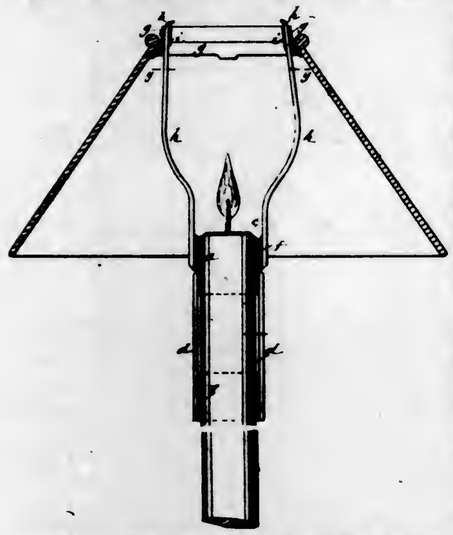
4. The ring formed with a removable head, with a sectional bow, and a fastening-pin, the parts being combined and operating substantially as and for the purpose set forth.

5. In an adjustable ring, the movable section, in combination with a fastening-pin attached to and concealed by the head of the ring, substantially as and for the purpose set forth.

257,024. WATER-PROOF COAT. EDWARD LANDSBURGH and JAY F. TOWNER, Baltimore, Md. Filed Nov. 16, 1881. (No model.)

Claim.—A water-proof coat having a ventilating-aperture at the junction of the sleeve and body, extending to the interior of the coat and surrounded by a flap, and a stiffening device to retain the said flap and aperture in an extended condition, substantially as specified.

257,025. CLOCK-MOVEMENT. FREDERIC A. LANE, New Haven, Conn. Filed Jan. 25, 1882. (No model.)

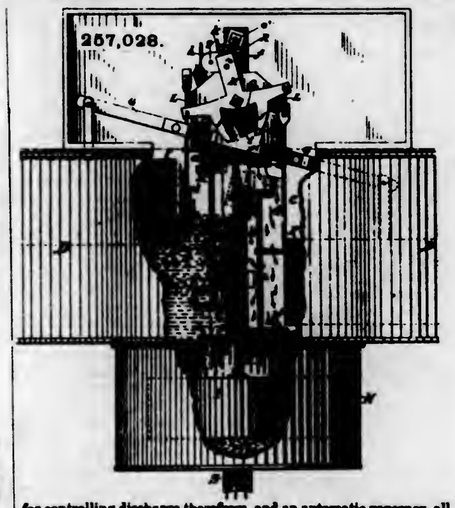


Claim.—The combination, in a clock-movement, of a plate forming the rear bearing of the main and center wheel shafts, a center plate forming a front bearing for the main-wheel shaft, and rear bearings for the shafts of the train and balance-wheel, the short front plate forming front bearings for the shafts of the center wheel and train, and a support for the front end of the balance-wheel shaft, all substantially as described.

257,026. PANTALOONS-PROTECTOR. JOHN T. LANGAN, Lyons, Kans. Filed Nov. 5, 1881. (No model.)

Claim.—A pantaloons-protector, C, curved from end to end to conform to the curve of the bottom edge of the pantaloons-leg, as described, and provided with a groove, D, to receive said lower edge, with stitch-holes *f* near the upper edge of said protector, and thread-channels *f'*, leading from said stitch-holes to said upper edge, as and for the purpose specified.

257,027. SHADE OR GLOBE HOLDER FOR CANDLES. DANIEL LEARY, New York, N. Y. Filed Feb. 1[illegible] 1882. (No model.)



Claim.—1. The combination, with the ring *f* of the shade-holder, of the upper ring, *a*, provided with the flange *c*, the lower ring, *b*, and the rods *d*, secured to the opposite sides of the two rings, substantially as herein shown and described, whereby the holder will be held firmly upon the candle and the shade supported and held erect, and all liability of its tipping sidewise prevented, as set forth.

2. The ring *g*, provided with the perforated plates *i i*, in combination with the rods *A A*, ring *f*, and the rings *a* and *b*, substantially as described.

257,028. THREE-CHAMBERED FLOAT WATER-METER. JULIUS LUDER, Washington, D. C. Filed Oct. 5, 1881. (No model.)

Claim.—1. The combination of registering mechanism, a primary distributing-chamber, and stationary measuring-chambers, which constitute the body of the meter, and are provided with valves

for controlling discharge therefrom, and an automatic governor, all arranged as shown and described, whereby when a spigot is opened the governor instantly acts to allow water to flow uninterruptedly or in a continuous stream from the distributing-chamber, through one or the other measuring-chamber and through the governor-cylinder, into the distributing-pipe, and when the spigot is closed the said governor instantly acts to cut off the stream thus passing through the meter and simultaneously arrest the registering mechanism, as specified.

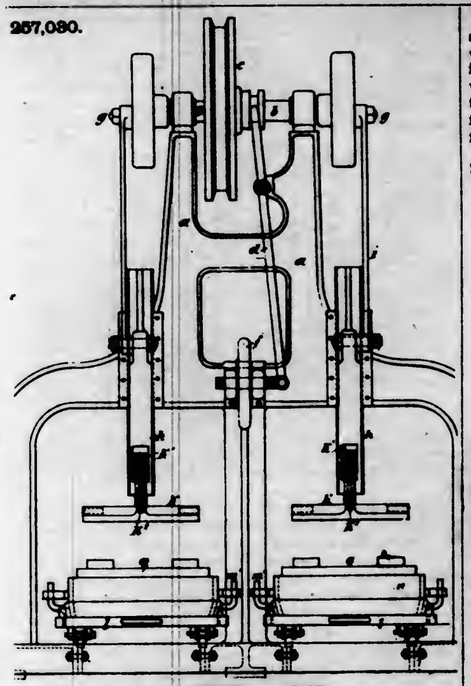
2. The combination, with registering mechanism, the stationary measuring-chambers having valves for controlling the discharge therefrom, and oscillating floats for operating said mechanism, of the automatic governor whose float and cylinder are placed beneath and its valve above the measuring-chamber, so that said governor will instantly begin to allow discharge or to cut it off, and simultaneously allow or arrest the action of the registering mechanism, as specified.

3. The combination, with measuring-chambers and registering mechanism connected therewith, of valves which are connected in pairs and located within the measuring-chambers and operate automatically to alternately allow and cut off both the supply to and discharge from said chambers, substantially as specified.

4. The combination, with the measuring-chambers, floats, and sway-lever G, of levers L L, connected with and operated by the latter, and the valves K, for regulating the induction of the said chambers, substantially as shown and described.

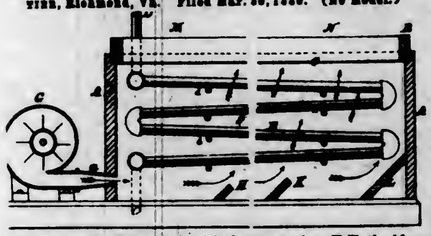
5. The combination, with the measuring-chambers, floats, and sway-lever G, of levers L, and the two-seat or pairs of valves K K', one set being arranged in each chamber, to operate as specified, for allowing one of said chambers to be supplied while the other is discharging, as specified.

6. The combination, with the measuring-chambers, floats, and sway-lever G, of levers L L, connected therewith, the valves K K', for regulating the induction and eduction of said chambers, and the automatic governor consisting of cylinder H, float I, valve W, and connecting-rod T, all arranged to operate substantially as shown and described.



257,029. MEDICAL COMPOUND. PETER E. LEVINGS, Rockford, Ill. Filed Aug. 9, 1881. (No specimens.)

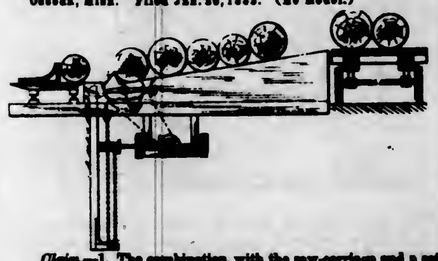
Claim.—The herein-described composition or extract, prepared from water, poplar-bark, wild-cherry bark, prickly-ash bark, dandelion-root, May-apple root, Indian-turnip root, and hops, substantially in the proportion hereinbefore set forth.



257,030. SAND HOLDING MACHINE. FRANCIS LEY, Vulcan Iron Works, Derby, England. Filed Feb. 18, 1882. (No model.) Patented in England June 21, 1881.

Claim.—The adjustable rammer consisting of the axis *b*, crank *g*, connecting-rod *i*, slide A, with screw-socket at its lower end, and pressure-plate *k*, with screw-stem *k'* entering the said screw-socket, substantially as described.

257,030.



257,031. MACHINE FOR DRYING TOBACCO. LAWRENCE LOFTIN, Richmond, Va. Filed Mar. 30, 1880. (No model.)

Claim.—1. The case A, with the steam-pipes E E, the blower G, tray B, and deflecting-boards H K L, arranged as described, and for the purposes specified.

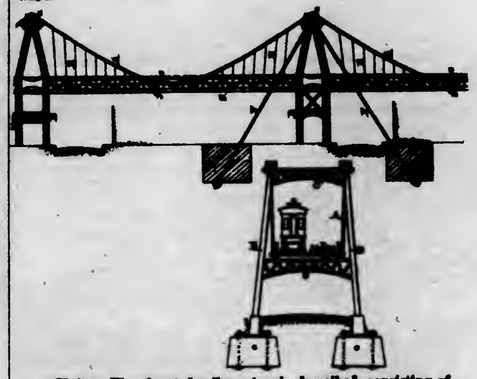
2. The deflecting-boards H K L, in combination with the blower G and steam-pipes E E, arranged as described, and for the purposes specified.

257,032. LOG FENDER AND TURNER. HENRY B. LOUD, Oscoda, Mich. Filed Jan. 30, 1882. (No model.)

Claim.—1. The combination, with the saw-carriage and a set of inclined skids or ways descending to the level of the saw-carriage, and having stop-projections at their lower ends, of a rotary shaft located beneath the level of the skids near the stop-projections, and having arms for lifting the logs over said stop-projections one by one, as described.

2. The combination, with the vertically-moving canting-bar and its immediate driving-gear, and the rotary log-delivering shaft with arms and its immediate driving-gear, of an adjustable driving-gear in common to both the foregoing devices, and combined with them, substantially as shown and described, so as to operate the rotary shaft by one movement, and to be disconnected therefrom and operate the canting-bar by the other movement, as set forth.

257,033. FOLDING COMB. JOHN LOWE, Clinton, Mass., assignor to Caroline E. Lowe, same place. Filed Mar. 8, 1882. (No model.)



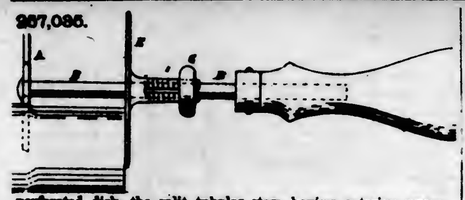
Claim.—1. A folding comb made substantially as herein shown and described, and containing the following elements, to wit: two pivoted combs and a plate pivoted between them, which plate is provided with grooved flanges for receiving the ends of the teeth of the combs when the combs are folded, whereby the teeth of the combs will be protected from being broken off and the hands will be protected from being pained by the ends of the teeth, as set forth.

2. The combination, with the pivoted combs A and B, of the plate D, pivoted between them, which plate is provided with opposite grooved flanges E and F, substantially as herein shown and described, and for the purpose set forth.

3. The combination, with the combs A and B, provided with the shoulders G and H in the backs at the pivoted ends, of the plate D, provided with opposite grooved flanges E and F, substantially as herein shown and described, and for the purposes set forth.

257,034. ELEVATED RAILWAY. LUTHER B. HASKFIELD and MARQUIS D. HOGAN, Brooklyn, N. Y., assignors of three-fourths to Samuel Bromberg and Samuel E. Hildenberg, both of same place. Filed Jan. 9, 1880. Renewed Mar. 8, 1882. (Model.)

Brief.—Trussed towers support continuous cables passing over chairs on said columns with anti-friction-rollers, the roadway being suspended from the cables by guys, the supporting-towers being braced, and the approaches at corners constituting solid roadways.



Claim.—The elevated railway herein described, consisting of the continuous cable A, extending the entire distance of each straight part, passing over chairs *a*, with friction-rollers, and supported by the road-bed D by guys E, and supported on towers B, provided with trusses C C', guys F, and stairways, and the solid roadway G at the corners, all constructed and arranged as shown and specified.

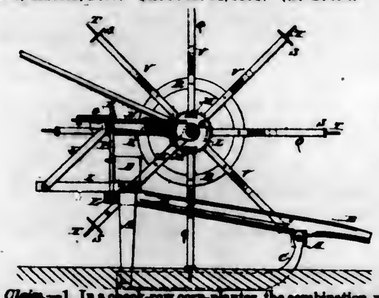
257,035. GUARD FOR PLUMBERS' SHAVE-HOOKS. JOHN W. MCARDELL, Brooklyn, N. Y. Filed Mar. 21, 1882. (Model.)

Claim.—1. A guard for plumbers' shave-hooks, constructed substantially as herein shown and described, and consisting of the

267,036.

perforated disk, the split tubular stem having exterior screw-thread, and the head-nut, as set forth.

2. The combination, with the hook A and shank B, of the adjustable disk E, substantially as herein shown and described, whereby the said disk will serve as a guard to protect the edge of the shave-hook and as a gage to limit the length of pipe shaved, as set forth.



3. The combination, with the hook A and shank B, of the disk E, provided with the split tubular stem F, having exterior screw-thread, and the head-nut G, substantially as herein shown and described, whereby the said disk can be readily adjusted, and will be held securely in place, as set forth.

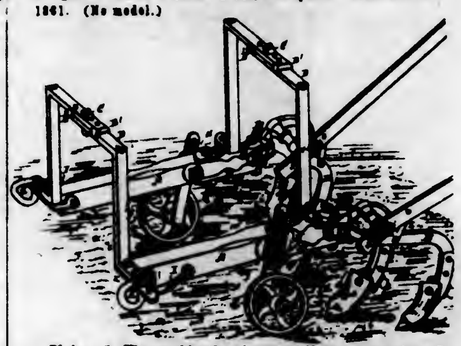
267,036. PANTALOONS-PROTECTOR. CHARLES J. MCDERMOTT, Sandy Hook, Conn. Filed Mar. 8, 1882. (No model.)

Claim.—The spring B, provided with the rubber ball *d* at the top, in combination with the shoe A, substantially as and for the purpose set forth.

267,037. CHECK-ROW CORN-PLANTER. ALFRED A. MCINTOSH, Lincoln, Nebr. Filed Jan. 24, 1882. (No model.)

Claim.—1. In a check-row corn-planter, the combination, with the seed-barrel D, the spoke-wheels Q, and the shaft G, of the pivoted bars F H, the stationary horizontal bar I, the pivoted connecting-bar J, and the forked bar K, substantially as herein shown and described, whereby the said forked bar is kept in a horizontal position as the shaft G rises and falls, as set forth.

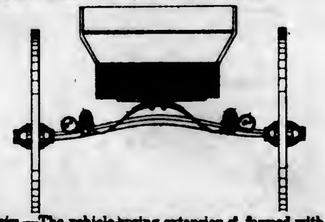
2. In a check-row corn-planter, the combination, with the shaft G, of cam-wheel L, the forked lever N, pivoted to the horizontal forked bar K, the connecting-rod O, and the seed-dropping slide R, substantially as herein shown and described, whereby the said dropping-slide will be vibrated uniformly, as set forth.



3. In a check-row corn-planter, the combination, with the spokes of the wheel Q, of the cross-heads S, provided with the spikes T, and arranged alternately with and at right angles to the plane of the wheel, substantially as herein shown and described, whereby the lines of the cross-rows will be indicated, as set forth.

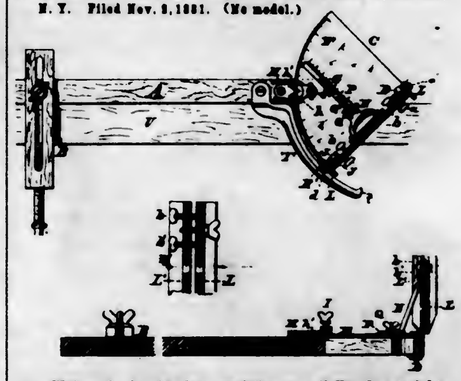
267,038. DENTAL IMPRESSION-CUP. JAMES V. MCHANN, Waverly, Ohio. Filed May 2, 1882. (Model.)

Claim.—An impression-cup consisting of the sections A A, beveled at their adjacent edges, and having respectively the lip E and recess C and the screw D, all combined substantially as shown and described, whereby the sections may be adjusted to and from each other for convenience in use, as set forth.



267,039. CULTIVATOR. THOMAS HEIKLE, Louisville, Ky., assignor to Thomas Heikle & Co., same place. Filed Nov. 21, 1881. (No model.)

Claim.—1. The combination, in a straddle-row cultivator, of the beams A, adjustable arches B, adjustable wheels G, and swinging plows attached to the rear of the beams, substantially as set forth.



2. In combination with the beams A and plates D D', the plows E E, each set being attached behind its own beam so as to swing thereon freely horizontally, substantially as set forth.

267,040. VEHICLE-SPRING. LAFAYETTE A. HELBURN, Denver, Colo. Filed Jan. 30, 1882. (No model.)

Claim.—The vehicle-spring extension *c'*, formed with an outward and inward curve of nearly circular form, and adapted to be secured to a side bar at one end and to form a flexible joint with the end of a spring at the other at a point underneath the side bar, substantially as and for the purpose set forth.

267,041. MITER BOX OR GAGE. JOHN J. MEYERS, Buffalo, N. Y. Filed Nov. 8, 1881. (No model.)

Claim.—1. A miter-box consisting essentially of a straight-edge, A, having a clamping device, B, a quadrant, C, pivoted to the forward end of said straight-edge by the bolt D, and two saw-guiding plates, L L', said plate L' being hinged to the quadrant C, and the plate L adjustably secured to the plate L', the saw-guiding plates being provided with means, substantially as described, for varying their inclination relative to the straight-edge A, substantially as and for the object specified.

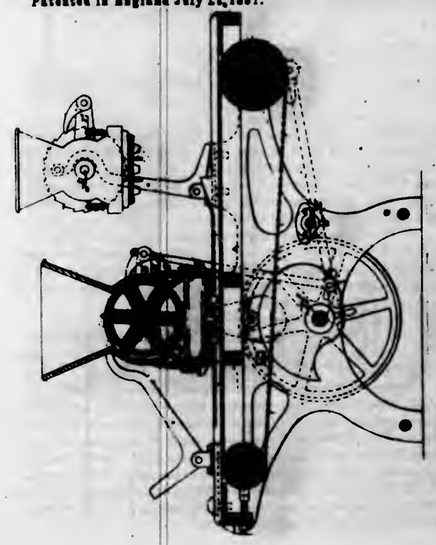
2. The combination, with the straight-edge A, of the quadrant C, having the indexes F and G and pointer *h'*, the saw-guiding plates L L', pivoted brace N, sliding plate P, with pointer Q', and the clamp-screw Q, substantially as described, for the purpose indicated.

3. In a miter-box, the combination, with the straight-edge A, of the index-plate C, pivoted to said straight-edge at its forward end by the bolt D, and the sighting-plate H, having a sighting-aperture, A, provided with an index-finger, *h'*, and on its forward end an adjusting-screw, I, adapted to press the index-plate C down upon the straight-edge A, the whole being constructed and combined for operation substantially in the manner, as and for the object stated.

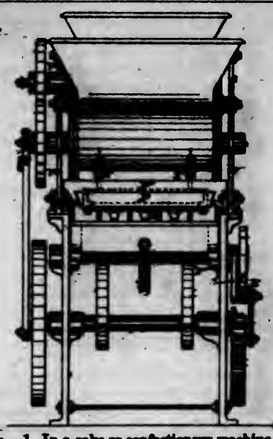
4. In a miter-box having two plates forming a guide for the saw, the combination, with said plates, of two sets of set-screws, *b b'*, adapted to push the said plates apart, and one set of screws, *a*, constructed to draw said plates together, said screws *a* being located about midway between said screws *b b'*, whereby said plates may be adjusted substantially in the manner as and for the purpose specified.

5. In miter-boxes, the combination, with the dial-plate C, having an index-pointer, *h'*, of the auxiliary index-pointer T, consisting of a curved arm fixed to the straight-edge A, and provided with a pointer, *t*, substantially in the manner as and for the object specified.

267,042. BOTTLE-STOPPER. PURCHAS HILLS, Brooklyn, N. Y. Filed Mar. 1, 1882. (No model.)



Claim.—1. The combination, with the stopper, the ball, and the lever, of a ring-loop upon the stopper and a hub upon the lever entering such ring-loop and having an opening for the ball, substantially as set forth.



2. The combination, with the ball, the stopper, and the lever, of a ring-loop upon the stopper, through which the ball passes, and a cylindrical hub with an eccentric opening upon the lever within such ring-loop, substantially as set forth.

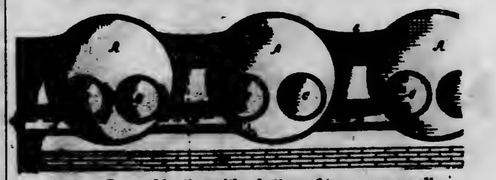
3. The combination, with the ball and stopper, of a lever having a two-part hub through which the ball passes eccentrically, and a ring-loop upon the stopper, substantially as set forth.

267,043. CAKE AND CONFECTIONERY MACHINE. J. HENRY MITCHELL, Philadelphia, Pa. Filed Sept. 2, 1881. (No model.) Patented in England July 14, 1881.

267,043.

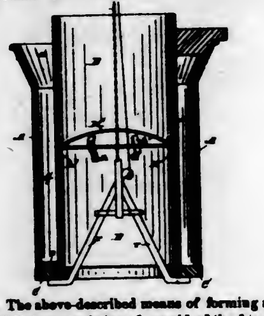
Claim.—1. In a cake or confectionery machine, a casing provided with a hopper at top and an opening at the bottom, in combination with an interior cylinder or roller eccentrically mounted, wings which work in and out of said roller, a nozzle-plate, a vertically-movable table, and mechanism for operating said roller and table, substantially as set forth.

2. In a cake and confectionery machine, the combination, with a hopper or upper chamber for containing dough, dough-dividing mechanism, and a secondary or press chamber provided with nozzles, and having a vertically-movable bottom, of a rising and falling table, whereby the rising table operates the nozzle-chamber and dough will be forced out through the nozzles upon the table, substantially as specified.



3. In a cake and confectionery machine, the combination, with a hopper or upper chamber for containing dough, dough-dividing mechanism, and a secondary or press chamber provided with nozzles, and having a vertically-movable bottom, of a rising and falling table, a nozzle-plate which receives dough from above, a yoke, frame, and springs, all operating substantially as described, whereby the rising of said table and nozzle-plate will force the dough through the nozzles and upon the table, substantially as set forth.

267,044. CLOTHES-RACK ATTACHMENT FOR BEDSTEADS. JOHN MOSSEL, Chicago, Ill., assignor to Mossel & Price, same place. Filed Jan. 25, 1882. (No model.)

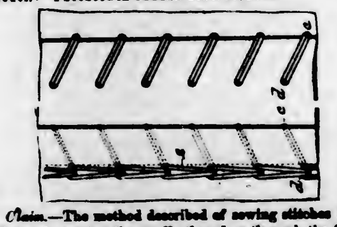


Claim.—In combination with a bedstead head-board, the fixed guides C C, extending from side to side, as shown, and the rack B, provided with pivoted hooks, and adapted to be drawn out at either side, substantially as described, and for the purpose set forth.

267,045. STEAM-BOILER. J. WILLIAM MOORE, Pittsburg, Pa. Filed Sept. 23, 1881. (No model.)

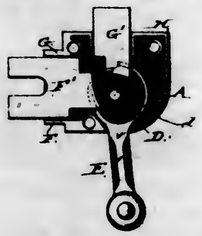
Claim.—In combination with a battery of two or more cylindrical boilers, A A, located above the boiler-furnace B and extending back longitudinally of the furnace-flue, a series of horizontal transverse water-flues, B B, connecting the sides of the different boilers and extending across the fire-chamber in the direct backward flue of the furnace, and a series of water-flue extensions, F F, projecting beyond the end boiler or boilers of the battery, substantially as and for the purposes set forth.

257,046. WELL-LINING APPARATUS. ALFRED W. MORGAN, Indianapolis, Ind., assignor to Louisa C. Morgan, same place. Filed Feb. 28, 1882. (No model.)



Claim.—1. The above-described means of forming a continuous concrete well-lining, consisting of a mold of the form and construction described, suspended over the well, and having its lower end closed by an annular plate or ring independently suspended, and adapted to be lowered into the well with the lining while the mold retains its position, as set forth.

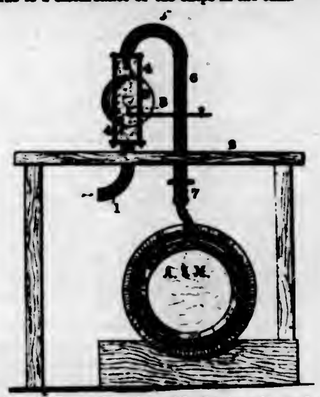
2. In combination with the outward-expanding tube A, the hatch D, lug *a*, and guard E, substantially as and for the purpose set forth.



3. In combination with the inward-contracting tube B, ring H and lugs *h h'*.

257,047. METHOD OF STITCHING FABRICS. JAMES H. MORLEY, Holyoke, Mass., assignor to the Morley Sewing Machine Company, of the State of Maine. Filed Apr. 6, 1881. (No model.) Patented in Canada Sept. 20, 1881.

Claim.—The method described of sewing stitches in fabrics, consisting in passing the needle-thread up through the fabric at *c*, then from *c* carrying a double thread across the fabric substantially at right angles to the line of the feed, passing said double thread down through the fabric at *d*, interlooping said thread, and forming upon the under side of said fabric, under the ends of said cross-stitches, two parallel lines of stitches, one of said parallel lines consisting of a single thread intermediate between said cross-stitches, and the second line of said stitches consisting of double-threaded loops interlooped one with the other, substantially as shown and described.

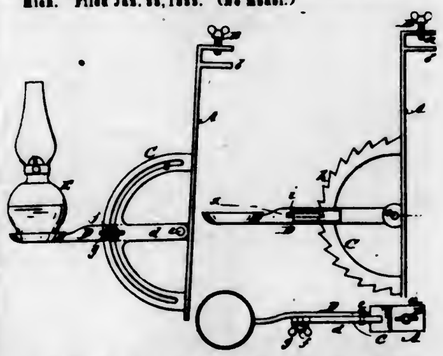


257,048. SASH-FASTENER. DANIEL P. HERRELL, South Norwalk, Conn. Filed Mar. 25, 1882. (No model.)

Claim.—A sash-fastener constructed as described, consisting of the case A, provided with stud *b*, and the lever-arm B, provided with a sleeve, D, and the cam-flanges *e e'*, in combination with bolt F, provided with a projection, *f*, and stop I, and the bolt G', provided with a projection and stop, *f'*, all constructed to operate substantially as and for purpose herein set forth.

257,049. APPARATUS FOR OBSERVING THE QUALITY OF LIQUIDS IN KEGGING. PAUL HERLEMANN, Baltimore, Md. Filed Mar. 31, 1881. Renewed Mar. 14, 1882. (No model.)

Brief.—The invention is designed to detect any muddiness of the beer due to a disturbance of the chips in the tuns.



Claim.—1. In combination with the tap-pipe and cock, the transparent illuminated section 3, as set forth.

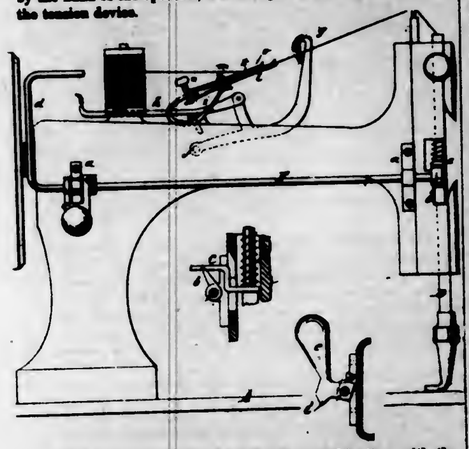
2. In combination with the tap-pipe and transparent section, the jet 8, as set forth.

3. In combination with the tap-pipe having vertical transparent section and cock 7, the jet 8, as set forth.

4. In combination with the pipe 1 and vertical transparent section 3, the pipes 5 6, cock 7, jet 8, and reflector 9, as set forth.

257,050. LAMP-BRACKET. HENRY LEE HUNSON, Charlotte, Mich. Filed Jan. 25, 1882. (No model.)

Claim.—1. In a lamp-bracket, the back piece, A, provided with the clips *a b* and set-screw B at its upper end and the arc-shaped piece C at its lower front end, in combination with the lamp-holding arm D, pivoted to the said back piece, and the means, substantially herein shown and described, for adjustably securing it to the arc-shaped piece, as set forth.



2. In a lamp-bracket, the back piece, A, provided with an attaching device at its upper end, and with the slotted arc-shaped piece C, in combination with the lamp-holding arm D, pivoted to the said back piece, and the clamping-screw *f g*, substantially as and for the purpose set forth.

257,051. PROCESS OF COLORING AND FINISHING PICTURES. CHARLES H. HYDES, Phelps, N. Y. Filed Apr. 13, 1881. (No specimens.)

Claim.—The process of coloring and finishing pictures, consisting, first, in rendering the paper upon which they are painted or photographed semi-transparent by treating the paper to a compound of the following ingredients: sugar of lead, one and one-fourth ounce; spirits of turpentine, one quart; Canada balsam, one pound; second, applying the color to the back; third, cementing the picture to a suitable backing; fourth, securing it to the backing by great pressure, and, fifth, finishing it on the surface, all in the manner described.

257,052. SEWING-MACHINE. DANIEL HEILEY, Bradford, assignor to himself and James Blain, Gilford, Ontario, Canada. Filed Jan. 17, 1882. (No model.)

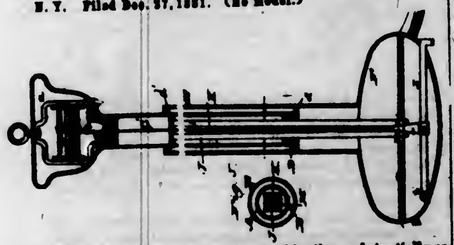
Brief.—The invention relates to mechanism whereby the presser-foot may conveniently be raised and the thread slackened by the hand of the operator, which stops the machine, and also to the tension device.

Claim.—1. In a sewing-machine, the combination, with the arm B, the presser-bar D, provided with the lug *c*, and the rod F, journaled in bearings on the side of the said arm, and provided with the arm *b* and the handle *d*, of the weighted arm *e*, having projection *e'*, substantially as and for the purposes set forth.

2. In sewing-machines, the lever G, provided with eye *g*, and the slide h, in combination with the arm of the machine, substantially as and for the purposes set forth.

3. The combination, in a sewing-machine, of the presser-bar raiser F and thread-slackener G, fitted for being operated contiguously to the balance-wheel, substantially as shown and described.

4. The tension device consisting of spring-tongues *k l*, provided with a slot, *k'*, the U-shaped plate *i*, and the spring *o*, combined for use as shown and described.



257,053. BOTTLE-STOPPER. STEPHEN S. NEWTON, Binghamton, N. Y. Filed June 10, 1881. (Model.)

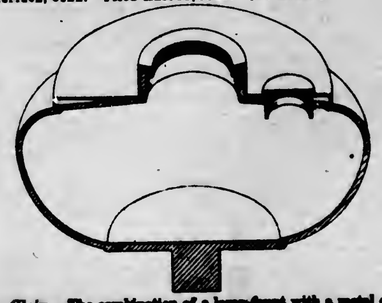
Claim.—1. In a bottle-stopper, the combination, with the discharging-tube having an enlargement, *a'*, and a head C C', of the clamp-ring G, adapted to move upward on the discharging-tube for the purpose of clamping the head and to be moved downward on said tube to release the head, substantially as set forth.

2. In a bottle-stopper, the combination, with the discharging-tube and elastic head, of the clamp-ring G, having a portion of its surface of less diameter than the diameter of the enlargement *a'*, substantially as and for the purpose set forth.

257,054. CHANDELIER. STEPHEN S. NEWTON, Binghamton, N. Y. Filed Dec. 27, 1881. (No model.)

Claim.—1. In a chandelier, the combination, substantially as herein set forth, of the following elements, namely: an upper stationary tube, a lower sliding tube, the strengthening-collar D, adapted to receive the pressure of the locking devices, the locking-bars J and K, and devices, substantially such as described, to crowd said parts J and K against the strengthening part D.

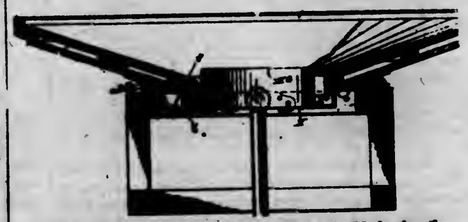
2. The combination of the lower sliding tube, the upper stationary tube, the strengthening-collar D at the lower end of said stationary tube, the bar K, adapted to be thrust outward against the strengthening part D, and the bar J, passing through said part D and connected to the lower shell, F, substantially as described, whereby it prevents rotation of the lower tube relatively to the other.



3. The combination of the lower sliding tube-section, the upper stationary tube, the strengthening-collar D at the lower end of the upper tube, the friction-bars J K, extending from the upper end of the sliding tube to the lower end, and mechanism, substantially as described, for forcing said bars outward against the part D, as set forth.

4. The combination of the lower sliding section, the upper stationary section, the two locking-bars J K, extending from the upper end to the lower end of the sliding tube-section, and a wedge having inclined faces opposite from the locking-bars and operated by the weight of the chandelier to throw said bars outward to lock the sliding section, substantially as set forth.

5. The combination of the following elements, viz: the lower sliding tube-section, the upper stationary tube-section, a cord-winding mechanism attached to the upper tube-section, a locking-bar carried by the lower tube-section and extending from the top to the bottom thereof, a sliding supporting-piece, *d'*, at or near the upper end of the lower tube-section, to which the upper end of the locking-bar is pivoted, and devices, substantially as described, which throw said locking-bar outward upon the pivot in said plate to lock the sliding section, as set forth.



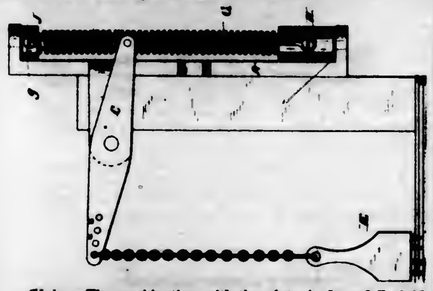
6. In a chandelier, the combination, with the upper stationary section, the lower outer sliding section, the locking-bars carried by the lower section, and the devices which crowd said bars outward, of the strengthening-piece D, cast with the spacing-flange *d*, substantially as set forth.

257,055. LAMP-FOUNT. JACOB J. NICHOLS, Brooklyn, N. Y., assignor to the Bradley & Hubbard Manufacturing Company, Meriden, Conn. Filed Mar. 11, 1882. (No model.)

Claim.—The combination of a lamp-fount with a metal covering-plate, constructed at the center with a burner socket or collar, and at one side with an opening provided with a flange, *c*, upon its under side, said flange extending through a corresponding opening in the fount and provided with a cover, substantially as described.

257,056. SLIME-TABLE FOR CONCENTRATING ORES. WILLIAM NICHOLS, Phœnix, Mich. Filed Dec. 31, 1881. (No model.)

Claim.—1. The combination of the inclined table having the annular groove at its outer edge, mechanism for rotating the table, the perforated water-supply pipe, which is supported in or above the annular groove in the table and discharges the water into the



groove, ore and waste launders or receptacles at the inner edge of the table, and the water-jet pipes for washing the ore down the table into its launder, substantially as set forth.

2. The combination of the inclined table, means for revolving the same, the head f', carried by said table, the hub I, and the annular receptacle constituting the launders I' and I², which receptacle extends out beyond the lower edge of the head f' to form the open offset i, substantially as described.

3. The combination of the main supporting-frame, the wheels thereon, the superposed ring-frame, and the inclined table carried thereby, the rack and worm, the water-supply pipes O and K, and the stationary hub having the ore and waste launders, substantially as set forth.

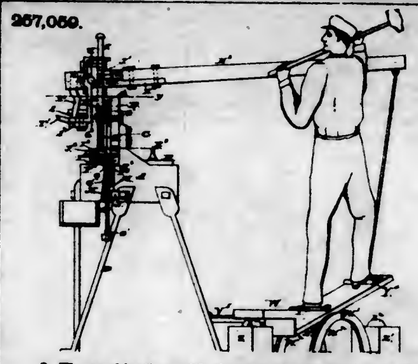
257,057. LOOM-TEMPLE. WILLIAM E. NEELE, Pittsfield, Mass. Filed Dec. 1, 1881. (Model.)

Brief.—A sliding head mounted on a rod fixed in the temple-stand is connected by a link with one arm of a lever pivoted on the stand. The other arm of the lever is connected by a chain with the claw or hooks that engage with the selvage of the cloth. A spiral spring placed on the rod between the sliding head and an adjustable back-stop serves through the sliding head, lever, &c., to draw the claw laterally and stretch the cloth.

Claim.—The combination, with the plate A, the rod I, rigid with this plate, the spring, the sliding head H, and the adjustable back-stop J, provided with a set-screw, *g*, of the rod G, the lever C, and the claw E, connected by a chain to said lever, substantially as and for the purposes described.

257,058. FAN. JOHN HOBEN, Middletown, Conn. Filed Mar. 8, 1882. (No model.)

Claim.—1. The combination, substantially as hereinbefore set forth, of the plaited feather A and the stub *a*, formed of a single piece, and the re-enforce B, secured to the feather at its junction with the stub.



2. The combination, substantially as hereinbefore set forth, of the plaited feather A, the stub *a*, the re-enforce B, and the handle C, provided with a socket, *c*, and for the purpose specified.

257,059. MACHINE FOR SHEARING, PUNCHING, AND RIVETING. WILLIAM A. PALMER, Rome, Ga. Filed Sept. 30, 1881. (No model.)

Claim.—1. In a punching and riveting machine, the bar O, provided with the goose-bill clamp P at its upper end, in combination with the springs O' O², the lateral guide N having shoulder N', and the bed-plate A, substantially as and for the purposes specified.

2. In a punching and riveting machine, the combination, with the bifurcated operating-lever, of the pivoted arm T, carrying at its lower end the cutter T', the adjustable blade S, and the laterally-adjustable stop F, the blade S being secured to the lower face of the casting E and the stop to the lower face of the casting F, the cutter operating between them, substantially as and for the purpose set forth.

257,060.

3. The combination, with the operating-lever of a punching and riveting machine, of the rocking treadle W, connected thereto by a rod, as shown, substantially as and for the purposes specified.

4. The combination, with the rocking treadle W, of the retracting-springs connected thereto and to the supports, and the blocks provided with stop-cushions on their upper faces, placed under the ends of the treadle, substantially as and for the purpose set forth.

5. In a punching and riveting machine, the bed-plate, punch-plate, and the pivoted punch secured to the lower end of the vertical bar I and operated by the lever H², in combination with the slotted casting E, the vertical bar J, carrying the hammer-head J' at its lower end, and the goose-bill clamp P, springs O' O², and lateral guide N, having shoulder N', substantially as specified.

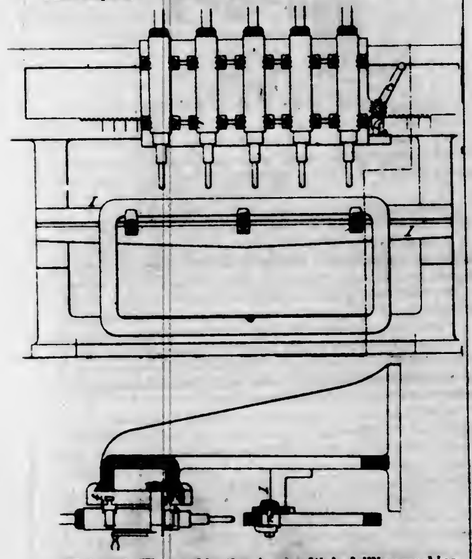
257,060. HEAD-BLOCK FOR SAW-MILLS. BARNES PARKHURST, St. Louis, Mo., assignor of one-half to Geo. E. Knight, same place. Filed Jan. 16, 1882. (No model.)

Brief.—The gage or stop is set and the movement of the adjusting-lever against said stop determines the movement of the log and the thickness of the board. A friction-brake attachment permits a backward movement of the knees under excessive shocks or pressure.

Claim.—1. In a head-block for saw-mills, the combined index, ratchet, and brake-wheel, in combination with suitable lever, index, and brake, as set forth.

2. In a head-block for saw-mills, the wheel H, with rim N, ratchet-teeth N', and index-teeth N², in combination with arm J and lever I, carrying reversible pawl, substantially as and for the purpose set forth.

3. In a head-block for saw-mills, the index, ratchet, and brake-wheel combined in one, in combination with a lever, I, having reversible pawl I', an index, J, and a brake, T, to receive the rebound, all substantially as specified.



4. The combination of wheel H, lever I, provided with pawl I', brake T, index J, and arm Q, with notches E E', substantially as specified.

5. In a head-block for saw-mills, the cam S, in combination with the wheel H and index J, secured to the frame A, for the purpose set forth.

6. In a head-block for saw-mills, the wheel H, lever I, provided with a pawl, I', arm Q, and index J, the latter being made thin, so as to act as a spring, and having a rib, *e*, for engaging with the teeth of the wheel and with notches of the arm Q, all substantially as and for the purpose set forth.

7. In a head-block for saw-mills, the combination of wheel H, lever I in rear, reversible pawl I', index J in front, shaft T, arm Q, cam S, brake T beneath the wheel, lever U, pawl V, scale-bar X, provided with stop Y, all supported by the frame A, and the shaft F, engaging with the main shaft E, all substantially as and for the purpose set forth.

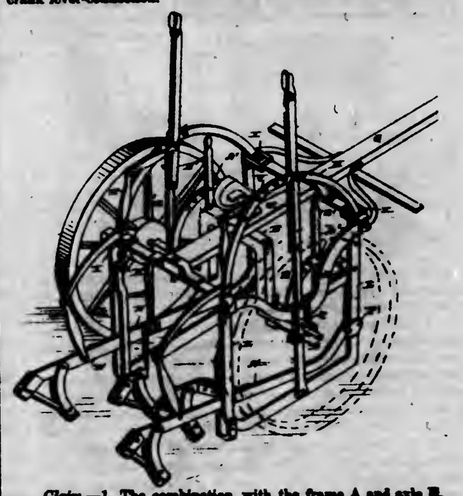
257,061. MULTIPLE-DRILLING MACHINE. CHAS. T. PARRY, Philadelphia, Pa. Filed Sept. 17, 1881. (No model.)

Claim.—1. The combination, in a multiple-drilling machine, of a guide-bar, a saddle adapted to the same, and mechanism for traversing the said saddle, with a series of drill-spindle carriers secured to the saddle so as to be adjustable thereon independently of each other and in the same direction as that in which the said saddle is traversed, all substantially as set forth.

2. The combination, in a multiple-drilling machine, of a fixed guide-bar, a saddle adapted thereto, mechanism for traversing the same, and a series of drill-spindle carriers adjustably secured to the saddle, with an adjustable pointer on the latter and a scale on the guide-bar, all substantially as set forth.

3. The combination, in a multiple-drilling machine, of a series of adjustable drill-spindle carriers, with a face-plate, I, rotating, adjustable thereon, and clamps for confining the object to be drilled, substantially as described.

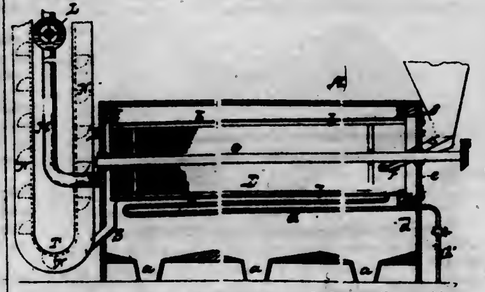
257,062. CORKSCREW. HARRY L. PERRYMAN, Lincoln, Nebr. Filed Feb. 28, 1882. (No model.)



Claim.—1. The combination, with a corkscrew provided with a shank, *d*, of mechanism, substantially as described, whereby in turning a cork a sudden jerk is imparted thereto, substantially as specified.

2. The combination, with the tube A, provided with the opposite slots, *c c*, and handle *a*, secured to one end of the tube, of the screw *i* and shank *d*, having stops *h h*, substantially as described, and for the purpose set forth.

257,063. SULKY-PLOW. JOHN H. PHILLIPS, Gillsville, Ga. Filed Feb. 21, 1882. (Model.)

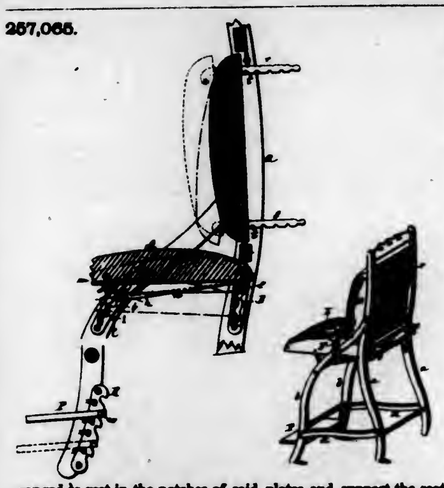


Brief.—The sides of this frame, including the plow-hangers, guides, levers, and racks, adjust to or from each other upon the axle and cross-bars. In front the plow-beams slide up and down by a link-and-lever connection, and at the rear are lifted by a bell-crank lever-connection.

Claim.—1. The combination, with the frame A and axle B, of the adjustable segments H and sliding boxes I, the stirrups P I, the plow-beams N, pivoted thereto, and the compound elbow-levers T and operating-lever S, all constructed and arranged to operate in the manner specified.

2. In combination with the segments A', the levers E' and O', the sliding boxes P, mounted upon the stirrups L, and the plow-beams N, pivoted to said boxes, all constructed and adapted to operate substantially in the manner specified.

257,064. GRAIN DRIER AND CLEANER. LEMUEL C. PORTER and COLIN MCNICOL, Winona, Minn. Filed Feb. 21, 1882. (No model.)



Claim.—In a grain drier, separator, and cleaner, the combination, with the air-tight case A, having the inside head, H, draft-openings *c c*, discharge S, making an air-tight connection with the elevator-tube T, and bottom hoppers, C, of the screen-reel D, steam-pipe grating under the same, suction-fan L, and pipe H, substantially as specified.

257,065. ADJUSTABLE CHAIR. JOHN PURSELL, New Haven, Conn. Filed Oct. 11, 1881. (No model.)

Claim.—1. The combination of the seat A, the notched plates B C on the rear and front legs below the seat, and rundles *c* A, ar-

257,065.

ranged to rest in the notches of said plates and support the seat, one of said rundles connected to the seat by links *f*, substantially as and for the purpose specified.

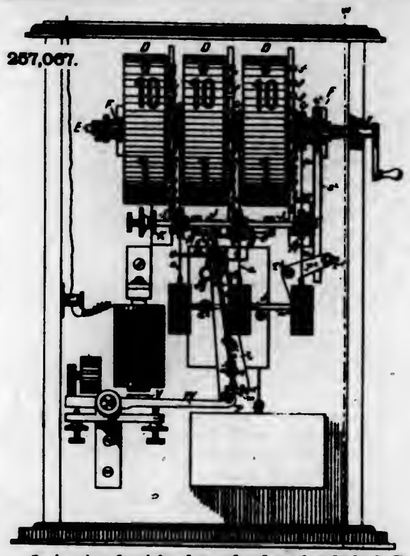
2. The combination of the seat A, the notched plates B C on the front and rear legs, with a rundle supporting the seat at the rear and extending into the notched plates at the rear, and a rundle at the front or opposite side extending into the said notched plates at the front and hung to the seat with a spring, *s*, applied to draw the two rundles toward each other, substantially as described.

3. The back D, notched arms *r s*, hinged to the back, with corresponding studs *t t* on the posts to engage the notches of the arms, and a stop above and in rear of one or more of the studs, substantially as and for the purpose described.

4. The arms composed of two parts, I H, hinged together, and the cushion L, provided with studs upon its under side, and with corresponding perforations in the said parts I H, substantially as and for the purpose described.

5. The combination of the foot-rest P, constructed with studs *w* at the rear, with the notched plates R, provided with studs *x* in front of the notches, and upon which the foot-rest will bear while the studs *w* engage the notches in the plate, substantially as and for the purpose described.

257,066. GAITER. WILLIAM A. QUINN, Cambridge, Mass. Filed Jan. 26, 1882. (No model.)



Claim.—A cloth over-gaiter, A, having a leather stay or reinforcing strip over its front seam, said stay being constructed with the widened or extended toe and instep portion, as herein shown and described.

257,067. FIRE-ALARM-REGISTERING APPARATUS. CHAS. H. RANDALL and HUGHES H. BURGESS, Boston, Mass. Filed Feb. 1, 1881. (Model.)

Claim.—1. A series of peripheral spaced and numbered wheels, D, arranged to turn separately and independently under the action of weights or their equivalents, and each provided with a series of concentrically-arranged and equidistant lateral pins, *f*, in combination with pawls M, arranged between the wheels, and each provided with two abutments for said pins, and with an actuating-lever, P, which lever is rigidly connected to and forms a part of said pawl, all combined and arranged together substantially as and for the purpose described.

257,067.

2. A series of peripheral spaced and numbered wheels, D, arranged to turn separately and independently under the action of weights or their equivalents, and each provided with a series of concentrically-arranged and equidistant lateral pins, *f*, in combination with pawls M, arranged between the wheels, and each provided with two abutments for said pins, and with an actuating-lever, P, which lever is rigidly connected to and forms a part of said pawl, and with a pusher, *r s*, arranged to travel in relation to and to operate upon and against each and all of said levers, all substantially as and for the purpose described.

3. A pusher, *r s*, and its carrier *l*, having notches *m*, and arranged to swing about an axis or center, in combination with a lever, W, arranged to vibrate, and in each vibration to enter into a notch of said carrier and therein work against said pusher, all substantially as and for the purpose described.

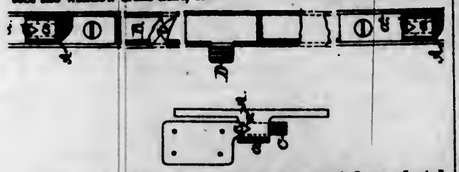
4. A pusher, *r s*, and its carrier *l*, having notches *m*, and together arranged to swing about an axis or center, in combination with an electro-magnet, and a lever, W, which is arranged to vibrate, and in each vibration to enter into a notch of said carrier and therein work against said pusher, and is operated upon through the said electro-magnet, all substantially as and for the purpose described.

5. The combination, with the pendulum of a clock or other suitable movement, and with the carrier *l* for a pusher, *r s*, which is moved by such clock mechanism, substantially as and for the purpose described, of the arm *p'* to said pusher-carrier *l*, and of the angular lever s^3, arranged to turn on a stationary support in relation to said pendulum, and the movement of said arm in conjunction with said pusher-carrier for said arm to place said angular lever at a bearing against the pendulum, and thereby arrest its movement, all substantially as and for the purpose described.

6. The pin *p'* of pusher *r s* and the stop-lever s^3 for the pendulum S of a clock or other movement, combined and arranged together for said pusher-pin, when moved in the proper direction to release said stop-lever from the pendulum, all substantially as and for the purpose described.

7. The carrier *l*, arranged to swing on or about a center, and carrying a pusher, *r s*, in combination with a slide-rod, m^2, for operation substantially as described, for the purpose specified.

8. The vertical pin n^2 to slide-rod m^2, in combination with the arm r^2 of stop-lever s^3 to the pendulum S of a clock or other movement, substantially as and for the purpose described.



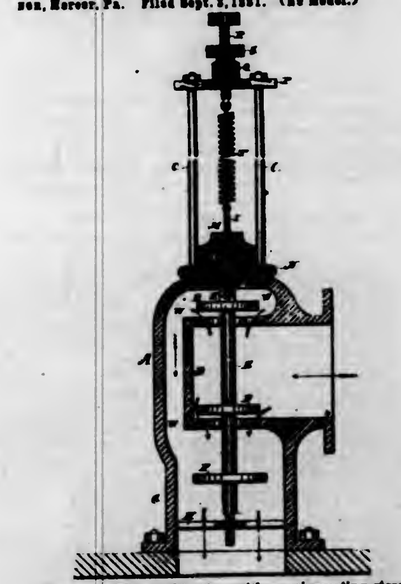
9. The peripheral spaced and numbered wheels D, each provided with concentrically-arranged pins *f*, the pawls M, each having two shoulders, *g h*, and an actuating-lever, P, in combination with a clock or other suitable movement, a carrier, *l*, carried by such movement, and having a pusher, *r s*, and notches *m*, and with the lever W, adapted to be vibrated, when severally constructed and arranged and operating together substantially as and for the purpose described.

10. The carrier *l*, carrying the pusher *r s*, in combination with the shaft of a clock or other movement, an electro-magnet, an armature, and an attached lever arranged directly beneath the pusher and acting to elevate the same, substantially in the manner described and shown.

11. The pusher-carrier *l*, provided with the notches *m*, each constructed at its inner end and along its sides substantially as shown and described, for the purposes set forth.

257,068. DUST-GUARD FOR RAILWAY-CAR WINDOWS. JOHN H. REYNOLDS, Troy, N.Y. Filed Dec. 8, 1881. (No model.)

Brief.—The hinges for the dust-guard B have notches with inclined sides, so that the force of the wind will cause the guard to ride up the incline when its position is to be changed and to settle in the notch, which will give it the proper position to protect the window from dust, &c.



Claim.—1. A dust-guard for railway-car windows, adapted to open and close automatically, as herein described, and provided with self-locking hinges adapted to secure the said dust-guard in position when turned in a perpendicular line to the side of the car and when thrown back from the window in line with the side of the car, substantially as herein specified.

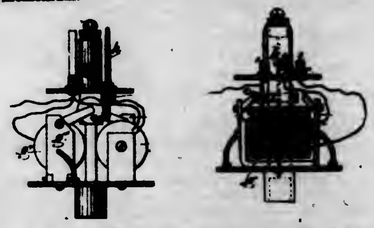
2. The combination, with a dust-guard, B, of hinges composed of a socket, *c*, provided with depressions *c'*, formed in the front and two sides of said socket, as herein described, and a plate, C, provided with a pendent projection, *c*, for the purpose of locking said dust-guard in position when projected perpendicularly from the side of the car and when thrown back from the window in line with the side of the car, and for raising said guard in the first phase of a turning movement, as herein specified.

3. In a dust-guard hinge, the plate C, provided with a shoulder, *c'*, adapted to strike against a socket-piece A for the purpose of preventing the outer edge of the dust-guard from striking against the side of the car, as herein specified.

4. The guard-strip E, provided with a lip, D, arranged as herein described, for the purpose of guiding and retaining the inner edge of the dust-guard against the face of the conjoining flange *b*, as herein specified.

257,069. GOVERNOR FOR STEAM-ENGINES. GEORGE ERNST, Mercer, Pa. Filed Sept. 3, 1881. (No model.)

Claim.—1. The combination, with a reciprocating steam-engine and a valve-chamber, A, provided with the interior chamber, B, having valve-seats C, and connected with the steam-chest and boiler of said engine, of a valve-stem, E, provided with double valves D, and a piston, F, with a wide intervening space between said piston and the inner wall of the valve-chamber, whereby when the steam is admitted into the cylinder of the engine the double valves will be closed by the momentum of the steam upon the piston, substantially as described.



2. The combination, with a reciprocating steam-engine and a valve-chamber, A, provided with valve-seats C, and connected with the steam-chest and boiler of said engine, of the valve-stem E, having the stem I projecting into the atmosphere, and provided with the double valves D, and a piston, F, with an intervening space between said piston and the inner wall of the valve-chamber, and spring T, whereby when the steam is admitted into the cylinder of the engine the double valves will be closed by the momentum of the steam upon the piston, and when the steam is cut off from the cylinder the valves will be opened by the spring, substantially as described.

3. The combination, with a reciprocating steam-engine and a valve-chamber, A, connected with the steam-chest and boiler of said engine, of the valve-seats C C, valve-stem E, provided with the valves D D, and piston F, stem I, sub-cover R, and spring T, secured at its lower end to the upper end of the stem I, and attached at its upper end to the lower end of the sub-cover, substantially as described, and for the purpose set forth.

4. The combination of the stem I, ring N, nut M, and reciprocating washer L, chambered into ring N, and having its upper face ground to form a steam-tight joint with the lower face of the nut M, substantially as described, and for the purpose set forth.

257,070. ELECTRICAL GAS-LIGHTING APPARATUS. THOS. H. REDDIE, Brooklyn, N.Y. Filed Mar. 18, 1881. (No model.)

Brief.—The lighting-current passes through a thermal spring—that is, through 1 r 2 f 3. The expansion of the spring *r* causes it to connect through 3 with another burner, or with an extinguisher on the same burner, or with an alarm, according to prearrangement of connections. The sliding grooved valve need not be forcibly held to a seat. A part of its movement may be effected by momentum.

Claim.—1. The combination, with a gas-burner, of a sliding parallel-sided valve passing across and acting to open and close the gasway, and two electro-magnets and their armatures acting at opposite ends of the valve to move it in either direction, substantially as set forth.

2. The combination, with the gas-burner, sliding valve, and two electro-magnets and their armatures for actuating the valve, of a thermostatic circuit-closer acting to divert the circuit-connection from the igniting-magnet to the extinguishing-magnet, substantially as set forth.

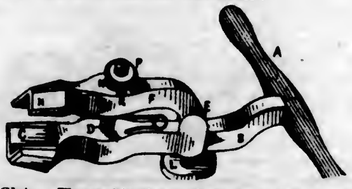
3. The combination, with the magnet and burner in an electric gas-lighting apparatus, of a sliding parallel-sided valve with a groove or neck thereon, adapted to move transversely across the pipe and open and close the gasway, substantially as set forth.

4. The combination, with the gas-burner, of the sliding valve, the magnet *f*, and armature *f'*, for opening the valve, and the spark-points *h* and *i*, the latter of which is moved by the armature *f'*, substantially as set forth.

5. The combination, with the gas-burner and the sliding valve, of the two electro-magnets, one to open the gasway, the other to close it, a thermal switch to change the circuit-connections when the gas is burning, and local circuit-connections and circuit-closers *p q*, substantially as set forth.

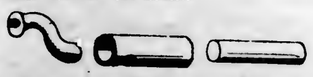
257,071. CHURN-COVER. EDWIN G. RICHARDSON, Poultney, Vt., assignor to H. D. Chapin, same place. Filed Feb. 11, 1881. (No model.)

Claim.—1. The combination, with a vessel and its cover, of the spring locking-levers, the central standard secured to the cover, the adjustable nut upon said standard, and the locking-cams upon which the ends of the springs bear, substantially as set forth.



267,071.

2. In a looking device for a churn or similar cover, the spring looking-levers bearing upon the edge of the cover, their ends projecting beyond said edge and adapted to enter and bear against the looking-cams, in combination with means for compressing their central parts in order to throw their ends outward and upward and hold the springs in such position, substantially as shown and described.

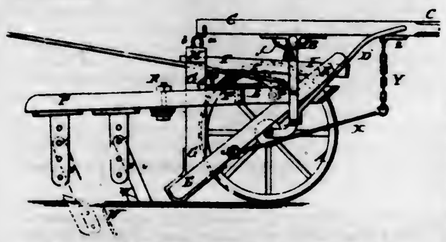


3. In combination with the spring looking-levers, the central standard secured to the cover and provided with adjustable nuts above and below the crossed springs, substantially as and for the purposes specified.

267,072. CARRIAGE-WRENCH. EDWIN A. ROBBINS, Boston, Mass. Filed Mar. 22, 1882. (No model.)

Claim.—The combination, with the shank B, having the rigid screw-bolt D, adjustable thumb-bolt L, jaw C, and cross-handle A, of the adjustable jaw H, having a shank-bar, F, provided with an incline-faced hole, T, and projections or ribs R, and the thumb-nut P, provided with a shoulder, S, and tubular projection N, all being constructed and arranged substantially as shown and described, as and for the purposes set forth.

267,073. VEHICLE-REACH. CHARLES K. ROBINSON, Lyons, N. Y., assignor of one-half to Hollis L. Hotchkiss, same place. Filed Aug. 12, 1881. (No model.)



Claim.—1. A vehicle-reach consisting of a metallic tube having solid bearing ends welded thereto, the whole forming one integral body, as herein shown and described.

2. A vehicle-reach consisting of a metallic tube with solid bearing ends welded thereto and a wood filling resting in the tube, as herein shown and described.

267,074. SULKY-CULTIVATOR. JOHN W. ROCKAFELLOW, Stockton, N. J. Filed Dec. 22, 1881. (No model.)

Brief.—The sulky-frame is provided with a sub-frame having oblique bars, which rest upon the ground and form supports or gages. This frame, together with the drag-bars, is suspended by a link-connection from the axle-frame, which may be vibrated laterally by the handles or hooked rigidly to the axle. Removable side beams.

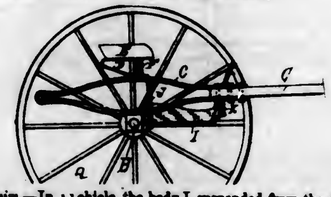
Claim.—1. The combination, with the carriage A B C D and the plow-beams L O P, of the inclined bars E, the uprights G, the cross-bars F H, and the longitudinal bar I, substantially as herein shown and described.

2. In a sulky-cultivator, the combination, with the inclined gage-bars E and the tongue C, of the draw-rods X and their supporting-chain Y, substantially as herein shown and described, whereby the draft is applied to the said inclined bars and the double-tree and whiffletrees are supported above the plants, as set forth.

3. In a sulky-cultivator, the combination, with the inclined bars E and the upright bars G, of the plow-beams L, substantially as herein shown and described.

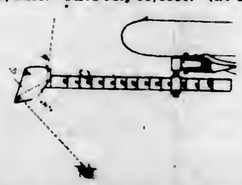
4. In a sulky-cultivator, the combination, with the tongue C and the cross-bar H of the gage-frame, of the hook-rod *a* and the eyebolts or staples *b*, substantially as herein shown and described, whereby the plows can be suspended above the ground, as set forth.

5. In a sulky-cultivator, the combination, with the axle B and the uprights G of the gage-frame, of the hook-rods *c* and the eyebolts or staples *d e*, substantially as herein shown and described, whereby the gage-frame and the carriage can be rigidly connected, as set forth.



267,075. MAGNETIC RECEIVER. JAMES HARRIS ROGERS, Washington, D. C., assignor of one-half to Frank Hume and L. G. Hine, both of same place. Filed Mar. 6, 1882. (No model.)

Claim.—1. The combination of the diaphragm, the magnet having its poles arranged in close proximity, the arm carried by one pole of the magnet and resting in contact with the diaphragm, and the helix carried by the other pole, substantially as and for the purpose set forth.



2. The combination of the casing, the diaphragm, the ring magnet secured to the casing, the helix on one pole of the magnet the opposite pole of the magnet, and the arm carried by the free pole of the magnet in contact with the diaphragm.

267,076. TWO-WHEELED VEHICLE. ROBERT ROSS, Santa Rosa, Cal. Filed Feb. 28, 1882. (No model.)

Claim.—In a vehicle, the body I, suspended from the springs C by the bolt J and from the shafts G by the spiral springs K, substantially as shown and described.

267,077. SIGHT FOR ORDNANCE. ANDREW H. RUSSELL, Watertown, Mass. Filed July 26, 1881. (No model.)

Claim.—The combination, with a gun provided with sights *b a*, of the reflecting-surfaces *d f*, carried, together with the rear sight, by a common holder adapted to be moved vertically and fastened in position, the rear sight, *h*, being arranged to move and be adjusted laterally on said holder, all substantially as and for the purpose specified.

267,078. WHIP. ANTHONY SCHARFF, Philadelphia, Pa. Filed Feb. 20, 1882. (No model.)

Claim.—1. The within-described tip for whips, said tip consisting of a coiled strip, *g*, of rawhide, having a central core, *h*, of tempered steel, as set forth.

2. The within-described tip for whips, said tip consisting of a coiled strip of rawhide, with central steel-wire core, *h*, and uncoiled depending strip *f*, as set forth.

267,078.

3. The combination, in a whip, of the stock, the tip consisting of a coiled strip of rawhide with steel core, and the covering comprising an inner braid, *i*, an outer braid, *n*, and an intermediate layer, *m*, of water-proof cement, as set forth.

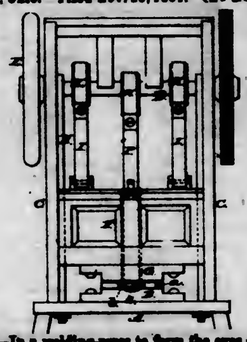
267,079. COTTON-PRESS. MICHAEL H. SCHREIER, Batesville, Ark. Filed Jan. 14, 1882. (No model.)

Claim.—1. In a cotton-press, the combination, with the follower A and the levers B, of the bolts *a*, guide-plates *c*, and rods *d*, inclosing said bolts, and the rods *b*, connecting the bolts with the said follower, and the ropes *e*, secured to the bolts *a* and passing over pulleys at the inner and outer ends of the levers, substantially as shown and described, and for the purpose set forth.

2. In a cotton-press, the combination, with the levers B and the ropes *e*, passing over pulleys at the ends of the levers, of the rods *b*, connected to the follower at one end and to the ropes at the other, and forming sliding joints with the said levers, substantially as shown and described.

3. In a cotton-press, the combination, with the follower A and the follower-chamber, of the lint-room placed above the follower-chamber and having a vertically-sliding rotary table, *k*, which forms the bottom of the lint-room and the top of the follower-chamber, and means for operating the said table, substantially as shown and described.

267,080. DIE FOR MAKING ELLIPTIC SPRINGS. CHARLES T. SCHOEN, Philadelphia, Pa., assignor of one-half to Charles Scott, same place. Filed Dec. 18, 1881. (No model.)



Claim.—The improved dies described, having curved faces, the one grooved and the other ribbed, substantially as set forth, and adapted for shaping the plate and for making the grooves or ribs therein by one operation.

267,081. IMITATION OF MARQUETRY BY PAINTING. WILLIAM SCHROEDER, San Francisco, Cal. Filed May 16, 1881. (No specimens.)

Claim.—The process substantially stated above, to wit: a series of steps for the production of ornaments, figures, &c., representing inlaid work on wood, consisting, first, in preparing the wood with sizing or shellac; second, in coating or grinding it with water-colors; third, in subsequently removing a part of the latter through the openings of stencils by means of a damp sponge; fourth, in applying colors through secondary stencils for finishing the designs with darker parts or lines; and, lastly, coating the whole with shellac or varnish to fix it, substantially as herein described.

267,082. MACHINE FOR MAKING HOES. ALBERT SCHWEER, Sandusky, Ohio. Filed Nov. 26, 1881. (No model.)

Claim.—In a welding-press to form the eyes of hoes or other tools, the combination, with the press-frame having guides H in its uprights C C, of the lower recessed die, E, the follower F, and upper die, G, having a bearing, *b*, through them, the welding and forming plunger L, reciprocating through the follower and upper die, and the eccentrics K N and pitmans I P, substantially as and for the purpose specified.

267,083. ART OF MAKING WATCH-CASES. ISAAC SCHWIRTER, Brooklyn, N. Y. Filed Dec. 15, 1881. (No model.)

Claim.—The method herein described of making covers for watch-cases, which consists in cutting or stamping out the ornamental rim A in a single homogeneous piece of metal, then stamping or striking up from a blank the head B, and finally uniting the rim to the edges of the head by means of solder, substantially in the manner and for the purpose described.

267,084. DEVICE FOR EXHIBITING OR HOLDING WHIPS. ORLANDO H. SCOTT, Marysville, Ohio. Filed Mar. 6, 1882. (No model.)

Claim.—In a device for exhibiting or holding whips, the combination of a whip and spring-key with a suitable slotted plate or holder adapted to receive and retain the whip and key, all substantially as and for the purpose stated.

267,085. FOLDING CUT AND BEDSTEAD. CHARLES T. SEGAR, Utica, N. Y. Filed Mar. 22, 1882. (No model.)

Claim.—1. A folding cot or bedstead consisting of side rails, A, pivoted legs B, and double parallel folding connections extending transversely between the legs of each end, and braces, substantially as specified.

2. The folding cot or bedstead consisting of the side rails, A, pivoted legs B, transverse parallel folding connecting-bars E E', jointed in the middle and pivoted to a vertical connection, F, and the chain-braces C, D, and A, substantially as specified.

3. In a folding cot or bedstead having the side rails and pivoted legs, the transverse parallel folding connections extending transversely between the legs at each end, and the extensions A under and supporting the rails, substantially as specified.

267,086. PADLOCK. WILLIAM W. SHALLUS, Lancaster, Pa. Filed Feb. 28, 1882. (Model.)

Claim.—In combination with the casing A, provided with groove B on its interior, the shackle having a longitudinal groove, E, and annular groove V, plate D, having hook C, tumbler G, provided with a beak, H, and recess I, tumblers I, adapted to work into the wards of the shackle, the intervening plates, spring P, and bow T at the key-hole, all arranged to operate substantially in the manner and for the purpose specified.

267,087. DEVICE FOR OPENING STOVE-DOORS. WILLIAM H. SHAW, Albany, N. Y. Filed Feb. 18, 1882. (Model.)

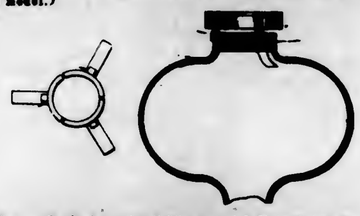
Claim.—1. The combination of a stove, the stove-door, and a pivoted lever that is attached to the stove in such relation to the door that one of its ends will catch under a projection on the door and first raise the free end of the door upward and then swing it open, substantially as shown.

2. The combination of the stove-door provided with a projection having an inclined plane and a vertical portion with a pivoted lever, by means of which the door can be first lifted and then thrown open, substantially as described.

3. The combination of the pivoted lever having the bearing-points P, and the projection O, which passes through the flange of the stove, whereby the lever may be rocked back and forth for the purpose of opening the door, substantially as set forth.

267,088. POST-VALVE. STORER SHEPARD, St. Louis, Mo., assignor of one-half to Thomas H. Bradley, Washington, D. C. Filed Jan. 14, 1882. (No model.)

Brief.—Valve G is guided in its ascent and descent by guides F F', the former bearing on ring a, whereby the friction is reduced, and the latter, by striking against C, prevents the valve rising too high in the chamber.

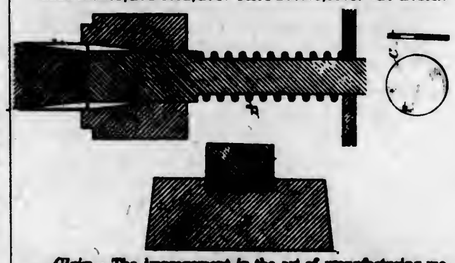


Claim.—1. A valve consisting of the disk E and the projections F F', which projections permit the valve to turn parallel to its seat and compel the disk to operate in a direct line between its seat and its cheek.

2. A valve provided with projections F', in combination with the pipe or bushing C and cylinder B, the contact of said projections with the bushing or pipe providing a check, substantially as described.

3. The valve-cylinder provided with the rim *a*, as and for the purpose described.

4. The cylinder B, having a valve-seat, *d*, and rim *a*, in combination with the pipe or bushing C and valve E, having upper and lower projections, substantially as set forth.



267,089. MEANS FOR ATTACHING BURNERS TO LAMPS. THORNTON A. SMITH, Philadelphia, Pa. Filed Feb. 23, 1882. (No model.)

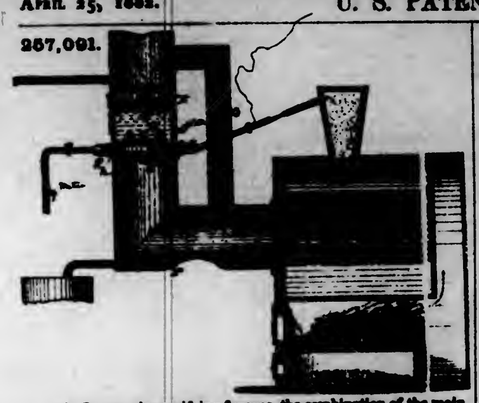
Claim.—1. A ring of suitable material divided into two or more sections, each section having thereto attached one or more arms or equivalent device, and one or more clasps or their equivalent, together with a ring or collar of suitable material and shape, having on its inner surface two or more slots, and a vertical flange on its outer rim for attaching to the bowl or neck of lamps, substantially as described, and for the purpose set forth.

2. A ring of suitable material divided into sections, having arms and clasps thereto attached, together with a ring having slots on its inner side to fit said clasps, and a vertical flange on its outer rim, in combination with a band or washer of rubber or other suitable material for attachment to bowl or neck of lamps, substantially as described, and for the purpose set forth.

267,090. MANUFACTURE OF METALLIC CAPSULES. ALBERT STORER, New York, N. Y. Filed Nov. 30, 1881. (No model.)

Claim.—The improvement in the art of manufacturing metallic capsules, which consists in first producing a cylindrical cup from a soft-metal blank by the conjoint action of a die and plunger, by which the disk is pressed or squeezed, substantially in the manner described, and then subjecting this cup to the action of a tapering die and plunger, by which said cup is pressed into the form of a tapering capsule, substantially as and for the purposes hereinbefore set forth.

267,091. SMOKE-PURIFYING FURNACE. ALONZO J. SIMMONS, Indianapolis, Ind. Filed Jan. 28, 1882. (No model.)



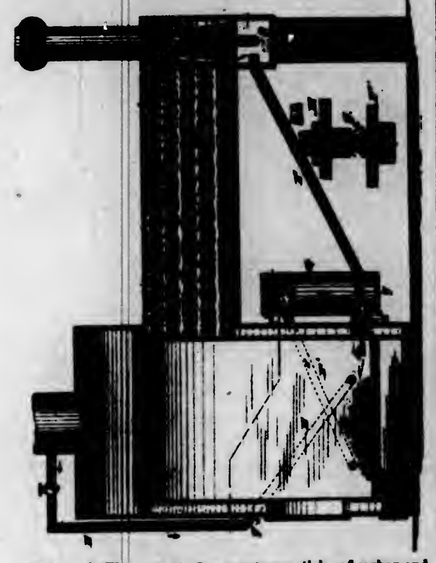
Claim.—1. In a device for deodorizing and cleansing the products of combustion in furnaces, a smoke-flue having a column of water therein, and provided with a series of injectors for the passage of steam, water, and products of combustion, the column of water being held up by the pressure from the steam and water issuing from the injectors, said injectors also acting to cause a vacuum in the lower part of the flue, substantially as set forth.

2. In a device for deodorizing and cleansing products of combustion in furnaces, a smoke-flue provided with a casing or receptacle containing a series of vacuum-injectors, said casing forming the bottom of a water-chamber in the flue, substantially as set forth.

3. A furnace provided with a flue having a series of injectors, a column of liquid in the flue above the injectors, and openings for steam and water pipes to the injectors, as set forth.

4. A furnace provided with a smoke-flue having a series of injectors, a column of water in the flue, pipes for the supply of steam and water to the injectors, and an overflow and auxiliary supply-pipe connected directly with the water-chamber, substantially as and for the purpose set forth.

267,091.



5. In a smoke-purifying furnace, the combination of the main flue having a casing and series of injectors supporting a column of water in said flue, the products of combustion passing through the injectors underneath the column of water, with an auxiliary flue having a suitable damper, whereby the products of combustion are carried off when the injectors are not in use, substantially as set forth.

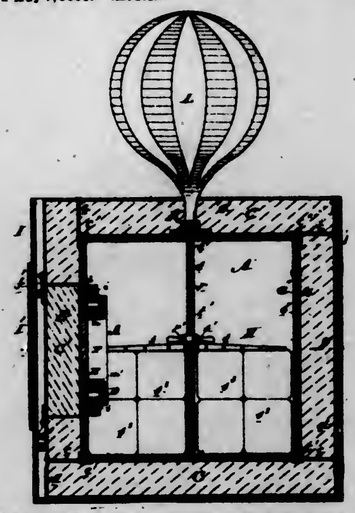
6. In a device for deodorizing and cleansing products of combustion arising from the manufacture of fertilizers or other articles giving off noxious vapors, a series of injectors secured in a casing fitted to the flue, said casing having openings for the passage of steam, water, and products of combustion to the injectors, as and for the purpose set forth.

7. In a device for deodorizing and cleansing products of combustion, the combination, with the injectors arranged in the flue, of adjustable pipes leading from the boiler-dome and water-supply, substantially as set forth.

8. The combination, with the flue P and injector-casing S, forming the bottom of a water-receptacle in said flue, of the bars X in said receptacle, whereby the gas-bubbles are broken up and their escape from the top of the water prevented, substantially as and for the purpose set forth.

267,092. FURNACE FOR CONSUMING SMOKE. ALONZO J. SIMMONS, Indianapolis, Ind. Filed Jan. 28, 1882. (No model.)

Claim.—1. The method of consuming particles of carbon and gases arising from combustion of fuel in furnaces, which consists in arresting said unconsumed products as they come under the petticoat-pipe, then conducting them to a drum or receptacle provided with a vacuum injector or injectors in its lower end and a pipe at its upper end, which conducts the lighter gases to a series of injectors, where they are commingled with steam and forced into the furnace, substantially as set forth.



2. In a device for consuming the products of combustion in furnaces, a drum connected with the smoke-arch beneath the petticoat-pipe, said drum having a lower pipe leading to the furnace, an upper pipe connected with a series of vacuum-injectors whereby steam is admitted, and a shield for preventing particles of carbon from entering said upper pipe, substantially as set forth.

3. In combination with a furnace, a drum, G, provided with a vacuum-injector, *g*, pipe I, entering the fire-box, pipe F, leading to the smoke-arch beneath the petticoat-pipe, pipe E, leading from the steam-dome, and pipe F', provided with a series of injectors, *g*, through which the products of combustion are forced upon the burning fuel, substantially as and for the purpose set forth.

267,093. COMPOSITION FOR THE MANUFACTURE OF ARTIFICIAL TILES. ROBERT SKINNER, San Francisco, Cal. Filed Aug. 31, 1881. (No specimens.)

Claim.—A concrete block consisting of a base composed of asphalt or pitch suitably tempered and an upper surface composed of melted resin, light sharp sand or silex, and Portland cement, constructed and united together in the manner substantially as herein set forth and specified.

267,094. SAFE. DAVID W. SMITH, Port Townsend, Wash. Filed May 7, 1881. (Model.)

Claim.—1. The combination of the safe A, having an opening, *g*, cut in one of its sides, with the apertured door-plate D, secured to the inner surface of the safe over and about said opening, and having a recess, *e*, equal in length and breadth to the opening *g*, whereby space shall be provided for accommodating the locks and hinges of the safe-door, substantially as shown and described.

2. In combination with a safe, the door-plate D, having recess *e*, aperture *i*, for ingress to the safe, a grooved projection, *m*, surrounding said aperture, and provided with rubber *m'*, and projecting screw-sockets *n*, substantially as and for the purpose set forth.

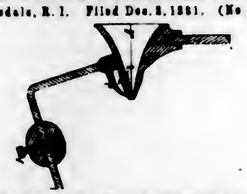
3. The combination of the safe A, the door-plate D, having grooved projection *m* and rubber *m'*, with the door F, having flange E, which is adapted to fit against the said rubber, and a bent projection, *o'*, adapted to engage with the inner surface of the safe when the door is closed, substantially as shown and described, and for the purpose set forth.

4. The combination of the safe A with the grooved and notched rod *r*, the binder H, nut *r'*, and the step *t'*, substantially as shown and described.

5. The combination of the safe A, the rod *r*, having groove *t* and notches *t'*, with the binder H, having arms *o*, hub *o'*, and wires *o²*, and the step *t'*, substantially as shown and described.

6. The combination of the safe A, provided with straps *s'*, secured to its outer surface, and rods *c*, held at right angles to the

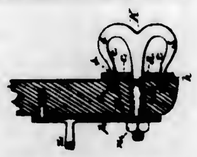
safe by the said straps, with the buoyant jacket C, having bands *d* on its outer surface and perforations for receiving the said rods, and nuts *f*, for holding the rods in position, substantially as shown and described.



7. The combination of the safe A, having screw-threaded socket K on top, buoyant jacket C, secured to the outer surface of the safe, and the sheet-metal buoy L, having its staff screwed into said socket, substantially as shown and described.

8. The combination of the safe A, constructed of metal plates *a a' b*, and the buoyant jacket C, secured thereto in sections, with the false safe I, having rollers secured to its inner surface to facilitate the egress of the safe from the said false safe, substantially as shown and described.

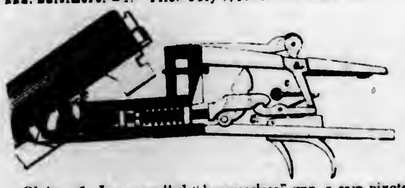
9. The safe A, constructed of metal plates *a a' b*, with opening *g*, for ingress to the safe, in combination with the rubber *h*, the recessed door-plate D, secured to the inner surface of the safe, and having projecting screw-sockets *u*, and the door F, having screws *u'*, substantially as shown and described.



10. The combination of the safe A, the rod *r*, and the binder H, having arms *e*, radiating from a central hub and connected by wires *r'*, substantially as shown and described, and for the purpose set forth.

257,095. TRUMPET FOR RAILWAY-HEADS. JAMES MONROE SMITH, Lonsdale, R. I. Filed Dec. 8, 1881. (No model.)

Claim.—The improved railway-head trumpet substantially as described, having to its throat the pivoted tongue, and also having the bent lever and adjustable weight to operate with such tongue, essentially in manner and for the purpose set forth.

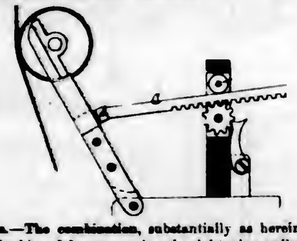


257,096. WHIFFLETREE-CLEVIS. JOHN E. SMITH, Charleston, Ark. Filed Jan. 25, 1882. (No model.)

Claim.—1. The double reversible clevis having a central threaded stem and lateral rearwardly-bent branches engaging by their terminal portions recesses in a face-plate, substantially as specified.

2. The combination, with the perforated double-tree, its back plate, *p*, and face-plate *c*, having lateral recesses A, of the reversible clevis K, engaging the recesses of the face-plate by the rear ends of its branches *e*, and provided with the securing-nut *n*, substantially as specified.

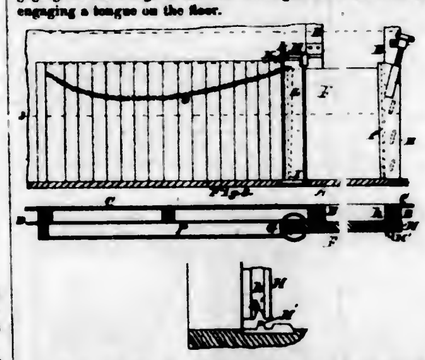
257,097. BREECH-LOADING FIRE-ARM. CHARLES W. SMITH, Baltimore, Md. Filed July 7, 1881. (No model.)



Claim.—1. In a so-called "hammerless" gun, a cam pivoted in the breech and adapted to cock the lock, in combination with a lug integral with or attached to the barrel, which said lug as the breech is opened traverses an arm of the cam in a direction away from its pivot, whereby the leverage gradually increases with the tension of the spring, as set forth.

2. In combination with the lock of a so-called "hammerless" gun, a cam pivoted in the breech and adapted to cock the lock, and having a projection against which the barrel abuts as the breech is closed, whereby the forward motion of the striker-bolt is unimpeded, as set forth.

3. In a so-called "hammerless" gun, a breech-piece chambered about the firing-pin, the said chamber having a lateral opening, in which is inserted a perforated plug, whereby any gases which leak into said chamber through the front opening for the pin are afforded a free vent to the air and their entrance through the rear bearing into the lock-cavity is prevented, as set forth.



257,098. BELT-TIGHTENER. FRANK SNYDER, New York, N. Y. Filed Feb. 3, 1882. (No model.)

Claim.—The combination, substantially as hereinbefore set forth, of the hinged frame carrying the tightening-pulley, the rack pivoted to such frame, the pinion engaging the rack, and the stop-pawl, for the purpose set forth.

257,099. GRAIN-DOOR FOR FREIGHT-CARS. JACOB R. SPRAGUE, St. Louis, Mo. Filed Dec. 29, 1881. (No model.)

Brief.—A cleat with a groove for the end of the door is pivoted in a step-plate at the mouth of the door-pocket and is swung behind the inner edge of the door and locked. A sliding cleat engaging the outer edge of the door has a groove at its lower edge engaging a tongue on the floor.

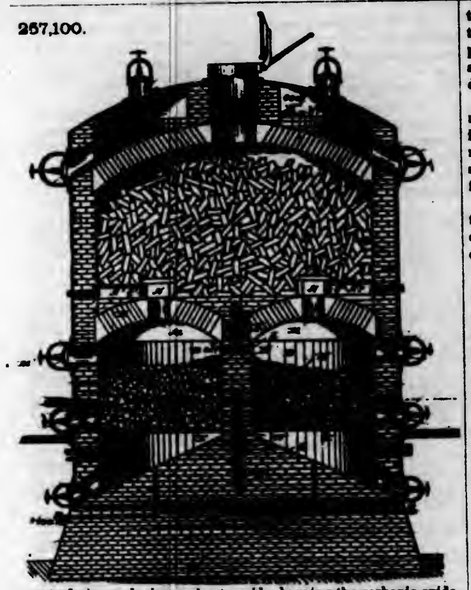
Claim.—1. The pivoted cleat or holder, in combination with a grain-car door adapted to swing laterally, the said cleat or holder in one position holding one end of the door and in the other position permitting the door to slide past it, as set forth.

2. The pivoted cleat G, having channel *g*, and adapted to turn on a vertical axis, in combination with a grain-car door, as set forth.

3. The combination, with the pivoted cleat G, of the lever M, hinged thereto, and adapted to lock the cleat either in engagement or out of engagement with the door, as set forth.

4. The combination of a grain-door, F, pivoted cleat G, and casing L, covering the cleat.

5. The combination of pivoted cleat G and step plate or block I, let flush into the floor, and constructed to give bearing to the lower end of the cleat.



6. The combination of the car-door F, pocket P, and pivoted cleat G, adapted to open and close the pocket, as set forth.

7. The combination of the locking-cleat H, having recess A' and inclined movement, and the tongue H', adapted to enter said recess, as set forth.

257,100. PROCESS OF AND APPARATUS FOR MANUFACTURING GAS. THEODORE G. STRIBORN, New York, N. Y. Filed Jan. 14, 1882. (No model.)

Claim.—1. The herein-described process of manufacturing gas, the same consisting in the following steps, to wit: raising to incandescence a mass of carbonaceous material by a blast or current of air, producing carbonic oxide, burning the carbonic oxide by a blast or current of air above the incandescent carbonaceous material, causing the products to pass into a mass of refractory material, and thus highly heating the same, throwing upon the mass of incandescent material carbonaceous gas-producing material sufficient when reduced to coke or charcoal to supply the amount of carbonaceous material consumed during combustion and generation of gas; raising the said mass to incandescence; decomposing steam by passing it through the incandescent material, producing water-gas, causing the water-gas to come into contact with the heavy hydrocarbons being distilled from the carbonaceous gas-producing material, and thus decomposing them and causing recomposition of the different elements; then causing all the gases and vapors distilled to pass through a mass of highly-heated refractory material, where they may be enriched with naphtha and fixed, substantially as specified.

257,100.

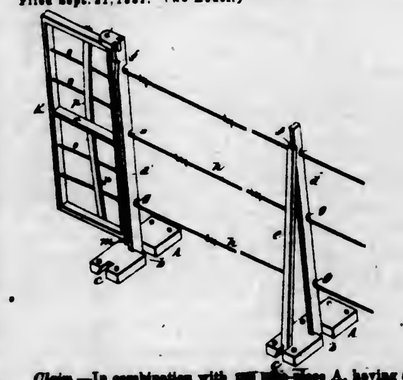
rent of air, producing carbonic oxide, burning the carbonic oxide by a blast or current of air above the carbonaceous material, causing the products to pass into a mass of refractory material, and thus highly heating the same, throwing upon the mass of incandescent material carbonaceous gas-producing material sufficient when reduced to coke or charcoal to supply the amount of carbonaceous material consumed during combustion and generation of gas; raising the said mass to incandescence; decomposing steam by passing it through the incandescent material, producing water-gas, causing the water-gas to come into contact with the heavy hydrocarbons being distilled from the carbonaceous gas-producing material, and thus decomposing them and causing recomposition of the different elements; then causing all the gases and vapors distilled to pass through a mass of highly-heated refractory material, where they may be enriched with naphtha and fixed, substantially as specified.

2. The process of generating gas, which consists in subjecting bituminous coal to the direct heat, by contact, of a mass of incandescent fuel for evolving the gaseous vapor from the former, and at the same time decomposing steam by injecting it into the incandescent mass of coke or fuel, and conducting the resulting hot products, hydrogen and carbonic oxide, through the distilling mass of bituminous coal for taking up the heavy tarry vapors therefrom, carbureting the mixed gases and vapor thus formed, while hot, in a separate chamber, and, finally, combining the carbureted mixture into a fixed gas by bringing it into contact with a mass of heated material in a separate chamber, substantially as specified.

3. The method herein described of manufacturing gas, consisting in raising to incandescence a mass of carbonaceous material by a current of air, producing carbonic oxide, then burning the carbonic oxide by a current or blast of air above the incandescent material, causing the products to pass through a mass of some refractory material, highly heating the same, then bringing in contact with the incandescent material bituminous coal or any other solid gas-making material, distilling the gases and vapors from the same by direct heat, then causing the gases and vapors to pass through highly-heated refractory material for the purpose of fixing said gases, substantially as described.

4. The process herein described of manufacturing gas, which consists in raising to incandescence a mass of carbonaceous material by a current of air, producing carbonic oxide, then burning the carbonic oxide by a current or blast of air above the incandescent material, and conducting the hot products into and through a mass of refractory material, thus highly heating the same; then bringing in contact with the incandescent carbonaceous material bituminous coal or other solid gas-making material, distilling the gases and vapors from the same by direct contact with hot coke, and at the same time decomposing steam by passing it into the heated coke, and conducting the resulting hot products through the mass of distilling coal for taking up and carrying off the heavy tarry vapors, then causing the commingled gases and vapors to pass through the highly-heated refractory material for combining and fixing them and producing a permanent gas, substantially as described.

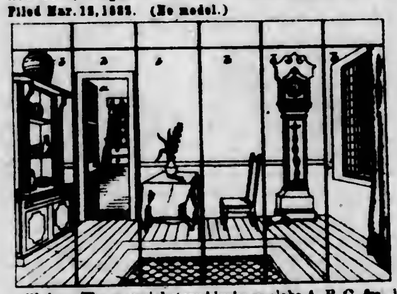
5. In an apparatus for generating gas from coal, the combination of the upper and lower chambers and intermediate connecting-chamber, the lower chamber being adapted to contain bituminous coal for distillation, and the upper one refractory material, to store up the heat necessary to fix the gases and vapors passing from the lower chamber, substantially as specified.



6. In combination with the lower chamber of the generator, the conical floor and the grate above the same, and the central column provided with flues for the admission of air into the said chamber, substantially as and for the purposes specified.

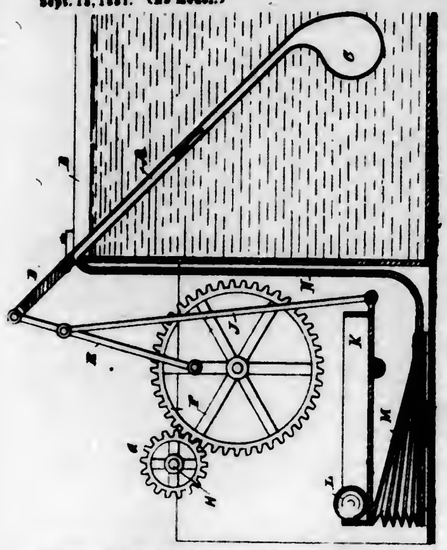
7. In combination with the upper and lower communicating chambers, the chambers located above the combustion and generating chamber, wherein liquid hydrocarbon is vaporized and supplied to the gases generated below in a nascent state, and an oil-supply pipe, substantially as and for the purpose set forth.

8. The combination, with the generator or lower chamber, of the heating and annular coal-chambers located successively above the said generating-chamber, substantially as shown and described.



9. The combination of the upper and lower chambers of the generator, the steam and air induction flues or pipes, the hydrocarbon-fluid chambers, and the coal-heating chamber, the whole being arranged to operate substantially in the manner specified.

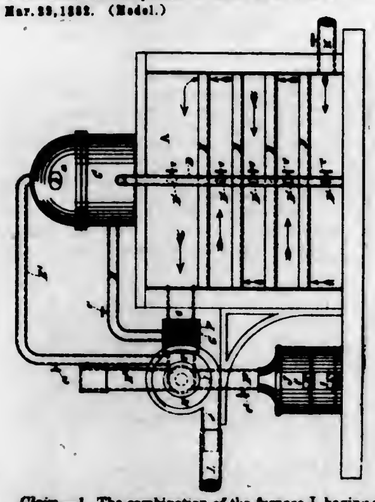
257,101. PORTABLE FENCE. EPHRAIM STAHL, Kenner, La. Filed Sept. 21, 1881. (No model.)



Claim.—In combination with the base-piece A, having slots *a b* cut in from its side and end, each slot having one side inclined, as shown, the post *d*, provided with a downward extension fitted to the side slot in said base-piece, and a notch, *f*, near its upper end, and the brace *e*, having its lower end provided with a downward extension which fits into said end slot of the base-piece, and having its upper end recessed to fit into said notch *f* and to embrace the sides of the post, substantially as shown.

257,102. PICTORIAL STORY-BLOCKS. WALTER STRANDBERG, New York, assignor to Edward I. Horsman, Brooklyn, N. Y. Filed Mar. 18, 1882. (No model.)

Claim.—The pictorial story blocks or slabs A, B, C, &c., having on their faces *b* illustrations of a scene, and on their other faces illustrations adapted to enter into the scene for successive display in said scene, substantially as described.

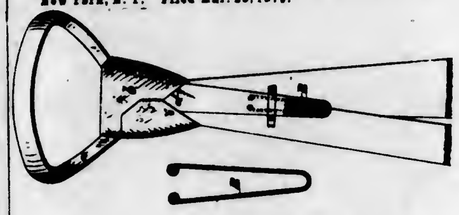


257,103. MOTOR. JOHN SUTLIFF, Sr., Huntsville, Mo. Filed Sept. 13, 1881. (No model.)

Claim.—1. In a *motor*, the combination, with the tubular lever A, pivoted on the edge of a water-tank, of devices for automatically and alternately filling this lever and its bulb with air and then exhausting the air, substantially as herein shown and described and for the purpose set forth.

2. In a motor, the combination, with the water-tank B, of the tubular lever A, terminating in a bulb, C, of the connecting-rods E and J, the wheel F, the pivoted box K, the weight L, the bellows M, and the flexible tube N, substantially as herein shown and described and for the purpose set forth.

257,104. APPARATUS FOR FUMIGATING, DISINFECTING, AND VENTILATING VESSELS, BUILDINGS, &c. BENJAMIN J. TAYMAN, Philadelphia, Pa. Filed Jan. 5, 1880. Renewed Mar. 29, 1882. (Model.)



Claim.—1. The combination of the furnace J, having a lower chamber, *i*, for containing charcoal or other fuel, and an upper chamber, *i'*, having a perforated bottom for containing sulphur or equivalent material, with the chemical-reservoir C and connecting-pipes E', and the fan H, having a hose, I, for fumigating vessels, buildings, &c., with chlorine gas, sulphurous-acid gas, and carbonic-acid gas, substantially as set forth.

2. The chemical-chamber A, having trays B and pipe M, in combination with the chemical-reservoir C, and pipes D and D' communicating therewith, and a chimney connected with the short pipe *e* of the chamber, for destroying offensive odors emitted in fat-rendering, &c., substantially as set forth.

3. The combination of the fan H with the chemical-reservoir C, pipe E, chemical-box F, having a cage, G, provided with a sponge, *d*, pipe D, having branch pipes D', and the chemical-chamber A, having trays B, and short pipe M, provided with a hose, for disinfecting vessels, buildings, &c., by the use of chemicals, substantially as set forth.

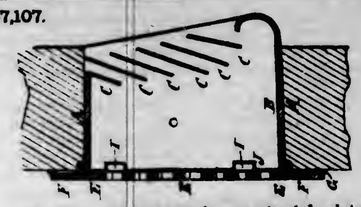
257,105. NECKTIE. HIRAM E. THAYER and GEORGE W. HAYNE, New York, N. Y. Filed Mar. 25, 1879.

Claim.—In a neck scarf or tie band, the tip B, constructed in skeleton form, as and for the purpose set forth.

257,106. CORSET-CLASP. DENNIS H. TIERNEY, Waterbury, Conn. Filed Feb. 27, 1882. (No model.)

Claim.—1. In a corset, the two busks A B, one provided with headed studs and the other with eyes having an enlarged opening for the insertion of the heads, the combination therewith of a lock arranged upon the busk to which the eyes are attached, but independent of the eyes and studs, and so as to be moved over and close the enlarged part of the opening in the eye to lock the clasp together, or removed therefrom to permit their separation, substantially as described.

2. In a corset, the two busks A B, one provided with headed studs and the other with eyes having an enlarged opening for the insertion of the heads, the combination therewith of a lock arranged to slide over and close the enlarged part of the opening in the eye to lock the clasp together, or removed therefrom to permit their separation, one or more of the said eyes constructed with a slot, *n*, and the lock with a projection, *m*, working through said slot, substantially as and for the purpose described.



3. In a corset, the two busks A B, one provided with headed studs and the other with eyes having an enlarged opening for the insertion of the heads, the combination therewith of the piece C, arranged to slide upon that part to which the eyes are attached, the said piece C carrying a part or projection which, by the sliding movement of the said piece C, will carry such part or projection over or remove it from the enlarged part of the opening in the eye, substantially as described.

4. In a corset, the two busks A B, one provided with headed studs and the other with eyes having an enlarged opening for the insertion of the heads, the combination therewith of the piece C, arranged to slide on the part to which the eyes are attached, with the loop D, hinged to the part B and to the piece C, whereby movement is imparted to the said piece C, to cover or uncover the enlarged part of the openings in the eyes, substantially as described.

5. In a corset, the two busks A B, one provided with headed studs and the other with eyes having an enlarged opening for the insertion of the heads, the combination therewith of the piece C, arranged for longitudinal movement on that part to which the eyes are attached, and carrying projections *f*, to pass over or from the enlarged part of the openings in the eyes, constructed with inclines upon their edge next the eye, substantially as described.

257,107. AIR-FLUE REGISTER. HENRY A. TOBEY, Dayton, Ohio. Filed Feb. 24, 1882. (No model.)

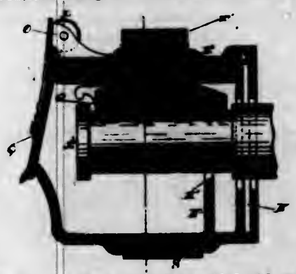
257,107.

Claim.—1. An air-flue register constructed, substantially as herein shown and described, with an inclined bottom having its inner part curved upward and forward, a slotted back, and a removable grate-door provided with a lock, as set forth.

2. In an air-flue register, the back formed of inclined overlapping cross-slats C, arranged with each lower slat a little in the rear of and at a less inclination from the perpendicular than the next upper slat, substantially as herein shown and described, whereby liquid filth thrown into the register is prevented from entering the air-flue, as set forth.

3. In an air-flue register, the bottom B, having a slight upward inclination, and having its rear part curved upward and forward, substantially as herein shown and described, whereby liquids and solids are prevented from passing from the said bottom into the air-flue, as set forth.

4. In an air-flue register, the combination, with the register-walls having sockets J and L, of the removable grate-door E, having lugs I and a lock, K, substantially as herein shown and described, whereby the grate-door can be readily removed and the register cleansed, as set forth.



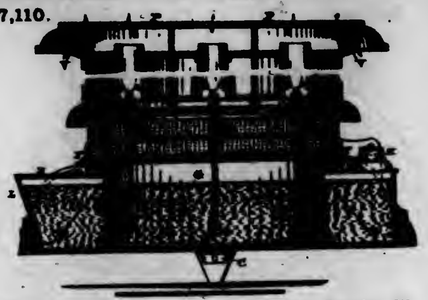
5. In an air-flue register, the combination, with the inclined bottom B, of the grate-door E, provided with the notches M in its bottom edge, substantially as and for the purpose set forth.

257,108. STARCH FOR LAUNDRY AND OTHER PURPOSES. ROBERT W. TAYLOR, Richmond, Va. Filed Mar. 15, 1882. (No specimens.)

Claim.—1. As a new article of manufacture, a starch-gloss or mica-starch for laundry purposes, composed of finely-powdered mica and ordinary starch, with or without the admixture of gum-arabic or other material, substantially as specified.

2. The herein-described composition of matter, consisting of finely-powdered mica, ordinary starch, and gum-arabic, in about the proportions and for the purposes specified.

257,109. CAR-AXLE BOX. WILLIAM L. TROUP and JOHN A. C. GEMMER, Harrisburg, Pa. Filed Nov. 23, 1881. (No model.)



Claim.—1. The pillow-piece F, provided with spring-hinge knuckles L or O, in combination with the spring-door Q, hinged thereto and removable therewith from the casing and repairable distinct from the casing A A, as and for the purpose set forth.

2. The guiding-ledges P P, arranged longitudinally on the under side of the pillow F, in combination with the brass or journal box G, admitted at its top between said ledges to resist the displacing side action of the brake, and that said box may be freed of said ledges to facilitate its removal after said pillow-piece has been removed, substantially as set forth.

257,110. OIL-STOVE. JAPHET S. VAN DUZEE, Albany, N. Y. Filed Jan. 27, 1882. (No model.)

Claim.—In an oil-stove, the combination of the reservoir B, made largest at its bottom and provided with an extension, L, and filling-hole H, the vertical partition G, provided with the gauzes J W, the partition being loosely placed inside of the reservoir, and the extension being provided with the gauze N, substantially as shown.

257,110.

257,111. GATE-HANGER. JOSEPH WADLEIGH, Rensselaer, Ill. Filed Jan. 3, 1881. (No model.)

Claim.—A gate-hanger constructed of two bars of half-round iron, in which the rollers are journaled, said bars bent at their ends, as shown and described, and welded together to form pivots for the hanger to turn on, as set forth.

257,112. MECHANICAL TOY. WILLIAM A. WEBBER, Medford, Mass. Filed Mar. 9, 1882. (No model.)

Claim.—1. A toy constructed in imitation of a living being and provided interiorly with mechanically-operated appliances, such substantially as described, adapted to produce musical sounds in a series of notes, as set forth.

2. A toy constructed in imitation of a living being, in combination with appliances, such substantially as described, arranged within the toy and adapted to produce musical sounds in a series of notes, and mechanical means operative from the exterior of the toy to move said musical appliances, as and for the purposes set forth.

3. A mechanical toy made in imitation of a living being, and having placed within it bellows or other wind mechanism, a series of reeds and reed-chambers, a raceway for a perforated music-sheet, air-passages leading from the raceway to the reeds, and mechanism for holding a perforated music-sheet in close contact with and feeding it along the raceway, and each and all constructed and arranged in relation to each other and to the outside of the toy to be operated, substantially as and for the purposes described.

257,113. MOWING-MACHINE. WILLIAM M. WEBBER, Ravenswood, W. Va., and CHARLES C. CAMPBELL, Richmond, Va. Filed Dec. 1, 1881. (No model.)

Claim.—1. The combination, with the frames *b b*, pivoted to the axle of the driving-wheels, of the frame *t*, carrying the shoe *s*, and finger-bar *s'*, rigidly secured thereto, the frame *t* being pivoted at its front end to the arm *w*, hinged to the frame *b*, and pivoted at its rear end to the frame *b*, whereby the finger-bar is made a floating one, substantially as described.

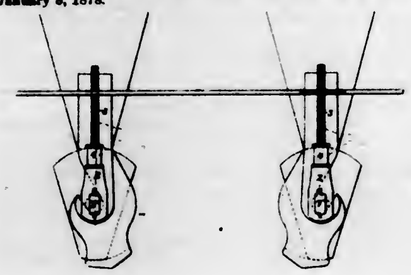
2. The combination, with the frames *b b*, pivoted to the axle of the driving-wheels, of the frame *t*, carrying the shoe *s*, and finger-bar *s'*, rigidly secured thereto, the frame *t* being pivoted at its front end to the arm *w*, hinged to the frame *b*, and pivoted at its rear end to the frame *b*, lever *b'*, and chain *a'*, secured to the lever and frame *t*, whereby the floating finger-beam may be raised and lowered as desired, substantially as described.

3. The combination, with the frame *b*, provided with the levers *b' b'* at its front and rear ends, respectively, the former connected by a chain with the arm *w*, pivoted to the frame *b*, and the latter connected by a chain with the frame *b*, of the shaft *k*, hub *o*, plate *m*, having arms *n*, universal joint *p*, and frame *t*, pivoted to the arm *w* at its front end and hinged to the arms *n* at its rear end, substantially as described.

4. The combination, with the cutter-bars *w' w'*, each provided with a heel, *o'*, adapted to reciprocate in a recess, *p'*, in the upper

257,113.

shoe of the shoe *z*, of the lever *q'*, pivoted to the shoe and provided with the bent rods *t'* at its inner end, and having slots *r' r'*, screws *s'*, passing through the slots and secured to the heels of the cutter-bars, and wheel *r*, provided with the serpentine flange *s* on its periphery, substantially as described.



5. The combination of the cutter-bars *n' u'*, each provided with a heel, *o'*, shoe *z*, lever *q'*, provided with the bent rods *t' t'*, and having slots *r' r'*, screws *s'*, wheel *r*, having the serpentine flange *s* on its periphery, and shaft *q*, arms *u u*, secured to the frame *t* and pivoted to the arms *u*, secured to the plate *m*, universal joint *p*, shaft *k*, and cone-pulleys *i d*, provided with circular flanges fast on the driving-axle and shaft *k*, and connected by a belt, substantially as described.

6. The combination, with the oscillating lever *q'*, pivoted to the shoe and provided with the bent rods *t'* at its rear end, and having slots *r' r'*, screws *s'*, passing through the slots and secured to the heels of the cutter-bars, and wheel *r*, of the supporting-rod *v'*, secured at its lower end to the oscillating lever *q'* and pivoted at its upper end to the frame *t*, substantially as described.

7. The combination, with the wheel *r*, provided with the serpentine flange *s* on its periphery, and the oscillating lever *q'*, of the bent adjustable rods *t' t'*, each provided with a loop at its front end, screws *s'*, and washers *w'*, to adjust the rods for wear, substantially as described.

257,114. MEASURING AND DISCHARGING APPARATUS FOR COOLING TUBES OF CHAR-FURNACES. JOHN H. WEBSTER, Boston, assignor to himself and Oscar B. Stillman, Brookline, Mass. Filed Feb. 28, 1882. (No model.)

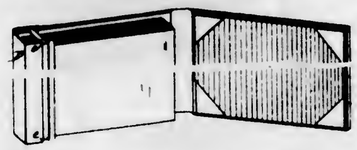
Brief.—Improvement on Letters Patent No. 199,118, dated January 8, 1878.

Claim.—1. The combination, with a movable measuring-box at the mouth of a cooling-tube and mechanism for intermittently oscillating or reciprocating said box, of an intermediate connecting arm or device of comparatively fragile construction, substantially as and for the purpose set forth.

2. The combination, with a pivoted measuring-box at the mouth of a cooling-tube and mechanism for intermittently oscillating said box, of the intermediate connecting-arm composed of the socketed part 2, attached to the trunnion of the box, and the fragile section 3, loosely inserted in the socket of the part 2, as set forth.

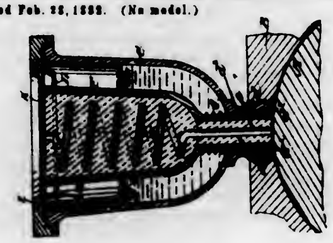
3. The combination, with a series of movable measuring-boxes and mechanism common to all the boxes of the series for intermittently oscillating or reciprocating said boxes, of intermediate arms or devices of fragile construction connecting the boxes with the operating mechanism, whereby when any box is accidentally obstructed the connection between such box and the others of the series is broken without interfering with the operation of the other boxes, as set forth.

257,115. PAPER-FILE. ALBERT R. WEISZ, Brooklyn, N. Y. Filed Feb. 21, 1882. (No model.)



Claim.—The combination, substantially as hereinbefore described, of the back, the groove formed in said back, the paper-supporting wire curved throughout its length, the eye formed near the inner end of said wire, the stop projecting from said eye, the pin passing through the sides of the groove and through the eye, the thumb-piece formed near the outer end of the wire, and the latch secured to the back at or near its outer end.

257,116. TABLE-LEAF SUPPORTER. WILLARD F. WELLMAN, Belfast, Me., assignor to himself and William C. Thompson, same place. Filed Dec. 15, 1880. Renewed Mar. 14, 1882. (Model.)

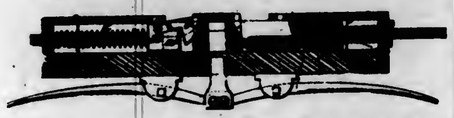


Claim.—In combination with the hinged leaf C, table rail F, and outwardly-folding rods A E, the keeper G, fixed on the rod E, and the spiral spring H, attached to the under side of leaf C and sliding at the lower end on the keeper G, as and for the purpose specified.

257,117. WRITING-TABLET. EDWIN P. WENTWORTH, Cape Elizabeth, Me. Filed Dec. 22, 1881. (Model.)

Claim.—The combination, with the tablet, flap, and pressing-strip, of the elastic band protected and covered by the flap, as described.

257,118. LUBRICATOR. JOHN H. WILLIAMS, Pittsburg, Pa. Filed Feb. 28, 1882. (No model.)



Claim.—1. The outer cup or vessel, C, having its neck *e* provided with an external thread, *d*, and an internal thread, *d'*, with vertical grooves *e* therein, substantially as and for the purpose herein described.

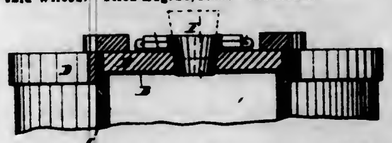
2. The combination, with the outer vessel, C, having grooves on the interior of its neck, and the cap or cover K, of the inner vessel, F, having grooves on the exterior of its neck, and the coiled-wire spring J, substantially as and for the purpose set forth.

3. The combination of the outer vessel, C, having grooves *e* in the interior of its neck *e*, and the inner vessel, F, having grooves *h* in the exterior of its neck *f*, substantially as and for the purpose herein described.

4. The combination, with the outer vessel, C, having grooves on the interior of its neck, and provided with the spring M, of the inner vessel, F, having grooves on the exterior of its neck, and provided with the flange L, having notches *l*, substantially as and for the purpose set forth.

257,119. CAR-COUPLING. CHARLES PERRY WILLSON, Summit Point, W. Va. Filed Mar. 6, 1882. (No model.)

Claim.—1. In a car-coupling, a horizontal pin adapted to engage with a vertical link, in combination with catches for engaging with and operating the pin from either side of the car, substantially as shown and described.



2. In a car-coupling, a coupling-pin having a conical head and a neck at each end, in combination with automatic catches adapted to be operated from either side of the car, and means for supporting said pin and catches, substantially as shown and described.
